WASHBURNE, Elihu Benjamin, b. Livermore, Me., 1816; as a boy was apprenticed in the Kennebec *Journal* office; studied law at the Harvard law school; was admitted to the bar, and in 1842 began practice at Galena, Ill., where he became acquainted with Gen. Grant. He was sent to congress as a whig in 1853, and held his seat until 1869, joining the republican party not long after its organization. In 1869 he was appointed secretary of state by President Grant, but resigned on account of ill-health, and was appointed minister to France, a position which he held until 1877, when he was recalled at his own request. In the Franco-Prussian war he was requested by the German government to act as its representative in France. He remained in Paris during the siege and the rule of the commune, and his energetic and impartial aid to foreign citizens and to suffering Parisians was recognized by the governments of France and Germany as well as by that of the United States. He d. 1887.

WASHING, DOMESTIC. Although domestic washing is with housekeepers a simple enough process, yet it may be useful to give a brief description of the most efficient way of conducting it, in so far as experience and correct principles can guide such an operation. The first essential is suitable water, in other words, *soft* water. See Water-supply. Yellow soap (q.v.) being the kind chiefly used in washing linen, it is well to bear in mind that it is not desirable to purchase it very pale in color, or very low in price. In order to gratify the desire for a light color soap-makers are obliged to reduce the strength of good dark soaps with adulterants; and it will give some idea of how easily the demand for cheapness may be met to state that hard soap which should not contain so much as 25 per cent of water, can be made with as much as 75 per cent. Soap, as is well known, improves by keeping. Soft or potash soap is sometimes used to wash coarse things, on account of its being stronger than hard soap, but its smell is objectionable. Soda is easily procured good; and with respect to washing-powders, as their merit depends on the amount of alkali which they contain, suffice it to say that to buy them is only a dear way of buying soda.

In arranging clothes for washing, it is desirable to sort them into kinds most suitable for washing together; such as lace, nets, and fine muslin into one heap; white body-linen into another; colored things of the nature of prints and ginghams into another; and so on. It is also desirable to wash clothes as soon as possible after they are soiled. Previous to washing, all white articles should be soaked for a night in cold water, in which a little soda has been dissolved, as the steeping in alkaline water greatly aids in removing all dirt of a greasy nature. The clothes should then be washed twice in clean tepid water with a sufficient supply of soap. If the water is quite cold, the dirt is taken off with difficulty; and if too hot, it is apt to fix it into the fiber of the cloth. The clothes should next be examined for spots or stains, so as to remove them, if possible, by an additional rubbing; after which they are boiled for at least 15 minutes in soap and water. Ink-stains or iron-molds require to be taken out with oxalic acid, or the essential salts of lemon (oxalate of potash); and fruit-stains by boiling the stained part with pearl-ash. After being boiled, the clothes are rinsed twice in cold water; and in the second rinsing, a little stone blue is added, to neutralize any yellowness occasioned by the washing. When this is done, they are wrung, and hung out to dry.

For the washing of flannels, it is even more desirable that the water should be softer than for linen or cotton; and it should contain no soda or potash in any form, as although a little alkali would more effectually remove dirt, yet it always turns woolens yellow, and at the same time thickens them. It is well to remember also that all rubbing, wringing, or squeezing tends to make woolen goods shrink, by facilitating their tendency to felt or mat into a thicker fabric. With respect to ladies' colored dresses made of fine wool, such as merino, it is considered best to wash them in warm soft water with ox-gall, say a pint in a tubful of water. Ox-gall is a soap in its chemical nature, and it clears and brightens the colors.

White silk articles, as stockings and gloves, should be washed with soap, first in milk warm, and afterward in nearly boiling water. They will be improved if hung up for a short time in the fumes of burning sulphur (sulphurous acid) while still damp.

WASHING OF FEET (called in Latin *pedilavium*, and sometimes *mandatum*, from the first word of the "little chapter" in the service), one of the ceremonial observances of the holy week (q.v.) in the Roman Catholic Church. It forms part of the service of holy Thursday, which day, from the word *mandatum*, is also called Maundy Thursday. The origin of this observance is extremely ancient. It is founded on the example and exhortation of our Lord in John xiii. 5–14; and is traceable in the writings of Justin, Tertullian, Ambrose, and Augustine, as well as in many of the early councils. In some churches, however, or at least at some particular periods, the day fixed for the ceremonial was good Friday, although for many centuries it has uniformly been assigned to holy Thursday. It is necessary, however, to distinguish from the ceremonial of the holy week, another washing of the feet (also called *pedilavium*), which, in the case of catechumens, preceded baptism, and which, in many churches, was accompanied by a washing of the head,

captilavium, and took place on palm Sunday (q.v.), thence called "Dominica Capillavii." To this usage Sts. Ambrose and Augustine distinctly refer. In the mediæval and modern church, the washing of feet has generally followed the solemn mass of the day. In those churches where the ceremony is still retained, the officiating bishop or priest, wearing a cope and girt with a towel, and attended by a deacon and subdeacon, washes, dries, and kisses the right foot of a certain number of pilgrims, generally twelve, in memory of the twelve apostles; after which all the pilgrims are hospitably entertained, and served in person by the bishop, who distributes to each a dole in money or provisions. An appropriate service, consisting of a gospel (John xiii. 1–14) sung by the deacon, a chapter ("Mandatum novum") chanted by the choir, and a prayer by the bishop, accompanies the ceremonial. The washing of the pilgrims' feet on holy Thursday forms a very striking part in the holy week ceremonial as carried out not only by the pope, but also by the bishops in most of the great cathedrals abroad. It was also practised by kings and other royal and noble personages, even down to a very recent date.

WASHINGTON, a Pacific Coast state, lies between lat. 45° 32′ and 49° n.; long., 117° to 124° 48′ w.; bounded on the n. by British Columbia and the Strait of Juan de Fuca; on the e. by Idaho; on the s. by Oregon, the Columbia river forming part of the boundary; on the w. mainly by the Pacific Ocean; length from e. to w., 360 m.; breadth, 240 m.; land area, 66,880 sq.m.; gross area, 69,180 sq.m., or 44,275,200 acres.

History.—Washington originally formed part of Oregon, which was discovered by Juan de Fuca, a Greek, in 1592; visited by a Spanish navigator in 1775, and three years after by Capt. Cook. In 1787 Berkeley, an Englishman, rediscovered the strait of Fuca, which had been missed by others. Capt. Gray, an American, visited the coast in 1791; and the English Capt. Vancouver in 1792; Capts. Lewis and Clark explored the interior during the presidency of Jefferson, and settlements were made by the Hudson Bay Company in 1828. In 1838 a Roman Catholic mission was established at Vancouver, and in 1845 Americans settled at Tumwater. It was constituted a separate territory in 1853, Mar. 2, and at that time comprised the region lying between the Pacific and the summit of the Rocky Mountains, and north of the Columbia river and the 46th parallel. Wars with the Indians in 1855 and 1858 retarded immigration, but in the latter year 15,000 persons were attracted by the discovery of gold at Frazer's river, many of whom became permanent settlers. In 1859, when Oregon was admitted into the union, the region between the eastern boundary of that state and the Rocky Mountains and north of the 42d parallel was added to Washington Territory. It then comprised 193,071 square miles, embracing what is now Idaho and parts of Montana and Wyoming.

There have been one or two tides of emigration caused by discoveries of gold, but the country is too remote to equal in inducements the states and territories lying to the east and south. In Feb., 1889, congress passed an enabling act, permitting Washington to form a state government, and on Nov. 11 it was admitted to the union.

Topography.—The great range of the Cascade Mountains, a continuation of the Sierra Nevada, passes through from n. to s. about 100 m. from the coast. Its highest peaks, all of them extinct volcanoes, are Mt. Baker, in lat. 48° 44′, 10,827 ft.; Mt. Rainier or Tacoma, 14,444 ft., but easily ascended for 11,000 ft.; Mt. St. Helena, 9,750 ft., a symmetrical, snow-covered cone; Mt. Adams, 9000 ft. The country between this range and the Pacific is densely timbered, contains a few fertile prairies and some rough and broken mountain lands. It includes the Puget Sound basin, Shoalwater Bay basin, the Chehalis Valley, and the Lower Columbia Valley. The Pacific Coast line is about 180 m. long; Puget Sound, with its inlets and arms—Juan de Fuca Strait, Admiralty Inlet, and Hood's Canal—has a surface of 2000 sq.m.; and a shore line of 1594 m. Its waters are free from shoals, the boldness of the shores gives harbors for the deepest vessels, and for safety in navigation the sound is unequaled. The Strait of Juan de Fuca is 95 m. long, with an average width of 11 m., and divides into Rosario Sound on the e. and the Canal de Haro on the w., there enclosing the archipelago of W. sound and connecting with the Gulf of Georgia on the n. The rise and fall of the tides is 18 ft. From the e. end of the strait Puget Sound extends southward for 80 m. The inlets and bays vary from 2 to 8 m. in length and from 1 to 6 m. in breadth. Among them are Neah Bay, Ports Discovery, Ludlow, Madison, Gamble, Orchard, and Blakely, Elliott's or Seattle, Tacoma, Steilacoom, Utsalada, and Bellingham Bays; Budd's Inlet (Olympia) and Penn's Cove. Hood's Canal, a narrower channel on the west, extends 60 m. Bellingham, on the eastern shore of the Gulf of Georgia, has a tide of 20 feet. There are also large and deep harbors, suitable for naval stations, on the Strait of Juan de Fuca. The important bays on the coast are Shoalwater and Gray's Harbor, both accessible to large vessels. The prominent headlands are Cape Disappointment, or Hancock, at the mouth of the Columbia, and Cape Flattery, at the entrance of Fuca Strait. The chief rivers entering Puget Sound are the Des Chutes, Puyallup, Duwamish, White, Black, Cedar, Snohomish, Skagit, Swinamish, Lummi, and Skokomish. Some are navigable, and many have notable fall and water-power. Eastern Washington comprises the valley of the Columbia and its large affluents, the Clarke, Spokane, and Lewis or Snake rivers, and the Spokane Plains or Plateau.

The Columbia river affords ship navigation nearly to the Cascade Mountains, and throughout the state this river and its largest affluents, the Lewis and Clarke, afford steamboat navigation, with occasional interruption from rapids. The Lewis flows north,

forming the southern portion of the Idaho boundary for 30 miles, and then entering Washington, flows west 150 miles to the Columbia. It is navigable to the Idaho border. The largest lakes are Washington, with an area of 60 sq.m., and an average depth of 200 ft.; Union, American, and Whatcom, all lying w. of the Cascade Mountains. The largest body of water in eastern Washington is Lake Chelan. The scenery of Puget Sound is unsurpassed in the United States.

Geology and Mineralogy.—The principal geological divisions in western W. are the Cambrian and Silurian, eozoic, cretaceous, and tertiary. The northern portion, Blue mountains, and Coast Range are referred to the azoic period; the central and s.e. portions are of volcanic formation. Western W. has been called the Pennsylvania of the Pacific Coast, by reason of its coal supply, the principal fields lying in or near the Puget Sound basin. Lignite, bituminous, semi-bituminous, and anthracite are found. The Puyallup fields yield coking coal chiefly. Gold is found on the Yakima River; silver, near Spokane. Iron ore is abundant; salt is abundant on the Spokane plateau, and petroleum in the Puyallup Valley.

Zoology.—This is largely that of Oregon. Among wild animals are the mountain-goat, bear, deer, antelope, marten, pecan, sewellel, beaver, otter, and prairie dog. Among birds and wild-fowl are the great horned owl, red owl, fish-crow, raven, hairy woodpecker, cedar bird, grouse, butcher bird, whippoorwill, and white-bellied swallow. The fish include the eulachon or smelt, black cod, salmon of several species, two species of trout, bass, halibut, herring, pickerel.

Botany.—The flora is that of Oregon. The estimated area of timber land is 20,000,000 acres. The timber of the Pacific slope is of great richness; the red fir and yellow fir (*abies Douglasii* and *a. grandis*), growing 300 ft. high, and from 6 to 8 ft. in diameter. Cotton-wood and willows abound in the coast valleys, and among other deciduous trees are the maple and ash.

Climate and Soil.—There are two seasons, the dry and the rainy, the latter comprising what are called the winter months (October to April), or the season during which rains prevail. Yet sunshiny days are not rare; snows, in western W. at least, are light, and sometimes do not occur at all. The climate of western W., owing to the Japan current, is relatively warm in winter and cool in summer. Destructive storms are unknown, and thunderstorms are moderate. Of 34 winters recorded on Puget Sound, only 6 were so severe as to necessitate the housing of stock. The average annual rainfall in w. Washington in 2–40 years was 52.52 inches, in e. Washington, 16.51 inches; mean annual temperature in w. Washington, 50.4°, in e. Washington, 49.7°. The rainfall is the heaviest in the w. part of the Pacific coast cos., ranging 79–107 inches.

The alluvial soil of western W., particularly in the river valleys, is very rich. The Upper Columbia Valley has a soil from one to twenty feet in depth, largely a light-colored loam particularly well adapted for wheat. In the Palouse country a black loam with a clay subsoil occurs.

Agriculture. — The staple products in Washington are wheat, barley, oats, hay, apples, and hops. In western Washington much of the tide land has been reclaimed, and is of great fertility. White clover and bunch grass abound in the eastern counties, and here are the principal grazing lands. Much of the land devoted to wheat is from 1500 to 3000 ft. above the sea; hundreds of miles of irrigating canals are in operation, and the annual production averages 8,500,000 bushels. Indian corn and large quantities of vegetables, fruits, and grasses are produced. Apples, pears, prunes, and small fruits thrive and are largely cultivated. The Puyallup Valley near Tacoma is becoming famous for its hops. The yield is sometimes as high as 1500 lbs. to the acre, and the annual production exceeds 8,300,000 lbs.

Industries, etc.—The U. S. census of 1890 reported for Washington, 1543 manufacturing establishments, employing $34,369,735 capital and 20,366 persons, paying $12,658,614 for wages, and $19,917,057 for materials, and having a combined output valued at $41,768,022. The principal manufactures, according to value of output, are lumber, saw, and planing mill products, flour and grist mill products, unmanufactured timber, brick and tile, foundry and machine shop products, and malt liquors. Tacoma has large lumber and smelting industries; Seattle, a fine coast trade, while its local manufactures are estimated at $10,000,000 annually; Anacortes, a railway center and port for steamship lines; and San Juan Islands, large quantities of lime. The coast waters and rivers teem with valuable food fish, including herring, smelt, cod, shad, and many others. The salmon fisheries of the Columbia, and of Shoalwater Bay, Gray's Harbor and Puget Sound are very extensive, and the oysters in these coast waters are abundant and particularly esteemed for their fine flavor. From the forests of Douglas or red firs, erroneously called Oregon pine, large quantities of masts and spars, frequently 150 feet in length, are sent to San Francisco, and to Europe, South America and Australia.

Commerce.—There is one customs district, that of Puget Sound, of which Port Townsend is the port of entry. Only two ports in the United States, New York and San Francisco, exceed Port Townsend in the number of American steam-vessels engaged in the foreign trade. Coal, wheat, lumber, salmon, and produce are exported, and from Tacoma are shipped wheat, fruits, hops, cattle, and garden stuff. The total exports of Puget Sound amount to nearly $12,000,000 annually, one-third being to foreign ports, principally China and Japan; and total imports, to over $7,000,000.

Railways.—The principal railroads are the Northern Pacific, the Union Pacific, and their branches, and the Great Northern. The Northern Pacific crosses the Cascade

Range 2837 feet above the sea-level through the Great Cascade tunnel, 9850 feet long and lighted by electricity. The trains descend the western slope by a series of zigzags. The total length of railroads in the state is about 3000 miles of local roads, the capital exceeds $21,000,000; funded debt, $18,000,000; total investment, $40,000,000; cost of roads and equipments, $42,000,000; and net earnings, $400,000.

BANKS.—On Oct. 31, 1896, there were 40 national banks in operation, with combined capital $5,788,000, deposits $6,433,093, reserve $1,951,106, and outstanding circulation $1,274,607; 14 state banks, with capital $550,700, deposits $815,498, and resources $1,445,742; and 5 private banks, with capital $297,309, deposits $1,041,708, and resources $1,567,916.

CHURCHES, EDUCATION, ETC.—The leading religious denominations numerically are the Roman Catholic, Methodist Episcopal, Disciples, Baptist, Presbyterian, Congregational, Protestant Episcopal, and Lutheran. The public school population at the close of 1896 was 108,800; enrollment, 90,113; average daily attendance, 63,200. The higher institutions include a state university at Seattle; Seattle university; Puget Sound university, Tacoma; Whitman college, Walla Walla; St. James college, Vancouver; Walla Walla college, College Place; Colfax college, Colfax; Whitworth college, Sumner; State agricultural college and school of science, Pullman; normal schools at Cheney and Ellensburg; and manual training schools at Seattle and Spokane. There were 20 libraries of 1000 volumes and upward each, with a total of over 76,000 volumes, and (1897) 219 periodicals of all kinds.

GOVERNMENT, ETC.—The capital is Olympia. The executive officers are a gov., lieut.-gov., and secretary, auditor, treasurer, and supt. of public instruction. The legislature consists of a senate and a house of representatives, senators elected for four years, representatives for two years. The judicial power is vested in a supreme court of five judges, serving four years and receiving $3000 each, district courts, a probate court in each co., and justices of the peace. Every male citizen 21 years of age is allowed to vote if he has lived in the state one year; county, ninety days; in the town and precinct, thirty days. New ballot laws based on the Australian system (q. v.) were adopted in 1890. W. is represented in congress (1897) by two representatives and two senators. In 1892 it cast four electoral votes for Harrison and Reid; in 1896, four for Bryan and Sewall.

FINANCES.—The 1890 United States census report gave the state debt as $300,000; county debt, $1,507,786; municipal debt, $1,046,510; school district debt, $291,362; total combined debt, less the sinking fund, $3,145,698. The total assessed valuation in 1896 was $204,677,668; bonded debt, 1897, $300,000, floating debt, $1,832,473.

The National Guard of the state has an authorized strength of 1879 officers and men and an actual strength of about 1050. The total liable to military duty is over 60,000.

The state hospitals for the insane are at Steilacoom and Medical lake; the penitentiary at Walla Walla; the state school for defective youth at Vancouver; the state reform school at Chehalis; and the state soldiers' home at Orting.

POPULATION.—There are 34 cos.; for pop., 1890, see Census Tables, Vol. XV. The total pop. 1853, was 3965; 1870, 23,955; 1880, 75,116 (15,861 of foreign birth); male, 45,977; female, 29,143; colored, 7917—3187 Chinese, 4405 civilized or taxed Indians; dwellings, 15,512; families, 16,380; persons to sq.m. 1. 1; engaged in agriculture, 12,781; in mining and manufactures, 7296. Pop. in 1890, 349,390. The largest cities, 1890, were Seattle, 42,837; Tacoma, 36,006; Spokane, 19,922; Walla Walla, 4709.

WASHINGTON, a co. in s.w. Alabama, bounded on the e. by the Tombigbee river; 1050 sq.m.; pop. '90, 7935. Co. seat, St. Stephens.

WASHINGTON, a co. in n.w. Arkansas; containing a sandstone called millstone grit; 927 sq.m., pop. '90, 32,024. Co. seat, Fayetteville.

WASHINGTON, a n. eastern co. of Col.; 1080 sq.m.; pop. '90, 2301. It is drained by the South Platte river. Co. seat, Akron.

WASHINGTON, a co. in n.w. Florida, having the gulf of Mexico on its s. border; 1340 sq.m.; pop. '90, 6426. Co. seat, Vernon.

WASHINGTON, a co. in central Georgia; drained by the Ogeechee and other rivers; 688 sq.m.; pop. '90, 25,237. Co. seat, Sandersville.

WASHINGTON, a co. in western Idaho, on Snake river; 2700 sq.m.; pop. '90, 3836. Co. seat, Weiser.

WASHINGTON, a co. in s. Illinois, bounded on the n. by Kaskaskia river; 540 sq.m.; pop. '90, 19,262. Co. seat, Nashville.

WASHINGTON, a co. in s. Indiana, bounded on the n. by the Muscatatuck river; 500 sq.m.; pop. '90, 18,619. Co. seat, Salem.

WASHINGTON, a co. in s.e. Iowa, bounded on the n.e. by the Iowa river; 576 sq.m.; pop. '90, 18,468. Co. seat, Washington.

WASHINGTON, a co. in n. Kansas; 900 sq.m.; pop. '90, 22,894. Co. seat, Washington.

WASHINGTON, a co. in central Kentucky; 300 sq.m.; pop. '90, 13,622. Co. seat, Springfield.

WASHINGTON, a parish in e. Louisiana, bounded on the e. by the Pearl river; 660 sq.m.; pop. '90, 6700. Parish seat, Franklinton.

WASHINGTON, a co. in s.e. Maine, having the Atlantic ocean on the s. ; 2452 sq.m. ; pop. '90, 44,482. Co. seats, Machias and Calais.

WASHINGTON, a co. in n. Maryland, bounded on the n.w. by the Potomac River, drained by the Antietam and other rivers, having the Blue Ridge or South mountain on its e. border ; 435 sq.m.; pop. '90, 39,782, chiefly of American birth, inclu. colored. Co. seat, Hagerstown.

WASHINGTON, a co. in e. Minnesota, having the Mississippi River for its s. boundary ; 400 sq.m.; pop. '90, 25,992, chiefly of American birth, with colored. Co. seat, Stillwater.

WASHINGTON, a co. in w. Mississippi, having the Mississippi River for its w. boundary, separating it from Arkansas ; partly subject to inundation ; 880 sq.m.; pop. '90, 40,414. Co. seat, Greenville.

WASHINGTON, a co. in s.e. Missouri, hilly, well timbered, and containing vast mineral resources ; 780 sq.m.; pop. '90, 13,153, chiefly of American birth, inclu. colored. Co. seat, Potosi.

WASHINGTON, a co. in e. Nebraska, having the Missouri River for its e. boundary, consisting of fertile prairies well watered ; 381 sq.m.; pop. '90, 11,869, chiefly of American birth. Co. seat, Blair.

WASHINGTON, a co. in e. New York, having Lake George for its n.w. boundary, with Vermont on the e. and the Hudson River on the w.; 861 sq.m.; pop. '90, 45,690. Co. seat, Argyle.

WASHINGTON, a co. in e. North Carolina, bounded on the n. by Albemarle Sound, having the mouth of the Roanoke River on the n.w. margin ; 360 sq.m.; pop. '90, 10,200. Co. seat, Plymouth.

WASHINGTON, a co. in s.e. Ohio, bounded on the s. and s.e. by the Ohio River, containing valuable petroleum wells ; 635 sq.m.; pop. '90, 42,380, chiefly of American birth. Co. seat, Marietta.

WASHINGTON, a co. in n.w. Oregon, bounded on the n.w. by the Coast range ; 645 sq.m.; pop. '90, 11,972. Co. seat, Hillsboro.

WASHINGTON, a co. in s.w. Pennsylvania, bounded on the e. by the Monongahela River ; 890 sq.m.; pop. '90, 71,155. Co. seat, Washington.

WASHINGTON, a co. in s. Rhode Island, having the Narragansett Bay for its e. boundary, on the s. the Atlantic ocean ; 340 sq.m.; pop. '90, 23,649. It has extensive woolen manufactures. Co. seat, Kingston.

WASHINGTON, a co. in s.w. S. Dakota, drained by the White River. It was formed in 1883, and contains a large part of the "bad lands" tract; 1510 sq. m.; white pop. '90, 40.

WASHINGTON, a co. in e. Tennessee; 344 sq. m.; pop. '90, 20,354, chiefly of American birth. Co. seat, Jonesboro.

WASHINGTON, a co. seat in s.e. Texas ; 600 sq.m.; pop.'90, 29,161. Co. seat, Brenham.

WASHINGTON, a co. in s.w. Utah ; 2446 sq.m.; pop. '90, 4009, chiefly of American birth. Co. seat, St. George.

WASHINGTON, a co. in n. Vermont, containing a part of the Green mountains and Camel's Hump, a peak rising 4088 ft. above the level of the sea ; 703 sq.m.; pop. '90, 29,606. Among its mineral products are verdantique marble, dolomite, serpentine, slate, and granite. Co. seat, Montpelier.

WASHINGTON, a co. in s.w. Virginia, bounded on the n.w. by Clinch mountain, contains a long ridge called Walker's mountain ; 622 sq.m.; pop. '90, 29,020. It has extensive beds of solid salt. Co. seat, Abingdon.

WASHINGTON, a co. in s.e. Wisconsin, drained by the Milwaukee, Mequon, and Rubicon rivers ; 430 sq.m.; pop. '90, 22,751, chiefly of American birth, with colored. Co. seat, West Bend.

WASHINGTON, city; seat of government of the United States of America; coextensive with the District of Columbia, on the Potomac river, where the Anacostia, or East Branch, joins the main stream, and within reach of the ocean tides. It is in latitude 38° 53′ to 39° north ; longitude, 76° 58′ to 77° 6′ west ; mean temperature, 54.7° ; forty miles southwest of Baltimore, 136 from Philadelphia, 230 from New York, 3167 from San Francisco, 106 from the mouth of the Potomac, and 185 from the Atlantic Ocean. The river at Washington is one mile wide and will float coastwise ships of ordinary draught.

The original site of this city was purchased from the aborigines in 1663 by an Englishman named Francis Pope, who called the place Rome, and the branch which empties into the Potomac the Tiber ; the elevated plateau received the name of Capitoline Hill. This "Pope of Rome," as he called himself, "builded better than he knew."

After the revolutionary war several states clamored for the seat of government, as it had been necessary to move it from place to place in order to avoid destruction by the armies As Maryland and Virginia offered the prescribed amount of land, 100 miles square, this district was finally accepted in 1790, and was first called the Territory of

Columbia, and finally the Federal District of Columbia (q.v.). In accordance with the act of March 30, 1791, the boundaries of the city and the location of the public squares and buildings were determined by President Washington himself, who thus, at the height of his fame, availed himself of the skill in surveying he had acquired in his youth. He called it the Federal City, but after his death it received his name. The topographical plan is the result of French influence, as the place was surveyed and laid out by Andrew Ellicott under the direction of Major L'Enfant, a French engineer who had served in the Continental army; he took the city of Versailles for his model. The plan of the city is very peculiar. It stands on an irregular plateau, forty feet above the Potomac and seventy-five feet above the sea-level, commanding a beautiful and picturesque landscape, best seen from the portico or dome of the Capitol, and which drew from Humboldt the declaration: "In all my travels I have not seen a more charming panorama." The numbered streets, increasing north from the Capitol and south from the Capitol, cross at right angles, the lettered streets extending east and west from the Capitol, which is always the starting-point of enumeration. North, South, and East Capitol streets also intersect here. Crossing all these rectangular streets diagonally, radiating from the Capitol, are twenty-one broad avenues named for the states of the Union. The circles, squares, and triangles formed by these intersections add much to the beauty of the city, as they open up delightful views of public buildings, monuments, and long avenues.

The plan was so extensive and the actual growth of the city so small that Washington was often satirically called "The City of Magnificent Distances." In 1800 it was said, "The Capitol is on an eminence near the centre of the immense country called here 'the city.' There is one good tavern, and several other houses are finished or being built." There were only 3000 inhabitants, and for years members of Congress lived principally in Georgetown. As the land around the Capitol commanded a high price, the healthful portions of the city remained unoccupied for more than fifty years. It was principally a deep morass covered with alder bushes. As soon as the north wing of the Capitol was finished, the corner-stone of which was laid in 1793, the public archives were transferred in a sloop from Philadelphia, and in the year 1800 Congress held its first session here. In 1814 a British army of 4500 men conquered the Americans at Bladensburg and took possession of Washington, after destroying the public buildings. It was not until 1851 that any attempt at draining and adorning the reservations and parks was made; work was commenced under the skillful guidance of Andrew J. Downing, but his death the next year and the neglect of Congress arrested it for twenty years. During the civil war the city was threatened by the Confederate forces, until, on May 23, 1861, the simultaneous advance of Wood, Heintzelman and Ellsworth routed them. Its fortifications "consisted of sixty-eight enclosed forts and batteries, having an aggregate perimeter of about fourteen miles, and emplacements of 1120 guns; of ninety-three unarmed batteries, having 401 emplacements; and of twenty miles of infantry trenches. The entire circuit of the line, exclusive of the chain bridge works and of the stretch across the Potomac from Fort Greble to Fort Lyon, was thirty-three miles; thirty-two miles of military roads, besides the existing streets and avenues of the district afforded the means of communication." These works were serviceable for the safety of the city during the war, but have been dismantled, with the exception of Fort Meyer, on Arlington Heights, now a cavalry station and the quarters of the signal corps of the army. Throughout the war Washington was a vast depot for military supplies; long trains of army-wagons were almost constantly passing through its streets; immense hospitals for the sick and wounded were erected, and many churches, public institutions, and the Capitol itself were at times given up to this service. During those critical years property greatly depreciated and no new buildings were erected. At the close of the war, May 23, 24, 1865, Washington was the scene of the grandest military display ever witnessed in America, when the scarred heroes with their tattered banners defiled with honor past the President, Andrew Johnson (q.v.), the successor of Abraham Lincoln (q.v.).

No government buildings having ever been erected on the west side of the Potomac river, Maryland and Virginia petitioned that the Virginia portion be retroceded to that state, and this was done in 1846. In 1871 arose a new era for Washington. The older city of Georgetown, which was founded in 1751, was in 1871 incorporated with this city, and is now locally called West Washington. It is picturesquely situated on a succession of eminences and contains many handsome residences; several bridges and lines of electric street railroads connect the two parts. After its incorporation as a city in 1802, the people elected their own mayors until 1871, when a territorial government was substituted for the municipal, and Washington was controlled by a governor and legislature. Sweeping reforms, which greatly improved the city, so increased the public debt, that in 1874 Congress again changed the government, and at present the city is ruled by the President and Congress through a board of three commissioners; its inhabitants have no vote either in the national or local government. There is a supreme court of six justices besides other officials. The common law of England prevails, modified by acts of Congress, and enactments still in force from former municipal governments. The debt is placed in the hands of the treasurer of the United States, and the revenues are secured by taxes on private property and privileges, and appropriations by Congress. The annual expenses of the city amount to nearly $6,000,000.

The magnificent location of Washington on a tongue of land between the broad

Potomac, the East Branch, and Rock Creek, a dashing hill stream, lends itself admirably to the grand scale adopted by its designers. Surrounded by an amphitheatre of hills, rising in some places to an elevation of 150 to 400 feet, its appearance, crowned by the Capitol, ninety feet above the level, is imposing and beautiful. Covering an area of seventy square miles, including Georgetown, more than one-half of its whole extent is occupied by parks and government reservations. Besides numerous small enclosures Washington has a zoological garden, covering 140 acres, and the Rock Creek park of more than 1500 acres, purchased in 1890 at a cost of $1,200,000, which extends for miles through forests and over hills along the banks of a picturesque stream. The soil of the adjacent country is light sandy loam and clay, the farming products of which are worth $4,000,000 annually. Snow never remains on the ground and the Potomac does not freeze over until January. The mean temperature is the same as that of San Francisco.

The streets and avenues are the widest in the world, from seventy to 160 feet, paved with asphalt and concrete and lined with shade trees. Many of them have a quadruple row of trees, including several thousand varieties. Among the smaller parks arising from the intersection of the streets are Lafayette, beautifully laid out north of the White House, and Lincoln Square, which marks the spot originally intended to be the geographical centre of the United States. A park of 300 acres stretches from the Capitol to the Washington Monument (q.v.), called The Mall, and to this is added 700 acres reclaimed from the Potomac, which includes the United States Fish Ponds and the Propagating Gardens. Stretching entirely across the city from northwest to southeast, and reaching from the Anacostia River to Kalorama Heights and Rock Creek, is Massachusetts Avenue, 160 feet wide, and for three miles graced with two rows of interlacing linden trees on either side. It is the grandest avenue on the continent, being four miles and a half in length. Pennsylvania Avenue, nearly as long, a section of which leads from the commanding portico of the Capitol to the imposing front of the Treasury Building, is the main street of the city, on which are located some of the principal hotels, stores, and theatres. Many of the circles and squares are adorned with statues, among them the equestrian figures of Washington, Scott, and General Thomas, and the standing figures of Garfield and Admirals Farragut and Dupont.

Favorite drives out of the city take visitors to the Soldiers' Home, with its enchanting view to Cabin John Bridge; to Rock Creek valley, rich in flowers and forest trees; to the heights above Georgetown, with a wide and impressive prospect, and to Arlington Heights, on the Virginia shore, where the national cemeteries, containing 17,000 Union soldiers' graves, are located. One mile east of the Capitol is the Congressional Cemetery of thirty acres, containing the tombs of a number of Congressmen. Oakhill, in Georgetown, is the resting-place of many distinguished men, including John Howard Payne, the author of "Home, Sweet Home." The oldest cemetery is at Rock Creek. The region northwest of the White House, formerly pasture ground, and known as "The Slashes," is now covered with elegant residences, the homes of cabinet officers, Congressmen, the foreign legation, and other distinguished men, surrounded by green lawns and beds of bright flowers, which give it a distinctive character.

Amid the luxurious foliage of the city gleams the marble whiteness of the majestic Capitol and the magnificent Government Buildings, erected at the cost of more than $100,000,000; taken as a group they are matchless in elegance. The Capitol is the most conspicuous object, its white dome being visible for miles around. Its lofty position, massiveness of form, beauty of material, and harmonious effect have elicited a general opinion that it is one of the most impressive edifices of modern times. When the structure was burned by the British, in 1814, it consisted of two wings only (the second one having been added in 1811), connected by a temporary passage-way or scaffolding. The main building is of sandstone, painted white, in rich Corinthian architecture, and covers, with the wings of white marble, three and one half acres of ground. Each of these sections has an imposing colonnade front on the eastern side; the central portico, being the finest, is used for the main entrance. The foundation of the rotunda was laid in 1818, March 2, and the main building was completed in 1827. The new wings were designed by Henry B. Latrobe, who was succeeded in 1817 by Charles Bulfinch, of Boston. He, in turn, was followed by Thomas U. Walter, who completed the new dome and the wings; the Hall of Representatives was occupied in 1857, and the Senate Chamber in 1859. The work progressed during the civil war, and on December 2, 1863, the statue of Freedom was placed on the dome. The entire cost of construction, extension, and repairs, exceeds $15,000,000.

The dome, 285½ feet high and 135¼ feet in diameter, is one of the most perfect in the world, and is exceeded in size only by St. Peter's, St. Paul's, the Invalides, and St. Joseph's. Surmounting it and supporting Crawford's colossal statue, nineteen and one quarter feet high, is a peristyled lantern, giving a classical finish to the whole. The 4000 tons of iron used in its manufacture is arranged in leaves or folds, which move with the atmospheric changes like the flutterings of a fan, glistening white in the sun. The rotunda, under the dome, ninety-six feet in diameter and 180 feet high, is adorned with historical paintings by Trumbull, Weir, Chapman, Vanderlyn, and Powell, and a striking frieze by Brumidi, representing scenes from American history; the Apotheosis of Washington, with figures and allegorical groups, also by Brumidi, forms the ceiling painting. By a staircase in one corner the famous whispering gallery is reached, in the interior of the dome, and the ascent is made to the lantern, from which a magnificent view of the city and surrounding country may be obtained.

From this superb piece of architecture down to the bronze doors, covered with statuettes and bas-reliefs illustrating scenes in the life of Columbus, by Randolph Rogers, cast in Munich in 1851, and equalled only in the old European cities, and the imposing Corinthian porticoes, with their wealth of statuary, scenes of surpassing interest constantly rise before the visitor—the massive marble staircases of the wings leading to the Senate Chamber and the Representative Hall (which is the largest legislative room in the world), adorned with historical paintings; the immense Doric Columns of the crypt; the National Statuary Hall, an artistic Greek Chamber, which each state assists in adorning, by presenting the statues of two of its most illustrious men; the Marble Room, said to be unequalled in the world, built entirely of native marble; the Supreme-Court room; the elegant Reception and Committee Rooms and Corridors; the President's Room, the most richly decorated in America, and the old Congressional Library, the largest in the country, containing 900,000 volumes, which are filled with the choicest treasures of literature. As a copy of every publication for which a copyright is taken out must be sent to the library, the number of books has increased so rapidly that a separate building has been erected e. of the Capitol. The enormous structure, 470 feet long and 340 feet wide, was virtually completed late in 1897, and is one of the finest buildings devoted to a library in the world. Its estimated cost is $6,000,000.

Committee Rooms, Library Rooms, Storage Rooms, etc., are arranged in the basement of the Capitol. The walls and ceilings of these rooms and corridors are many of them, handsomely decorated. In a small room under the Colonnade are six columns, formed like Indian corn, which are said to have been designed by Jefferson.

A park of about fifty acres surrounds the Capitol, laid out by Olmsted. In the open ground on the eastern side, opposite the grand Façade, stands a colossal statue of George Washington, by Greenough (q.v.). To the right is a marble group, the "Settlement of America," by the same sculptor, and to the left is the "Discovery of America," a figure of Columbus, by Persico (q.v.). Above the portico is a bas-relief of the "Genius of America," by Persico, and in the pediment above the north portico a group represents the "Civilization of the United States." It is on the broad steps of this central portico that the Presidents of the United States are inaugurated. On the west side of the building a beautiful marble terrace, 884 feet long, reached by two broad flights of steps, has been constructed, which adds greatly to the appearance of that side of the edifice. Near this terrace is an immense statue of Chief Justice Marshall, by Story. In this locality are also Simmons' Naval or Peace Monument and the statue of President Garfield. Joining the Capitol grounds on the west is The Mall, where are located the Botanical Gardens, the Department of Agriculture and the Smithsonian Institution (q.v.). The Department of Agriculture is a building of brick and brown stone, in the Renaissance style, with greenhouses, graperies, and experimental grounds around it, covering ten acres. The business of the Department is to distribute over the country seeds, plants, and general agricultural information.

On the south side of The Mall is also situated the Army Medical Museum, containing a library of 200,000 volumes and a large assemblage of specimens representing the effects of wounds, diseases and surgical operations, models of barracks, hospitals, ambulances, and the microscopic department is admirably arranged. Near this is the National Museum, containing unsurpassed collections of great interest, which include specimens of natural history, ethnology, antiquities, geology, arts, and industry. Here are bronzes, Japanese curiosities, china, tapestries, art and textile industries, paintings, etc. Near the Department of Agriculture is the Bureau of Engraving and Printing, where paper money and bonds are manufactured.

About one mile and a quarter northwest of the Capitol, approached by a magnificent avenue, 160 feet broad, and lined with trees, stands the Executive Mansion, otherwise known as the White House, surrounded by a cluster of superb granite buildings occupied by the various Departments. The President's House is a two storied freestone building, 170 feet long and eighty-six deep, with a handsome portico of eight Ionic columns on the north and a semicircular Ionic colonnade on the south. On the west side is a range of conservatories, and twenty acres of highly cultivated grounds surround it, with an addition of fifty-five acres extending to the Potomac. The corner-stone was laid in 1792, and it was modelled after the Duke of Leinster's palace in Ireland. President Adams was its first occupant, in 1800. After it was burned by the British in 1814, the blackened walls were painted white; hence its popular name the "White House." It was rebuilt in 1818. The largest apartment, the historic East Room, is eighty feet by forty, and twenty-two feet, and is open to the public daily from ten o'clock until two. Other beautiful rooms are named from the color of their respective decorations and furniture in red, blue, and green. The Reception Rooms, which contain portraits of the Presidents and their wives, are shown by special order only.

In the immediate vicinity of the Executive Mansion is the immense granite building in the Roman Doric style, occupied by the State, War, and Navy Departments, which measures 567 feet in length and 471 feet in breadth, enclosing two courts. It was erected in 1871–88, cost $10,000,000, and is the largest granite building in the world, the huge blocks weighing from ten to twenty tons. The State Department occupies the south wing, and requires the services of 1300 persons to administer its affairs. Here are seen the original Declaration of Independence and Washington's sword and commission. The War Department has possession of the centre and the northern and western wings, with a force of 1500 clerks and 3000 men employed outside. It is the headquarters of

the army of 27,000 men. The Navy Department is in the eastern part of the building, and here are models of war-ships, portraits, etc., and a library of 30,000 volumes. On the east and opposite side of the White House is the Treasury Building, an immense structure 468 feet long and 264 feet wide, with an Ionic colonnade on the east front, and surrounded by porticoes. Here are the Cash Room, the Redemption Division, and the Silver Vaults. The Secret Service Division has a collection of forged money and portraits of forgers.

About half way between the Capitol and the White House is the Department of the Interior, otherwise called the Patent Office, an immense building 453 feet long and 331 feet deep, in Doric architecture of marble, freestone, and granite. The halls of the upper floor contain an extensive collection of patents and models, about half a million having been granted in the United States since 1836. There is nothing like it in the world. The Pension Building is an enormous brick structure, resembling an Italian palace, surrounding a court surmounted by a terra-cotta frieze, the glass roof of which is supported by eight lofty pillars. It will accommodate about 20,000 people at an Inauguration Ball.

Opposite the Patent Office is a highly ornamental structure, occupied by the Post Office Department, which began operations as early as 1789.

The Corcoran Art Gallery is an ornament to the city, located near the War Department. It was built and richly endowed by the late William W. Corcoran, and is the receptacle of one of the finest collections of paintings and statuary in America. Statues of famous artists adorn the outside of the building. The Government Printing Office and the Washington Barracks are historical buildings. The Washington Navy Yard dates from 1804, and contains the great national cannon foundry, established by the first Cleveland administration, and it has manufactured most of the armament of the new gun-boats and cruisers. Near by are the Marine Barracks. The United States Naval Observatory is on the Potomac, between Washington and Georgetown, and it is admirably equipped for astronomical study. From the flag-staff on the principal building a signal ball is dropped daily at noon, transmitting by telegraphic connections the mean time all over the United States. Another edifice has been specially adapted to the reception and employment of the great equatorial telescope, made by Alvan Clark, and mounted in 1873. It has an object glass of twenty-six inches, and cost nearly $50,000. The Signal Office and Weather Bureau are also of interest. The United States Arsenal lies at the southern point of the city, between the Potomac and the Anacostia rivers, and has pleasant grounds, magazines, barracks, and cannon captured from the enemies of the United States.

The U. S. census of 1890 reported for Washington, 2295 manufacturing establishments, employing $28,865,089 capital and 23,404 persons, paying $14,622,264 for wages and $17,194,667 for materials, and having a combined output valued at $39,331,437. Georgetown is the port of entry for Washington, and contains Georgetown university, an old Jesuit institution founded in 1789, and the Convent of the Visitation.

Washington abounds in schools and colleges; white and colored pupils are separated. The most prominent educational institutions are the Columbian university (Baptist), Howard university (non-sect.), Georgetown university (R. C.), Gallaudet college (non-sect.), Gonzaga college (R. C.), the Catholic university of America, and the American university (Meth. Epis., organized in 1891). Howard university and Wayland seminary (Baptist) are exclusively for colored students. The Corcoran School of Science and Arts has a preparatory school attached. There are numerous churches, libraries, newspapers, and magazines. The water supply is brought from the Great Falls of the Potomac by a cylindrical conduit to a distributing reservoir near Georgetown. The sewer system discharges into the Potomac and Anacostia rivers.

Among the unofficial public buildings are the Lafayette square opera house, New National theatre, Academy of Music, Allen's grand opera house, Metzerott Music hall, Pacific building, Masonic hall, Odd Fellows' hall, and Washington market. There are several hospitals, including one for the insane, and eye and ear dispensaries, orphan asylums, the Columbia institution for deaf and dumb, reform school, and many private charitable institutions.

Multitudes of people of every class visit Washington, and its pleasant winter climate makes it an eminently desirable place of residence for persons of wealth and refinement. The fashionable season begins with the meeting of Congress in December. From Christmas to Lent, receptions, balls, and dinners abound. The President receives the calls of the public from twelve to three P. M., on four days in the week, and on January 1. In 1896 the assessed valuations were, real estate, $180,376,908, personal property, $9,532,851, total, $189,909,759; tax rate $15 per $1000. In 1897 the funded debt was $16,933,000.

In the environs are many interesting points—Mt. Vernon (q.v.), Annapolis (q.v.), with the old Carey house, and the Arlington mansion (q.v.), once the residence of George Washington Parke Custis.

Population 1810, 8208; 1820, 13,247; 1830, 18,826; 1840, 23,364; 1860, 61,122; 1870, 109,199; 1880, 177,624; 1890, 230,392.

WASHINGTON, city and co. seat of Davies co., Ind.; on the Baltimore and Ohio Southwestern and the Evansville and Terre Haute railroads; 20 miles e. of Vincennes. It contains a high school, St. Simon's academy, electric light and street railroad plants, waterworks, national and state banks, and about a dozen churches, and has railroad machine shops, grain elevator, various manufactories, and, in the vicinity, several large

coal mines. It has large interests in the shipment of coal, grain, and live-stock. Pop. '90, 6064.

WASHINGTON, city and co. seat of Washington co., Ia.; on the Burlington route and the Chicago, Rock Island, and Pacific railroads; 52 miles n.w. of Burlington. It contains a high school, academy, public library, national and state banks, electric light plant, water supply from deep wells, and about a dozen churches; is principally engaged in agriculture and manufacturing, and has several weekly and monthly periodicals. Pop. '90, 3235.

WASHINGTON, a city in Franklin co., Mo.; on the Missouri river and the Missouri Pacific railroad; 54 miles w. of St. Louis. It contains public high and grammar schools, parochial schools, St. Mary's institute, fair grounds, Turners hall, state bank, electric light plant, waterworks supplied from the river, and manufactories of corn cob pipes, zithers, flour, shoes, artificial ice, and brewery and foundry products. In the vicinity is an abundance of fire and potter's clay. It was chartered as a city of the third class in 1894. Pop. '90, 2725.

WASHINGTON, a borough in Warren co., N. J.; on branches of the Delaware, Lackawanna, and Western railroad, here connected by a spur with the Central of New Jersey road; 67 miles w. of New York city. It is noted for its manufactories of pianos and organs, silk goods, underwear, and sashes and blinds, and has several public day and night schools, electric lights, waterworks supplied from a mountain reservoir, national bank, and weekly and monthly periodicals. Pop. '90, 2834.

WASHINGTON, town and co. seat of Beaufort co., N. C.; on the Pamlico river and the Atlantic coast line railroad; 128 miles e. of Raleigh. It is accessible from the ocean by vessels drawing 8 feet of water; has a large trade in fish, oysters, cotton, grain, and vegetables; and contains national and state banks, grain elevators, machine shops, lumber and shingle mills, and ice, harness, and barrel and box factories. Pop. '90, 3545.

WASHINGTON, borough and co. seat of Washington co., Pa.; on Chartiers creek and the Baltimore and Ohio, the Pennsylvania Co.'s, the Pittsburg, Cincinnati, Chicago, and St. Louis, and the Waynesboro and Washington railroads; 31 miles s.w. of Pittsburg. It is the seat of Washington and Jefferson college and of the Lemoyne cremation plant; contains a female seminary, Trinity Hall school, public and school libraries, national and private banks, and manufactories of brass, malleable iron, glass, tubes and pipes, carriages, and other articles. The town has natural gas and large bituminous coal interests. Pop. '90, 7063.

WASHINGTON, Mount, "the Crown of New England," as it has been called, is the highest summit of the White Mountains, and with the exception of the peaks of the Black Mountains of North Carolina, is the loftiest mountain east of the Rocky Mountain range. It is situated in Coos co., New Hampshire, in lat. 44° 16′ 25″ n.; long. 71° 16′ 25″ w., about 85 miles n.n.-east of Concord, and is 6285.4 feet above the sea. It descends quite steeply towards the west, but on the east is prolonged into two long spurs, and is cleft by Tuckerman's and Huntington's ravines, and on the north by the extensive gorge called the Great Gulf. The mountain is ascended from the northeast by a wagon road about 8 miles long.; from the southwest by a footpath, and from the west by a steam railroad, opened in 1869, and having a grade of 3596 feet in three miles. The first white man to ascend it, it is believed, was Derby Field, of Portsmouth, in 1642, and the first scientific exploration was that of Rev. Manasseh Cutler (q.v.), of Ipswich, and six others in 1784, who gave it its present name. The sides, for about three-fourths of the distance up, are thickly wooded; then a growth of stunted firs and spruces succeeds, and finally a cone-shaped summit covered with a confused mass of rocks is reached, an almost level area of about an acre at the top, affording room for the United States Signal service observatory, and the summit Hotel (opened in 1873). The summit is covered with clouds much of the time, even in summer, but when an unobstructed view is obtained, the Atlantic ocean may be seen, off Portland, together with parts of five states and the Province of Quebec. It is claimed by mariners that the mountain may be descried twenty miles from land.

The most recent conclusions of geologists are that Mount Washington was wholly submerged during the glacial period. Boulders abound on its sides, and at the summit rocks are found that are common in the town of Randolph to the north. Its summit has the temperature of middle Greenland, at 70° n. latitude, and here grow sedges, rushes, and lichens found only in arctic regions, and plants that bloom exactly at the same times with those in Labrador and Greenland. A small species of snake is occasionally seen on the summit, and midsummer brings to life a rare butterfly, *Klanoba Semidea*, an inhabitant of Labrador and the highest peaks in the Colorado mountains. The range of the thermometer at the summit in midsummer is from 30° to 50°, and the mercury sometimes falls to 20° below the freezing point; while in winter, a temperature of 59° has been recorded. See White Mountains.

WASHINGTON, Bushrod, LL.D., 1762–1829; b. Virginia; son of John Augustine Washington, George Washington's younger brother. From 1780–81 he was a volunteer member of Col. Mercer's troop of horse. After the war he studied law in Philadelphia,

and returned to his native co. to practice. He was a member of the state house of delegates, and of the state convention which ratified the U. S. constitution. In 1798 he became one of the judges of the U. S. supreme court. He inherited Mount Vernon from his uncle.

WASHINGTON, George, commander-in-chief of the continental forces in the war of the American revolution, and first president of the U. S., was b. in Westmoreland co., Va., near the confluence of Bridge's creek and the Potomac river, Feb. 22, 1732, and was the oldest son of Augustine Washington by his second wife, Mary Ball. His remote ancestor was John Washington, who emigrated from England about 1657 with his brother Lawrence. They are believed to have been sons of Lawrence Washington, at one time fellow of Brasenose coll., Oxford, in 1631 proctor of Oxford univ., and afterwards rector of Burleigh, a Royalist; himself the son of Lawrence Washington of Sulgrave, Northamptonshire, and descended from John Washington of Whitfield, Lancashire. John became a landed proprietor and planter in Virginia, in the "Northern neck," a district between the Potomac and Rappahannock rivers, and left two sons, Lawrence and John, the former being the father of Augustine. The little recorded concerning Augustine Washington represents him as a man of high character. By his first wife he had two sons, Lawrence and Augustine; by Mary Ball, who is represented as possessing both intelligence and beauty, four sons and two daughters. Soon after George's birth his father removed to a farm on the Rappahannock river, opposite Fredericksburg, where he d. in 1743. This estate was bequeathed to George; the other children were handsomely provided for, Lawrence receiving what is now called Mount Vernon; and the widow was left a life interest in the property of those by the second marriage. But while the family had a competency and were large landed proprietors, the facilities for education in the colonies—particularly in the south—were at this time so meager that the younger children were forced to depend on the poor common schools of the neighborhood, where they acquired but the veriest rudimentary branches. Such education as he received George completed by the time he was 16 years of age, his last two years of schooling having been devoted mainly to the study of engineering-geometry, trigonometry, and surveying; probably from his having a mathematical turn of mind, and also because the profession promised advantages, in view of the wild state of the country, and the increasing demand for accurate surveys.

His half-brother, Lawrence, was an outside instructor, and Lord Fairfax, cousin of Lawrence's father-in-law, a scholarly man, by his advice and example helped and stimulated the boy. To Lord Fairfax, it is believed, Washington owed the fine literary style he acquired. Though naturally diffident, he saw much society, and that of the best, and at the age of 13 wrote out for his own use 57 maxims of civility and good behavior.

He was athletic in form, given to much exercising, a graceful and expert rider, and fond of the wild life of the woods and encampments. He had the customary boyish proclivity toward imitation of military service, possibly in a marked degree, and appears to have been generally chosen as their leader, and to have been deferred to in the settlement of disputes which arose among them by the companions of his youth. As a growing lad, he was not remarkable as a scholar; was rather reserved and sedate in his demeanor; and was more than is usual among boys of a religious turn of mind. In 1740 his elder brother, Capt. Lawrence Washington, served under Admiral Vernon in the expedition against Carthagena, and named his residence on the Potomac Mount Vernon, in honor of his commander, who offered George a commission as midshipman on his ship, which, but for the opposition of his mother, he would have gladly accepted. In 1748 he received a commission as public surveyor, and the summer months of the next three years were occupied by him in the duties of his profession; more particularly in the region of the Alleghanies, and ranging over the immense tracts of land owned by lord Fairfax. Surveyors were scarce, and the remuneration was ample, and as the young Virginian was economical, he saved money, and acquired property by purchase, long before he reached his majority. This fact, and the qualities of character which he displayed, gained him a solid reputation; and he was thus early regarded with esteem and confidence by the leading men in the province. The year 1751 found the frontiers threatened by the French and Indians, and frequent attacks and depredations occurred, necessitating some provision for the public safety. The colony was accordingly divided into military districts, to each of which an adjutant-general was appointed, with the rank of major, and a salary of £150 per annum. George Washington received one of these appointments, and entered with zeal on the study of the art of war and military tactics and strategy, under experienced provincial officers, among whom was his elder brother, who had seen service on the Spanish main. These studies were varied by an excursion with his half brother (Lawrence Washington) to Barbadoes, whither the latter was sent by his physicians; and who, on his death, soon after, bequeathed to George the estate of Mount Vernon, which had been left to him by his father. The care of this property and his military duties occupied George until 1753, when he was sent as a commissioner, by Gov. Dinwiddie, to gain information concerning the intentions of the French, who had sent an expedition to the headquarters of the Ohio. Washington acquitted himself of this mission very creditably, displaying great judgment, coolness, and address. In the spring of 1754 he was made second in command of the six companies which formed the military establishment of the colony, and with three of these companies, was sent forward to occupy the outposts of the Ohio. This was his first campaign, and he at once distinguished himself by defeating a detachment of the French under De Jumonville;

and, his superior officer dying suddenly, he was raised to the chief command of the detachment. In 1755 Washington became attached to Gen. Braddock's staff and passed through the ill-fated campaign of that year with great *éclat*, his personal bravery under fire becoming thoroughly established; while it was recognized that the fact of his wise counsel not having been listened to had been in no slight measure the cause of Braddock's defeat. The duty now fell to Washington to reorganize the provincial troops, and he retained the command of them until the close of the campaign of 1758, when he resigned his commission, and retired into private life; dissatisfied, as it would appear, with the course of the government in failing to recognize the claims of provincial officers, and in preferring to them the officers of the royal army. On Jan. 6, 1759, Washington married Mrs. Martha Custis, a young widow with two children, wealthy in her own right. The management of her large estate, combined with that of his own, now occupied the most of his time, at least until about 1763. Having been elected to the house of burgesses of Virginia, he now began to appear prominently in public affairs, attending regularly every meeting of the assembly; and though seldom speaking, taking care to be thoroughly informed upon every prominent public question. He moved much in society, also; practised a generous hospitality at Mount Vernon; associated constantly with the leading men of the colony; and soon, and imperceptibly, he had gained a recognized position as a man of profound ability and marked personal influence. At this time he was frequently made the depositary of important trusts, and was very often chosen to act as arbitrator in disputes arising among the colonists. His devotion to business and affairs was untiring; his industry extraordinary. He personally took charge of all his numerous accounts and business records, conducted his large and increasing correspondence, and drafted all his own contracts and deeds. At the outbreak of the revolution he was recognized as the leading man in the colony of Virginia, and was, it is believed, the wealthiest in the colonies. When the dispute between the colonies and England began, Washington held that arms should be the last resort. His respect for lawful authority, and the chances of losing his great estate, made him dread any rupture; nevertheless, he drew up in 1769 a non-importation agreement, which was signed by the state assembly, and at the convention at Williamsburg, Aug. 1, 1773, he was among the foremost in asserting the right of the colonies to self-government. He was one of the six Virginia delegates appointed to the first continental congress, 1774; and in June, 1775, was appointed by that body commander-in-chief of the continental army. For this important position his previous education had exactly adapted him. Not only was he skilled in military affairs; taught by precept and experience the art of war; but his extensive knowledge of the geographical character of the country, and his familiarity with the characteristics and qualifications of the royal army, made him certainly the most dangerous antagonist as a commanding officer, with whom that army could have to cope in the colonies.

Immediately after his appointment Washington left Philadelphia and joined the army at Cambridge, assuming command on July 3, 1775. This army numbered 17,000 men, all told, including the sick. It was in want of everything which could make it an effective fighting force—arms, ammunition, accoutrements; and, worse than all, *esprit de corps*. The course pursued by congress in making its appointments had occasioned much discontent among the general officers; the organization was defective; a commissary and adj.-gen. were more needed than a brave warrior or a skillful tactician. In Washington, fortunately for the country, were combined all three. He proceeded at once to complete an effective organization of his small army, by forming it into six brigades of six regiments each, keeping the troops from each colony, as far as practicable, together, and placing them under a commander from their colony. He sustained a constant correspondence with congress; pressing his views earnestly upon that body, and, though slowly, with marked success. All the officers were commissioned anew by congress, and by degrees a continental army was formed. Washington corresponded with the heads of the different colonial governments, and afterward with the governors of the various states; and by these various means succeeded at length—not only in creating the American army, but in becoming the sole channel of communication between it and the numerous and complicated depositories of authority in the United States. But all this was accomplished amid embarrassments innumerable. The army itself became diminished by the expiration of terms of enlistment; there were cabals among the officers, and disagreements with the civil authorities; yet, despite all opposing influences, the British were held in check during the year 1775, and until a new army could be collected, and arms and ammunition supplied. On March 4, 1776, the Americans took possession of Dorchester Heights, and on the 17th the British evacuated Boston, and their fleet put to sea; whereupon Washington at once proceeded to New York, with the design to prevent a landing. In this he was foiled; partly through the incompetence of his own officers; partly on the account of the royalist strength in New York. The landing was effected, and the Americans were defeated in the battle of Long Island, Aug. 27, 1776; and Washington was forced to abandon New York to its fate, and retreat up the e. bank of the Hudson. He crossed the Hudson, Nov. 12, with only 4,000 men; was hotly pursued through New Jersey by the British; and, when he crossed the Delaware into Pennsylvania, had less than 3,000 weary, half-starved, dispirited soldiers under his command. Three weeks later, with only 2,400 men, he captured more than 1,000 Hessians

at Trenton ; stole away from the superior forces of Cornwallis, defeating his reserve at Princeton ; and by Mar. 1, 1777, not a British or Hessian soldier was to be found in New Jersey, save a remnant at New Brunswick and Amboy. Frederick the Great declared, with regard to the achievements of Washington and his little band of heroes, between Dec. 25, and Jan. 4, following, that they were not excelled in brilliancy by any recorded in the annals of military actions. In the mean time congress had seen the necessity of enlisting a regular army of men for a longer period than a year, which had been its previous judgment ; and it now conferred dictatorial powers on Gen. Washington. The campaign of 1777 opened about the middle of June, and was disastrous to the Americans from the beginning. They were defeated in the battle of the Brandywine, Sept. 11 ; and the British entered Philadelphia two weeks later. On Oct. 4 they were again defeated at Germantown ; and early in December, Washington and his half-clothed and worn-out command made their terrible march to Valley Forge ; where on the 11th they went into winter quarters, in a fortified encampment. During that winter Washington and his troops were subjected to inconceivable privations ; and to add to his embarrassment, a conspiracy among his own general officers had nearly resulted in deposing him from his command ; and was only frustrated by the firmness and good sense of congress, and by the friendly influence of Lafayette and De Kalb, who fully sustained him in this trying moment. Meanwhile, the men suffered for lack of food and proper clothing ; the quartermasters and commissariat departments were deranged and inadequate ; and the patriot cause was at the lowest ebb of its fortunes. But congress took up the question of properly recruiting and providing the army ; a treaty with France was ratified with great rejoicing on the part of the Americans ; and the British, although only 20 m. distant from the American camp, permitted the winter and spring to pass without any offensive movement. All of these circumstances combined enabled Washington to open the campaign of 1778 in somewhat better condition, and with an army in good spirits. Howe evacuated Philadelphia June 18, and Washington crossed the Delaware with his whole army, attacking the enemy at Monmouth, when they retreated, after a sharp engagement. Washington continued his march to the Hudson, which he crossed, and encamped near White Plains. He now distributed his troops in a line of cantonments around New York, extending from Long Island sound to the Delaware ; arranged for the defense of New England ; and in December went into winter quarters. During the whole of 1779 Washington retained his position in the highlands of the Hudson, and remained on the defensive. In 1780 the French government sent out Count Rochambeau, who arrived at Newport, R. I., July 10, with an expedition ; and combined operations were concerted, but not carried out on account of the naval superiority of the British. The features of importance of this year were the capture and execution of Maj. Andre, and the discovery of the treason of Benedict Arnold. The year 1781 found Washington hampered by a vacillating and unreliable congress, doubtful of its own powers, and, although now strongly supported by the French auxiliary army and liberal supplies from France, unable to bring these advantages into full use and application. But in the latter part of September the Americans and French united completely invested Yorktown, Va., where was lord Cornwallis, with the British force. On Oct. 17 the latter proposed a cessation of hostilities ; and two days later he capitulated with his whole army. This concluded the active operations of the war, and the following year was chiefly occupied by Washington in endeavors to heal quarrels among his officers, and to obtain for them from congress the concessions they demanded, and to which they were doubtless rightfully entitled. There is no doubt that had Washington so desired, he could at this time have founded a monarchy, sustained by the bayonets of his army. He took the course, on the contrary, of quelling this disposition on the part of his soldiers, whenever it showed itself. On Nov. 25, 1783, the British evacuated New York ; on Dec. 4 he delivered his farewell address to the army ; and on Dec. 23 he resigned his commission and retired into private life.

During the next five years after the close of Washington's military career, he found sufficient occupation in attending to the affairs of his homestead and property, and in fostering the progress of his native state. Mount Vernon was now constantly the scene of a profuse hospitality, over which Washington presided with the courtly dignity and grace which were natural to him, and which he dispensed with princely generosity. In the convention of 1787, which framed the constitution of the United States, Washington acted as a delegate from Virginia. He was unanimously chosen the first president of the United States, and on April 30, 1789, took the oath of office in New York, where congress was then sitting. Washington's administration of the civil government was marked by the methodical precision which had characterized his conduct through life. His conscientious habit of undertaking no duty until he comprehended its entire scope and bearing, was also specially apparent in his new position. He thoroughly informed himself concerning all affairs of state, and every political act of importance which had been performed by the government and its agents since his retirement. He personally directed the organization of the different departments of the government under the new system, and in accordance with the constitution, and no act of his better showed the solemn seriousness which he attached to the great drama now being performed on the western continent, than his appointment to the offices of heads of these departments of such distinguished and able men as Jefferson, Hamilton, Knox, Randolph, and Jay.

Congress opened in January, 1790; and meanwhile Washington had found time to make a tour through the eastern states, to better acquaint himself with the views of those who were presently to lay the foundation for the commercial and manufacturing supremacy of the United States. Before congress, in his first message, he presented a profound and eminently judicious series of suggestions of laws and provisions, which were at once made the basis of legislation. Not only the skeleton of a new government was now being infused with life and made active and puissant; but the framework of the whole political and social system of the country was being erected. The people were, in the case of their social formation, assimilating; while, in that of their political organization, they were separating into two parties; the same two parties which were henceforth—in different forms, and at times under different names—to sway the course of the empire of the west. The democrats and federals each included the names of many of Washington's closest personal and political friends. Not only on this account, but from the sense of justice which ruled his life, he refrained sedulously from allying himself with either party; and, on the contrary, strove to reconcile the differences between the leaders which he foresaw must inevitably in the future bring about wider differences among the people. The success of his first administration, and the universal sense of a security under his direction which did not appear in the least to be certain under that of any other, produced a general anxiety, as it drew to a close, that Washington should accept the reins of government for a second term. Jefferson and Hamilton—wide apart as the poles in their political opinions, and personally at enmity with each other—agreed in this; and each wrote a letter to Washington urging his compliance with what was now a great popular demand. To their solicitation and those of others he acceded; and on the 4th of March, 1793, took the oath of office for the second time as president of the United States. The very beginning of Washington's second administration saw the United States drawn into the vortex of European politics. The French revolution and the "reign of terror" had culminated in the French republic. Great Britain and France were at war, and gratitude seemed to demand that the western republic should sustain her sister state in the existing struggle. But Washington was especially opposed to foreign complications, and while he accepted the French republic, and received its representative, he steadfastly adhered to his resolution, and the proclamation of neutrality was published April 22, 1793. Now arose factions in the United States, on the one side seeking to enforce practical adherence to the cause of France; on the other, sustaining Washington, though accused bitterly of bias in favor of the ancient enemy of America. Between democrats and federalists the line was now drawn strictly on this basis. Dissensions and resignations occurred in the cabinet; and Jacobin clubs were formed among the people, and were as virulent in the expression of their animosities as were their prototypes in France. In the midst of all the excitement consequent to such a state of affairs, Washington sent John Jay as envoy extraordinary to England, who negotiated the treaty which was signed by Washington on Aug. 18, 1795. The publication of the terms of this treaty aroused the most violent discussion in and out of congress. The latter body called upon the president for the correspondence and instructions involved in the negotiations, and these Washington declined to furnish. Acrimonious debate followed, but the president held firm to his position, and the matter died out. Thus by his wisdom and determination did Washington preserve his country—just emerging from the trials and vicissitudes of the war of independence—from engaging in entangling alliances which would certainly have precipitated renewed warfare, and perhaps have rendered impossible the growth of the magnificent superstructure of which he had laid the solid foundation. On Sept. 15, 1796, Washington published his farewell address to the country he had formed—almost out of chaos. He delivered his last presidential message; a new election resulted in placing John Adams in the presidential seat—though Washington could have been elected for a third term, had not the pressure of his private affairs induced him to decline the honor; and the father of his country retired to his home at Mount Vernon, followed by the love and admiration of a people who now fully recognized his public spirit, his stanch integrity, and the extent of his intellectual resources.

Here he devoted himself to agriculture, but in 1798 the prospect of a war with France led to his appointment as commander-in-chief of the national army. On Dec. 12, 1799, he was exposed in the saddle, for several hours, to cold and snow, and attacked with acute laryngitis, for which he was repeatedly and largely bled, but sunk rapidly, and died, Dec. 14. His last words were characteristic. He said: "I die hard; but I am not afraid to go. I believed from my first attack that I should not survive it. My breath cannot last long." A little later he said: "I feel myself going. I thank you for your attentions; but I pray you to take no more trouble about me. Let me go off quietly. I cannot last long." After some instructions to his secretary about his burial he became easier, felt his own pulse, and died without a struggle.

Europe and even his enemies paid tribute to the memory of Washington; the sermons and addresses in commemoration of his noble life grew into a literature; his name was perpetuated in the names of a multitude of American localities, and his countenance became a perpetual heirloom among his people. It was remarked by Gen. Henry Lee that he was "first in war, first in peace, and first in the hearts of his fellow-citizens."

Washington was 6 ft. 2 in. in height, with brown hair, blue eyes, large head and hands, and strong arms. The portraits painted in his early life are perhaps the most

truthful, as the artificial teeth worn in his later years altered decidedly the expression of his face. The statue by Houdon, at Richmond, has been accepted as the typical likeness, but the forehead is too retreating. The earliest known portrait, by Charles Wilson Peale, was painted in 1772. That by Joseph Wright, painted in 1782, was highly approved by Washington himself. Those by Trumbull and Sharpless are considered faithful in most respects; those by Stuart are somewhat idealized. No one picture can be accepted as entirely satisfactory. Washington was a forcible but not a fluent speaker. He was attentive to his personal appearance, somewhat fond of display, and to a natural diffidence was doubtless due the cold and reserved manner that distinguished him when in public life. Towards young people, and especially towards his nieces and nephews—his adopted children, for he had none of his own—he was gracious and gentle. He inherited from his mother a fiery temper, and sometimes lost control of himself. He was fond of fox hunting, visited the theater occasionally, and was a moderate wine drinker, but was opposed to the use of tobacco, although he raised it for export. He was, like nearly all Americans of property at that period, a slaveholder, but a considerate master, and possessed at his death 124 slaves, whom he directed, in his will, to be emancipated at the death of his wife, so that the negroes of the two estates, who had intermarried, might not be separated. As early as 1786 he expressed himself in favor of abolition by legislative authority. He was not a scholar, and the 1200 or more vols. that composed his library were chiefly on agricultural and military topics. He was a devoted member of the Protestant Episcopal church.

The early biographers of Washington erred in representing him as of almost superhuman excellence, unconsciously discouraging the American youth, before whom he was placed as a model. The criticism of later times deems it but honest to portray the man as he was, and there are writers who are inclined to rate him below some of his generals in military ability, and in political wisdom after Hamilton, Jefferson, and others; but even these echo the tributes paid by the world to his unselfish devotion to duty, especially to the cause of independence, to his courage, his sublime hopefulness under defeat, his strong will, his marvelous insight into character, his abiding faith in God and his absolute integrity and purity of motive. When these virtues are considered, few, if any, heroes of history can be placed beside him.

His wife, who was of the same age, is described as amiable in character and lovely in person. She was the daughter of Col. John Dandridge, of New Kent co., and was born in May, 1732. Her first husband, to whom she was married in June, 1749, was Daniel Parke Custis, a wealthy planter. By the courtesy of the period she was called Lady Washington, and whether in her own happy and hospitable home or at the federal court, she presided with great dignity and grace. She died at Mount Vernon (q.v.), May 22, 1802. See Sparks's *Life and Writings of Washington*, 12 vols., 8vo (Boston, 1834–37); *Life of Washington*, by Chief Justice Marshall, 5 vols., 8vo (Philadelphia, 1805); *Life of Washington*, by Washington Irving, 5 vols., 8vo (N. Y., 1855–59); and the abridged edition (N. Y., 1888); *The Writings of Washington*, collected and edited by W. C. Ford (N. Y., first vol., 1889); the lives by Stoddard (N. Y., 1886); E. E. Hale (N. Y., 1888); and Lodge (2 vols., Boston, 1889); Baker's *Character Portraits of George Washington* (Philadelphia, 1887); Walker's *George, Mary and Martha Washington* (N. Y., 1887); Conkling's *Memories of the Mother and Wife of Washington* (Auburn, N. Y., 1851); Johnston's *Original Portraits of Washington* (Boston, 1882); Baker's *Bibliotheca Washingtonia* (Phila., 1889); the biographies by Ford and Wilson (1896), etc.

WASHINGTON, William Augustine, 1752–1810; b. Virginia; was educated for the ministry, but was appointed a captain in the continental army, and fought in the battles of Long Island, Trenton, and Princeton. He was in command of a troop of light-horse in South Carolina for a time, and distinguished himself by his gallantry at the battle of Cowpens, receiving in recognition thereof a silver medal from congress. During the southern campaign of 1781 he was captured at Eutaw Springs, and was held a prisoner until the war ended. He afterwards settled in Charleston, S. C., and in 1798 was a member of Gen. Washington's staff, with rank as brig.-gen.

WASHINGTON AND LEE UNIVERSITY, at Lexington, Rockbridge co., Va., founded in 1749 as "Augusta Academy"; called in 1776 "Liberty Hall Academy" and chartered in 1782 under that name; in 1798 it took the name of "Washington Academy"; in 1813 its designation was changed to "Washington College," and in 1871 it assumed its present title. In 1798 Gen. Washington gave it 100 shares of stock in the James river canal company, which were converted into an interest-bearing fund of $50,000. In 1802 it received $25,000 from the Cincinnati society; and in 1826, another bequest of $46,500 from John Robinson, a soldier of the Revolution. Its present name is intended to pay equal honor to Gen. Robert E. Lee, who was its president from 1865 until his death in 1870. Gen. G. W. C. Lee succeeded his brother in the presidency, and resigned in Dec., 1896, on account of failing health. The university has no denominational patronage. It has funds amounting to $650,000, and an annual income from endowment of $36,000. Its buildings and grounds are valued at $200,000. In laboratories and apparatus it has a complete outfit, and its extensive museum comprises zoological, mineralogical, and geological cabinets, with an herbarium of 5000 specimens. It has a gymnasium and athletic grounds. The university is divided into thirteen elective

schools, including law, engineering, and the applied sciences. In 1896 it had 18 professors, instructors and lecturers; students, 223. President (from July 1, 1897), William L. Wilson, LL.D.

WASHINGTON MONUMENT, a huge obelisk erected in the city of Washington, having a total height of 555 ft. 5⅛ in. Work was begun in 1858, continuing slowly till 1877, when it ceased, but was resumed in 1878, and finished in 1885. The Washington National Monument soc. originated the plan and controlled the work of construction till 1877, when its property was conveyed to the U. S. The foundation of gneiss had originally a thickness of 23.3 ft., and was 80 ft. square at the base, lessening to 58.6 ft. square at the top. From this the obelisk proper rose, having walls of 15 ft. thickness, with an average facing of 16 in. white marble ; at the base the shaft was 55 ft. 1.5 in. square. It became evident that the foundations were not secure for so lofty a structure, and the great work of strengthening then began in 1878, by which time the obelisk had risen to a height of 156 ft., weighing 22,373 gross tons. Excavations 13.5 ft. deep were made around the base and filled with concrete, thus enlarging the area covered by the foundation from 6,400 to 16,000 ft. The rubble-stone base was partially torn out, and replaced by concrete joined to the concrete foundation ; and the shaft was reduced to 150 ft. The foundation now weighs 36,912 gross tons. The shaft is 34 ft. 5.5 in. square at the top, weighs 43,633 gross tons, and is 500 ft. 5⅛ in. high; the apex, weighing 300 tons, is 55 ft. high, its summit being nearly 600 ft. above the tide-water of the Potomac. The aluminum point which caps the apex is said to be the largest article ever made from that metal. The apex has 262 marble pieces, of seven-inch thickness. Toward the cost of erection the Monument soc. had expended $300,000 ; the total cost has been $1,187,710.31. Lieut. Col. T. L. Casey, of the U. S. engineers, had charge of the work of construction since its passing under the control of the U. S. The original designs were by Robert Mills. The altitudes of some of the highest structures in the world are here given for comparison: St. Paul's, London, 404 ft.; St. Peter's, Rome, 434¾ ft.; Strasbourg cathedral, 495 ft.; Cologne cathedral, 514 ft. The W. M. is 231 ft. higher than the Bartholdi statue.

WASHINGTON UNIVERSITY, founded in St. Louis, under an act of incorporation by the state of Missouri in 1853, comprises several departments, and is intended to embrace the whole range of university studies, except theology, and to afford opportunity of complete preparation for every sphere of practical and scientific life. The charter provides that "no instruction, either sectarian in religion, or partisan in politics, shall be allowed in any department of said university; and no sectarian or party test shall be allowed in the election of professors, teachers, or other officers of said university, or in the admission of scholars thereto, or for any purpose whatever." The university comprehends: 1, the undergraduate department, including the college and the school of engineering; 2, the Henry Shaw school of botany; 3, the St. Louis school of fine arts; 4, the St. Louis law school; 5, the St. Louis medical college; 6, the Missouri dental college; 7, Smith academy; 8, Mary institute; 9, the manual training school. The polytechnic school embraces courses in civil and mechanical engineering, chemistry, and general sciences. The university has large collections in mineralogy and natural history, and intimate connection with the Missouri botanical garden and the Shaw school of botany. The number of professors and other instructors in 1896 was 175; students in all departments, 1823. The total number of graduates from the graduate and undergraduate departments, 3317. Winfield S. Chaplin, LL.D., chancellor.

WASH'ITA, a river of the United States, rises on the western borders of Arkansas, and runs e. and s.e. through Louisiana, emptying into the Red river, 30 m. from its mouth; it is 600 m. long, and navigable to Camden, 300. Its chief branches are the Saline river, La Fourche, Tensas, and Little Missouri. See OUACHITA.

WASH'OE, a co. in n.w. Nevada, having the Truckee river on the s.e. and bordering on California; 5620 sq. m.; pop. '90, 6437. Washoe and Roop cos., Nev., were consolidated (1883) as Washoe co. Co. seat, Reno.

WASHOE SILVER MINES, a rich deposit of siliceous argentiferous galena, discovered in 1859 in a range of hills on the e. side of the Sierra Nevada, on the borders of California and Nevada territory, near the sources of Carson river, 160 m. e. by n. of Sacramento. The ore produces as much as $2000 to the ton, and is largely exported to Europe. The discovery of these mines caused a great excitement in California, and a large emigration.

WASHTENAW, a co. in s.e. Michigan ; produced in one year 906,011 lbs. of wool, 720 sq.m. ; pop. '90, 42,210, chiefly of American birth, inclu. colored. Co. seat, Ann Arbor.

WASP, *Vespa*, a Linnæan genus of insects, now forming the family *vespidæ*, a very numerous and widely distributed family, of the order *hymenoptera* and section *aculeata*. They are distinguished from all the other *hymenoptera* by their wings, when at rest, being folded throughout their entire length. The wings of all the wasps exhibit a similar pattern of nervation, with one marginal and three submarginal cells, and an incom

plete terminal submarginal cell. Their antennæ are usually angled, and somewhat club-shaped at the extremity. The maxillæ are long and compressed; there are glands at the extremity of the labrum; the tongue is trifid, its tips laciniated. The body is naked, or but slightly hairy. The general appearance resembles that of bees; the color is usually black, with yellow markings. The division between the thorax and abdomen is very deep, the abdomen often stalked. The legs are not fitted for collecting pollen, like those of bees. The females and neuters have stings, generally more formidable than those of bees. The larvæ have tubercles instead of feet. The wasps differ very widely in their habits, some being solitary, the family *eumenidæ* of some entomologists; others social, to which the name *vespidæ* is sometimes restricted. Neuters are only found among the social wasps. Some of the solitary wasps make curious burrows in sand, or construct tubes of earthy paste on the sides of walls, in which they form cells for their eggs, at the same time placing there a store of food for the larvæ, some of them using for this purpose perfect insects, others caterpillars, which are stung so as to be rendered incapable of motion without being killed. Others make little earthen cells on the stems of plants, and store in them a little honey for their young. The social wasps have various modes of constructing their nests, which are sometimes formed in excavations in the ground, sometimes attached to walls, boughs of trees, etc., and formed of a paper-like, or sometimes a pasteboard-like substance, produced by mixing into a pulp, with their saliva, small particles of woody fiber, torn by their broad and powerful mandibles from gate-posts, palings, the bark of trees, etc. Great diversities are to be seen in the arrangement of the combs within the nest. The combs are made of a substance similar to the outer covering of the nest, but generally thicker and firmer. As the nest is enlarged, new paper is made for the purpose, the whole nest being inclosed in the last-made envelope, and the inner ones, which sufficed for its former size, are removed to give place to combs. Several inner envelopes are generally found in a wasp's nest, so that paper-making must be a great part of the industry of these insects. The nests of the wasps of tropical countries are often very large, sometimes 6 ft. long, and the communities very numerous. In colder regions the increase of the community and of the nest is arrested by the approach of winter, when the males and the neuters die; but a few of the females survive, passing the winter in a torpid state in some retreat, and found new communities in spring. In a community of wasps there are many perfect females —not a single queen, as in the case of hive bees. Wasps in their perfect state feed very indiscriminately on a great variety of animal and vegetable substances, as insects, flesh, fruit, sugar, etc. Grapes or gooseberries, especially if over-ripe, are often found to contain a wasp in the interior. Wasps often invade bee-hives and steal honey. There is a Brazilian species (*myropetra scutellaris*) which stores up honey like bees. Wasps may be killed by pouring hot water on their nests; but more easily by the vapor of burning sulphur, when the nests are not in the ground; or ether or chloroform may be used to stupify the wasps, so that the nest may be safely destroyed. The largest British species of wasps is the hornet (q.v.), found only in the s. of England. The most abundant species, diffused over all parts of the country, are *vespa vulgaris* and *V. media*. The former is about eight lines long. The front of the head is yellow, with a black center; there are many yellow spots on the thorax, and a yellow band with black points at the posterior margin of each ring of the abdomen; the rest is black. *V. media* is very similar, but rather larger. *V. vulgaris* makes its nest in the ground; *V. media* suspends it generally to the branches of trees, sometimes to the projections of walls. See illus., vol. III.

WASSON, David Atwood, b. Me., 1823; studied at an academy; was a teacher at the age of 19; spent a year in Bowdoin college; went to sea as a common sailor for his health; studied law, but relinquished its practice after a short time; entered the Congregational theological seminary at Bangor, 1849, and completed the course; settled at Groveland, Mass., 1851; changed his theological views, and became a preacher of an independent church there, and, with an interval of six months, remained till 1857; supplied the society of Theodore Parker for a few months, and retired from failure of health; was engaged in the Boston custom-house for four years, and spent two in Germany. He wrote much for reviews. He d. 1887.

WASTE, in the law of real property, is "any act or omission of the tenant of a particular estate, by which the estate of the reversioner or remainder-man is diminished in value." It may be voluntary, where the act of the tenant is willful; or permissive, rising from neglect. The waste may be by a tenant for life or for years as against him who holds the fee, but not by tenant in fee simple against his heir, or by tenant in fee tail against the next donee.

WASTEL. The old English name for a kind of fine white bread or cake.

WASTE LANDS, according to the general use of the term, are uncultivated and unprofitable tracts in populous and cultivated countries. The term waste lands is not employed with reference to land not reduced to cultivation in countries only partially settled. There is a large extent of waste lands even in the British islands. Of the 77,144,000 acres which they contain, only about 58.5 per cent. are arable land and improved pasture; 36 per cent. are occupied with woods and plantations; 25 per cent. of the acreage of Scotland consists of cultivable lands and pasture, while 70.5 per cent. of the sur-

face is taken up by mountains, heath, water, etc. In Ireland, 72 per cent. consists of cultivable lands and pasture. In the United States, the total acreage of farms in 1890 was 632,218,619, an increase of nearly 100,000,000 acres since the previous census. The forest area has been roughly estimated at 500,000,000 acres.

The improvement of waste lands is very much a question of expense. It is often more profitable to improve lands already cultivated, and to bring them into a higher state of cultivation and productiveness, than to reclaim waste lands; in attempting which, much money has often been lost. Much of the cultivated land of America is far from having been brought to the highest state of cultivation of which it is evidently capable, or to a state equal to that of the best cultivated lands of similar soil and situation. In many instances, however, waste lands have recently been improved with great advantage, and it seems probable that no small part of the waste lands of the country are capable of profitable improvement. The process must often be slow and gradual, especially where the soil is naturally very poor, as even the addition of large quantities of manure to very poor soils will not render them fertile, but on the contrary will be followed by a sterility greater than before. The quantity of guano which a rich soil would gratefully receive will destroy every vestige of vegetation on a very poor soil.

The waste lands of Britain are of very various character. Some of them are bogs, already sufficiently noticed in the article Bog. Others are marshes and fens, generally very near the level of the sea, and often within the reach of its tides, chiefly in the eastern counties of England. See Bedford Level. Of these, a great extent has been reclaimed, and has become very productive; much still remaining, however, to be done. There are also extensive moors both in England and in Scotland, often of very poor soil, and often also at such an elevation above the level of the sea as to render profitable agriculture hopeless. This is not the case with all the moors, and it is sometimes possible to effect great improvement by drainage; so that land, formerly almost worthless, may be converted into good pasture. In many places the heath has been extirpated, and the moorland changed into good pasture, and even into good arable land. It is sometimes found very profitable to break up such land, even at very considerable elevations, and afterward to lay it down in pasture, the produce being much greater than it was before. Even in the most elevated tracts, drainage is beneficial; although it must always be considered whether or not drainage will pay. The highest sheep-pastures of the south of Scotland have been greatly improved by a kind of superficial drainage (*sheep-drains*), consisting of mere open channels for water; but in the greater altitudes of the Highlands, and amidst their more rugged steeps, even this is out of the question. In some cases, chiefly of the more level moorlands, much improvement is effected by *paring and burning*, the surface being pared off by the *breast-plough* or *paring-spade*, and burned, generally in heaps, of which the ashes are spread upon the soil. The application of lime is of great benefit in many cases, as is also that of chalk and of marl, but the expense must always be considered, and many tracts of waste lands are so situated that the application of such manures is impossible. Railways have rendered the reclamation of waste lands profitable in many districts in which formerly it would not have been so.—The chalk *downs* of the south of England may, in great part, almost be considered as waste lands, although used for sheep pasture; but they have been found capable of great improvement, although in a slow and gradual manner, by tillage, and the application of manures.—Sands near the sea-shore are fixed by sowing certain grasses (see Ammophila), and are capable of further improvement by cultivation and the application of manures; particularly where the sand is in considerable part calcareous. The most barren and hopeless sands are those which are almost entirely siliceous. Some time ago a company proposed to experiment on a large scale on sand of this kind, by conveying the sewage of London to the Maplin sands on the coast of Essex. Very different opinions were expressed by scientific men as to the probable result of the experiment, which was important both as to the reclamation of wastes and the disposal of sewage. Liebig deemed the siliceous sand incapable of profiting by the rich manure poured upon it. The company commenced their works, but failed to complete them.

WASTING PALSY is one of the terms applied to the disease described in this work under its old name of Tabes Dorsalis.

WATAUGA, a co. in n.w. North Carolina, having the Blue Ridge mountains on the s.e. border; 392 sq.m.; pop. '90, 10,611, chiefly of American birth, with colored. Co. seat, Boone.

WATCH, a small portable machine for measuring time, the construction of which is essentially the same as that of a clock (see Horology), except that the moving power is obtained from the elastic force of a coiled spring instead of from a weight, and the movement regulated, so as to be isochronous, by a balance and balance-spring (q.v.) instead of a pendulum. The going part of a watch consists of a train of wheels and pinions, kept in motion by a spring, called the main-spring; the last and fastest wheel of the train, the scape-wheel or balance-wheel, acting so as to keep in vibratory motion a balance whose movement, again—which is made isochronous by the action of another

spring called the balance-spring—regulates to a uniform rate the revolution of the scape-wheel, and consequently the motion of the rest of the train, and the uncoiling of the main-spring.

The main-spring is a thin ribbon of steel coiled in a barrel. The inner end of it is fixed to a strong spindle, the axis or *arbor* of the barrel, around which it is coiled, and the outer end is fixed to the inside of the barrel. By its tendency to uncoil itself, the spring sets the barrel in motion, and it produces as many revolutions of the barrel as it makes turns itself in unwinding. As its elastic force is greater when it is tightly coiled than when it has to some extent unwound itself, the spring, if its force were applied without modification to the watch train, would act upon it unequally, the power exerted diminishing as the spring uncoiled; so much so, that the watch could not go uniformly throughout the day, though it might keep time from one day to another. A piece of machinery, called a fusee, is employed to correct the variations in the force of the spring, and equalize the power exerted upon the train. The fusee is a cone with a spiral groove, connected with the barrel which contains the main-spring by a chain, one end of which is fixed at the broadest part of the cone, and the other end to the barrel. The barrel moves the fusee by means of the chain, which, as it runs off the sides of the fusee, is coiled upon the outside of the barrel. In winding a watch the key is placed on the axis of the fusee, and by the same movement the main-spring is coiled around its spindle, and the chain wound off the barrel, to cover the cone of the fusee. So when the spring is all coiled up, and its force upon the barrel is greatest, the chain is acting at the small end of the fusee, and its leverage upon the fusee is least; as the force of the spring diminishes, the chain having got to a broader part of the fusee, the leverage is increased; and the grooving of the fusee being, when perfect, arranged so that a section of the fusee along its axis would present two hyperbolas placed back to back, secures that the force of the spring, modified by the leverage of the chain, shall produce a uniform motion of the fusee. From the fusee this motion is communicated to the watch-train, the first wheel of the train—called the fusee-wheel or the great wheel—being set upon the fusee. The use of the fusee is now obsolete, although it was formerly used in almost all old English watches. In modern watches the great wheel forms part of the barrel, and the diminishing power of the main spring as it uncoils is neutralized by the *Escapement*, several forms of which are described below. No very great accuracy in time keeping is possible with the fusee and vertical escapement.

Between the train of wheels and pinions in a watch and that of a clock, until we come to the escapement, there is no difference, except that there is one more wheel and pinion in the watch-train than in the clock-train; the reason of which is, that the scape-wheel of a watch revolves, not like that of a clock, in a minute, but usually in about six seconds, making necessary an additional wheel to revolve in a minute and carry the seconds hand. A great variety of watch escapements are in use. The oldest, which has now gone out of use, is the vertical escapement. It exactly corresponds to the crown-wheel escapement in clocks (see HOROLOGY). The accompanying figure shows a watch-train with this escapement. It may be useful also as indicating, in a general way, the arrangement of the wheel-work in a watch (fig. 1). The main-spring contained in the barrel B, sets in motion the barrel, which, by means of the chain *c*, moves at a uniform rate the fusee F, along with which turns the fusee-wheel W, the first or great wheel of the watch-train. It will be easily seen how, from the great wheel, motion is communicated successively to the center-pinion D, and the center-wheel D′ (which turn in an hour); to the third-wheel pinion, E, and the third wheel, which is upon the same arbor, E′; and to the fourth or contrate-wheel pinion G, and the contrate-wheel G′. The upright teeth of the last named wheel move the balance-wheel pinion H, and with it the balance-wheel or scape-wheel H′, which is fixed upon its arbor. The scape-wheel (and in this escapement the contrate-wheel also) is what is called, from its shape, a crown-wheel. Upon the arbor or verge of the balance K, are two pallets, *p*, *p*, at a distance from each other equal to the diameter of the scape-wheel, and so placed that, as the scape-wheel revolves, its teeth give them alternately an impulse in different directions, which keeps up the vibratory motion of the balance. The balance is made to vibrate isochronously by the action of the balance-spring (q.v.); and its vibration regulates the escape of the teeth of the scape-wheel, and so the motion of the whole train, exactly as that of the pendulum does in an ordinary clock. The vertical escapement is liable, though in a less degree, to the same objection as the old crown-wheel and the crutch or anchor escapements in clocks. There is a recoil of the scape-wheel after one of its teeth has been stopped by a pallet, which interferes more or less with the accuracy and uniformity of the motion of the train. See HOROLOGY.

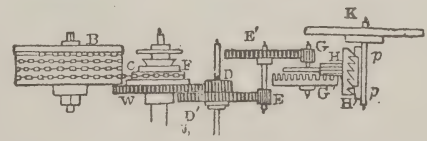

FIG. 1.

Almost immediately after the invention of the balance-spring, attempts began to be made to introduce an escapement which would produce greater accuracy than the

vertical escapement. Hooke, Huygens, Hautefeuille, and Tompion introduced new principles, each of which has since been successfully applied, though they all, from imperfect execution, failed at the time. The first real improvement was made by George Graham, the inventor of the dead escapement in clocks. This is called the horizontal escapement; it was introduced in the beginning of the last century, and it is still the escapement used in most foreign watches. The impulse is given to a hollow cut in the cylindrical axis of the balance, by teeth of a peculiar form projecting from a horizontal crown-wheel. Other forms of escapement in high estimation are the lever escapement, originally invented by Berthoud, improved by Mudge; the duplex escapement, the principle invented by Hooke, the construction perfected by Tyrer; and the detached escapement of Berthoud, improved by Arnold and Earnshaw. The last-mentioned is that which is employed in marine chronometers and in pocket-chronometers, as watches made in all respects like chronometers are called. The lever escapement is that which is used in most English watches. In it the scape-wheel and pallets are exactly the same as in the dead escapement in clocks. See HOROLOGY. The pallets are set on a lever which turns on their arbor; and there is a pin in a small disk on the verge or arbor of the balance, which works into a notch at the end of the lever. The pin and notch are so adjusted, that when a tooth of the scape-wheel has got free, the pin slips out of the notch, and the balance is detached from the lever during the remainder of its swing; whence the name *detached* lever escapement, originally applied to this arrangement. On the balance returning, the pin again enters the notch, moving the lever just enough to send the tooth next in order to escape from the dead face of the pallet on to the impulse face; then the scape-wheel acts upon the lever and balance; the tooth escapes, and another drops upon the dead face of the pallet, the pin at the same time passing out of the notch in the other direction, leaving the balance again free. This arrangement is found to give great accuracy and steadiness of performance. To prevent the teeth from slipping away while the balance is free, the faces of the pallets are slightly undercut, and this makes them secure while at rest; moreover, there is a pin on the lever which moves through a notch on the balance disk, while the pin moves through the notch in the lever, which is so adjusted as to guard against the lever moving and the teeth escaping, while the balance is free.

In watches, even more than in clocks, variations of temperature, unless provided for, produce variations in the rate of going, the increase or diminution of the temperature affecting to some extent the moment of inertia of the balance, and to a great extent the elastic force of the balance-spring. A rise in the temperature makes the balance expand, and therefore augments its moment of inertia; it adds to the length of the spring, and thereby diminishes its elasticity, the elastic force of a spring varying inversely as the length; and the time of vibration of the balance, which depends upon the moment of inertia directly, and upon the elastic force of the spring inversely, is increased—the watch, that is, goes more slowly—in consequence both of the increase of the inertia and of the diminution of the elastic force of the spring. A fall in the temperature is attended by opposite results, the watch going more rapidly than before. A watch without a compensated balance would vary very much more than a clock without a compensation pendulum, but that being usually carried in the waistcoat pocket, it is kept at a pretty uniform temperature. To invent a satisfactory compensation was at one time the great problem for watch-makers. The compensation can obviously be made in either of two ways—by an expedient for shortening the effective length of the balance-spring as the temperature rises, so as to increase the elastic force of the spring; or by an expedient for diminishing the moment of inertia of the balance as the temperature rises, so as to correspond to the diminution of the force of the spring. The first method was that made use of by John Harrison (q.v.), who first succeeded in making a chronometer capable of measuring time accurately in different temperatures; but an adaptation of the other method, invented about eighty years ago by Earnshaw, is that which is always employed now (Fig. 2): *t a t'* is the main bar of the balance, and *t b*, *t' b'* are two compound bars, of which the outer part is of brass and the inner part of steel, carrying weights, *b*, *b'*, which may be screwed on at different places. The brass bar expands more with heat, and contracts more with cold than the steel bar; therefore, as the temperature rises, the bars, with their weights, bend inward, and so the moment of inertia of the balance is diminished; as it falls, they bend outward, and the moment of inertia is increased; and of course the diminution or the increase must be made exactly to correspond to the diminution or increase in the force of the spring.

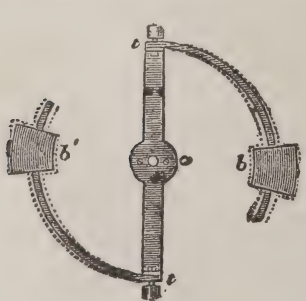

FIG. 2.

The chronometer is just a large watch fitted with all the contrivances which experience has shown to be conducive to accurate time-keeping—e.g., the cylindrical balance-spring, the detached escapement, and the compensation-balance. As a watch which will keep time in one position will often not do so equally well in another, marine

chronometers are always set horizontally in a box in *gimbals* (q.v.), an arrangement which keeps the chronometer horizontal, whatever the motion of the vessel.

The great importance of an accurate time-keeper at sea is for determining the longitude (see LATITUDE). This use was first distinctly pointed out by Sir Isaac Newton. A committee of the house of commons, of whom this philosopher formed one, having been appointed on June 11, 1714, to consider the question of encouragement for the invention of means for finding the longitude, the result of their meetings was a memorial containing an explanation of the different means proper for ascertaining the longitude, and recommending encouragement for the construction of chronometers as the best means of ascertaining it. An act of parliament was then passed, offering a reward for this purpose.

The first chronometer used at sea was invented by John Harrison. After many years of study it was completed in 1736. After several further trials and improvements, and two trial voyages to America, undertaken for the satisfaction of the commissioners, the last of which was completed on Sept. 18, 1764, the reward of £20,000 was finally awarded to Harrison.

Somewhat later than this, several excellent chronometers were produced in France by Berthoud and Le Roy, to the latter of whom was awarded the prize by the académie royale des sciences. Progress was still made in England by Arnold, Earnshaw (the inventor of the compensation still in use), and Mudge, to whom prizes were awarded by the board of longitude, and under whom a perfection nearly equal to that of the present day was obtained. The subsequent progress of watch-making has been chiefly directed to the construction of pocket-watches on the principle of marine chronometers, or to the combination of accuracy with convenient portability. The adjusted lever watch is now made in Clerkenwell with a degree of accuracy which enables the performance to be warranted within an error of one second a day.

While the compensation of a chronometer can never be made perfectly accurate for all degrees of temperature, there are always two temperatures at which a well-constructed chronometer will go with perfect accuracy. The explanation of this lies in the fact that while the variations of elastic force in the spring go on uniformly in proportion to the rise or fall of the temperature, the inertia of the balance cannot be made to vary as it should do, in exact correspondence to them inversely. The variation of the elastic force may be represented by a straight line inclined at some angle to a straight line divided into degrees of temperature; the corresponding changes of the moment of inertia will be represented by a curve, and this curve can coincide with the straight line representing the variations of elastic force only at two points, corresponding to two different temperatures. The particular points in the case of any chronometer are matter of adjustment. For instance, one chronometer may be made to go accurately in a temperature of 40°, and also in a temperature of 80°, at other temperatures being not so accurate; another chronometer to go accurately at a temperature of 20° and of 60°. It is manifest that the former would be adapted to voyages in a warmer, the latter to voyages in a colder climate. Apparatus for testing chronometers have been long in use in the observatories at Greenwich and Liverpool. In the latter, there is now an extensive apparatus for this purpose, devised by the ingenious astronomer, Mr. Hartnup, In a room which is isolated from noise and changes of temperature, the chronometers are arranged on a frame under a glass case, so contrived that they may be subjected in turn to any given degree of temperature. The rate of each under the different temperatures is observed and noted, and the chronometers registered accordingly. These observations are of the greatest importance both to ship-captains and instrument-makers, who can have their instruments subjected to the observations on payment of a fee.

It may be stated that the main-spring had been employed as the moving force of time-keepers for about a century before the invention of the balance-spring; but very little is known about the action of these forerunners of the watch. A watch without a balance-spring must have been a very rude and untrustworthy contrivance. The honor of first proposing the balance-spring is undoubtedly due to Dr. Hooke, though Huygens and De Hautefeuille also invented it independently much about the same time.—See Denison's *Rudimentary Treatise on Clocks and Watches;* Wood's *Curiosities of Clocks and Watches;* Benson's *Time and Time-tellers* (1875). See WATCHMAKING, etc.

WATCH, on shipboard, a division of the crew into two, or if it be a large crew, into three sections; that one set of men may have charge of the vessel while the others rest. The day and night are divided into watches of four hours each, except the period from 4 to 8 P.M., which is divided into two *dog-watches* of two hours' duration each. The object of the dog-watches is to prevent the same men being always on duty at the same hours.

WATCH HILL, the extreme S.W. limit of the state of Rhode Island, in the t. of Westerly; containing several large hotels and a light-house, built of granite, 40 ft. high, showing a fixed white light 60¾ ft. above the sea. It is a popular summer resort.

WATCHING AND WARDING, in Scotch law, mean the services rendered by one who holds lands under burgage tenure. These services are merely nominal.

WATCHMAKING BY MACHINERY. The idea of making watches by machinery upon a uniform system first occurred to Aaron L. Dennison, a Boston watch-maker, in 1848. His original plan was to gather together under one roof several little labor-saving machines which were used in Switzerland for some of the processes of watchmaking, to supplement these by new contrivances, and to run them all by one power. He thought that in this way he might be able to turn out ten watches a day. The scheme was considered wild and impracticable. However, he managed to form a small company, which built a factory at Roxbury, Mass. But the Swiss authorities passed a law prohibiting the exportation of machines, models, or drawings, so that the pioneer company was obliged to construct its own machines, with which the first machine-made watch was turned out, 1853. Subsequently the works were removed to Waltham, Mass., and here the American Watch company was incorporated. This company has been very successful. Its buildings cover nearly five acres of ground, and it turns out in the neighborhood of 7,000,000 watch movements annually. Great improvements, many of recent date, have been made in the machinery. Since 1878 the cost of producing a movement has been reduced one half, and the share which mechanism has in the finished watch has been increased, so that now, beyond collocation, nothing remains for handwork, save the preparation of the jewels, done in a hand-lathe, and the cutting of gold regulating screws for high-grade balances. Watchmaking by machinery necessitates a great number of operations, many of which must be repeated several times. In making the movements of some of the Waltham stem-winding watches nearly 4000 distinct mechanical operations are required, and in the fabrication of any movement at least from 600 to 800 processes are employed. Exclusive of the manufactories of cheap and inferior watches with which the markets are flooded, there are in the U. S. a number of manufacturers of high-grade movements. among which are the Elgin National Watch Co., the Waterbury Watch Co., and the New York Standard Watch Co. The first-class machine-made watch has now a high rank as an accurate and trustworthy time-keeper, and possesses a great advantage, inasmuch as its parts are interchangeable; *i.e.*, the parts of all watches of a certain number or kind are turned out identical in size, so that a broken or worn-out part can be easily replaced, and the owner need only send on the number of his watch to enable the factory to send him a duplicate of the part. Outside of the U. S. comparatively few watches are made by machinery ; in Switzerland this American idea is gaining ground, and factories for making watches by machinery are increasing ; while England, whose manufacturers have been almost driven from the market by the cheapness and excellence of the American machine-made watch, is slowly awakening to the fact that she must adopt the American methods in order to compete successfully in the watch trade with American manufacturers.

WATCH, NON-MAGNETIC. A watch whose quick-moving parts—viz., escapement, balance, and balance spring are made from non-magnetic metals invented in 1884 by C. A. Paillard, a Genevese horologist. The compensation balance and balance spring are made from Paillard steel, a metal produced by carbonizing an alloy of palladium, copper, silver, and steel, remaining parts of escapement, from alloys of gold, aluminum, or aluminum bronze.

The steel escapements of ordinary watches become magnetized when introduced into magnetic fields, such as exist about dynamos and electric-motors. The balance becomes a compass, the poles tending to point n. and s., and are also attracted and repelled by the surrounding magnetized steel pieces of the watch. By such attraction and repulsion the regular oscillation of the balance is interfered with, and the watch ceases to keep correct time. The variation in magnetized watches varies from a few seconds to several hours per day. When heavily magnetized the watch stops. The introduction of electric-motors on street railways renders non-magnetic watches practically a necessity.

WATCH-RATES, in England, are the rates authorized to be levied in a parish or borough for the purpose of watching and lighting.

WATELET, Claude Henri, 1718–86 ; b. Paris ; French writer on art and amateur artist. A number of portraits and other pieces were etched by him, but his reputation rests rather upon his books, *Essay on Gardens* (1774) and *Dictionary of the Arts of Painting, Sculpture, and Engraving.* The last-named work was completed by Levesque, and was issued in 5 vols. in 1792. Another, but less meritorious publication, was *The Art of Painting* (1760), in which he strove to instruct through the medium of verse. He was a contributor to Diderot's *Encyclopédie,* and was admitted to the French academy.

WATER. The ancients considered matter to be composed of four elements : Earth, Air, Fire, and Water, in varying proportion, Water imparting the properties of coldness and wetness. This view was slightly modified about the beginning of the 16th century, somewhat more early in the 17th by Van Helmont, but it remained for Lavoisier near the close of the 18th century to explain the composition of air and water and put chemistry upon its present basis. Cavendish definitely determined the volumetric composition of water, but explained the facts in accordance with the dying theory of phlogiston. The relative merits of Cavendish, James Watt, and Lavoisier are thus stated by Kopp (from Roscoe): "Cavendish first ascertained the facts upon which the discovery of the composition of water was based, although we are unable to prove that he first deduced

from these facts the compound nature of water, or that he was the first rightly to recognize its constituent component parts. Watt was the first to argue from these facts the compound nature of water, although he did not arrive at a satisfactory conclusion respecting the nature of the components. Lavoisier, also from these facts, first clearly recognized the compound nature of water, and determined exactly the amount of its components."

The chemical formula for water was until about the middle of the present century generally written HO, and indeed is by some chemists so written at the present time. This formula belongs to a system that indicates proportional composition in the simplest manner, 1 part of hydrogen to 8 parts of oxygen, without reference to atomic weights or vapor densities. The modified formula, H_2O, while necessarily expressing the same proportional composition in accordance with experimental facts, is based on evidence that oxygen takes part in chemical changes in proportions of 16 rather than 8, and also upon the principle that substances which are gaseous or which can be changed to vapors without decomposition shall receive a formula indicating a total weight equal to twice their vapor density when stated in terms of hydrogen. Water vapor is 9 times as heavy as hydrogen; the formula of water should therefore indicate a weight of 18, and H_2O does this for $H_2=2, O=16, 2+16=18$. H_2O also accords with the decomposition of water vapor into two volumes of hydrogen for every one volume of oxygen.

Water occurs abundantly in nature in three familiar forms—vapor, liquid, and solid. It is a constituent of all animals and vegetables. About 66 per cent. of man, 75 per cent. of fishes, and 90 per cent. of fresh vegetables is water. It is a plentiful component of many minerals which are apparently dry; for instance, gypsum is about $\frac{1}{5}$ water. It forms part of a large number of crystalline salts; $\frac{36}{249}$ of copper sulphate, or blue vitriol, is water, while almost exactly half of crystallized borax is the same.

Water is the product of many chemical changes; among the more prominent of these may be mentioned the oxidation of hydrogen and all its compounds, e.g., the burning of marsh gas ($CH_4+2O_2=CO_2+2H_2O$); the combination of acids and bases, e.g., sulphuric acid and slaked lime ($H_2SO_4+Ca[OH]_2=CaSO_4+2H_2O$); the action of hydrogen on hot oxides, e.g., iron oxide ($Fe_2O_3+3H_2=2Fe+3H_2O$); and the decomposition under the influence of heat of a majority of those organic compounds which contain both oxygen and hydrogen, e.g., oxalic acid, sugars and starches, fibrin, albumen, etc.

Water (H_2O) is at normal pressure and between 32° and 212° F. (0° and 100° C.) a liquid transparent, nearly colorless, neutral in reaction and without taste. It has, to man, a faint indescribable odor which is doubtless perceptible to animals at considerable distances. When seen in large quantities, or through long tubes, it has a blue tinge. Its specific gravity is 1., and it forms the standard of comparison for all solids and liquids. It is 825 times as heavy as air. In the form of vapor, it is 9 times as heavy as hydrogen and its molecular weight is 18. A cubic foot of water at its maximum density weighs 997 oz., and a gallon weighs 70,000 grains. See Avoirdupois, Gallon. A cubic centimetre weighs 1 gramme, and a litre weighs 1000 grammes or 1 kilogramme. See Metric System. Water is only slightly compressible, each atmosphere of added pressure diminishing its bulk fifty-one millionths; a pressure of 30,000 lbs. will reduce 14 volumes to 13. It is a poor conductor of heat and of electricity. It has, however, the greatest capacity for heat of any substance (hydrogen excepted), and is taken as the standard of specific heats. See Heat. If 1.000 heat unit is required to raise the temperature of 1 gramme of water 1 degree Centigrade, it is found that .0319 heat units will raise 1 gramme of Mercury 1 degree, so the specific heat of Mercury is called .0319.

The effects of heat upon water are stated thus in Jago's *Morganic Chemistry:* "Among the properties of water, the physical changes it undergoes as a result of the application of heat are of such importance as to warrant a somewhat extended description. As is well known, at a temperature below the freezing point water exists in the solid state and is known as ice. Taking a piece of ice at a temperature much below that at which it was formed, say, 20° C., the following is a history of its changes as a result of the continuous application of heat: As heat is first applied, the ice rises in temperature and at the same time increases in volume (expands); these changes proceed regularly until a temperature of 0° C. is attained. At that point the temperature remains stationary, notwithstanding that the absorption of heat continues. During this time the ice melts, and the heat thus absorbed, without causing any corresponding elevation of temperature, is employed in doing the work of converting the solid ice into liquid water. The heat necessary to melt a given weight of ice at 0° C. into water at the same temperature would raise the same weight of water from 0° to 79° C.; a fact which is expressed in other words, by saying that the latent heat of water is 79 heat-Units. During the melting of ice a considerable diminution in volume occurs, 10 volumes of water only being produced from 10.9 volumes of ice. As soon as the whole of the ice is melted, the temperature once more commences to rise, and does so steadily until a temperature of 100° C. is attained. The water at 0° C. diminishes in volume with an increase in temperature, until at 4° C., when it commences to expand, and continues to do so until 100° C. is reached. At 4° C., therefore, water is at its maximum density; either an increase or diminution of temperature results in expansion. At 100° C. the water commences to boil and remains stationary in temperature, but is not all at once converted into vapor;

on the contrary, between five and six times as long is necessary to boil away the whole of the water as was requisite in order to raise it from the freezing to the boiling point. In exact figures the quantity of heat necessary to convert a given weight of water into steam is sufficient to raise 537.2 times the weight of water from 0° to 1° C. The steam produced is at the same temperature, 100° C., as the boiling water; the large amount of heat is employed in the conversion of water from the liquid to the gaseous state. The whole of the water having been converted into steam, a further application of heat results in the expansion of the steam, which follows the general laws governing the relation of gases to heat.

"In cooling, steam passes through a series of changes which are just the reverse to those it experiences on being heated. During the condensation of steam into water and the solidification of water to form ice, heat is liberated in the same quantity as was required in the first place to effect respectively the liquefaction of ice and the conversion of water into steam."

It has been stated above that water has its maximum density at 4° C. (39.2° F.). The effect of this peculiarity is explained by Roscoe, as follows: "Although the amount of contraction on heating from 0° to 4° is but small, yet it exerts a most important influence upon the economy of nature. If it were not for this apparently unimportant property, our climate would be perfectly Arctic, and Europe would in all probability be as uninhabitable as Melville Island. In order better to understand what the state of things would be if water obeyed the ordinary laws of expansion by heat, we may perform the following experiment, first made by Dr. Hope: Take a jar containing water at a temperature above 4°, place one thermometer at the top and another at the bottom of the liquid. Now bring the jar into a place where the temperature is below the freezing point, and observe the temperature at the top and bottom of the liquid as it cools. It will be seen that at first the upper thermometer always indicates a higher temperature than the lower one; after a short time both thermometers mark 4°; and, as the water cools still further, it will be seen that the thermometer at the top always indicates a lower temperature than that shown by the one at the bottom; hence we conclude that the water above or below 4° is lighter than water at 4°. This cooling goes on till the temperature of the top layer of water sinks to 0°, after which a crust of ice is formed; and if the mass of the water be sufficiently large, the temperature of the water at the bottom is never reduced below 4°. In nature precisely the same phenomenon occurs in the freezing of lakes and rivers; the surface water is gradually cooled by cold winds, and, thus becoming heavier, sinks, whilst lighter and warmer water rises to supply its place; this goes on till the temperature of the whole mass is reduced to 4°, after which the surface water never sinks, however much it be cooled, as it is always lighter than the deeper water at 4°. Hence ice is formed only at the top, the mass of water retaining the temperature of 4°. Had water become heavier as it cooled down to the freezing point, a continual circulation would be kept up, until the whole mass was cooled to 0°, when solidification of the whole would ensue. Thus our lakes and rivers would be converted into solid masses of ice, which the summer's warmth would be quite insufficient thoroughly to melt; and hence the climate of our now temperate zone might approach in severity that of the Arctic regions.

"Sea water does not freeze *en masse*, owing to the great depth of the ocean, which prevents the whole from ever being cooled down to the freezing point; similarly, in England, very deep lakes never freeze as the temperature of the whole mass never gets reduced to 4° C."

The expansion of water at the time of freezing is evidenced by the bursting of water pipes and vessels and disintegration of wet bricks after freezing and of natural rocks.

The melting point of ice is 0° C. (32° F). This is commonly the freezing point of water, but various conditions may cause it to remain liquid at a much lower temperature. "In closed vessels, at perfect rest, and *out of contact with air*, the temperature of water may be lowered to 14° F. (—10 C.) without solidification, but if the water at this temperature be shaken, it instantly freezes, the temperature immediately rising to 32° F. (0° C.). In closed vessels, *air being present*, or in very narrow tubes, water may be cooled to 5° F. (—15 C.) without freezing, solidification occurring on the slightest motion being imparted to the liquid. If water be surrounded by certain mixtures (such as chloroform and sweet almond oil, which may be mixed in such proportions that the liquid has the same density as water) the water thus encircled may be cooled, without solidifying, to —4° F. (—20° C.). If in this state, however, it be touched with a piece of ice, it instantly freezes and expands. The melting point is lowered .0075 C. for every additional atmosphere. At a pressure, therefore, of 13,000 atmospheres, ice would be converted into water at 4° F. (—18° C.). Water at 39.2° F. (4° C.) enclosed in a perfectly tight vessel where expansion is impossible, will not freeze although cooled below zero." Pidy's *Handbook of Modern Chemistry*. See Fusing and Freezing Points.

Ice, snow, and frost are forms of frozen water. The crystals are six-sided or star-shaped (hexagonal system). They may often be seen in great beauty and variety at the beginning of a snow storm. The Sp. Gr. of ice is .91662. See Ice.

Water evaporates at all temperatures. Even ice and snow evaporate without perceptibly melting. When water is heated at the point when its vapor tension balances

the atmospheric pressure, bubbles of steam begin to escape and the water is said to boil. This takes place at sea level and 76° mm. pressure of the barometer at 212° F. (100° C.), but is evidently variable with pressure and elevation. See Boiling. One volume of water becomes 1696 of steam.

Water is a solvent of the widest range and application. On this account natural waters are never pure, but hold in solution solids and gases. See Water Supply. Distilled water is obtained by condensing the steam from boiling water. The earlier portions of the distillate contain ammonia and other gases from the water, but if suitable water was used for distillation the portions obtained after rejecting the earlier portions are reasonably pure. Such a process does not free water from many liquids which boil at nearly the same point or which are carried over in its vapor. Distilled water from water containing alcohol or glycerin or hydrochloric acid would constantly contain those substances.

Water is applied as a solvent of solids, liquids, and gases. Any complete discussion of solution would require a consideration of a great many special cases. It takes place in the case of solids for the most part without marked evidence of chemical change. The solid is recoverable upon evaporation of the water. There are, however, a great variety of compounds known as *solution compounds* which exist only in water and which are decomposed upon evaporation of the water (e.g., see *Chemical News*, Apr. 10, 1890. Many compounds called *cryohydrates* have been separated in which the water at low temperatures combines in definite proportions with usually anhydrous compounds, or combines in proportions different from the usual proportions. Many facts concerning *cryohydrates* may be found in Cornelley's *Tables*.

Gases usually dissolve with an elevation of the temperature of the liquid, and in greater quantity in cold than in hot water ; water at 0° C. (32° F.) will dissolve 1148 times its volume of ammonia, at 15° C. (59° F.), 782 volumes, and all the ammonia leaves the water after boiling some time. Many gases, not very soluble in water, dissolve in direct proportion to the pressure—twice as much at two atmospheres as at one.

Solids usually dissolve with a lowering of temperature. They dissolve more rapidly with agitation, fine division, application of heat, situation at the top rather than the bottom of the liquid. Most solids dissolve in greater proportion in hot water than in cold. There are exceptions to this statement ; and some dissolve only a little more, others with an enormous increment in the hot solvent. The solid dissolves in all proportions in water up to a certain limit, at which no more will dissolve ; the solution is saturated. The limit of solubility is different with every variation of temperature (usually), so that cooling a solution saturated at any temperature, generally makes necessary the deposition of a portion of the solid ; evaporation has a similar effect by removing a part of the water. When the cooling or evaporation takes place slowly the solid may be deposited in regular forms known as crystals. These methods are practical on a large scale.

Solutions of salts have a higher boiling point than water and a lower freezing point. For instance, a saturated solution of calcic chloride boils at 179.5° C. (355° F.). Sea water freezes at about 29° F. Solids in solution are largely deposited when the solvent freezes.

A great variety of chemical changes and decompositions are conveniently effected in water solution ; the fine division and intimate mixture desirable being easily obtained in this way.

Water is an oxide of great stability ; when the combination of hydrogen and oxygen takes place to form water a great deal of heat is disengaged—more than from corresponding weights of any other substances. It is, however, subject to decomposition in various ways. The electric current from 2 or 3 Bunsen cells passed through acidulated water decomposes it into its constituent gases ; great heat accomplishes the same result ; a number of metals (sodium and potassium) at ordinary temperatures displace half its hydrogen, and, when heated, the whole ; hot iron removes its oxygen, setting all the hydrogen free ; a jet of steam driven upon white hot coal is decomposed, the oxygen combining with the carbon of the coal. Great labor has been expended to determine the exact ratio between the constituents of water ; this work cannot be considered as completed at the present time. When water is decomposed by electricity, two volumes of hydrogen are obtained to one of oxygen ; this ratio is not exact, because part of the oxygen is liberated in a condensed form—as ozone, and because the oxygen is much more soluble in water than hydrogen. The oxygen is, therefore, a little less than half the volume of the hydrogen. If, however, one volume of pure oxygen and two volumes of pure hydrogen are exploded in an enclosed space—a rudimetre—the exact combination is shown. The product, if all through the experiment a temperature as high as the boiling point of water is maintained, is, from the three volumes, two volumes of water vapor ; if, however, the water condenses to the liquid condition it is not measurable. Two volumes of hydrogen and one volume of oxygen give two volumes of water vapor. The weight relations are determined as follows : Pure hydrogen is passed in constant current over heated oxide of copper from which the hydrogen takes oxygen and forms water ; the water is collected and weighed ; the loss of weight in the copper oxide gives the oxygen, the difference between the water and oxygen gives hydrogen. Extraordinary precautions are taken to secure purity of hydrogen and copper oxide and to collect all the water. A recent modification of this classical experiment has been to

obtain the weight of hydrogen directly. Palladium is a metal which "occludes," or alloys with, a large quanity of hydrogen, which is released by heat. So that in this modification the hydrogen is obtained from the loss of weight of the hydrogen-palladium alloy; the oxygen and water are weighed as before. This has not seemed to add anything to the accuracy of results. Water consists of 88.864 per cent. oxygen, 11.14 hydrogen, according to the best experiments. This, as ordinarily stated, is in the ratio of 16 to 2.

Water enters into definite chemical union with many oxides. The products are of two very different classes. If the trioxide of sulphur (SO_3) be brought in contact with water an immediate union takes place with the evolution of much heat, and the product is the well-known compound, sulphuric acid (H_2SO_4). SO_3 is often called the *anhydride* of sulphuric acid, because it represents that acid without its water. It is not, however, supposed that the H_2O exists as water in the H_2SO_4, but that the whole forms a single stable compound. If the oxide of lime (C_aO) is treated with water again, heat is disengaged and there is produced a solid, only sparingly soluble in water, called calcium (or lime) hydroxide ($C_aO_2H_2$). This is chemically directly the opposite of the acid, and is called a base, alkali, or hydroxide. In this particular case the water may be again separated by heat, but in other similar cases it cannot. The union with water to form compounds of an acid nature is rather characteristic of oxides of the non-metallic elements, though some of the higher metallic oxides have this property or tendency; while the union with water to form compounds of a basic, or acid-neutralizing nature is more characteristic of metallic oxides.

Water also forms a part of a great many crystalline salts. It combines with them in exact proportions and seems to be essential to some of the properties of the salt—its cohesion, its color, its crystalline structure. Many crystals contain no *water of crystallization.* Some which contain it, part with it easily in only moderately dry air, and crumble to powder. They are said to effloresce, e.g., common washing soda (Na_2SO_4, $10H_2O$). Others part with all their water of crystallization when heated to 100° C. (212° F). Others still retain a certain definite proportion to a much higher temperature than that at which the greater part can be driven off. This more firmly held water is often called *water of constitution.* Many salts melt in their own water of crystallization when slightly heated. Water of crystallization is indicated by Aq or H_2O in a formula ($CuSO_4,5H_2O$ or $CuSO_4,5Aq$). The difference between water of crystallization and water of constitution is by some writers indicated by Aq for the former, and H_2O for the latter ($CuSO_4,H_2O,4Aq$). Of course the amount of water is an important consideration in calculations involving the weight of crystalline salts.

Sea Water.—Since the publication of Forchhammer's extensive researches in 1865, our knowledge of the ocean has been much extended by the North Sea Expedition, the study of the German ocean and the Challenger Expedition with its elaborate reports. Sea Water is a complex solution of various salts which are nearly constant in their relation to one another, though varying perceptibly in relation to the water in which they are dissolved. The approximate specific gravity is 1.026—1.028 (see *infra*), and the salts are in the proportion of about 3.5 to 96.5 of water. The following table by Dittmar represents the results of a large number of analyses:

Chloride of Sodium, 77.758; Chloride of Magnesium, 10.878; Sulphate of Magnesium, 4.737; Sulphate of Lime, 3.600; Sulphate of Potash, 2.465; Bromide of Magnesium, .217; Carbonate of Lime, .345; Total, 100.000. These salts represent the probable, though not certain, combination of the acids and bases found in analysis. There are a large number of other elements in small, and some in extremely minute proportion. Thus there have been found silicon, boron, iodin, fluorin, phosphomo, nitrogen, silver, copper, lead, zinc, cobalt, nickel, manganese, aluminum, strontium, barium, iron, arsenic, gold, lithium, rubidium, cæsium, in addition to the elements given as salts in Dittmar's table. In computing the results of analyses of sea water, Forchhammer computed the relation of each constituent, and of all the salts, to Chlorin, taken as 100; and this method of comparison has been followed by other chemists, substituting, however, for chlorin, halogens computed as chlorine. According to Dittmar's averages the total salts are in the ratio of 180.58 to every 100 of halogens (bromin, which is very small, being computed as chlorin).

The relation of the various constituents to each other is nearly constant, with two exceptions—lime and carbonic acid. The quantity of lime increases with the depth very slightly, though measurably; and the explanation is suggested that the forms of life that manufacture carbonate of lime shells have their habitat near the surface, but sink to the deep sea after death and thus become a source of lime in the deep water. It also appears from many analyses of the bottom obtained in the voyage of *The Challenger* that in the majority of analyses a large percentage was carbonate of lime.

The carbonic acid has been elaborately discussed by Pornöe, Buchanan, and Dittmar. It consists of the Co_2 in normal carbonate (of lime), of "loose carbonic acid," and, in a few exceptional cases, of free carbonic acid. From Dittmar's analyses the normal range of Co_2 from normal carbonate is from .14 to .16 per 100. of total solids, with more in deep than in surface waters; and the conclusion of the discussion of loose carbonic acid may be stated in his own words: "(1) Carbonic acid rarely occurs in the free state; as a rule, it falls short of the quantity which would produce bicarbonate. (2) In

surface waters it is relatively high where the natural temperature is relatively low, and *vice versa*. (3) Within ranges of equal temperature it seems to be less in the surface water of the Pacific than it is in that of the Atlantic ocean. Of the 195 samples of sea water which Buchanan analyzed for carbonic acid only 22 contained fully saturated bicarbonate, and only 2 out of these free carbonic acid in addition to bicarbonate."

The oxygen and nitrogen of sea water are absorbed from the atmosphere, and analyses of surface water agree fairly with the calculated amount to be expected at the given pressure and temperature. The oxygen is, however, subject to constant diminution through processes of oxidation. None of the deep sea waters from the Challenger expedition were found entirely free of oxygen.

The salinity of the water is subject to considerable variation—salinity being the ratio of salts to the weight of the whole water. The method employed consists in taking the specific gravity of the water and computing from this. The formation or melting of ice, the rain, and the inflowing of rivers are the chief causes affecting the salinity. In the Atlantic the maximum is 1.0285, and the minimum 1.0255; in the Pacific, which is much less known, it ranges between 1.02719 and 1.0255 pure water=1.000.

The temperature, on the whole, decreased towards the bottom, steadily reaching a general minimum of about 2° C., occasionally going a fraction of a degree and even 2° below the zero point. It is largely influenced by currents and barriers.

WATER-BED, called also the Hydrostatic Bed, or Floating Mattress. It is well known that the life and health of every part of the animal body depend on the sufficient circulation through them of refreshed blood. See Circulation. Now, when a person in health is sitting or lying, the parts of the flesh compressed by the weight of the body do not receive the blood so copiously as at other times; and if from any cause the action of the heart has become weak, the interruption will follow both more quickly and be more complete. A peculiar uneasiness soon arises where the circulation is thus obstructed, impelling to change of position; and the change is made as regularly and with as little reflection as the winking of the eyes to wipe and moisten the eyeballs. A person weakened by disease, however, while generally feeling the uneasiness sooner, as explained above, and becoming restless, makes the changes with increasing fatigue; and should the sensations become indistinct, as in the delirium of fever, in palsy, etc., or should the patient have become too weak to obey the sensation, the compressed parts are kept so long without their natural supply of blood that they lose their vitality, and become what are called sloughs or mortified parts. These, if the patient survives, have afterward to be thrown off by the process of ulceration, leaving deep hollows to be filled up by new flesh during a tedious convalescence.

It was to mitigate all, and entirely to prevent most of the evils attendant on the necessity of remaining long in a recumbent posture, that the hydrostatic bed was devised by Dr. Neil Arnott, late one of the queen's physicians. The bed may be shortly described as a mattress floating on water, with a loose sheet of caoutchouc cloth properly secured between it and the water, to prevent its being wetted. A person rests on it as a water-fowl does on its bulky feathers, with as little inequality of local pressure as if in a bath. A trough of the dimensions of a wide sofa or a bed, having 6 or 7 in. depth of water in it, with the required caoutchouc covering, is the foundation, on which clothes and pillows are laid as in a common bed.

WATERBRASH. See Pyrosis.

WATER-BUDGET, a heraldic bearing in the form of a yoke, with two pouches of leather appended to it, originally intended to represent the bags used by the crusaders to convey water across the desert, which were slung on a pole, and carried across the shoulders. The Trusbuts, barons of Wartre in Holderness, bore *Trois boutz d'eau*, three water-budgets, symbolizing at once their family name and baronial estate.

WATER-BUG, the popular name of a tribe or section of heteropterous insects, *hydrocorisæ*, which live almost entirely in water, and feed upon other aquatic insects. The anterior portion of the first pair of wings is horny; the antennæ are very small, and concealed beneath the eyes. The *hydrocorisæ* are divided into two families, *notonectidæ* and *nepidæ*. Of the former, the boat-fly (q.v.) is an example. The *nepidæ* are popularly known as Water-Scorpions.

WATERBURY, city and co. seat of New Haven co., Conn.; on the Naugatuck and Mad rivers, and several smaller streams that here unite, and on the New England and the New York, New Haven, and Hartford railroads; 30 m. n. of New Haven. The site was called Mattatuck by the Indians; the white settlement originally formed a part of Farmington, and was incorporated as a town in 1686, and the town received a city charter in 1853. The city is surrounded on three sides by hills. A handsome public park, containing a soldiers' monument and a costly drinking-fountain occupies a central position, and from it the principal streets diverge. Waterbury is widely noted for the extent and variety of its manufacturing interests, which are promoted by the excellent power furnished by the rivers. According to the census of 1890, nearly half of the entire capital, or $8,192,219, was invested in 15 plants, manufacturing brassware in a great variety of forms. Foundry and machine shop products, buttons, hardware, watches, clocks, and German silverware are also produced in large quantities. There are nearly 20 buildings used for public school purposes, including a high school. The value of public school

property exceeds $600,000, and the annual expenditure for public education $160,000. Among private schools, St. Margaret's diocesan school (Prot. Epis.) and the convent of Notre Dame (R. C.) have high rank. The noteworthy buildings include the city hall, high school, Silas Bronson public library, and, among about 25 churches, St. John's (Prot. Epis.), one of the most beautiful in the state, with a spire 200 feet high. There are also Masonic and Odd Fellows' halls, a state armory, opera house, and several hotels. The city has electric light and street railroad plants, waterworks supplied from two large reservoirs, one of which receives mountain water from Litchfield co., 11 miles distant, the entire plant costing nearly $1,000,000, and excellent sewerage. There are several national, savings, and private banks, and daily, weekly, monthly, and quarterly periodicals. In 1896 the city had a net debt of $875,500, and, at a rate of one-fourth of actual value, an assessed property valuation of $10,700,000. Pop. '90, town, 33,202; city, 28,646.

WATER CALTROPS. See TRAPA.

WATER CHESTNUT, *Marron d'eau* the name given in France to the edible seeds of the *trapa natans* (see TRAPA).—The name water chestnut is also given to the edible tubers of the *scirpus tuberosus*, a plant of the natural order *cyperaceæ* (see BULRUSH and CYPERACEÆ), which is cultivated by the Chinese in tanks very abundantly supplied with manure. It is destitute of leaves, except a slender short sheath or two at the base of each culm. It is stoloniferous, and the tubers are produced on the stolons. They are in high estimation among the Chinese, both for food and as a medicine, and are eaten either raw or boiled. They are called *pi-tsi* or *maat-ai*.

WATER-COLOR PAINTING, in some of its forms, was employed from the most ancient times until the middle ages, when oil was sometimes added to the gum, with which the colors were prepared. About 1410 the brothers Van Eyck, at Ghent, made improvements in the use of oil-colors, which entitle them to be called the initiators of the modern school of oil-painters. In the method known as *distemper*, the pigments are ground up with size and water, or with gum-water. In ancient Egyptian paintings the colors, mixed with gum and water, were sometimes laid immediately on stone walls, sometimes on a coating of plaster, on wood, and baked or wet clay. The Greeks mixed their colors with gum, the yelk and white of eggs, and water. Sometimes, it is said, milk also was added. The gum was used to make the paint adhere after the water had evaporated. Until 1410 the Italian artists employed the distemper of the ancients; and afterward they still used it in fresco-painting. Michael Angelo employed it in his greatest works, and thought oil-painting unworthy of a true artist. Most artists of that day painted their easel pictures in oil, and their frescos in distemper. In the true fresco the colors, mixed with water, are applied directly to the smooth wet surface of good lime mortar, when a crystalline surface is formed, which almost excludes water. In dry fresco, the plaster, having first dried thoroughly, the artist moistens again as large a part of it as he can cover with color at a single sitting.

Water-color painting, the most delicate of the graphic arts, is in an especial sense an English art. It was in England first that it attained to the dignity of a recognized artistic pursuit, and came to be—what it now is—admittedly the rival of oil-painting in brilliancy and power. It has had a large share in the modern prosperity of the fine arts; and of late has been practised by eminent artists in various countries, as France, Germany, and Austria. In the illumination of missals, water-colors were used mixed with the body white; and the same is true of the miniature painting of the 18th c. Frescoes and painting in tempora were also in a sense works in water-color. But the art of water-color, as we now understand the term, had its origin in quite a different way. Dürer, and certain of the German, Dutch, and Flemish artists, were accustomed to outline drawings with a reed pen and fill in those outlines with an auxiliary flat wash. Gradually the hard lines were replaced by touches with the brush, and the result was a monochrome in browns and grays, bistre, or Indian ink. These again came to be tinted, and so suggested the full use of colors. Rembrandt often drew in brown, and added dashes of strong color; and Rubens produced something very like modern water-color drawings. The modern art became emancipated from the old traditions by "gradual disuse of the general shadow tint; and imitation of the local color, not alone of the objects themselves, but of every modification resulting from light, dark, half-tint, or distance, a method which at once led to far greater truth and richness than could ever have been attained by merely passing color over the universal shadow tint." The stained drawing gradually gave way to the more perfect tinted drawing. But the tinted style predominated till 1790; and it may be said that the water-colors of the 18th c. were tinted monochromes. It was in the 19th c. that Girton and Turner showed what scope and power there was in the art. Artists who used the stained and tinted manner were Malton (1726–1801), Paul Sandby, R.A. (1725–1809), often called, though without justification, "the father of water-color art"; also (all in the last half of the 18th c.) Grimm, Webber, Clevely, Pars, and Rooker. Wheatley, Westall, and Gilpin used water-color as well as oil. Rowlandson, Cristall, Hills, Wright, Mortimer, Gresse, Hearne, J. R. Cozens, and Dayes greatly promoted the growing art. Nicholas Pocock (1749–1831) displayed a new richness and force. John Smith (Warwick Smith) first advanced beyond the weakness of mere tinting. Thomas Girton (1773–1802) attained great richness of tone and breadth; his compositions were grand but simple; he massed light and shade in broad and sometimes abrupt forms. J. M. W.

Turner (1775–1851 : see TURNER) soon distanced all his predecessors and contemporaries, and in his hands water-color painting became a new art. He wholly abandoned preliminary tinting; minute details are imitated in local color; his work is marked by breadth, fullness, warmth, as well as grace. Other more or less important names are those of Delamotte, Varley, J. J. Chalon, A. E. Chalon, Samuel Prout, Peter de Wint, Liverseege, Cotman, David Cox, Essex, Richardson, Newton, Copley Fielding, Robson, W. Hunt, Ross, Harding, Cattermole, Holland, Penley, Lewis, Houghton, Pinwell, Birket Foster, Sir John Gilbert, Herkomer, etc.

In the exhibitions of water-color paintings yearly held in the United States, particularly in New York, great variety in technique and subject is seen, but no distinctive American "school" has as yet been developed. Among the artists prominent in figure painting are Winslow Homer, William M. Chase, C. Y. Turner, Robert Blum, Irving R. Wiles, Thure de Thulstrup, the Morans and Mrs. Rhoda Holmes Nichols; in landscape, may be mentioned Alexander Wyant, J. Francis Murphy, Samuel Colman, R. Swain Gifford, Henry Farrer, and Childe Hassam; in marine painting, William T. Richards and Charles A. Platt; in architecture, Harry Fenn and Hughson Hawley; in flowers and still-life, the Misses Greatorex and Mrs. Julia Dillon. The best guides for one desiring to learn the art of water-color painting are the handbooks published by Winsor and Newton, one of which, Aaron Penley's *Sketching from Nature in Water-Color*, is of especial excellence. See also the chapter on Water-Color painting in Hamerton's *The Graphic Arts*, and the historical work by Penley, *The English School of Painting in Water-Colour*.

At present, water-color paintings may be divided into three kinds : (1) those where the coloring is mainly transparent; (2) where it is usually opaque; (3) where transparent, semi-transparent, and opaque colors are freely used in combination. The quick drying of the water-color pigments is favorable to rapid execution, and greater clearness of color is attained than is practicable in oils. The progress of the art has been greatly promoted by modern chemical developments in the preparation of the colors—great variety of really permanent colors being now procurable. These are various pigments ground with gum or other mucilage, and may be kept in cakes, the usual vehicle for moistening and applying them being gum arabic and water. But for artists they are now usually prepared so as to be kept moist in small earthenware pans or metallic tubes. The British society of painters in water-colors was instituted in 1804; and the American Society of Painters in Water-Colors, in 1867.

WATER-COLORS are painters' colors mixed with water and some adhesive material, as gum or size, instead of oil. Those intended for drawings on paper are prepared with great care, and are usually formed into dry cakes with gum. Those for coloring walls and scene-painting are roughly prepared with glue or size. These are often called distemper colors, from the Italian term *tempera*, applied to them to express their application to temporary purposes.

WATERCOURSE, in law, means a stream flowing naturally and constantly between ascertained banks. Ownership in a watercourse is included under the name land; and a conveyance of land vests in the grantee not only the land strictly so-called, but all the streams crossing the surface of the land. In case of a division of two estates by a watercourse, the estate of each proprietor is bounded by the central line of the stream. Proprietors of land adjoining a watercourse are called riparians. All owners of lands through which water flows have the same rights, a usufruct in the water, to a reasonable use of which every riparian proprietor is entitled; but one is not allowed to flow it back upon the proprietor above him, or to flood the proprietor below. A navigable watercourse, if it lie entirely within the limits of a state, is subject to the authority of the state government. A navigable river, flowing between two or more states, is subject to the right of congress to regulate commerce between the states. The proprietors of land lying along a navigable watercourse are not owners of its bed.

WATER-CRAKE. Another name for the water-ousel, or dipper (q.v.).

WATER-CRESS. See CRESS.

WATER-CROW. See DIPPER.

WATER-CROWFOOT, a popular name for certain aquatic species of *ranunculus* (q.v.). Among those found in the United States is the indigenous *R. multifidus*, the YELLOW WATER-CROWFOOT, found from eastern New England to Illinois and northward, and *R. aquatilis*, the common WHITE WATER-CROWFOOT, introduced from Europe.

WATER-CURE. See HYDROPATHY.

WATER-DOCTOR, originally meant a physician who diagnoses a case by means of observations taken from an inspection of the urine. At present, however, it is the popular designation of an hydropathist. See HYDROPATHY.

WATER-DOG, a kind of dog, of which the poodle (q.v.) is regarded as a sub-variety. The head is rather large and round, the ears long, the legs rather short, the general form compact, the hair everywhere long and curly. The water-dog of England, common before the poodle had been introduced from the continent, is still much esteemed by professional wild-fowl shooters, and by the fishermen of the north-eastern counties.

WATER-DROPWORT, *Œnanthe*, a genus of plants of the natural order *umbelliferæ;* having ovato-cylindrical fruit, not prickly nor beaked, each carpel with 5 blunt convex ribs, and single vittæ in the interstices; the calyx teeth lanceolate; the petals obcordate and radiant, with an inflected point; the partial involucre of many rays; the flowers of the circumference on long stalks and sterile, those of the center subsessile and fertile. A number of species are natives of Britain—large perennial plants, with a strong and generally disagreeable aromatic smell, and compound or decompound leaves. The COMMON WATER-DROPWORT (*Œ. fistulosa*) and the HEMLOCK WATER-DROPWORT, or WATER HEMLOCK (*Œ. crocata*), are both common in wet places in Britain and throughout Europe, and both are narcotic acrid poisons. The roots of the latter have some resemblance to small parsnips, and hence fatal accidents have frequently occurred. The FINE-LEAVED WATER-DROPWORT, called water fennel by the Germans (*Œ. phellandrium*, formerly known as *phellandrium aquaticum*), is also common in ditches and ponds both in Britain and on the continent. It has a jointed root-stalk (*rhizome*), with tufted whorled fibers and a strong zigzag stem dilated at the base. The leaves are decompound. The fruit has a peculiar aromatic but disagreeable smell. It is not so poisonous as the other species just named. It was at one time erroneously regarded as a specific against pulmonary consumption; but it has been advantageously employed in pulmonary complaints.

WATEREE', a river of the United States, formed by the junction of the Catawba and Fishing creek in the s.e. part of Chester co., South Carolina, runs s.e. and unites with the Congaree to form the Santee. Steamboats ascend the Wateree to Camden, 200 m. from the sea.

WATEREE, a township in Kershaw co., S. C.; pop. '90, 4698.

WATERFALL is a break in the continuity of slope of the channel of a river or stream, so abrupt that the body of water *falls* from the higher to the lower level. Waterfalls occur most frequently in mountainous countries, where the streams from the mountain-sides enter the valleys. It is only when the side of the valley is composed of hard rock that there can be a waterfall; in friable strata the stream wears out a ravine or side-valley. These mountain waterfalls, however, are generally rather curious and picturesque than grand, the volume of water being in most cases comparatively insignificant, though the height of fall is occasionally very great. All mountain waterfalls necessarily change their aspect from season to season—in winter, a roaring torrent plunging headlong into the abyss; in summer, often a mere film of water trickling down the face of the precipice. Waterfalls in comparatively level districts are not nearly so common, and their height of fall is insignificant compared with that of mountain cataracts; but the much greater volume of water, its steady and even flow to the head of the precipice over which, in solid column, it descends with a thundering plunge, place such waterfalls among the grandest of nature's phenomena. It is where the course of a large river passes from a higher to a lower plateau, and where the upper plateau is edged with rock, that the grander cataracts are formed. If the rocks are of the same hardness from top to bottom, the edge of the escarpment, supposing it to be perpendicular at first, becomes worn off, and a slope or *rapid* is formed. But when the upper edge is hard and the under strata soft and friable, the reverberation of the spray wears away the softer parts below, leaving a projecting ledge at the top, which breaks off, piece by piece, as it becomes too much undermined, so that the fall is constantly receding. The question of the rate of regression of waterfalls has not hitherto occupied much attention, and has only been estimated in the case of Niagara, Bakewell giving its annual value at one yard, while Lyell limits it to about a third of this. Some of the most remarkable waterfalls of the world are the Yosemite, California, in a valley of the same name; a fall 2,550 ft. in entire height, but broken into three leaps; the Orco falls at Monte Rosa, 2,400 ft.; Gavarnie (Pyrenees), 1400 ft.; Staubbach (Switzerland), 1000 ft.; Maanelvan (Norway), 940 ft.; Niagara (q.v.); Zambezi (q.v.); Missouri; the great Kaietur fall in British Demerara, over 700 ft. The cataracts of the Velino and Anio, in Italy, are artificial.

WATER FLEA, *Daphnia*, a genus of *entomostraca*, of the order *cladocera*, and family *daphniadæ*. One species, *D. monoculus*, is abundant in pools and ditches in Britain. It comes to the surface in the mornings and evenings, but keeps near the bottom during the heat of the day. It swims by taking short springs, whence its popular name. It feeds on minute particles both of animal and vegetable substances. It is a beautiful object for the microscope; the whole interior organization being visible through the transparent carapace. The male is much smaller than the female, and comparatively rare. The eggs, after leaving the ovary, are retained in a cavity between the body and the carapace, until the young have attained almost their perfect form. See illus., CRUSTACEANS, ETC., vol. IV.

WATERFORD, a maritime co. of the province of Munster, Ireland, is bounded on the n. by the counties of Tipperary and Kilkenny, on the e. by Wexford, on the s. by St. George's channel, and on the w. by the co. of Cork. Its greatest length from e. to w. is 52 m., and its breadth n. to s. 28; the total area being 721 sq. m. The pop. in '51 was 164,051; in '61, 134,252; in '71, 123,310; in '81, 112,768; and in '91, 98,251. The fishing-grounds on the coast, once thought inexhaustible, are now said to be unproductive. The coastline extends from the estuary of the Suir, Waterford harbor, to that of the Blackwater at Youghal, and is partly flat, partly rocky, but in general very dangerous

for shipping. The rocky district contains some remarkable caverns. The surface is in general mountainous; the principal ranges being Knockmeledown, the Cummeragh, Monevolagh, and Drum. The Cummeragh mountains are the loftiest, and abound in wild and picturesque scenery. The Suir (q.v.) and the Blackwater (q.v.) are the chief rivers. There are no lakes worthy of note. The climate is moist, and the soil, over a considerable part of the county, is marshy; but the upland districts are well suited for tillage, and the lower pasture-lands, although inferior in fattening properties to those of the great central plain, produce excellent butter, which is exported in large quantities. In geological structure, the mountains present the old and new slate, separated by red and gray quartz rock and quartzose slate. Of quarry slate, there are two principal varieties, which are raised extensively for local use. The valleys belong to the limestone series, being an outlying prolongation of the great bed of the central plain. Lead, iron, and copper are found. The former two have proved unprofitable, but the copper-works at Bonmahon and Knockmahon have for many years been very productive. Marble of several colors and of considerable beauty is quarried near Cappoquin and Whitechurch, and potter's clay of good quality is found at Kildrum, near Dungarvan. The chief occupations of the population are pasturage and dairy farming; but a considerable manufacture both of cotton and linen has been recently introduced at Portlaw, and the shipping-trade has of late years become active and profitable.

Waterford is divided into eight baronies. The most considerable towns besides Waterford city (q.v.) are Dungarvan, Carrick-beg—properly a suburb of Carrick-on-Suir, which is in Tipperary—Lismore, Cappoquin, Tallow, and Tramore. Clonmel, although chiefly in Tipperary, lies partly within this county. Waterford returns three members to parliament—two for the county, and one for Waterford city. This district, in common with the adjoining county of Wexford, is believed to have been anciently peopled by a Belgic colony. The Danes also formed a settlement at the mouth of the Suir. From the date of the invasion, Waterford became a stronghold of the English, large grants having been made by Henry II. to the family of Le Poer; and in all the alternations of the subsequent struggle with the Irish population, it continued for the most part a firm center of English influence. The county abounds with antiquities, ecclesiastical and military, and of the Celtic and Danish, as well as the Anglo-Norman period.

WATERFORD, a town and village in Saratoga co., N. Y.; at the junction of the Hudson and Mohawk rivers, and on the Champlain canal and branches of the Delaware and Hudson railroad; 4 m. n. of Troy. There are gas and electric lights, electric street railroads connecting with Troy and Cohoes, a private bank, high school with library, and waterworks supplied from the Hudson river. Excellent power for manufacturing is provided by the falls of the Mohawk. The manufactures include knit goods, screw plates, stocks and dies, lamp black, boilers, and foundry and machine shop products. Waterford was incorporated in 1794 as Half Moon Point, and was set off from the town of Half Moon in 1816. Among the local attractions are remains of earthworks thrown up to resist an expected movement by the British under Burgoyne in the Revolutionary war. Pop. '90, 5286.

WATERFORD, a city, capital of the co. of the same name, but itself a co. of a city, and a parliamentary borough, is situated in n. lat. 52° 16′, w. long. 7° 6′ on the river Suir, 12 m. from the sea, and 97 s.s.w. from Dublin, from which city it is connected by the Great Southern and Western, and Waterford and Limerick railways, as also by the Waterford, Dungawan and Linmore railway. The city, with the exception of an inconsiderable suburb, with which it is connected by a bridge of 39 arches, 852 ft. long, opening for the passage of ships, lies on the right bank of the Suir, along which a handsome and spacious quay extends for a distance of nearly a mile, and from which the city ascends gradually in well-built streets. Vessels of 2000 tons are now enabled to discharge their cargoes at the quay; but there is an anchorage for still larger ships about 6 m. lower down the river, at Passage. The chief public buildings are the Protestant and Roman Catholic cathedrals, the Protestant Episcopal palace, the (Catholic) college of St. John, the model national school, and the city and county court-houses. Ring or Reginald's tower was erected in 1802, and rebuilt 1819. In addition to the union workhouse, there is an infirmary, a dispensary, a fever hospital, a district lunatic asylum, and a penitentiary. The chief trade is with England, in the export of butter, pork, bacon, corn, flour, eggs, and live-stock. Steam-navigation has received a great impulse, and there is now a ship-building yard, with patent slip, graving-bank, and dock, on the Kilkenny bank of the river. Pop. '91, of parliamentary borough, 27,623. One member is returned to parliament.

Waterford is originally of Danish foundation; but at the invasion, the city was taken by assault by Strongbow, by whom it was enlarged, and made a place of strength. It received a charter from John, which was forfeited under James I., but restored by Charles I. in 1626. But few remains of its ancient buildings are now to be seen.

WATER-GAS, a term first applied to hydrogen on account of its being the gas which was liberated when steam was brought into contact with red-hot iron; the oxygen of the steam uniting with the iron, forming oxide of iron, while the hydrogen was evolved. Subsequently it was discovered that, when carbon was employed in place of iron, there was not only hydrogen liberated, but oxide of carbon, which is also a gas; it was then found that, if this mixture of hydrogen and oxide of carbon was enriched by the addition of naphtha, etc., it would make an illuminating gas; but so far as known, there was

no practical application made of this fact till 1830, when Michael Donovan patented a process for the manufacture of an illuminating gas composed of hydrogen and oxide of carbon, enriched to give it illuminating power, which was called water-gas, and was essentially the same as is now manufactured under that name. A Belgian by the name of Jobard obtained a patent for water-gas in 1832; and later, George Lowe, an English engineer, also obtained a patent. M. Selligne, of Paris, employed three iron retorts for making water-gas, two of which contained charcoal, while the third was two-thirds filled with red-hot iron chains, upon which a slow stream of shale oil was allowed to flow. Steam was passed into the first retort, where it was decomposed; from thence into the second, where the red-hot charcoal converted any CO_2 (carbonic acid) into CO (carbonic oxide). The gases then passed into the third retort containing the red-hot chains upon which the "shale oil" was flowing and being vaporized, thereby imparting to the gases illuminating properties. Later, Mr. Kirkham, an English engineer, took hold of the process, and, in 1852, it was patented in England by Messrs. John and Thomas Kirkham. An attempt was then made to introduce it into England, but without much success. It was then taken to Paris and there created considerable excitement, and was about to be extensively introduced, when, by some misunderstanding in regard to its poisonous properties, it was abandoned. In 1871 there was introduced into this country a process called after its inventor, Tesse du Motay; it is now in use by the municipal and New York gas-light companies in New York city. Water-gas, before being enriched, has a specific gravity of about one-half that of air; it has a strong odor, and burns with an almost non-luminous flame, producing an intense heat. It consists of about equal parts of hydrogen and carbonic oxide, some marsh gas, and a small percentage of carbonic acid, sulphur compounds, and any volatile impurities in the coal. After being enriched and purified it still has a strong odor and a gravity of about .66 compared with air. Its illuminating power is from 25 to 30 candles. It requires less oxygen to burn it, but will not explode as quickly as coal gas, and when exploded exerts less shock, as is shown by windows being blown out without breaking the glass. The fact that it can be produced with rapidity from smaller apparatus, and, as is claimed, more economically than coal gas, seems to indicate for it an extended use in the future.

WATER-GLASS, the soluble silicates of potash or soda, or a mixture of both. It is usually prepared by boiling silica with caustic alkali under pressure, about 60 lbs. to the square inch, in a digester. When pure and solid, it has the appearance of common glass, and is slowly soluble in boiling water. A solution of water-glass is used, mixed with sand, etc., to form artificial stone. It is also spread on the surface of stone to protect it from decay, as it sinks in and cements the particles together; and it enters into the composition of some kinds of cement. In the art of stereochromy, or fresco-painting (q.v.), water-glass is now much used. It has also become useful in certain dyeing processes, having in some cases been found to answer the purpose of dunging.

WATER-HEN. See GALLINULE.

WATERHOUSE, ALFRED, b. 1830, an English architect, studied the practice and theory of his profession in the office of a Manchester architect from 1848 to 1853, after which he spent some time traveling in Italy. His first great work was the building of the court of assize at Manchester, his plan having been accepted after a public competition; and he afterwards designed the county prison. His next works were the new building of Balliol college, Oxford, and of Caius college, Cambridge. Other important buildings designed by him are the Manchester city hall, Pembroke college, Cambridge, Owen's college, Manchester, the South Kensington natural history museum, London, Eaton hall, Cheshire, and Iwerne minster, Dorsetshire. He is an admirer of Gothic architecture, and his works are generally in that style.

WATERHOUSE, BENJAMIN, 1754–1846; b. R. I.; educated at London, Edinburgh, and the university of Leyden. He was professor of theory and practice of medicine in Harvard university, 1783–1812; was appointed U. S. hospital surgeon in 1812, and was post-surgeon, 1818–21. He delivered the first course of lectures on natural history ever given in this country, into which he introduced the study of mineralogy. He secured the foundation of the Cambridge botanic garden. He defended Jenner's discovery of vaccination, and wrote several books.

WATERLAND, DANIEL, D.D., a clergyman of the English church, prominent in the theological controversies of the first half of the 18th century. He was born on Feb. 17, 1683, at Waseley in Lincolnshire, of which parish his father was the rector. After going through the usual course of study at Magdalen college, Cambridge, he was admitted into orders; and in 1713 he became rector of Ellingham on the nomination of the earl of Suffolk. It was shortly after this that he published his first book, *Advice to a Young Student, with a Method of Study for the first Four Years*—an unpretentious but useful work, which soon became very popular, and brought its author into notice. King George I. appointed him one of his chaplains in 1717. About this period he began to be engaged in theological controversy, one of his earliest works being a criticism of a book by Dr. Whitby, in which a severe attack was made upon bishop Bull's *Defence of the Nicene Creed*. Whitby answered him; Waterhouse rejoined; and in 1719 the latter expanded his writings upon this subject into his *Defence of Christ's Divinity*. This work

was sharply criticised by Dr. Clarke and other Arians; to whom Waterland replied in a work published in 1724. Upon the same subject he, in 1720, preached and published a series of sermons at the request of the bishop of London. Within a few years after this he passed through a rapid course of promotion in the church. In 1721 he was appointed rector of the parish of St. Augustine in the city of London; in 1724 he got the chancellorship of the cathedral of York. He was appointed a canon of Windsor in 1727, and archdeacon of Middlesex in 1730. He held along with the latter appointments the valuable living of Twickenham. During these years he was indefatigable in controversy; not only keeping up a paper war against the Arians, but entering the lists against free-thinkers, such as Middleton and Tindal, and against those of the Anglican body who did not share his doctrines upon the subject of the Trinity and the eucharist. *A Critical History of the Athanasian Creed* (1724); *A Review of the Doctrine of the Eucharist* (1737); and *Scripture Vindicated* (1734), are considered among the most noteworthy of his productions. In 1738 were published two volumes of his sermons, edited by one of his friends—the one upon Justification, the other upon the Communion of Infants. Waterland died on Dec. 23, 1740. A complete edition of his works, accompanied by a pretty full memoir of his life from the pen of Bishop Van Mildert, was published at Oxford in 1823, in ten vols. 8vo; an eleventh vol. containing a general index, was added in 1828.

WATER-LILY, a name commonly enough given to the different species of *nymphæa* and *nuphar*, and also of *nelumbium*, all genera of the natural order *nymphæaceæ* (q.v.), and indeed often extended to all the plants of that order. Britain produces three species —*nymphæa alba*, the white water-lily; and *nuphar luteum* and *nuphar pumilum*, called yellow water-lilies. The two former are frequent in still waters in most parts of the island; *nuphar pumilum* is more rare, and chiefly found in Scotland. All have heart shaped leaves, floating on the water. The beautiful and fragrant white flowers of *nymphæa alba* float upon the water; the flowers of the yellow water-lily, which are of comparatively little beauty, are raised by their stalks a little above it. The seeds of these, as well as of the water-lily of the Nile, (*nympæa lotus*—see Lotus), are farinaceous, and are sometimes used for food. The Turks prepare a cooling drink from the stems of *nuphar luteum*.—The Sweet-Scented Water-Lily of North America, *nymphæa odorata*, has a large white flower of great beauty, and of very sweet smell. Not only *nymphæa lotus*, but also *N. rubra* and *N. pubescens*, are regarded as sacred plants by the Hindus. *N. cærulea* was also held sacred by the ancient Egyptians.

WATERLOO, a co. in central Ontario, drained by the Grand river; 530 sq.m.; pop. '91, 50,464. Co. seat, Berlin.

WATERLOO, city and co. seat of Blackhawk co., Ia.; on the Cedar river and the Burlington, Cedar Rapids, and Northern, the Chicago Great Western, and the Illinois Central railroads; 93 miles w. of Dubuque. It has gas and electric lights, street railroads, waterworks, good sewerage, national and state banks, about 15 churches, collegiate institute, West high school, public library, school for stammerers, conservatory of music, and daily, weekly, and monthly periodicals. The river affords valuable power. The manufactures include locomotives, electric cars, paper, gasoline engines, well-drilling machinery, and many minor articles. Pop. '90, 6674.

WATERLOO, a township and town in Laurens co., S. C.; pop. '90, township, 3669; town, 291.

WATERLOO, Battle of, the decisive conflict which annihilated the power of Napoleon I., was fought June 18, 1815, in a plain about 2 m. from the village of Waterloo, and 12 m. s. from Brussels. Agreeably to the unanimous resolve of the allies to attack Napoleon on all sides, and crush him as they had done in 1814, British and Prussian troops were stationed in the Netherlands, under the command of Wellington and Blücher respectively, in order to attack France on the north. Napoleon, on his side, well aware that for a considerable time no weighty attack could be made on France except by these forces, and fully recognizing the immense advantage to be gained by destroying one enemy before the others could come up, rapidly concentrated the bulk of his troops; and with a suddenness and secrecy which defied all effective counter-preparations, crossed the Belgian frontier, and fell with one part of his forces on the Prussians at Ligny (q.v.), and with the other part, under Ney's immediate command, on the army of the prince of Orange at Quatre-Bras (q.v.). The Prussians—as Wellington, after learning Blücher's dispositions for the battle, had foretold—were, after a contest of the most obstinate description, completely defeated; but the prince of Orange, by the aid of the re-enforcements promptly forwarded to him by the English commander, succeeded in withstanding Ney's attack. In the plan preconcerted by the allied generals such a result was not unforeseen, and in accordance with their scheme of firm resistance and retreat if necessary (to allow time for the Russians and Austrians to assemble on the eastern frontier of France), Blücher retreated northward (instead of eastward, as Napoleon expected,) nearer the place of rendezvous with Wellington at Mont St. Jean; while early on the morning of the 17th, the Anglo-Netherlanders retired along an almost parallel route till they reached the forest of Soignies, in front of which they were formed in battle-array, facing southward. Napoleon, imagining that the Prussians were in total rout, and that their complete dissipation would easily be accomplished by Grouchy's division (33,000 men), which he had sent in pursuit, crossed to Quatre-Bras

with the rest of his troops, and uniting with Ney, marched in pursuit of Wellington, arriving on the plain of Waterloo in the evening.

The two armies which then confronted each other, though nearly equal in strength, were composed of very different materials. The French army, numbering from 69,909 to 72,247 men (according to French authorities, English historians varying in their estimate from 74,000 to 90,000, though its exact strength cannot be ascertained, owing to the loss of the official returns), was composed of veteran troops, who had enthusiastically ranked themselves once more under the standard of the chief who had so often led them to victory. The Anglo-Netherlands army, which numbered 69,894, of whom only 25,389 were British, 6,793 of the king's German legion, 10,995 Hanoverians, 6,303 Brunswickers, 2,926 Nassauers, and 17,488 Netherlanders, consisted, with the exception of a small number of Peninsula veterans, wholly of young soldiers, a large proportion of whom had never been under fire; the Hanoverians were only militia, some of them being fit but for garrison duty; while the behavior of many of the Belgian troops during the battle showed plainly enough that they mainly increased the *numerical* strength of the army, as they left it to the Dutch soldiers to vindicate the wrongs of the Netherlands. The French had 240, while their opponents had only about 156 guns. With such an army, to maintain even a defensive conflict with an army of veterans, commanded by the greatest gen. of the time, was a task which (laboring under a mistake as to the exact superiority in number of his opponents) it required all Wellington's rare tenacity of purpose to undertake; yet undertake it he did, depending on Blücher's promise to join him an hour after midday.

On the morning of the 18th, the two armies found themselves ranged in battle-array opposite each other: the allies, posted on a line of eminences, had their left wing resting on Frischermont, the farm-house of La Haye Sainte in front of their center, while their right wing curved convexly round behind Hougomont, and rested on Braine Merbes. The French were ranged on a parallel row of eminences, having La Belle Alliance in their center, with some divisions of cavalry and infantry in reserve behind the right wing; Kellermann's dragoons behind the left wing; and the guard, stationed with the 6th corps, in the rear. Skirmishing had continued all the morning; but the first serious attack was not made till between eleven and twelve, when a part of the 1st corps advanced against Hougomont, with the view of making the more important attack to be made against the allied left. This preliminary assault, however, though unsuccessful, was maintained with great vigor for a considerable time; till Napoleon, dreading a further loss of time, prepared to make his grand attack on the left center. At this time (half-past one P.M.), he learned that the advanced guard of the 4th Prussian corps (Bulow's) was appearing in front of St. Lambert, 2 to 3 m. to his right; and being forced to detach his 6th corps (Lobau's) with the reserves of cavalry behind his right wing, to keep them in check, he had to modify his grand plan of atttack on the Anglo-Netherlanders, and accordingly ordered Ney to break through their center. At two P.M., after a furious preliminary cannonade, from which Wellington sheltered his men (as at various other times during the battle), by retiring them to the reverse of the slope, Ney advanced against the left center with 20,000 men, but had only succeeded in putting to flight a Belgian brigade, when he was attacked and driven back by Picton's division, his retreating columns charged and broken by the English cavalry, and 2,000 prisoners taken. Nevertheless, after a brief space, Ney returned to the charge, and carried La Haye Sainte, though his repeated attacks on the infantry in position were constantly repulsed, and his retreating columns severely handled by the British cavalry, who, disordered by success, were as often overthrown by the French cuirassiers. By this time (half-past four P.M.), Bulow had succeeded in deploying from the woods, and, advancing against Planchenoit, in the rear of the French right, carried it after a vigorous conflict. Lobau's corps, however, aided by a re-enforcement from the guard, speedily re-took the post, and driving the Prussians back into the wood, secured the French right flank for a time; Napoleon, though now learning that another Prussian corps (the 1st, under Ziethen) was coming up by Ohain to join the allied left, being still confident that he could destroy the Anglo-Netherlanders before the Prussians could render effective aid. During the conflict with Bulow, Ney had been warmly engaged with the center and right of the enemy, who had made various attempts to regain the wood of Hougomont and La Haye Sainte, and had supported his repeated attacks with not only his own cavalry, but (by, at any rate, the "tacit consent" of the emperor) with the cuirassiers, lancers, and chasseurs of the guard, and the whole of the mounted reserve, without, however, producing any result other than a great slaughter on both sides, and the useless sacrifice of 18,000 of the finest cavalry ever seen. Napoleon now resolved on another vehement assault on the immovable British center, and directed against it in succession two columns, one composed of four battalions of the middle guard, and the other of four battalions of the middle and two of the old guard, supporting them with flank attacks of other infantry divisions, of cavalry, and with a dreadful fire of artillery. The advancing French were met with a well-sustained fire from every piece which could be brought to bear upon them; the first attacking column was fairly driven down the slope by the English guards, and the second was totally routed by a bayonet-charge of Adams' brigade, the British cavalry following up the fugitives. Ziethen had now (7 P.M.) joined the left of the English line; Bulow, further re-enforced, had carried Planchenoit, and

was driving the French right wing before him: and the combined attack on the retiring masses of the French by the whole effective force of the Anglo-Netherlanders on the one side, and of the Prussian cavalry on the other, converted an ordinary, though severe defeat into a rout unparalleled in history. The magnificent cavalry, wantonly destroyed by Ney in fruitless attacks upon an "impracticable" infantry, would then have been of incalculable service, but they were no longer to be had. The last square of the guard still stood its ground, to protect the flight of the emperor; but it was speedily surrounded, and on the soldier-like refusal of Cambronne to surrender, was in a moment pierced through and broken to pieces. From this time all resistance was over; the roads southward, especially that to Genappes, were crowded with fugitives fleeing for their lives from the pursuing cavalry; and though the English light cavalry, exhausted with their severe work during the battle, soon ceased the pursuit, it was kept up with great energy throughout the whole night by the Prussian troopers, who seemed bent upon at once avenging the defeats of Jena, Auerstadt, and Ligny, and glutted their fierce animosity by an indiscriminate slaughter. The total loss in this battle was, from the obstinacy and determination with which it was contested, necessarily large; the figures are: British and Hanoverians, 11,678; Brunswickers, 687; Nassauers, 643; Netherlanders, 3,178; a total of 16,186; which added to 6,999 Prussians, gives the aggregate allied loss, 23,185. The French had 18,500 killed and wounded; 7,800 prisoners (some French accounts raise the total list of *hors de combat* to 32,000), and 227 cannon captured.

This great battle has given rise to numerous controversies among the British, French, and German historians of the great struggle between Europe and Napoleon—the points in dispute being, (1) as usual, the numbers engaged on each side, (2) the ability shown by each general in his dispositions for the conflict, and (3) the relative share of the British and Prussians in producing the final result. These questions can be briefly and satisfactorily answered. The strength of the English army is known from official estimates; the French army, as shown by its maneuvers throughout the day, was more numerous, and though its amount cannot, with perfect accuracy, be ascertained, it was certainly over 70,000, and under 80,000; but the fact that many Belgians in the duke's army took to their heels as soon as the French marched toward them, and fled direct to Brussels, increased the disproportion, already sufficiently great, between the two armies; the Prussians had only 35,000 men under fire at Waterloo, and half of these only for about half an hour. Fault has been found with Wellington for giving battle in front of a wood, but the accusation is foolish, as several good roads traversed the wood, thus affording means of retreat, if necessary, and the wood could have been held by skirmishers to protect the retreating infantry. Napoleon's faults were chiefly —the late hour at which he (not calculating on the arrival of the Prussians at all, and certainly not without Grouchy) commenced the conflict, and the reckless manner in which his cavalry reserves were wasted; and his neglecting to take into account the steadiness—a steadiness new to one of even his experience—with which, as he was warned by Soult, who knew it only too well, the British infantry were wont to maintain their ground. As to the third point, there is no doubt that Bulow's attack on Planchenoit distracted Napoleon's attention, and drew off 10,000 of his forces; but though the Prussians had not come up, the battle could not have been otherwise than a drawn battle; however, the effect of their successful attack on the French right, by taking in flank also the squadrons which recoiled before the invincible steadiness of the British, was the conversion of an otherwise drawn battle into a glorious victory.

WATER-METER, an instrument for measuring the amount of water flowing through a pipe. In many places where water is comparatively scarce it is customary to charge for it on a meter basis, and in testing the efficiency of boilers it is necessary to have an accurate measurement of the amount of water which is fed into them. One of the oldest forms of water-meter, which is still in very general use is the piston meter. These are made with both one and two pistons and in the case of the latter the motion of one of the pistons moves the valve which starts the other, and *vice versa*. In the single piston meter water is admitted first on one side of the piston and then on the other. In both cases the motion of the pistons actuate a train of wheel-work which registers either the number of gallons or the cubic feet of water which have passed through the meter. Another type of meter in extensive use is the Crown meter. The essential parts of this meter are an outside cylindrical case and a piston which is also a hollow cylinder of smaller diameter which has a slight motion of revolution so that its axis describes a small circle in the center of the case. The parts are so arranged that as the water passes through the meter the motion of the piston moves a train of wheel-work which registers the amount of water. Two other types of meters of importance are known as the disk meter and one that acts on the principal of the rotary pump. The Venturi meter is especially adapted to the measurement of large quantities of water. It consists simply in a contraction of the section of the pipe carrying the water and two small vertical pipes which are connected to the largest and the smallest section of the main pipe. The difference of pressure in these two small pipes is proportional to the rate of flow of water in the pipe. The indications are taken on a moving strip of paper.

WATER-POWER. The value of water-power depends much on the nature of the source of supply, whether steady or otherwise. Where streams supplying water-power are liable to fall off much in dry weather, large impounding reservoirs are necessary to keep the mills from being stopped during summer. These, however, being generally expensive concerns, are seldom made for one mill, but rather by some association of mill-

owners; and often by a water company or commission for supplying a town with water, to afford compensation to the mills by storing up flood-water, for what is abstracted for the use of the town. On small streams there is generally a pond provided fit to hold a night's water, or, perhaps, even a Sunday's, in addition; but in the case of large rivers, there is, in general, only a weir or dam across the river to direct the water into the intake lade. When the inclination in the bed of the stream is small, the lades require to be proportionally long, to give sufficient fall, and are often above a mile long or more from the intake to the lower end of the tail or discharge lade, where the water is returned to the stream. The rise and fall of the tide has been frequently used for driving water-wheels.

The most usual mode of applying water to the driving of machinery before the general adoption of turbine wheels was by means of a vertical wheel which is put in motion either by the water acting on blades or floats by impulse derived from its velocity acquired in falling, or by the weight of water being applied to one side of the wheel. The former mode of applying the water was generally adopted in low falls, say under six ft. or thereabouts, and to what is called an undershot wheel—i.e., a wheel where the effective head of water is below the level of the center; and to make the application efficient, that portion of the periphery of the wheel measuring from the point of impact of the water to a point directly below the center, requires to be surrounded by a casing, generally of stone, but sometimes of cast iron, called the arc, closely fitted to the extremity of the floats, so as to prevent any considerable escape of water.

The wheel, which may be either of timber or of cast-iron, or partly of both, consists of axle, arms, floats, which are generally radii of the circle, but are sometimes set a little obliquely to the radius, pointing up stream; and generally there are also a sole, being a lining round the circumference at the lower edge of the floats, having openings for the escape of air; and a shrouding or circular plate at each side of the wheel, and of the same depth as the floats.

Sometimes, when there is very little fall beyond the mere current of the stream, the floats simply dip into the water like the paddles of a steamer, in which case no sole or shrouding is required; and to make allowance for the rise of the water in the tail-lade during floods, which is generally called *back-water*, and seriously impedes and sometimes stops the motion of the wheel, occasionally the wheel and its arc are so constructed as to be capable of being raised or depressed together, without throwing the machinery out of gear.

The other mode of applying the water to a vertical wheel by making it act by its gravity, is the more perfect and economical mode, where circumstances will admit of it, and is generally adopted in falls of any considerable height, say of six ft. and upward, and where the water can be let on above the level of the center. The wheels are called respectively *breast* and *overshot wheels*, according as the water is let on more near to the level of the center or to the crown of the wheel; and they have, instead of straight floats, curved or kneed buckets, according as they may be made of iron-plate or of wood, and of such a shape as to retain the water down to the lowest possible point. There are generally in good wheels ventilating openings in the sole for the escape of air. The overshot wheel has this disadvantage that, as the water has little or no power until considerably past the top center, the wheel is burdened with a useless weight of water.

The direct overshot wheel has the water run, without changing its direction, right over the top; which arrangement has this advantage, that as the top of the wheel moves in the same direction as the stream, it gets the benefit of the whole initial velocity and impulse of the water; but, on the other hand, the bottom of the wheel, if at all immersed in water, which it generally is to some extent, meets with obstruction by moving against the current.

The *pitch-back overshot* is a modification of the last, making the water to pass alongside the wheel, and then to return and be let on the top of the wheel in a contrary direction. This requires longer and more complicated troughs, and by the change in direction, part of the impulse from the water is lost, but the bottom of the wheel moves in the direction of the tail-water, and is not liable to be impeded by being immersed in it.

On the whole, it is generally thought better to apply the water at about 30° from the top of the wheel. In such high-breast or nearly overshot wheels, the water is let on to the buckets over the top of the sluice, which is made to open by lowering, and shut by lifting. In this way, however small may be the quantity of water, it is always applied at the highest possible level, which is of importance when it is its weight multiplied by the height of descent, not its impulse, that yields the effective power.

The structure of the overshot and breast wheel is nearly the same as that of the undershot, excepting in the substitution of curved or angular buckets, for straight floats; but even in the undershot wheel the floats are sometimes made with a slight curvature.

In any description of wheel, the motion may be taken off the axle by torsion, which necessarily requires rigidity in the arms; or it may be taken directly off the periphery, when the power is applied to a pinion working into segments, either external or internal, attached to the shrouding. In this arrangement there is no torsion of the axle, or transverse strain on the arms, and therefore the latter are more often made of round, wrought-iron rods, with a slight axle. This wheel is much lighter than with the massive axle and the strong wooden or cast-iron arms, and is called a *suspension* or *spider-wheel.*

In reckoning the power of water, its weight being 62½ lbs. to a cubic foot; theoretically 528 ft. falling vertically 1 ft. a minute, would be equal to 1 Boulton and Watt horse-power of 33,000 lbs. lifted 1 ft. a minute; but the effective power is far short of that, and 60 per cent of it, requiring 880 cubic ft., falling 1 ft. a minute, is generally reckoned a fair allowance for an effective horse-power. Seventy-five per cent, requiring 704 ft., falling 1 ft. a minute, is about the highest that has ever been spoken of, and it is doubtful whether any more than 75 per cent has ever been attained; while with low falls and imperfectly constructed wheels, it is often reckoned that a horse-power requires nearly 1000 cubic ft. a minute.

The velocity of the periphery of an undershot wheel is usually from 500 to 600 ft. a minute, and that of a bucket-wheel, overshot or breast, from 300 to 450 feet. It is seldom that the whole height of a fall can be advantageously made use of; for if the wheel be placed so low as to get the benefit of the whole height of the fall in low states of the water, very often it is liable in floods, to have the lower rim immersed, and to be obstructed or stopped by back-water.

The most extensive application of water-power in the world is the Niagara Falls power plant. For this installation the Niagara river was tapped about a mile above the falls by a canal 250 feet wide and an average depth of 12 feet. There are 10 inlets to the canal by which water is taken to the wheel pit. The latter is 178 feet deep and the tail-race connects with the river below the falls. The tail-race is a tunnel 7000 feet long and 21 feet by 18 feet at its largest section. The water from the canal drives twin turbines, which are a special design of what is known as the Fourneyron type, each pair of which develops 5000 horse power with a fall of 140 feet. Each pair of wheels is connected with a vertical hollow shaft 38 inches in diameter, but solid at the joints, where it is 11 inches in diameter. The upper end of these shaft carry the revolving fields of the large alternating current dynamo machine. The wheels discharge about 430 feet of water per second and revolve at the rate of 250 revolutions.

Turbines.—In the proper turbine (from Ital. *turbino*, a whirlwind), the water passes either, first, vertically down through the wheel between fixed screw blades, which give it a spiral motion, and then strikes similar blades attached to a movable spindle, but placed in the opposite direction, so that the impact of the water communicates a rotatory motion to the blades and spindle; or, second, a modification of the foregoing is to pass the water from the center horizontally outward through fixed curved blades, so as to give it a rotatory or tangential motion, and thereby cause it to act on the blades of the wheel which revolves outside.

In the reactionary wheel, which is in principle almost identical with Whitelaw and Stirret's wheel, previously described under the article BARKER'S MILL, the water is admitted at the center of the wheel from below, passes to the circumference between curved blades of the wheel, and escapes by tangential orifices at the circumference, there being valves made to open more or less, according to the quantity of water and to the power required.

The vortex wheel of Prof. Thomson takes in the water after descending through tubes, at the circumference, where, by means of fixed blades, it acquires a tangential motion, and then passes through between the curved arm of the wheel, and escapes at the center. As the two last described wheels work always under water, they are not liable to be obstructed by back-water, or to have their power lessened thereby more than what *is* due to the diminished fall, and they are understood to yield a good percentage of power, sometimes stated at 75 per cent; but all turbines are somewhat delicate, and liable to be choked by leaves or twigs, unless the water be carefully strained. Although only a few horizontal wheels have been described, their name is legion, and it would take a book to mention them all, or to describe their respective characteristics.

The reciprocatory hydraulic engine works exactly on the same principle as the ordinary non-condensing steam-engine. The water, under considerable pressure, is admitted at one end of a cylinder, the exit valve at that end being simultaneously closed, while it is shut off from the other end, and the exit valve there opened; and so the alternating action of the valves and of the piston goes on continuously. To work smoothly and effectively, the piston ought to be of large diameter, in proportion to the length of stroke, and to go slowly; otherwise the quick jerking is apt to shake and to injure the engine; and generally it is better to have two cylinders and pistons working together, as that enables them to work more equally, and to turn the crank without the use of a fly-wheel.

Both the turbine and the reciprocatory engine have been made use of as water meters.

The turbine and the reciprocatory engine have the advantage of being able to take the use of a fall much greater in height than the diameter of the largest wheel that can be made. See *Hydraulic Machinery*, by R. G. Blaine, and *Hydraulic Motors, Turbines, and Pressure Engines*, by G. R. Brodmer.

WATER-PROOFING. See INDIA-RUBBER. Besides the application of caoutchouc, peculiar methods have been employed to render cloth impervious to water, at the same time allowing the passage of air, the absence of this property in the impermeable caoutchouc manufactures having been found disadvantageous. Two plans are adopted for

water-proofing woolen cloths, without rendering them quite impervious to air—the air is to dip the cloth into a solution of soap, and thoroughly rub it into the texture, after which it is dipped into a solution of alum, a decomposition of the soap and alum is effected, and the minute openings between the fibers are in some way partly filled so as to exclude water. In the second plan, the cloth is dipped into a solution of gelatine or isinglass, and afterward in a solution of galls. A kind of tanning process is the result, the gelatine which has pervaded the cloth being rendered as insoluble as leather by its union with the tannin of the galls.

WATERSCAPE (also *seascape*) is an artist's term of somewhat recent origin, denoting a sea-view in contradistinction to a landscape.

WATER-SHED (Ger., *wasser*, "water," *scheiden*, "to separate"), is a range of high land lying between two basins, which distributes its waters to either side. The Rocky Mountains form the chief watershed of the United States, and four of our largest rivers —the Missouri, the Rio Grande the Colorado, and the Columbia—have their sources in this elevation.

WATER-SHIELD, *Brasenia peltata*, now classed with the water-lilies in the family *nymphæaceæ*. It has long, slender stems which arise from prostrate root-stocks. The oval leaves, having the slender petioles attached at the center, are from 2 to 4 in. long, and float on the surface of the water. The upper surface is green; the under surface and all the other parts, of a dull purple. The solitary flowers, on axillary peduncles, bloom at the surface, but soon become submerged. The calyx and corolla are each composed of four parts, with from 12 to 18 stamens, and from 4 to 18 pistils. The plant grows in water varying from 1 to 15 ft. deep. The only species known is that named above, which grows in ponds and slow streams from Canada to the gulf of Mexico along the northern border of Puget's sound, and in eastern India and Australia.

WATER-SPOUT. See WHIRLWINDS.

WATER-SUPPLY. Water is one of the primary wants of human life, no less essential than air and food; hence the strong and religious interest that has always been attached to the means of its supply. In the earliest records of civilization, we read of the digging of wells, and of quarrels about the possession of them. The "pools of Solomon," near Bethlehem, which remain now almost as perfect as when they were built, were connected with a scheme for supplying Jerusalem with water. In Assyria and Persia, from the earliest times, water has been conveyed to towns from astonishing distances in open channels or canals, and in subterranean tunnels, or *kanats*. In Egypt also, and in China, gigantic works for conveying water, both for domestic use and for irrigation, have been in existence from remote antiquity. Nor were these undertakings confined to the eastern hemisphere; we have evidence of the existence of kindred works in pre-Christian America. The ancient city of Mexico, which was built on several islands near the shore of the lake, was connected with the mainland by four great causeways or dikes, the remains of which still exist. One of these supported the wooden aqueduct of Chapoltepec, which was constructed by Montezuma, and destroyed by the Spaniards when they besieged the city. Hydraulic works on a great scale had also been executed by the Incas of Peru. Of all the ancient nations, the Romans paid the greatest attention to the supply of water, and carried the construction of *aqueducts* to the greatest perfection and magnificence. If we except the supply of New York from the Croton river (see AQUEDUCT), and that of Glasgow from loch Katrine, the efforts to supply modern cities are as yet insignificant compared with those of the Romans. The last-named works, finished in 1858, can convey 50,000,000 gallons a day a distance of 26 miles. It is only since the beginning of the sanitary movement, occasioned by the repeated visitations of cholera beginning with 1832, that the subject of water-supply, and more especially the *quality* of water-supply, has seriously occupied public attention. The result of every inquiry and every day's experience has been to bring out more strongly the decided effects on the health of a community arising from the quantity and quality of the water at their command; and as the river and surface sources of supply near the chief seats of population are becoming every year more contaminated by sewage (q.v.), the drainage from manured land, the droppings of animals, and the refuse of manufactures, enterprise and engineering skill must be directed either to procuring a supply of pure subterranean spring water from the chalk or other absorbent strata, or to bringing pure water from greater distances than hitherto. In 1867 a royal commission was appointed to inquire into the condition of the water-supply of London; and numerous schemes were laid before them. Mr. Bateman proposed to utilize the high drainage-grounds of north Wales, from which the river Severn is supplied, having an area of 204 sq. miles. The water was to be conveyed for the most part in an open aqueduct 173 m. long, and capable of carrying 230,000,000 of gallons a day, to service-reservoirs on the high land near Stanmore, about 10 m. from London (from which it was to be delivered, at high pressure, by means of pipes, to the whole city). The total cost was estimated at £11,400,023. On the ground of the distance, the committee reported against the proposal; as, on like grounds, they also did against a rival scheme for taking the supply from the lake districts of Cumberland and Westmoreland. Owing to the exceptionally great rain-fall in these regions (140 in. on an average), it is calculated that the two lakes of Ullswater and Haweswater, with a drainage of 100 sq.m., receive together an average daily discharge of 550,000,000 gallons. From this water it was proposed to supply not

only the metropolis, but the principal towns of the n.w. of England; but from various causes the scheme was abandoned. A bill has lately passed both houses of parliament to supply Manchester with water from Thirlmere. The Thames water has in some respects a superiority over the soft waters usually obtained from high gathering-grounds. It is well aërated, and keeps well. Recently, a covered conduit, 80 m. long, has been constructed, which conveys 8,000,000 gallons of pure chalk spring-water from the sources of the Dhuis, in Champagne, to Paris; and operations are about complete to bring the chalk springs of the Vanne, calculated to yield 22,000,000 gallons a day, also to Paris, a distance of 104 miles.

The chief points of interest on this subject may be arranged under the heads of the sources of supply, the qualities of water, and the arrangements for its conveyance and distribution.

Sources of Water.

The ultimate source of all *fresh* water is rain (q.v.). When it has fallen on the earth, it presents itself chiefly in the forms of surface-water, rivers, and springs.

Surface-collection.—Rain-water, as it is formed in the upper regions of the atmosphere, is the purest that nature supplies; but in descending, it brings with it whatever impurities are floating near the surface, which, in the neighborhood of towns, are numerous, consisting of various gases, together with soot and other floating particles, organic and inorganic. Rain-water has a strong affinity for organic impurities—that is, the corrupting ingredients derived from vegetable and animal bodies, and which are diffused over every surface in the vicinity of living beings; hence, when collected from the roofs of houses, it has a tendency to rapid putrefaction. Being free from saline ingredients, it is excellent for washing, but is not generally pleasant to drink.

But if we resort to a barren district of rock, destitute of vegetation, and remote from the pollution of towns, we may obtain water with comparatively little organic impurity. Notwithstanding several defects, it happens in various places that a surface-supply is the best that can be had.

Rivers.—The water obtained from running streams is in part what has flowed immediately from the surface, and in part the water of springs, shallow or deep. In any case, a considerable amount of contact with the ground has taken place, and in consequence saline and organic matter is liable to be dissolved in a greater or less degree. The extent of the impregnation, as well as the kind of material dissolved, will depend on the rocks and strata of the river-basin.

River-waters, besides the qualities they derive from their primitive sources, are apt to contain mud, decayed leaves, the exuviæ of fish, and other matters in suspension, and are thus deficient in the clearness and transparency so essential to the satisfaction of the eye in a drinking-water. Moreover, the water partakes of the extremes of summer and winter temperature. But the great objection to water from rivers is their general pollution from the manure used upon the land, sewage, and manufactures, so that there are now few rivers left from whose lower course a supply could be taken for domestic purposes. On the other hand, the supply from one of our large rivers is boundless and unfailing; and it conveys the surface-drainage and spring effusions of a large tract of country, without incurring any trouble or expense as to the original sources. Rivers that issue from lakes are generally the purest, as the suspended matter has time to be precipitated.

Springs.—The qualities that recommend water to the eye and to the palate belong in a pre-eminent degree to spring-water (see Spring): it is clear, sparkling, and of an agreeable and uniform temperature at all seasons of the year (about 50° Fahr.); it is well aërated, and is totally free from the offensive taint so common in all other waters, as well as devoid of the animalcules generated by organic impurity; and where a sufficient number of springs can be collected to suffice for a town, it is the most desirable of all sources of supply. About a quarter of the water brought to Edinburgh is spring-water collected on the slopes of the Pentlands.

Quality of Water.

Perfectly pure water is hardly to be found; rain-water, and even artificially distilled water, are only approximates. The chief impurities may be considered under the heads of mineral matter in supension, mineral matter in solution, and organic matter.

Mineral Matter in Suspension.—When running water comes upon a loose bottom, it carries the finer particles of sand and earth along with it. If the water comes into a position of perfect stillness, the matters thus floated gradually sink to the bottom again. Particles of clay, owing either to their excessive fineness or to their adhesive attraction for water, subside very slowly, and impurities of this nature are not easily remedied. Besides earthy matter, compounds of iron and lead are also in some circumstances present in a solid state, and may be got rid of by filtering. To separate clay-powder from water, the practice has long been resorted to in India and China of putting in a piece of alum, which seems to produce a kind of coagulation.

Dissolved Mineral Matter.—Spring-water, which is generally clear and sparkling, holding no solid matter in suspension, is seldom without a large amount of dissolved mineral matter, sometimes as much as 2 parts in 1000, commonly from 1 in 1000 to 1 in

20,000. River and surface water also contains more or less dissolved minerals (see AERATED WATERS). The great bulk of the solid matter held in solution in ordinary waters consists of the salts of soda, potash, lime, and magnesia. The most material are the salts of lime and magnesia, as they are the causes of what is called "hardness" in water, which we shall speak of more particularly afterward. The most important salt of lime is the soluble hydric carbonate formerly known as *bicarbonate*, which is derived from chalk or limestone. Chalk or limestone is a *carbonate* of lime (otherwise *calcic carbonate*)—that is, a compound of lime with one equivalent of carbonic acid (carbonic dioxide)—and is almost insoluble in water; but when water containing an excess of carbonic acid—as is the case with spring-water especially—passes over limestone, it gives the carbonate a double dose of carbonic acid, and converts it into bicarbonate, which is soluble. The waters having bicarbonate of lime for their chief impurity are familiarly spoken of as the chalk-waters. The other salt of lime often present in water is the *sulphate* or *gypsum*. The important distinction between the bicarbonate and the sulphate lies in the fact, that the first, the bicarbonate, may be in great part precipitated, or thrown down in a solid form, by boiling, which drives off the solvent carbonic acid; whereas the second, the sulphate, cannot be so precipitated. The chief effect of the boiling takes place in the first five minutes.

Apart from its hardness, it has been made a question whether water containing salts of lime is injurious or not to the human constitution. Dr. Lankester holds that there is evidence to prove that carbonate of lime in large quantity is positively injurious; and most physiologists are agreed that pure water is the best for securing the health of animals and man.

With regard to magnesia, its salts are well known to act as powerful medicines when taken in large doses, and it may be presumed are not altogether without effect in the small quantities existing in ordinary magnesian waters. A foreign physician has lately made the observation, that magnesia is the characteristic ingredients of water in the districts where the diseases called *cretinism* and *goiter* abound.—Of salts of *soda* and *potash*, the principal is common salt, or the chloride of sodium. Sodic sulphate (Glauber's salt) occurs along with the chloride in the salt-springs of watering-places as well as in the sea-waters. None of all these salts have any effect on the hardness. In the case of sea-water, which is very hard, the effect is not due to common salt, but to the lime and magnesian salts dissolved in it; were it not for these, sea-water would be perfectly suitable for washing, although not for drinking.—Salts of *iron* in considerable quantity make what are called technically named *chalybeate* waters, which belong to the medicinal class. When the iron exists in the spring as carbonate, which is the most usual case, on exposure to the air it is changed into the peroxide, and falls down in the form of an ochery precipitate. Salts of iron give an inky taste to the water, and a yellowish tint to linen washed in it.

Hardness in Water.—The quality of hardness in water is commonly recognized by the difficulty experienced in washing, and by the amount of soap necessary to form a lather. This quality is injurious also in the preparation of food; but its action is most universally felt in washing operations. It occasions the chapping of the skin, an enormous waste of soap, an extra labor, and a corresponding tear and wear of clothes. Every grain of chalk contained in water decomposes 10 grains of soap; and thus the hardening matter contained in 100 gallons of water, such as is supplied to London, will destroy 35 oz. of soap—that is, the first 35 oz. of soap added to this quantity of the water will disappear without forming any lather, or having any cleansing effect. Soap is a compound, formed of an alkali (soda or potash) joined to an oily acid. When a salt of lime, then, is present in the water, the lime decomposes the soap, and combines with the oily acid to form a lime-soap, which is insoluble, and has no detergent properties.

The most usual hardening ingredients are the salts of lime. Salts of magnesia and of iron are also hardening salts. Salts of soda and potash have no hardening effect. Dr. Clark, formerly professor of chemistry in Marischal college, Aberdeen, has devised a scale of hardness which is now universally employed in the chemical description of waters. The hardening effect that would be produced by one grain of chalk dissolved in a gallon of water is one degree of hardness; in like manner, four grains per gallon would produce four degrees of hardness; ten grains, ten degrees; and so on. The degrees are expressed in numbers—thus, 1°, 4°, 10°, 15°, are one, four, ten, fifteen degrees respectively. The degree of hardness of any particular water can be readily and exactly determined by Dr. Clark's soap test (q.v.).

Next to washing, the deleterious consequences of hardness are felt in various culinary operations, especially in the furring of boilers and cooking utensils, and in the infusion of tea. It is a fact of universal experience that hard water requires more tea than soft water to make an infusion of the same strength, and also renders the infusion muddy. Subcarbonate of soda in crystals, by decomposing the earthy salts, improves the water; but if more is added than what will exactly decompose the earthy salts present, it injures the fine flavor of the tea. It may be stated generally, that for the purposes of washing and cooking, a water of less than 6° is soft, but above this point the hardness becomes objectionable. At 8°, the water is moderately hard; at 12°, it is very hard; at 16°, the hardness is excessive; and much above this, it is intolerable.

To make these observations more intelligible we may mention a few instances of

known waters, with their place in the scale. In Keswick the water is under half a degree of hardness; in Lancaster it is 1½°; and in Manchester, 2°. The water of the Dee at Aberdeen, which is used for the supply of the town, is 1¼° of hardness. The water of loch Katrine is of great purity, having only two grains of solid matter of all kinds in the gallon, and 1° of hardness. The waters of the Welsh mountains, from which it has been proposed to supply London, have on an average less than 2°. The river Clyde, which formerly supplied Glasgow, is 4½°, and may also be reckoned a soft water. The Thames at London, as well as the New river, is about 14°, while many of the tributaries of the Thames rise as high as 16°; but being all chalk-waters, they may be materially softened by boiling. Springs from the chalk commonly range from 16° to 18°; but particular springs are to be met with in some parts of the world four or five times as hard, from the presence of bicarbonate of lime. The water of the treasury pump in London has from 50° to 60° of hardness. In many parts of the continent hard waters abound; but the testing of waters has not been so much attended to there as in this country.

The evidence laid before the royal commission above referred to went to prove that there is no reason whatever to suppose that the hardness of the Thames water, which averages about 15°, would be in the least degree prejudicial to health. It appears that the hardness of springs is generally considerable; and that surface-waters may be collected in a state that is to be considered soft (4°.94).

Lead in Water.—Injurious effects have frequently arisen from the contamination of water with lead, derived from leaden pipes and cisterns. Some kinds of water are known to act powerfully on a leaden surface, and others scarcely at all; but the qualities and circumstances on which the action depends have never been satisfactorily determined. Distilled water, and soft lake and river waters in general, act most decidedly, but by no means in proportion to their softness. The presence of air in the water seems one essential condition; light also increases the action, as does the presence of vegetable matter; it has been observed that when leaves drop by chance into a lead cistern, the spots where they lie become visibly corroded. The water of loch Katrine, according to extensive sets of expriments by distinguished chemists, is allowed to have an intense action* on lead under certain circumstances—viz., "1st, If the lead be bright and highly polished; and 2d, If the lead and water be freely exposed to the access of air." But it "does not exert any noxious action on lead when the metal is in its ordinarily dull state." The coating formed on the surface of the metal is held to protect it from further chemical action. Still there are opposing facts to show that this protective action is not always to be relied on; and that water that has passed through any considerable length of lead pipe, or stood for some time in a short one, or in a cistern, should never be used without care; a ninth part of a grain of lead per gallon has been known to derange the health of a whole community. Dr. Clark made the unexpected discovery that sand-filters completely separate the lead.

Organic Impurities.—The contamination of water by vegetable and animal substances takes place in various ways. The most obvious and abundant source of this class of ingredients is the sewage and refuse of towns; and next in order may be ranked the contact with soils rich in organic matter. Among organic impurities may be classed offensive gases, such as carbureted, sulphureted, and phosphureted hydrogen; vegetable fibers in a state of rottenness; putrefying products of the vegetable or animal kingdoms; starch, muscular fiber, etc.; urea and ammoniacal products; vegetable forms—algæ, confervæ, fungi, etc.; animalcules—infusoria, entomostraceæ, annelidæ or worms, etc. Water falling on a growing soil, and running off the surface to lie in stagnant ponds, is in very favorable circumstances for being tainted with vegetable and animal life. Water-plants will spring up and feed numerous tribes of animalcules, and each pool will be a constant scene of vitality. In such a state the water is usually unfit for drinking; the palate instantly discerns a disagreeable taint, and no one will use it who can do better. The surface-water of a district overgrown with peat-moss has usually a peaty flavor, as well as a dark and dirty color. The infusion of peat does not breed animalcules, being a strong antiseptic; but it is an objectionable ingredient nevertheless. Very slow filtration has been found to remove the color of the infusion in some degree, but not entirely. Lime removes the peat most effectually, but there is both expense and risk in applying it. It is perhaps doubtful whether any specific unwholesomeness can be justly attributed to peat-water; but it is unpalatable, and the use of it is shunned by the inhabitants of peaty districts, and even by cattle. The presence of peat in the lands used as collecting-grounds for surface-water—and it is generally such worthless tracts that are so employed—is a disadvantage attending that mode of supply.

Chalk-water, which, as it issues from a spring, is perfectly free from organic matter, has a source of contamination within itself. When exposed to light and air, the duplicate dose of carbonic acid that keeps the chalk dissolved, becomes decomposed; and the carbon of the decomposed acid gives rise to a green vegetation, which soon acquires an offensive marshy smell.

Organic matter in a putrefying state forms the worst kind of contamination that

* The water of loch Katrine is remarkably well aerated, having 7¼ cubic in. of air per gallon, of which 2½ in. are oxygen. Dr. Clark had a suspicion that the oxygen may turn out to be in some different state or modification from common oxygen.

water can have. Though we may not know the precise effects of these impurities on the animal system, the single fact of their rendering the water repulsive to the taste and nauseous to the stomach would be sufficient to condemn their use. What is disagreeable to the senses, must be presumed to be unwholesome in addition, until the contrary is proved. Though no one has ever yet gone the length of maintaining, as a general truth, the wholesomeness of water abounding in vegetation, insects, and decaying matter, yet the water of the Thames, even within the influence of the tides, where it is contaminated by the whole sewage of the metropolis, found defenders until lately, on the plea that the amount of impurity was too small to do harm. This ground is at length given up; but Thames water above Teddington lock is still sanctioned as safe water for the companies to supply to the inhabitants of London, notwithstanding the sewage of the numerous populous towns that the river receives above that point. As to this plea of smallness of amount, the highest medical authorities hold that it is impossible to say how small a quantity of organic matter in a state of fermentation may not do harm. We are not, however, left merely to presume that organic impurity in water is prejudicial to health. During the cholera visitation of 1853–54, a gigantic experiment was undesignedly made on half a million of human beings. It so happened that a certain district of London was supplied by two rival water-companies, the two mains running often side by side, and some houses taking water from the one, and some from the other. The whole inhabitants were living alike in all respects save one—viz., that one company drew its water from high up the Thames, where it was of comparative excellence, while the other drew its water from low down the river, where it was profusely contaminated with town-drainage. Among this population, there were more than 4,000 deaths from cholera; and when the epidemic had subsided, an inquiry was made, house by house, as to those deaths, and as to the water-supply of the several houses where they had occurred. The inquiry was conducted with every precaution, to avoid sources of fallacy; and the result was this: in the one set of houses, the mortality per 10,000 of the population was 37; in the other set of houses it was 130—that is to say, the cholera death-rate was 3½ times as great in the one set as in the other.

It is a common notion that *every drop of water teems with life;* but this is a mistake. Deep wells, and spring-water in general, contain little or no living organic matter. Consequently, it is quite possible to obtain a liquid perfectly free from animalcules and vegetation. The presence of living creatures, vegetable or animal, discernible either by the naked eye or by the microscope, is a proof of organic taint in the water, and is one of the tests of this kind of impurity. With respect to rain-water, Dr. Hassall states, in his evidence before the general board of health: "I have made several examinations of rain-water immediately after its dissent to the earth, obtained in both town and country, and can confidently assert that it does not, in general, contain any form of living vegetable or animal matter." The conditions necessary for the development of vegetation and animalcules over and above the presence of matter for them to feed on, are *air*, *light*, and *stillness*. With regard to the probable effects on health of living creatures contained in water, Dr. Hassall's observations are worthy of attention: "All living matter contained in water used for drink, since it is in no way necessary to it, and is not present in the purest waters, is to be regarded as so much contamination and impurity—is therefore more or less injurious, and is consequently to be avoided. There is yet another view to be taken of the presence of these creatures in water—viz., that where not injurious themselves, they are yet to be regarded as tests of the impurity of the water in which they are found."

Means of purifying Water.

The mechanical impurities of water, or the solid particles rendering it muddy or milky, may in most cases be removed by mechanical means. The two processes for this purpose are *subsidence* and *filtration*. The effects of subsidence are strikingly seen in the case of rivers that pass through lakes. See GENEVA, LAKE OF. The subsidence of solid particles depends on their own weight, as compared with the weight of an equal bulk of water. To favor the process, the most perfect stillness should be allowed. It is expedient to have partitions placed in the subsiding reservoirs at short intervals, more effectually to prevent the agitation of the water. The water should be run off from the top, and not from the bottom. By making the bottom of the subsiding reservoir form a declivity from opposites sides, and providing means to let off the water occasionally from its lowest depth, it is possible to get quit of the subsided mud. It is always found of advantage in clearing water from solid particles, whether by subsidence or by filtration, to mix together streams of different qualities.

In constructing an artificial filter on a large scale, a basin is formed, having the floor nearly level, but slightly inclining toward a center line, and made water tight by puddling the bottom and sides with clay. On the floor is laid a series of layers of gravel, coarse at first, and getting gradually finer upward; next, a layer of slate-chips or seashells, then one of coarse sand, on which is placed the actual filtering layer of fine sand. The depth of this layer is from twelve to thirty inches, that of the entire mass from four to six feet. The water being admitted gently on the top of the sand, sinks down and is conducted by a series of channels, generally of tile-pipes, into the main drain. A filter in a clean state will pass from twelve to eighteen vertical feet of water in twenty-four

hours. The solid matter intercepted does not penetrate more than three-fourths of an inch into the sand, so that, by removing a very thin film from the surface, the filter is again clean. What is scraped off the top, is capable of being washed and put again to use. "This process of filtration," says prof. Clark, is "efficacious in removing mechanical impurities to an extent that could scarcely be believed without seeing the process."

The cleansing power of sand can hardly be accounted for on the theory of mere mechanical interception. Though there is no chemical action, strictly speaking there is no doubt that the attraction of adhesion is at work—a power that plays a greater part in natural processes than has generally been assigned to it. Some substances manifest this adhesive attraction more strongly than sand, and have therefore still greater efficacy as filters; though practically, and on the large scale, sand is the most eligible. Powdered charcoal has long been known as a powerful filtering medium, attracting and detaining especially organic matter. Animal charcoal, or that derived from burning bones, is still more efficacious than wood charcoal. A filter of animal charcoal will render London porter almost colorless.

According to recent researches, it would seem that loam and clay have similar properties, and may be made available as filters. Professor Way states that "they have powers of chemical action for the removal of organic and inorganic matters from water to an extent never before suspected." The filthiest liquids, such as putrid urine and sewer-water, when passed through clay, dropped from the filter colorless and inoffensive. The clay used was that known as pipe-clay.

For filters for domestic use, see FILTER.

Softening of Water rendered Hard by Chalk—Clark's Process.—This is one of the most beautiful applications of science to the arts of life that could perhaps be named. We extract the inventor's own account of it (retaining the old nomenclature) as read at the meeting of the society of arts:

"In order to explain how the invention operates, it will be necessary to glance at the chemical composition and some of the chemical properties of chalk; for while chalk makes up the great bulk of the matter to be separated, chalk also contains the ingredient that brings about the separation. The invention is a chemical one for expelling chalk by chalk. Chalk, then, consists, for every 1 lb. of 16 oz., of lime, 9 oz.; carbonic acid, 7 oz.

"The 9 oz. of lime may be obtained apart, by burning the chalk, as in a lime-kiln. The 9 oz. of burnt lime may be dissolved into any quantity of water not less than 40 gallons. The solution would be called lime-water. During the burning of the chalk to convert it into lime, the 7 oz. of carbonic acid are driven off. This acid, when uncombined, is naturally volatile and mild; it is the same substance that forms what has been called soda-water, when dissolved in water under pressure.

"Now, so very sparingly soluble in water is chalk by itself, that probably upward of 5,000 gallons would be necessary to dissolve 1 lb. of 16 oz.; but by combining 1 lb. of chalk in water with 7 oz. addititional of carbonic acid—that is to say, with as much more carbonic acid as the chalk itself contains—the chalk becomes readily soluble in water, and when so dissolved, is called bicarbonate of lime. If the quantity of water containing the 1 lb. of chalk with 7 oz. additional of carbonic acid, were 400 gallons, the solution would be water of the same hardness as well-water from the chalk-strata, and not sensibly different in other respects.

"Thus it appears that 1 lb. of chalk, scarcely soluble at all in water, may be rendered soluble in it by either of two distinct chemical changes—soluble by being deprived entirely of its carbonic acid, when it forms lime-water, and soluble by combining with a second dose of carbonic acid, making up bicarbonate of lime.

"Now, if a solution of the 9 oz. of burnt lime, forming lime-water, and another solution of the 1 lb. of chalk and the 7 oz. of carbonic acid, forming bicarbonate of lime, be mixed together, they will so act upon each other as to restore the 2 lbs. of chalk, which will, after the mixture, subside, leaving a bright water above. This water will be free from bicarbonate of lime, free from burnt lime, and free from chalk, except a very little, which we keep out of account at present for the sake of simplicity in this explanation The following table will show what occurs when this mutual action takes place:

AGENTS.		PRODUCTS.	
Bicarbonate of lime in 400 gallons.....	Chalk.....16 oz. with Carbonic acid 7 oz.	= 16 oz. of chalk	= 2 lbs.
Burnt lime in 40 gallons of lime-water.....	.....9 oz.	= 16 oz. of chalk	

"A small residuum of chalk always remains not separated by the process. Of 17½ grains, for instance, contained in a gallon of water, only 16 grains would be deposited, and 1½ grains would remain. In other words, water with 17½° of hardness, arising from chalk, can be reduced to 1½°, but not lower.

"These explanations will make it easy to comprehend the successive parts of the softening process.

"Supposing it was a moderate quantity of well-water from the chalk-strata around the metropolis that we had to soften, say 400 gallons. This quantity, as has already been

explained, would contain 1 lb. of chalk, and would fill a vessel 4 ft. square by 4 ft. deep.

"We would take 9 oz. of burnt lime, made from soft upper chalk; we first slack it into a hydrate, by adding a little water. When this is done, we would put the slacked lime into the vessel where we intend to soften; then gradually add some of the water in order to form lime-water. For this purpose, at least 40 gallons are necessary, but we may add water gradually till we have added thrice as much as this; afterward, we may add the water more freely, taking care to mix intimately the water and the lime-water, or lime. Or we might previously form saturated lime-water, which is very easy to form, and then make use of this lime-water instead of lime, putting in the lime-water first, and adding the water to be softened. The proportion in this case would be one bulk of lime-water to ten bulks of the hard water."

It is of importance that the lime-water—that is, the softening ingredient—be put into the vessel first, and the hard water gradually added, because there is thus an excess of lime present up to the very close of the process. Instead of lime-water, the lime itself may be put at once into the vessel, and some of the water to be softened gradually added to dissolve it. The softened water thus obtained has no action on lead pipes or cisterns, as many soft waters have. One ton of burned lime, used for softening, will produce three and a half tons of precipitate. The present water-supply of the metropolis, if subjected to Clark's process, would deposit about fifty tons of chalk daily.

The process is and has been in successful use on a large scale at various works constructed under the direction of Mr. Homersham, C.E., London, some of them 20 to 25 years since, and others more recently, for softening spring water derived from the chalk, the oolitic, the lower greensand, and other geological formations, for the supply of Aylesbury, Aston, Clinton, and Mentmore in Bucks; the city of Canterbury with its suburbs, and Herbert hospital, in Kent; Castle Howard in Yorkshire, Caterham, Godstone, Nutfield, Redhill, and Warlingham in Surrey; Park Place Henley in Oxfordshire; Tring in Herts. Works have also been more recently constructed for supplying softened spring-water to Sandringham, Norfolk, the seat of his royal highness the prince of Wales, and to Bushey and Stanmore, Middlesex.

The process should always be carried out in suitable covered reservoirs, and is then found to be as conveniently applicable, and even more so, for softening large as small quantities; and spring-water varying from 18 to 20 degrees of hardness by Clark's scale is thus readily softened down and supplied to the consumers at from 2½ to 4½ degrees of hardness. The process for several years past has been in use at Sandhurst, 105 m. n.w. of Melbourne, in Australia, for lessening the amount of organic matter always found to exist in surface-water impounded in large open reservoirs or artificial lakes, and for this purpose is very superior to filtration through sand. Indeed, in the warm climate at Sandhurst, the amount of organic matter becomes so great as to plug up the pores of the sand, and render filtration impracticable.

Natural Process of Purification from Organic Matter.—Although, by means of sand and other filters, or of the liming process, organic contamination of water may be much reduced, there still remains enough to render the water unsafe for use. Is water, then, once corrupted with organic matter, hopelessly and permanently so? This question can be answered in the negative. Filthy water has a tendency to purify itself, and this in two ways. In the first place, in any shallow stream of polluted water, such as the kennels of a street, there may be observed long brushes of a sort of slimy vegetation adhering to every projection of the bottom. All this matter has been disengaged from the water, which thus flows away so much the purer. The second and most effective part of the natural purification consists in the actual decomposition of the impurities. The nitrogen of the decaying matter, then, goes to form nitric acid, which, uniting with bases, forms salts of the class called *nitrates*, of which salpeter is one. Thus, what was in a state of putrefactive change, offensive to the senses, breeding loathsome insects, and causing dangerous disorders, is changed in course of time into a stable and harmless product. This process is constantly going on in rivers and other waters containing organic matter. In the case of streams passing through populous districts, the contamination goes on at a rate far beyond the power of natural purification; but we can easily conceive how a river, very much contaminated with organic impurities at one part of its course, may, after flowing a long way through an uninhabited tract, be almost restored to its natural state. The process is one of oxidation, and takes place at the expense of the free oxygen, of which, in healthy, normal water, there ought to be 29 per cent of the entire volume of gases held in solution.

The oxidation is much favored and hastened when the water percolates or filters very slowly through porous beds of earth. If the filtration has been sufficiently prolonged to convert all the decaying matter into carbonic acid or nitrates, the water will be pure, as far as the organic taint and the presence of animalcules are concerned, and will, in fact, be neither disagreeable nor unwholesome, the amount of the dissolved carbonates or nitrates being unimportant.

Dr. Smith has proved by direct experiment that decomposing organic matter passed through a filtering-bed is changed into nitric acid. "A jar, open at both ends, such as is used with an air-pump, was filled with sand, and some putrid yeast, which contained no nitric acid, was mixed with pure water, and poured on the sand, and allowed

to filter through. The production of nitric acid was abundant." It is not improbable that other earthy matters, such as loam and clay, may have a still more decided influence in hastening the formation of the nitrates; and perhaps by imitating more closely the slow mode of filtration by which nature converts surface-water into spring-water, it may yet be practicable to make the most contaminated waters fit for use.

Conveyance, Storage, and Distribution.

Into the engineering operations connected with the conveyance of water from its source to the town to be supplied, we need not enter, beyond noticing that when the source is below the level of the houses, steam or other power is necessary to lift or propel the water to the necessary height; while in the more general and more desirable case of the source being higher than the place where the supply is to be delivered, the water is made to flow by its own gravitation, either in a channel or culvert with a continuous descent, as in the ancient aqueduct (q.v.), or in the simpler and more economical modern plan of a line of cast-iron pipes following the inequalities of the surface. In many cases, both principles are employed, the water flowing for the most part in a gently-sloping conduit, tunneled through hills where nccessary, and being carried through valleys in tubes decending and ascending—an inverted siphon, as it is called. The Croton aqueduct, which supplies New York, is carried across the Manhattan valley, upward of 100 ft. deep, in this way. The Glasgow supply from loch Katrine flows mainly in a sloping channel carried through tunnels and over bridges; but there are four miles of iron pipings across valleys.

The extent of the storage in reservoirs depends on the nature of the supply. If water is derived from perennial springs, whose minimum flow equals the maximum demand, the storage may be the least possible. If a river is the source, the reservoirs should be large enough to hold such a stock as will carry the consumers over the periods when the river is polluted by rains; they should also be large, on the principle of allowing time for purification by subsidence, especially if artificial filtration be not employed. In places where the supply is obtained from surface drainage, or from a small stream, the practice is to build reservoirs capable of containing a five or six months' supply, it being necessary to provide against the greatest droughts that ever happen in any season.

The reservoirs should be deep, so as to prevent vegetation, and the distributing or service reservoirs should be roofed.

In distributing water over a town, two different methods have been adopted, known respectively as the *intermittent* and the *constant* systems of supply. On the intermittent system, water is laid on once a day, or once in two or three days, as the case may be, and fills a tank attached to every separate house, and from this tank the water is drawn off as required. The feeding-pipe of such a tank or cistern is provided with a ball-cock which ingeniously shuts off or admits the supply, as the cistern may be full or empty. On the constant system, no tank is absolutely needed, but the house-pipes are kept constantly charged through their unbroken connection with the distributing reservoir, which must therefore be higher than the highest house to be served. The intermittent supply was until lately employed everywhere in the metropolis; but it is universally admitted that the other system is vastly superior in every respect. The disadvantages of the intermittent practice have been strongly set forth in all the recent official reports on sanitary improvement; the expense of the erection and repair of cisterns, the trouble requisite to keep them clean, the contamination of the water by the neighborhood of sources of pollution, the frequent waste of water that occurs, the difficulties imposed on the poorer class of tenements where cisterns are not provided—are a few of the objections urged against this mode of supply. In a letter in the *Times*, January 3, 1866, Dr. H. Jeaffreson thus describes the condition, in regard to water-supply, of the centers of typhus infection in Lambeth, Southwark, Bethnalgreen, etc.: "Those houses the best supplied have each a butt, holding about 80 gallons, into which water flows from a stand-pipe for from ten minutes to half an hour each day, and is supposed to supply the wants of 20 persons for cooking, the washing of their persons, house, and linen, and for the rinsing down of the water-closets at such times as it may suit the caprice of any one of the inmates."

One important advantage, arising from the constant system, is the ease with which water can be had in time of fires. The water being supplied at high-pressure, all that is necessary is to affix a hose to the water-plug in the street, when a jet corresponding in height to the pressure is obtained, which can be immediate directed against the fire.

Cisterns, pipes.—Owing to the action of water on lead, already described, it is desirable to avoid the use of that metal in connection with very soft lake or river water. With regard to lead *pipes*, if the precaution is taken when the water has stood for any time in them, of allowing the first portions to run off before any is taken for use, little danger can arise; but either lead *cisterns* should be wholly avoided, or means taken to ascertain whether they contaminate the water; and if so, a remedy should be applied. There are various substitutes for lead as a lining for cisterns. Slate slabs are highly recommended. Gutta-percha is also found to be an easily fitted, cheap, and durable lining. For a few

days, the water tastes of the naphtha used in applying the lining; but afterward, no kind of water, not even acids, have any action on the gutta-percha. Pipes of gutta-percha may also be used; they are cheap, and easily fitted up.

Common-wells.—The simplest of all water-supplies is that of a cottage or farmhouse in the country, with a good spring rising to the surface close by; and yet what a poor use is usually made of such a precious boon! The country well is generally a simple cavity to receive the spring, rudely lined, it may be, with stones, but with open mouth, into which dust and dead leaves are blown by every wind, and foul surface-water is trickling from all sides. Being exposed to the light, there is generally a profuse vegetation on the bottom and sides, and, in addition to these impurities, it is further muddied by the dipping in of buckets, often dirty on the outside. Who has not been disgusted, when asking a drink at a cottage, to get water thick with dust and visible impurities, knowing, at the same time, that it might be so easily remedied? A surface-spring should always be covered, and made to issue by a pipe, half a day's labor to create a fall, and a clay drain-tube, will generally convert a filthy puddle into a crystal fount. It is singular to see this blindness to the impurity of water in people otherwise cleanly enough. This is a subject worth the attention of country physicians and clergymen. The evil effects of drinking impure water are not confined to towns. May not the putrid sore throat and malignant fevers that often sweep away whole households in the country, especially in autumn, be partly owing to the cause now pointed at?

Deep wells should invariably be covered, and carefully protected from the infiltration of superficial ooze. The situation of pump-wells is often singularly ill chosen in this respect. The gravitation, reservoir, and direct pumping system, are the three methods of supplying water to cities. Where a sufficient supply can be collected and stored, at an elevation giving the necessary head, no other force than gravity is needed. In the second system the water is pumped up into a reservoir; if there be no elevated ground for the reservoir, a stand-pipe is employed, to secure sufficient head and constancy of pressure. Stand-pipes are, some of them, 170 ft. high, and are single or double. In level cities the stand-pipe partly takes the place of the reservoir. In the Holly, or direct pumping system, the water is pumped directly into the distributing mains, thus avoiding the first cost of reservoir or stand-pipe. In case of fire, extra pressure is put on, and a stream of water can be thrown without the aid of an engine. The cost of construction of water-works varies from $10 to $40 per capita, according to the system used, and the population. See Sanitary Science, Artesian Wells.

WATER-TABLE, a set-off in a wall sloped on top to throw off the rain.

WATER TOWER, a long pipe capable of being raised to a vertical position; used by fire companies to throw a stream of water into the upper stories of a building. A flexible pipe connects with the lower end of the W. T., terminating in several inlets, into each of which water is pumped by the engines. The W. T. is mounted on trunnions; a short piece of flexible pipe, moving between two side flanges, is fixed at the end of the pipe, between it and the nozzle; a stud projects from each side of the nozzle, entering a groove in the flange; and a wire rope connects this nozzle with a drum on the truck below. The water is sent downward from the nozzle by winding up this rope; and the reverse movement is accomplished by unwinding it. The W. T. may be moved on its own axis; and the stream may be directed in any direction. The fire-boats used in New York harbor for the protection of the shipping, are provided with water-towers.

WATERTOWN, a town in Middlesex co., Mass.; on the Charles river and the Fitchburg railroad; 8 m. w. of Boston. It was incorporated in 1630, and contains the villages of Watertown, East Watertown, Mount Auburn, Union Market, Arsenal, and Bemis. The town is connected with Boston by electric railroad; is the seat of a U. S. arsenal; and has a high school, public library, electric lights, national, savings, and co-operative banks, and manufactories of woolen, rubber, and elastic goods, stoves, starch, hosiery, cardigan jackets, needles, and indurated ware. Pop. '90, 7073.

WATERTOWN, city and co. seat of Jefferson co., N. Y.; on the Black river and the main and branch lines of the Rome, Watertown, and Ogdensburg railroad; 10 m. e. of lake Ontario, 69 m. n. of Syracuse. The river here is nearly 200 ft. wide, is spanned by several bridges, and has falls and rapids which provide good power for manufacturing. There are gas and electric lights, electric street railroads, several small public parks, national and savings banks, high and graded schools, Y. M. C. A., and high school libraries, convent of the Immaculate Conception, Irving school, kindergarten, and daily, weekly, and monthly periodicals. The principal manufactures are foundry and machine shop products, paper, woolen goods, leather, agricultural implements, wagons, carriages, air and vacuum brakes, furniture, printing presses, electrical apparatus, and sleighs. Pop. '90, 14,725.

WATERTOWN, a city in Dodge and Jefferson cos., Wis.; on the Rock river, and the Chicago, Milwaukee, and St. Paul and the Chicago and Northwestern railroads; 45 m. w. by n.w. of Milwaukee. It is the seat of the Northwestern university (Lutheran), and the Sacred Heart university (R. C.), and has a high school, university libraries, gas and electric lights, national and state banks, about a dozen churches, public park and daily and weekly newspapers. The river is here crossed by several bridges, and by two dams, provides power for manufacturing. There are several mills, breweries, large malt-house, foundry, shoe factory, and brass works. Pop. '90, 8755.

WATERVILLE, a city in Kennebec co., Me.; on the Kennebec river and the Maine Central railroad; 18 m. n. of Augusta. It is the seat of Colby university (q. v.), and of

the Coburn classical institute, and has a high school, college, and other libraries, electric lights, electric street railroads, waterworks, national and savings banks, building and loan associations, and daily, weekly, and monthly periodicals. Power for manufacturing is supplied by Ticonic falls. The leading industrial plants are the car and locomotive shops of the Maine Central railroad, and cotton, paper, and pulp mills. Pop. '90, 7107.

WATERVLIET, a city in Albany co., N. Y.; on the Hudson river, the Erie canal, and the Delaware and Hudson railroad; opposite Troy. It was chartered as a city in 1896, having previously been known as the village of West Troy. The city is the seat of the famous Watervliet arsenal, established by the U. S. government in 1807. The plant includes foundries and shops for making field, coast defense, and siege guns, shot and shell, gun carriages, and small ammunition. The city also contains a large and noted bell foundry, and extensive car works. There are electric light and street railroad plants, national bank, nearly a dozen churches, and a weekly newspaper. Pop. '90, 12,967.

WATER VIOLET. See HOTTONIA.

WATER YAM. See LATTICE LEAF.

WATERY GRIPES is the popular name for a form of serous diarrhea occurring in infants, in which there are copious discharges of thin watery motions, often limpid, or almost colorless, and occasionally intermixed with flakes or shreds. This form of diarrhea may be induced in weakly children by sudden impressions of cold on the surface, so as to check perspiration; or it may be brought on by cold drinks taken when the body is heated. The exhaustion brought about by the copious excretions from the bowels is sometimes so great that the case might be mistaken for one of cholera. See CHOLERA INFANTUM.

WATKINS GLEN, in Schuyler co., N. Y., a deep and rugged ravine ascending between two long ranges of low hills on the w. side of the Seneca Lake valley. It derives its name from the neighboring village of Watkins. Its course is nearly e. and w., and it rises 800 ft. in about 3 miles. The remarkable forms assumed by the river rocks, and the cascades on the falling stream make it one of the most charming of American glens, and it is visited annually by over 50,000 persons. Among the principal objects of interest are Glen Alpha, the cathedral, the well, and Rainbow Fall.

WATKINSON, DAVID, 1778–1857; b. Suffolk, England; educated by Mrs. Barbauld. In 1795 his parents came to this country and settled in Middletown, Conn. He engaged in business in New York city and in Hartford, and in 1841 retired. Most of his life was spent in Hartford. By his will liberal legacies were given to several public institutions, the more notable being $100,000 for the formation of the Watkinson library and $40,000 to the Hartford hospital and for the foundation of a juvenile asylum.

WATLING STREET, one of the great Roman highways of Britain, commencing at Dover, passing through Canterbury and Rochester to London, and thence through Uriconium and Chester to Caer-Seiont, the ancient *Segontium,* in Caernarvonshire. From Uriconium a branch proceeded n. by Manchester, Lancaster, and Kendal, into Scotland. Traces of the ancient road are still to be found in many parts of its course, and in some it is still an important highway. A street in London retains its name. The origin of this name is very uncertain; the most probable supposition is that the original name was *Stratum Vitellianum.*

WATLING ISLAND, one of the Bahamas (q.v.).

WAT'ONWAN, a co. of s. Minnesota; 430 sq. m.; pop. '90, 7746. Co. seat, St. James.

WATSON, ALFRED AUGUSTIN, D.D., D.C.L., b. New York, 1818; graduated at the univ. of New York, 1837; studied law, but, having determined upon the life of a minister, he was ordained priest in the Prot. Epis. church, 1845. He had several charges in N. Carolina, and was chaplain of the 2d regiment troops of that state. He was consecrated the first bp. of East Carolina, 1884.

WATSON, HENRY COOD, 1816–75; b. London, Eng.; as a child, showed musical talent, and in 1829 appeared at the Covent Garden theater in Weber's *Oberon.* He became a musical critic and composer, in 1840 came to New York, and was connected with several of the journals of the day as art and musical critic, as well as a writer on other topics. In 1845, with Poe and Charles F. Briggs, he founded the *Broadway Journal,* which proved a failure financially, though conducted with ability. He was one of the founders of the Philharmonic society of New York, and had a chief share in organizing the notable Castle Garden Mendelssohn concert. In 1855 he founded *The Musical Guest,* and published many of his own compositions in its columns. Later he was editor-in-chief of *Frank Leslie's Illustrated Newspaper;* in 1862 started the *Art Journal,* and for the last 12 years of his life was the musical critic of the New York *Tribune.*

WATSON, JAMES CRAIG, 1838–80; b. Canada West, of American parents; graduated at the university of Michigan, 1857; a teacher there for some time of mathematics, and an assistant at the observatory; appointed prof. of astronomy, 1859, and of physics and mathematics, 1860; became director of the observatory in 1863; took charge of the observatory of the Wisconsin state university, 1877. He discovered many asteroids. He was at the head of the successful American expedition which observed the transit of Venus at Peking, China, 1874. He was awarded in 1870 the gold medal of the French academy of sciences for his various astronomical discoveries. He prepared many

astronomical charts; was the author of a *Popular Treatise on Comets*, and a work on *Theoretical Astronomy*.

WATSON, JOHN (IAN MACLAREN), clergyman and author, b. at Manningtree, Essex, England, of Scotch parents, in 1850; educated at Edinburgh university, New College, Edinburgh, and Tübingen. On completing his studies he decided to become a minister of the Free church, largely, it is said, to gratify the wishes of his father, and in 1874 he received his license. After serving as assistant for a short time to Dr. J. H. Wilson of the Barclay church, Edinburgh, he was ordained in 1875 as minister of the Free church in Logiealmond, where his close contact with the life of a little Scotch community furnished him with material and suggested types for many of his stories. Logiealmond has been identified with the "Drumtochty" of these stories, although Dr. Watson has said that no real person has been described in his writings, and that where types have suggested themselves to his mind they have been so idealized as to be unrecognizable in the original. After leaving Logiealmond he ministered for three years at Free St. Matthew's, Glasgow, and was then called to Sefton Park church, Liverpool (1880). Before this he had conceived the idea of writing a book dealing with local Scotch life, but distrust of his own powers prevented him from carrying it out till many years later. When his first volume of stories appeared, under the title of *Beside the Bonnie Brier Bush* (1894), its success was instant and complete. It was published both in England and America. It was followed by *The Days of Auld Lang Syne*, and *The Upper Room* (both in 1895), *Kate Carnegie*, *The Mind of the Master* and *The Cure of Souls* (Yale Lectures on Practical Theology, 1896). In the winter of 1896–97 Dr. Watson visited the United States, where he was received with unusual evidences of popular esteem. In 1897 a drama based on the characters and incidents of his stories and entitled *Beside the Bonnie Brier Bush*, was prepared for the stage by James MacArthur in collaboration with Tom Hall.

WATSON, RICHARD, D.D., 1737–1816; b. England; graduated Cambridge, 1759; obtained a fellowship, 1760; ordained in the church of England; prof. of chemistry, 1764; tutor at Trinity college, 1767; regius prof. of divinity, Cambridge, and rector, Somersham, 1771; archdeacon of Ely, 1780; bishop of Llandaff, 1782. His chief works are *An Apology for Christianity, in a Series of Letters, addressed to Edward Gibbon, Esq.; Chemical Essays; A Sermon on the Wisdom and Goodness of God, in having made Rich and Poor; An Apology for the Bible, in a Series of Letters, addressed to Thomas Paine; Miscellaneous Tracts.*

WATSON, RICHARD, 1781–1833; b. England; was apprenticed at the age of 14 to a carpenter; joined the Methodists, 1796; ordained, 1800; became a member of the conference. After a few years he joined the Methodist new connection; was stationed at Manchester and Liverpool, and edited the Liverpool *Courier;* returned to the regular Wesleyan connection; was stationed in London; was one of the secretaries of the missionary society, and a teacher of theology to candidates for the ministry; was elected president of the conference in 1826. He published *A Defense of the Methodist Missions in the West Indies; Remarks on the Eternal Sonship of Christ;* and *Use of Reason in Matters of Revelation; Theological Institutes; Conversations on Scripture for the Young; Biblical and Theological Dictionary.*

WATSON, WILLIAM, poet, b. in Wharfedale, Yorkshire, Eng.; began to write verse at an early age but did not attract favorable notice until his publication of the *Epigrams of Art* (1884). In the following year he published a series of sonnets in the *National Review*, entitled *Ver tenebrosum*, in which he attacked the policy of the English in Egyptian affairs. In 1892 his poem called *Wordsworth's Grave and Other Poems* gave him considerable fame, and in the same year he wrote a memorial poem to Tennyson under the title of *Lachrymae Musarum*. This poem was greatly admired by Mr. Gladstone, and the author received a pension from the government. Among his later works are *Lyric Love* (1892); *The Eloping Angels* (1893); *Excursions in Criticism* (1893); *Odes and Other Poems* (1894); *The Father of the Forest* (1895); and *The Purple East* (1896); the last named having for its subject the Armenian difficulty.

WATT, JAMES, mechanician, engineer, and man of science, famous as the improver, and almost the inventor of the steam-engine, was born at Greenock, in Scotland, Jan. 19, 1736. His father was a blockmaker and general merchant at Greenock, was long a member of the council of that burgh, and for a time a magistrate. Two members of James Watt's family—his grandfather and his uncle—had had some local reputation for scientific or engineering ability. The former was a teacher of mathematics, surveying, and navigation at Crawfordsdyke, near Greenock; the latter practiced as a land-surveyor and engineer with great success at Ayr. The grandfather, Thomas Watt, had been brought early in life to Lanarkshire from the neighborhood of Aberdeen, where his family had previously lived. The father of Thomas Watt, the great-grandfather of James, is said to have farmed a little property of his own in Aberdeenshire, and to have been killed while fighting on the side of the Covenanters against the marquis of Montrose.

James Watt was very weakly as a child, and being unable to go to school with regularity, he became, to a great extent, his own instructor. What schooling he did get, he got in the schools of his native town. He early manifested a turn for mathematics and calculations, and a great interest in machines, and accordingly—his father's business, for which he had been destined, having greatly declined—he was, at the age of 18, sent to London, to learn the trade of a mathematical instrument maker. Ill-health compelled

him to return home about a year after; but he had made good use of his opportunities in London; and on his health improving, he resolved to set up as a mathematical instrument maker in Glasgow. The incorporation of hammermen of that city put difficulties in his way; but the authorities of the university took him by the hand, appointed him mathematical instrument maker to the university, and gave him the use of premises within their precincts. He occupied these premises from 1757 to 1763. They seem to have been badly situated for his business, for which, moreover, at that time there was but little room in Glasgow; and Watt during those years was scarcely able to make a living. In 1763 he got a place of business in the town, and after that he did somewhat better; still, he had to eke out his income by making or mending fiddles (which he was able to do, though he had no ear for music), or doing any mechanical job which came in his way; and no work requiring ingenuity or the application of scientific knowledge seems to have come amiss to him. At length, in 1767, he fell upon a new and a more lucrative occupation. In that year he was employed to make the surveys and prepare the estimates for a canal projected to unite the Forth and the Clyde. This work could not be carried out at the time, because it failed to obtain the sanction of parliament; but Watt had now made a beginning as a civil engineer, and henceforth he got a good deal of employment in this capacity. He made surveys for various canals, for the improvement of the harbors of Ayr, Port-Glasgow, and Greenock, and for the deepening of the Forth, the Clyde, and other rivers. One of the tasks committed to him was to decide whether a projected canal between the firth of Clyde and the Western ocean should be made by way of Crinan or of Tarbert; and the last—also the greatest—undertaking of this kind on which he was employed was a survey for a canal between fort William and Inverness; a work which has since been executed on a greater scale by Telford. In his surveys, he made use of a new micrometer, and of a machine, also of his own invention, for drawing in perspective—the latter of which appears to have been for several years about this time one of his sources of income. The reports which he drew up in the capacity of engineer are said to have been remarkable for perspicuity and accuracy.

Living in the college at Glasgow, in constant intercourse with the professors of the university, with access to books, and with much unemployed time on his hands—having, too, a great love of knowledge, and a lively interest in mechanical novelties—Watt had been a diligent student of science, and experimenter in the application of science to the arts. As early as 1759 his attention had been directed to the capabilities of steam as a motive-force by Mr. Robison (q.v.), afterward professor of natural philosophy in the university of Edinburgh, who was then a student in Glasgow. It had occurred to Mr. Robison that steam-pressure might be used to propel wheeled-carriages; but it does not appear that either Watt or he attempted to carry out this idea. In 1761 or 1762, however, Watt made a series of experiments on the force of steam, using a Papin's digester. These do not seem to have led to any results; and it was not till the winter of 1763–64 that he began the investigations which ended in his improvement of the steam-engine. During that winter a working model of the Newcomen engine, kept for the use of the natural philosophy class in the college, was sent to him to be put in repair. Watt quickly found out what was wrong with the model, and easily put it into order. But in doing this he became greatly impressed with the defects of the machine, and with the importance of getting rid of them. The Newcomen engine (see STEAM-ENGINE) was still but little used, and only for pumping water out of mines. It was a cumbersome machine, and it required so much fuel that the expense of working it had restricted, and must always have restricted its use. It was not a steam-engine at all. It was worked by means of the atmospheric pressure; steam being only used in producing by its condensation, a vacuum in a cylinder, into which—the vacuum made—a piston was depressed by the pressure of the air. The steam issuing from a boiler was admitted into the cylinder until it filled it, when the supply was cut off by a self-acting cock; and then the steam was condensed in the cylinder by means of a jet of water. The water so greatly cooled the cylinder that the greater part of the steam at each stroke of the piston was wasted in heating its walls; and on the other hand, much of the injected water was heated to the boiling-point, and gave off steam which resisted the descent of the piston. Watt found that about four-fifths of the steam, and consequently of the fuel, was wasted; and he saw that to make the machine work economically, two apparently incompatible conditions must be obtained—first, that the walls of the cylinder must constantly be of the same temperature as the steam which came in contact with them; and second, that the injected water must never be heated up to 100°, the boiling-point *in vacuo*. He now experimented upon the conducting power of various substances, and made trial of a cylinder made of wood steeped in oil; but with this cylinder, though it cooled les rapidly than a metallic one, there was still far too much waste of steam. Constantly, from the end of 1763, occupied with the subject of steam, he at length, early in 1765, hit upon the expedient which solved all his difficulties—the separate condenser, an air-exhausted vessel, into which the steam should be admitted from the cylinder and there condensed. The separate condenser at once prevented the loss of steam in the cylinder which had arisen in the process of condensation; and there was no difficulty in keeping it cool, so as to prevent the undue heating of the injection-water. He had now got a perfectly economical engine on Newcomen's principle, but he did not rest content with

this—he resolved to make steam his motive-power. Closing the cylinder at both top and bottom, and connecting the piston with the beam, to which it was to communicate motion, by a piston-rod passing through a stuffing-box, he admitted the steam by suitable valves alternately above and below the piston, to push it downward and upward in turn; and this done, his invention was substantially complete. He had at last made a real steam-engine, capable of being worked with a comparatively small expenditure of fuel, and of yielding any desired amount of power. Comparing his invention with the atmospheric engine of Newcomen, it must be admitted that it is not without justice that the popular voice has awarded him the name of inventor of the steam-engine.

Watt, soon after perfecting his model, formed a partnership with Dr. Roebuck, then of the Carron iron-works, for the construction of engines on a scale adapted to practical uses; and a model was erected at Kinneil, near Borrowstounness, where Dr. Roebuck then lived. But Roebuck got into difficulties; and nothing further was done until, in 1773, Watt entered into a partnership with Matthew Boulton of Soho, near Birmingham, when, Roebuck's interest having been repurchased, the manufacture of the new engine was commenced at the Soho iron-works. A patent for his invention had been taken by Watt in 1769. He got from parliament a prolongation of his patent for 25 years in 1775.

The advantages of the new engine were in no long time found out by the proprietors of mines; and it soon superseded Newcomen's machine as a pumping-engine. Watt afterward made numerous improvements in its construction (for the most important of which see STEAM-ENGINE); and in conjuction with his partner Boulton, he immensely improved the quality of the workmanship employed in building engines and other machines. In the years 1781, 1782, 1784, 1785, he obtained patents for a series of inventions—among them the sun-and-planet motion, the expansive principle, the double engine, the parallel motion, and the smokeless furnace, of most of which the chief purpose was to make steam-pressure available for turning machinery in mills. The accomplishment of this—extending the application of the new power to the arts—was of scarcely inferior importance to the invention of the steam-engine itself. The first contrivance invented by Watt for this purpose was lost to him through the treachery of a mechanic, who had been employed in making the model, who sold it to a manufacturer named Prickards, who got a patent for it for himself. The application to the steam-engine of the governor (see STEAM-ENGINE) was Watt's crowning improvement. He made numerous inventions unconnected with the steam-engine, several of which he patented, but they are all of minor importance.

He retired from business in the year 1800, giving up to his two sons his interest in the extensive and prosperous business which Boulton had created at Soho. He died at Heathfield in Staffordshire, on Aug. 25, 1819, in his 84th year. Watt was twice married: first in 1763, to his cousin, Miss Miller; and a second time shortly after his removal to Birmingham, to a Miss M'Gregor of Glasgow. He had a most extensive and accurate knowledge of the physical sciences—to several of which he made important contributions—and an almost unsurpassed fund of general information. (His claims to be considered the discoverer of the composition of water are considered in the article WATER.) He was elected a fellow of the Royal Society of Edinburgh in 1784; a fellow of the Royal Society of London in 1785; a corresponding member of the Batavian Society in 1787; and in 1808, a corresponding member, and afterward a foreign member, of the institute of France. The university of Glasgow conferred on him the degree of LL.D. in 1806. His statue, the funds for which had been raised by a public and almost a national subscription, was erected in Birmingham in 1824; and his statue is now to be seen in the streets of many of our larger towns. The honor paid to his memory and to himself in his later years appear to have been deserved by his personal qualities, no less than by the immeasurable benefits which his inventive talents have conferred upon the human race.

WATTEAU, ANTOINE, was b. at Valenciennes, in the year 1684. In 1702 he betook himself to Paris, where for some time he worked as assistant to a scene painter. When this employment failed him, by the retirement of his master from Paris, he employed himself in copying pictures. The talent which he showed in this humble walk of the art drew the attention of Gillot, a popular painter of the day, who engaged him to assist in his studio. In no long time it was found that the pupil excelled his master, who speedily relinquished the field in his favor, and became an engraver. The success of Watteau was now assured; he was made a member of the French academy, and became by special favor *peintre de fêtes galantes du roi*. In 1718 he visited England, it is believed chiefly on account of his health, and to consult a certain Dr. Meade, then famous, for whom, during his stay, he painted one or two pictures. He remained about a year, without, as it should seem, much benefit. After his return home, his health gradually declined; and in 1721 he died at Nogent, near Paris.

In virtue of their charming color and graceful design, the pictures of Watteau continue to please, though his reputation as an artist is now but a faint echo of that which, in his lifetime, he enjoyed. He employed himself chiefly in painting small landscapes, with something of the nature of the *fête galante* going on in them—idylls in court-dress, which, as preserving for us the fopperies of the time, are not without a certain value distinct from their properly artistic one.

WATTERSON, HENRY, b. D. C., 1840; editor of the *Democratic Review* in 1858; removed to Tennessee in 1861, and was in the confederate army during the civil war except for one year, when he edited the Chattanooga *Rebel*. For a year after the war he was editor of the Nashville *Banner*. On the death of G. D. Prentice he became editor of the Louisville *Journal*, afterwards consolidated with other papers, and called the *Courier-Journal*. He was elected to congress in 1876. In 1892 Mr. Watterson was very influential in committing the Democratic party to the policy of a radical reform of the tariff. He has published *Oddities of Southern Life and Character* (1883).

WATTERSON, JOHN AMBROSE, D.D., b. Blairsville, Penn., 1844; was educated at St. Vincent's coll., Penn., and at St. Mary's coll. and sem., Md.; was ordained a Rom. Cath. priest, 1868; held the chair of classics at St. Mary's coll., and then of theology, and was elected pres. of the coll. and sem., 1880. He was consecrated bp. of Columbus, O., 1880.

WATTLE. See ACACIA.

WATTLE-BIRD, *Anthochæra carunculata*, an Australian bird, of the family of honey-eaters (*meliphagidæ*). It is about the size of a magpie, grayish brown above, each feather striped, and bordered with white; the tail brown, long, wide, and graduated. It derives its name from a pendulous reddish wattle on each side of the throat.

WATTS, GEORGE FREDERICK, b. London, Eng., 1817. His first large oil-paintings, "Echo," and "Alfred inciting the Saxons," received a prize of £500 at the Westminster Hall competition of 1843, and were placed in the then new houses of parliament, for which he also painted "St. George overcoming the Dragon." In 1867 he became a royal academician. He has executed several large fresco designs of merit, the best being that in Lincoln's Inn hall, representing the law-givers of different ages and races, and some remarkable portraits. He retired 1896.

WATTS, HENRY, 1815–84; b. and d. London; graduated at Univ. coll. in 1841. His writings on chemistry are valuable and very extensive. In 1850 he was appointed editor of the *Journal of the Chemical Soc.*, and in 1866 was chosen a Fellow of the Royal Society.

WATTS, ISAAC, was b. on July 17, 1674, at Southampton, where his father had a boarding-school. He was educated at the grammar-school of his native place, and afterward sent, at the age of 16, to an academy in London, kept by Mr. Thomas Rowe, an Independent minister. Here his devotion to his studies was so excessive as to permanently injure his constitution. In 1696 he became tutor in the family of sir John Hartopp, at Stoke-Newington, with whom he remained six years. During the latter part of this time he officiated as assistant to Dr. Chauncey, minister of the Independent church in Mark lane, to whose post he succeeded in 1702. His health was throughout infirm; and in 1712 he was prostrated by an illness so violent that he never thoroughly recovered from its effects, though he lived for many years afterward. A visit which he paid to sir Thomas Abney, at Theobalds, for change of air, resulted in his domestication in the establishment till his death, 36 years afterward, on Nov. 25, 1748. As his health permitted, he continued to discharge his clerical duties, and to occupy himself with literary pursuits. His theological works were numerous, but are now quite forgotten. His treatise on *Logic*, though long since superseded, had in its day a considerable reputation, and was adopted as a text-book by the university of Oxford. "He was," says Montgomery, "almost the inventor of hymns in our language." His poetical works are: *Horæ Lyricæ; Hymns and Spiritual Songs; Psalms of David in the Language of the New Testament; Divine and Moral Songs for Children.* His psalms and hymns were long used exclusively in the churches, and many of them are found in all modern church collections. A complete collection of his works was published by Drs. Jennings and Doddridge (6 vols. 4to. 1754).

WATTS, JOHN, 1749–1836, b. N. Y.; recorder of New York. He was a member of congress, 1793–96; and judge of Westchester co., 1802–8. He founded an orphan asylum in New York. His father JOHN (1715–89) was an extensive land-holder, who served for many years in the legislature, and in the council. He married a sister of James De Lancey, the governor of New York, was a partisan of the royalists, and left the colony for England in 1775. His estates were confiscated.

WATTS, THOMAS, a distinguished philologist and librarian, was b. in London in the year 1811. At school he studied Latin and French, and in due time Greek as well; but he principally distinguished himself by his attainments in English. He read every book that came in his way, and he wrote, apparently with the utmost ease, tales, essays, and poetry, very much above the average, not alone of school-boy composition, but of the magazine-writing of the day. To a knowledge of the classics and French, Watts soon added an acquaintance with the other languages of the Latin family—as Italian, Spanish, and Portuguese; likewise with the German, Dutch, Swedish, Danish, and Icelandic. The facility with which he acquired these several languages, encouraged him to undertake, from time to time, the study of some of the oriental tongues, viz., Hebrew, Arabic, Persian, Turkish, and even Chinese. In each of these he made considerable progress, but cannot be said to have mastered any of them as he did those languages before named, and as he subsequently mastered the Russian, Polish, and Hungarian. There are few Englishmen who know anything of the three languages last named, which Watts could read and translate with the utmost ease—being as familiar

in fact, with their great writers as he was with those of Germany or France. It remains only to mention that Watts was also well acquainted with the Welsh language and literature, besides having some knowledge of the Gaelic and Irish as well. Upward of 20 languages have thus been named with which he was well acquainted. No other Englishman has approached him as a linguist, considering the *variety* as well as the *number* of languages which he acquired; while of foreigners, it is not too much to say that Mezzofanti alone appears to have surpassed him.

In 1832 Watts first became a "reader" in the reading-room of the British museum, where, in studying some of the languages mentioned, he became acquainted with the deficiencies in the literature of other countries under which the national library then labored. In 1837 the Rev. Mr. Baber, then keeper of the printed books, purchased, at his recommendation, a small collection of Russian books, which Watts offered to catalogue as a volunteer. This brought him the acquaintance of Mr. Panizzi, who, becoming aware of his attainments, recommended him for employment in the library. Accordingly, he was engaged as an assistant in the department of printed books, Jan., 1838. At that time, the books were being transferred from the old rooms in Montague house to the new library. It was Watts's duty to assist in the rearrangement of the books, and when this was finished, he was intrusted with the responsible duty of arranging and placing on their shelves, according to subjects, all the new works purchased or otherwise acquired for the library. For this his vast acquirements as a linguist eminently qualified him. In other respects also his knowledge of languages was brought to bear in the service of the museum. He drew up lists of desiderata in all the languages of Europe. It was at his suggestion also that the first large orders were given for American books. "The object" (says Watts in a letter to the principal librarian in 1861, printed by order of the house of commons in 1866) "which has been kept in view during the last three-and-twenty years has been to bring together from all quarters, the useful, the elegant, and the curious literature of every language; to unite with the best English library in England or the world the best Russian library out of Russia, the best German out of Germany, the best Spanish out of Spain, and so for every language from Italian to Icelandic, from Polish to Portuguese. In five of the languages in which it now claims this species of supremacy, in Russian, Polish, Hungarian, Danish, and Swedish, I believe I may say that, with the exception of perhaps fifty volumes, every book that has been purchased by the museum within the last three-and-twenty years has been purchased at my suggestion. I have the pleasure of reflecting that every future student of the less known literatures of Europe will find riches where I found poverty." The number of books classified and arranged by Watts, while only an assistant in the library, is reckoned at about 400,000 volumes, and of these as many as 100,000 were arranged upon a plan of his own invention, now known as "the elastic system." "One of the advantages," he says, in the letter before mentioned, "obtained by this system is, that when the new library, which surrounds the new reading-room, was ready for the reception of books, these 100,000 volumes were removed to their new locality without the necessity of altering a single press-mark: had the operation of altering the press-marks been still required, as under the former system, the amount of labor necessary to effect it would have been enormous, and the expense not less than some thousands of pounds." Here it may be mentioned that it was Watts who first suggested the erection of a library and large reading-room in the vacant quadrangle, where now rises the splendid dome erected under the auspices of Panizzi. The suggestion was originally made in a series of articles contributed anonymously to the *Mechanics' Magazine* for 1836 and 1837, since that time acknowledged by Watts as his own. In one of these, speaking of the quadrangle, he says: "The space thus unfortunately wasted would have provided accommodation for the whole library. A reading-room of ample dimensions might have stood in the center, and been surrounded on all four sides by galleries for the books, communicating with each other, and lighted from the top." In 1856 Watts was promoted to be assistant-keeper of the printed books; and on the opening of the splendid new reading-room in 1857, he was most fitly appointed its superintendent. In Aug., 1866, Watts was appointed keeper of the department of printed books. He died Sept. 9, 1869. Watts was a member of the philological society of London; he was also an honorary member of the Hungarian academy, to which he was elected at the same time as the late lord Macaulay. Among the literary productions of Watts may be mentioned: "Notes of a Reader," contributed to a weekly periodical entitled *The Spirit of Literature*, 1830; numerous poetical pieces contributed to Linnington's *Rhetorical Speaker and Poetical Class-Book*, 1833; *A Letter to Antonio Panizzi, Esq., on the reputed Earliest Printed Newspaper, "The English Mercurie*, 1588," 1839; *A Sketch of the History of the Welsh Language and Literature* (reprinted from Knight's *English Cyclopædia*), 1839; more than a hundred biographies of eminent men, Russian, Hungarian, Bohemian, etc., contributed to the same *Cyclopædia;* numerous articles in the *Biographical Dictionary* of the society for the diffusion of useful knowledge; papers in the *Transactions of the Philological Society*, among which are an "Essay on the Hungarian language," and a biographical notice of cardinal Mezzofanti; also contributions to the *Quarterly Review*, the *Athenæum*, and other literary periodicals.

WAT TYLER. See Tyler Insurrection.

WAUKEGAN, city and co. seat of Lake co., Ill.; on lake Michigan, and the Chicago and Northwestern and the Elgin, Joliet, and Eastern railroads; 35 miles n. of Chicago. It contains a high school, St. Joseph's school, school of the Immaculate Conception, St. Alberta's convent, public library, hospital, national and state banks, electric and acetylene gas light plants, electric street railroads, and waterworks supplied from the lake. The manufactories include extensive wire and iron works, sugar refinery, starch and lubricating works, and foundries and machine shops. The city also has a large interest in the lake fisheries. Pop. '90, 4915.

WAUKE'SHA, a co. in s.e. Wis.; 576 sq. m.; pop. '90, 33,270. Co. seat, Waukesha.

WAUKESHA, city and co. seat of Waukesha co., Wis.; on the Fox river, and the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, and the Wisconsin Central railroads; 20 miles w. of Milwaukee. It is the seat of the state industrial school for boys, and of Carroll college (Pres.), and has a high school, Keeley institute, electric lights, about a dozen churches, national banks, the shops of the Wisconsin Central railroad, large malleable iron works, numerous mineral springs and bottling works, and quarries of good building-stone. Pop. '90, 6321.

WAUPAC'A, a co. in e. Wisconsin; 756 sq. m.; pop. '90, 26,794. Co. seat, Waupaca.

WAUSAU, city and co. seat of Marathon co., Wis.; on the Wisconsin river, and the Chicago, Milwaukee, and St. Paul, and the Chicago and Northwestern railroads; 40 miles n. of Stevens Point. It has electric lights, waterworks, public parks, national banks, about 20 churches, co. court-house, co. insane asylum, and daily and weekly newspapers. The principal industries are those connected with the lumber trade, and milling, mining, and granite quarrying. Pop. '90, 9253.

WAUSHA'RA, a co. in central Wisconsin, bounded on the s.e. by Fox river; 645 sq. m.; pop. '90, 13,507. Co. seat, Wautoma.

WAVE, the name given to a *state of disturbance* propagated from one set of particles or a medium to the adjoining set, and so on; sometimes with, sometimes without, a small permanent displacement of these particles. But the essential characteristic is, that energy (see FORCE), not matter (q.v.), is on the whole transferred. The theory of wave-motion is of the utmost importance in physical science; since, besides the tide-wave, waves in the sea, in ponds, or in canals, undulations in a stretched cord (such as a piano-forte wire), or in a solid (as sound-waves or earthquake-waves), we know that sounds in air are propagated as waves (see SOUND), and that even light (see UNDULATORY THEORY) is a form of wave-motion.

In the present article we will merely *state* some of the more important conclusions which mathematical analysis has established in the more difficult of these inquiries, comparing them with the observations of Scott Russell and others; while we give at full length the very simple investigations of the motion of a wave along a stretched cord, and of the propagation of a particular kind of sound-wave.

To find the rate at which an undulation runs along a stretched cord, as for instance, when a harp-string is sharply struck or plucked near one end, a very simple investigation suffices. Suppose a uniform cord to be stretched with a given tension in a smooth tube of any form whatever, we may easily show that there is a certain velocity with which the cord must be drawn through the tube in order *to cease to press on it at any point*, that is, to move independently of the tube altogether. For the pressure on the tube is due to the tension of the cord; and is relieved by the so-called centrifugal force (see CENTRAL FORCES) when the cord is in motion.

If T be the tension of the cord, r the radius of curvature of the tube at any point, the pressure on the tube per unit of length is

$$\frac{T}{r}.$$

If m be the mass of unit length of the cord, v its velocity, the centrifugal force is

$$\frac{mv^2}{r}.$$

These are equal in magnitude, and so destroy each other, if

$$T = mv^2.$$

Hence, if the cord be pulled through the tube with the velocity thus determined, there will be no pressure on the tube, and *it may therefore be dispensed with.* If we suppose the tube to have a form such as that in the figure, where the extreme portions are in one straight line, the cord will appear to be drawn with velocity v, along this, the curved part being occupied by each portion of the cord in succession; presenting something like the appearance of a row of sheep in Indian file, jumping over a hedge.

FIG. 1.

To a spectator moving in the direction of the arrow with velocity v, the straight parts of the cord will appear to be at rest, while an undulation of *any* definite form and size whatever runs along it with velocity v, in the opposite direction. This is a very singular case, and illustrates the possibility of the propagation of a *solitary* wave.

Thus we have proved that the velocity with which an undulation runs along such a cord is

$$\sqrt{\frac{T}{m}}.$$

If l be the length of the cord in feet, w its whole weight, W the appended weight by which it is stretched, $g = 32.2$ ft., the measure of the earth's gravity, this becomes

$$\sqrt{\frac{W}{w} lg}.$$

This formula is found to agree almost exactly with the results of experiment. We can easily see why it should be to some small extent incorrect, because we have supposed the cord to be inextensible, and perfectly flexible, which it cannot be; and we have neglected the effects of extraneous forces, such as gravity, the resistance of the air, etc.

Let us next consider the motion of air in a cylindrical tube, in the particular case in which the leg of a vibrating tuning-fork is applied at one end. This is a simple case of the propagation of sound-waves. We shall treat it by a synthetical process, somewhat like that given by Newton.

As we have already seen (see PENDULUM), a simple vibration such as that of a pendulum or tuning fork is the resolved part, in a definite line, of the uniform motion of a point in the circumference of a circle. What we have now to show is, that such a motion of all the particles of air in the pipe, the *phase* of the vibration (or the position of the particle in its path at any instant) depending on its distance from the end of the tube, is consistent with mechanical principles. When this is done, it will be easy for us to trace, in this particular example, the process by which the wave is propagated from one layer of the fluid to the next. We must now consider (a little more closely than in PENDULUM or SOUND) the nature of the simple vibration of each particle of the air.

Suppose P to move, with uniform velocity V, in the circle APB, and let PQ be drawn perpendicular to the fixed diameter, OA, then the acceleration of P's motion is $\frac{V^2}{OA}$ in the direction PO. Hence in the motion of Q, which is a simple vibration, we have, by the rule for resolving velocities and accelerations (see VELOCITY),

$$\text{Velocity of Q} = \frac{PQ}{OA} V \text{ in the direction QO};$$

$$\text{Acceleration of Q} = \frac{OQ}{OA} \frac{V^2}{OA} \text{ in the direction QO.}$$

Next consider two particles of air near one another in the axis of the tube, or the masses of air in two contiguous cross-sections of the tube. If the phase of vibration were the same for both they would be *equally* displaced from their original positions and the air between them would be neither compressed nor dilated. Hence, that a wave may pass, the phases must be different. Let, then, Q represent the position of the one particle, or layer, in its line of vibration at any instant; Q′, the simultaneous position of the other. The first will be displaced through a space OQ from its position of rest; the second, through a space OQ′; and their distance will therefore be altered by the amount QQ′, which may be taken to represent the compression or dilatation. But it is easy to see that, as P and P′ move round, QQ′ is always proportional to PQ. Hence the compression or dilatation of the air in any cross-section of the tube is proportional to the velocity with which it is moving. Hence the difference of pressures before and behind any such section is proportional to the difference of velocities—i.e., to the acceleration of the motion while the section passes over a space equal to its own thickness. And this is consistent with mechanical principles, for the *mass* of air in the section is constant, while the difference of pressures before and behind produces the acceleration, and should therefore be proportional to it. The particles of air in cross-sections of the tube therefore vibrate, each in the same period as does the tuning-fork, but the phase is *later* for each section in proportion to its distance from the fork. Where the phase is one or more whole vibrations later than that of the fork, the motion is exactly the same as that of the fork, and *simultaneous* with it. At all other points, it is the same as that of the fork, but not simultaneous. Thus the greatest displacement of the fork is immediately shared by the layer next it, later by the next layer, and so on. Thus, a *wave* of displacement travels along the tube from one section to the next, while each particle merely oscillates backward and forward through (in general) a very small space about its position of rest.

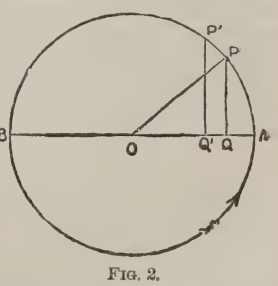

FIG. 2.

The reader who has followed the little geometrical investigation above will have no

difficulty in proving for himself that the velocity with which the wave travels is proportional to

$$\sqrt{\frac{p}{\rho}},$$

where p is the pressure, and ρ the density of the air. The easiest mode of doing this is to express, in terms of these and other quantities, the equation given us by the laws of motion,

$$\text{Mass} \times \text{Acceleration} = \text{Difference of pressures},$$

and to assume that Hooke's (q.v.) law holds, even during the *sudden* compression of air. This, we know, is not the case; so that a correction has to be applied to the above expression; depending on the heat developed by sudden compression or lost in sudden rarefaction, by each of which the elastic force of the air is *increased*. But this has been already discussed in Sound.

The above formula shows us, however, that the velocity of sound is not affected by the pressure of the air—i.e., the height of the barometer—since, in still air, p is *proportional* to ρ. The velocity does depend on the temperature, being, in fact, proportional (*ceteris paribus*) to the square root of the temperature measured from absolute zero. See Heat.

We see also from the formula that the velocity is inversely as the square root of the density of the gas—the pressure being the same. Thus a sound-wave travels about four times faster in hydrogen than in air.

Also we see that, within the limits of approximation we have used, the velocity does not depend upon the intensity, pitch, or quality of the sound (q.v.). The investigations which seem to lead to slight modifications of this conclusion are too recondite to be introduced here. We can only mention, also, the beautiful investigations of Stokes (q.v.) connected with the extinction of a sound-wave as it proceeds, partly by fluid friction, partly by radiation. And we may conclude by stating that the result of a completely general investigation of the velocity of a sound-wave gives, to a first approximation, the result we have deduced from the study of a simple particular case.

We now come to the consideration of waves in water. Of these, there are several species. One, however, we may merely mention, as its theory is the same as that just briefly discussed. This is a sound-wave, or *wave of compression*, in water. Its velocity is considerably greater than that of sound in air (see Sound). The others, which are commonly observed on the surface of water, depend on mere changes of level, and their effects; and in studying them, we may consider water as incompressible.

The first of these is what is called a *long* or *solitary* wave. Its essential characteristic is, that its length is great compared with the depth of the liquid in which it moves. To this class belong the tide-wave (see Tides), and the long wave which accompanies a canal-boat, and which we see slowly traversing the canal when the boat is stopped. Scott Russell has made many interesting observations on this wave, all of which accord well with the results of the mathematical theory of its propagation. The velocity of this wave depends solely on the depth, not on the density of the liquid in which it moves—and in a uniform canal the velocity is that which would be acquired by a stone falling freely through a space equal to half the depth of the water. Another characteristic of this wave is that, after it has passed, it leaves the water bodily transferred through a small space along the bed of the canal—forward or backward, according as it consists of an elevation or a depression of the water-surface. Scott Russell has shown that the most favorable rate at which a canal-boat can be drawn is when its velocity is such that it rides on the crest of the solitary wave. If drawn at any other speed, it leaves the solitary wave behind, or is left by it; and in either case, part of the horse's work is expended in producing fresh solitary waves. An excellent mode of observing these waves is to tilt slightly a rectangular box containing some water, and restore it to its original position. A long wave is thus formed, which is reflected repeatedly at the ends of the box, and whose rate of motion may be accurately observed by watching the image of a candle reflected at the surface of the water. If the sides of the box be made of glass, and some light particles be dispersed through the water, their motions enable us to discover all the circumstances of the propagation of this wave.

We next come to what are called *oscillatory* waves in water or other liquids. To this class belong all waves whose length from crest to crest is small compared with the depth of the liquid; from ripples on a pool to the long roll of the Atlantic. They are never observed as solitary waves, their general characteristic being their periodical recurrence. And, by watching a piece of cork floating on the surface, we see that it moves forward when at the crest of the wave, and backward through an equal amount when in the trough. Also it rises while passing from the trough to crest, and sinks from crest to trough. Mathematical investigation, confirmed by experiments with floats at sea, and with short waves in the glazed box before described, shows that each particle of the water describes a *circle* about its position of rest in the vertical plane in which the wave is advancing. Particles at greater and greater depths describe smaller and smaller circles. The diameters of these circles diminish with extreme rapidity. At a depth equal to the distance from crest to crest (i.e., the length of the wave), the displacement

of the water is already only $\frac{1}{8\,8\,5}$ of that at the surface. At the depth of two wave-lengths, it is about $\frac{1}{3\,0\,0\,0\,0\,0}$ of that at the surface. Thus we may see to how small a depth the ocean is agitated even by the most tremendous wind-waves; for, according to Scoresby, 43 ft. is about the utmost difference of level between crest and trough in ocean-waves. If the wave-length be 300 ft. (which is a large estimate), then at a depth of 300 ft. the water-particles describe circles whose radii are only the $\frac{2\,1}{8\,8\,5}$ of a foot, or about four-tenths of an in.; and at 600 ft. this is reduced to $\frac{1}{1\,2\,0\,0}$ of an in.; while the depth of the Atlantic is in many parts more than three or four miles. In this case, the velocity of propagation of the wave has been shown to be

$$\sqrt{\frac{gl}{2\pi}}$$

where g is, as before, 32.2 ft.; l is the wave-length in feet; and π is the ratio of the circumference of a circle to its diameter (see QUADRATURE OF THE CIRCLE). Thus the velocity of an oscillatory wave in deep water is proportional to the square root of its length. This fact has been of use as an analogy in helping us to account for the *dispersion* (see REFRACTION) of light, where, by experiment, we know that the waves of red light are longer than those of blue light, and also that they travel faster in refracting media. When the depth is not infinitely great compared with the length of a wave, theory and experiment agree in showing that the motion of each particle takes place in an ellipse whose major axis is horizontal. These ellipses diminish rapidly in length as we descend in the liquid, but still more rapidly in breadth; so that, as was to be expected, the particles *at* the bottom oscillate in horizontal straight lines. The expression for the velocity of propagation is now by no means so simple as in the previous cases—but is easily shown to include the values already given. So far, the first approximation. A section of the surface made by a vertical plane in the direction of the wave's motion, is shown to be bounded by the *harmonic curve*, or curve of *sines*, the form assumed by a vibrating string (see SOUND); from which it follows that the crests are similar to the troughs. The second approximation makes the troughs flatter, and the crests steeper, and also shows that the particles are, on the whole, carried *forward* by each successive wave. The amount of this progression diminishes rapidly with the depth below the surface. A third approximation shows that the velocity is, *ceteris paribus*, greater the greater is the height of the waves. When waves advance toward the shore, their circumstances change, in general gradually, from those of oscillatory waves to those of waves of translation, as the depth of the water becomes less and less considerable in comparison with the length of the wave; and it is found by experiment that they "break," as it is called, when the depth of the water is about equal to the height of the crest above the undisturbed level. All the curious phenomena of breakers are thus easily explained by the results we have already given, when they are considered with reference to the gradual alteration of the depth of the water.

Finally, we must notice a singular phenomenon often observed, viz.: that, of a series of waves breaking on the coast, every eighth, or ninth, or tenth, etc., is seen to be higher than its predecessors or successors. The explanation is simple enough, and points to the simultaneous existence of two or more sets of oscillatory waves of different lengths, due in general to quite distinct causes, which reach the shore together. This might lead us to consider the very interesting case of "*Co-existence of Small Motions*" presented by the interference (q.v.) of such waves: but we have already in various articles (see POLARIZATION, SOUND, UNDULATORY THEORY) given sufficient examples to illustrate the great principle. There remains the consideration of the propagation of waves in elastic solids, among which, at least so far as luminiferous vibrations are concerned, it appears that the ether (q.v.) must be ranked. This is a subject of a higher order of difficulty than any of those before mentioned, and, in the case of light at least, has not yet been treated in a thoroughly satisfactory manner, though such men as Cauchy, Neumann, Maccullagh, Green, and Stokes have written profound memoirs upon it. See illus., SOUND, Vol. XIII.

WAVERLY, a village in Tioga co., N. Y.; on the Chemung river and the Delaware, Lackawanna, and Western, the Erie, and the Lehigh Valley railroads; 16 miles s.e. of Elmira. It has a national bank, high school, with library, electric lights and street railroads, daily and weekly newspapers, and manufactories of toys, furniture, cigars, machinery, and car wheels. It ships large quantities of grain, and is surrounded by a farming and dairying country. Pop. '90, 4123.

WAVRE, a t. in the province of South Brabant, Belgium, situated on the Dyle, 15 m. s.e. of Brussels, has a pop. of (1890) 7575, and manufactories of cotton-yarn and paper. Wavre is better known as the scene of a desperate and protracted conflict between the French and Prussians, on June 18–19, 1815. The former, under Grouchy, Gerard, and Vandamme, advanced against the Prussians at the same time as Napoleon directed the troops under his immediate orders against Wellington at Waterloo (q.v.), and being much superior in number (32,000 to 15,200), drove the Prussians, under Thielmann, into Wavre, where they defended themselves with desperate firmness, repulsing 13 different assaults in the course of the 18th. On the following morning, Thielmann, who had heard of the victory at Waterloo, attacked Grouchy, but was repulsed with vigor, though the urgent orders of Napoleon forced the latter to retreat to Laon.

WAX. Under this term, chemists include various matters of a well-known (so-called *waxy*) appearance, derived both from the animal and the vegetable kingdoms. While in their general relations they approximate to the fats, they differ materially from the latter in their chemical composition; those of them which have been carefully examined, being found to consist partly of mixtures of alcohols and compound ethers, and partly of free fatty acids. Their general properties may be thus laid down: They are solid or semi-solid matters; are easily broken when cold, but at a moderate warmth are soft and pliable, and fuse at a temperature below 212°. They have a peculiar glistening appearance, are lighter than water, are insoluble in that fluid and in cold alcohol, but dissolve readily in ether; they are combustible, and burn with an illuminating flame, are non-volatile, and when heated in a free atmosphere, undergo decomposition. In this category are included spermaceti (which has been already considered), bees-wax, Chinese wax, and other less known kinds, as palm or vegetable wax (obtained from the bark of *ceroxylon andicola*, by the action of hot water and pressure), Carnahuba wax (an exudation from the leaves of a Brazilian palm), sugar-cane wax, etc.

Bees-wax is an animal secretion formed by the bees from sugar, and constitutes the material of which the cells of the honey-comb are composed. It is obtained by expressing the honey, and fusing the residue in boiling-water. In this state it is of a yellow color (*cera flava*). It may be bleached, so as to form white wax (*cera alba*), by being exposed in thin slices to the action of solar light, or by the action of nitric acid. (Chlorine readily destroys the color, but renders the wax unfit for candle-making, as a portion of the hydrogen of the wax is replaced by chlorine, and the candles, when burning, evolve irritating vapors of hydrochloric acid gas.) From the researches of sir B. Brodie (*Phil. Trans.*, 1848–49), it appears that wax consists of three different substances, *myricin*, *cerin*, and *cerolein*, which are separable from one another by means of alcohol. *Myricin*, which is insoluble in boiling alcohol, constitutes more than two-thirds of the bulk of ordinary wax *Cerin*, or *cerotic acid*, which dissolves in boiling alcohol, but separates on cooling, varies in quantity in different specimens. In one sample of genuine bees-wax, Brodie found that it constituted 22 per cent, and it was always present in European samples, while in Ceylon wax it was entirely absent. This curious variation in the nature of an animal secretion, under different conditions of life, resembles the variations sometimes noticed in the acids of butter, in which the butyric and caproic acids of one season are replaced in another by vaccinic acid, differing from the former acids in the amount of oxygen alone. *Cerolein*, the substance soluble in cold alcohol, is a greasy body, constituting 4 or 5 per cent of ordinary wax. Without entering into chemical details, we may observe that bees-wax yields the following derivatives: Cerotic acid or cerin, $C_{27}H_{54}O_2$; cerylic alcohol or cerolin, $C_{27}H_{55}\cdot OH$; melissylic alcohol or melissin, $C_{30}H_{60}\cdot OH$; melissic acid, $C_{30}H_{60}O_2$; palmitic acid, $C_{16}H_{32}O_2$; myricin, $C_{30}H_{61}\cdot C_{16}H_{31}O_2$; and melene, $C_{30}H_{60}$.

Chinese wax, $C_{27}H_{55}\cdot C_{27}H_{53}O_2$, is supposed to be the produce of a species of insect of the coccus family, and consists principally of cerotic acid, in combination with oxide of cerotyl.

Both yellow and white bees-wax occur in the Pharmacopœia. The characters and tests, as given in that work, are—*Of yellow wax:* "Firm, breaking with a granular fracture, yellow, having an agreeable honey-like odor; not unctuous to the touch, does not melt under 140°, yields nothing to cold rectified spirit, but is entirely soluble in oil of turpentine; boiling water in which it has been agitated, when cooled, is not rendered blue by iodine." *Of white wax:* "Hard, nearly white, translucent; not unctuous to the touch, does not melt under 150°." The iodine test is used because wax is often adulterated with starch. Wax was formerly much employed internally as an emollient medicine, in cases of suspected ulceration of the intestines. At present it is only used as an external agent, being an ingredient of many ointments and plasters.

The commercial value of bees-wax is very great; and if it were possible to ascertain the total of the quantity produced, it would cause great surprise at the amount of valuable material derived from a source apparently so insufficient. Its chief uses are for candles, modeling, medicinal cerates or ointments, besides many minor purposes. Nearly 500 tons are annually imported into Great Britain, the value of which is about £80,000; but so large is the quantity consumed in the ceremonies of the Greek and Roman churches, that Russia alone consumes more than four times that amount, and the various Catholic countries probably ten times as much. The Insect Wax of China, or Pe-la, has lately been imported in small quantities, and used in the manufacture of candles by Messrs. Price & Co.; but it is far too costly for general use (see Wax Insect). In China, this wax is very highly valued, and is so costly as to be used only by the highest classes; it is white, and breaks with a crystalline fracture and pearly luster. Of vegetable wax, there are four distinct kinds known in commerce. The first in importance is the Japan Wax, which is almost as white and compact as refined bees-wax, which it closely resembles; it was first brought to Great Britain in 1859, and since then, some very considerable importations have taken place. It is said to be obtained by boiling the seeds of a species of Rhus (*R. succedanea*). It has only been used in making candles. Brazilian Vegetable Wax is also an article of regular importation, but only in small quantities; it is obtained from the leaves of *corypha cerifera*, the carnahuba palm of the Brazilians. It forms a glossy varnish-like covering; and when the leaves

are gathered, and begin to shrink from withering, it cracks and peels off, and is collected and melted into masses. It is hard and brittle, and of a dull yellow color. The candle-makers have used it for mixing and improving other materials. In Brazil, candles are wholly made of it, or half the quantity of stearine is added. The VEGETABLE WAX of the Andes is also yielded by a palm (see WAX PALM). Although much used in Mexico, it has not yet become of commercial importance to Europe. It is chiefly used for candles in the churches. MYRTLE WAX, though rarely seen in Europe, is much used in the British colonies of North America and the United States, and at the cape of Good Hope; it is also in use in Brazil. It is procured by boiling the berries of *myrica cerifera* in North America, and probably from other species in Brazil, and at the cape of Good Hope. It resembles bees-wax very much, except that it has a greenish yellow instead of a yellow color. It is only used for candle-making. See CANDLEBERRY.

Of the manufactured compounds called wax, the following are the chief—viz., sealing-wax (q.v.). MODELERS' WAX, used by artists for modeling small works. It consists of equal parts of bees-wax, druggists' lead-plaster—olive oil and yellow resin—and just sufficient whiting added to produce the consistency of putty. GILDERS' WAX consists of four parts of bees-wax, well mixed by melting with one part each of verdigris and sulphate of copper.

The bees-wax of commerce is of a dirty yellow color, and mixed with many impurities. It has, consequently, to undergo a process of bleaching, by which it is rendered quite white and pure. The usual process is to melt the wax with boiling water, and stir them together for a short time, so as to separate the impurities from the wax. It is then allowed to rest for a short time, and the pure wax floats on the top; and when cold, is taken off in a cake, the lower part of which is often discolored with the dirty water. This is scraped off and mixed with the next lot to be operated upon. The purified portion is next remelted, and is then allowed to trickle from the melting-pan on to a wooden cylinder, revolving rapidly, and partly immersed in pure cold water, in a large cistern. This throws it into the water in the form of fine, thin, feather-like flakes, which cool and harden instantly in the water. When all is run off, the wax is removed from the water, and laid on linen cloths, placed on tables in a field for the air to bleach. From time to time, the flakes are turned over and examined; and when the bleaching effect of the air seems to have stopped, the wax is remelted, and converted into flakes in the cistern, and replaced in the bleaching-ground until it is quite white.

WAX, MINERAL, is a natural product known under the name of ozokerit. It used only to be found in small quantities oozing from rocks of coal formation, though near Edinburgh, candles, as curiosities, were made of it by the miners. Lately, however, immense deposits of the hydrocarbon have been found in several parts of Europe, chiefly in Galicia and Roumania, and it has now become a commercial article for the manufacture of candles. When found, it has a dark, rich-brown color, slightly greenish and translucent in thin films; but when refined, it resembles well bleached bees-wax. Its melting-point is about 60°. It is found also in Utah and California.

WAXAHACHIE, town and co. seat of Ellis co., Tex.; on the Houston and Texas Central and the Missouri, Kansas, and Texas railroads; 30 miles n. of Dallas. It has several national banks, the Park high school, electric lights, street railroads, cotton-seed oil mill, cotton compresses, and daily and weekly newspapers; is in a cotton, wheat, and corn region; and annually handles large quantities of cotton. Pop. '90, 3076.

WAX-FLOWERS. For the manufacture of wax-flowers the wax is bleached, and prepared in thin sheets of various colors, which are cut out into the shape for petals and leaves according to the kind of flower to be imitated. They are easily made to adhere, either by a slight amount of heat or a little melted wax.

WAX INSECT, *Coccus sinensis;* see COCCUS, a very small white insect, a native of China, of the same genus with the cochineal and kermes insects, and with the scale insects, which are the pest of our greenhouses, valuable on account of the wax which it produces. It is found about the beginning of June on the branches of certain trees on the juices of which it feeds, particularly on those of a kind of sumach (*rhus succedaneum*). The wax is deposited on the branches as a coating which resembles hoar-frost. This is scraped off toward the end of August, melted in boiling-water and strained through a cloth. See WAX. The Chinese wax insect has been introduced by the French into Algeria.—Another wax insect is found in South America, but is not yet well known, nor has its wax become an article of commerce.

WAX-MYRTLE. See CANDLEBERRY.

WAX-PALM, *Ceroxylon*—or *Iriartea—andicola,* a lofty palm, found in the Andes, on the eastern borders of Peru, at an elevation of 3,000 ft. and upward above the level of the sea. It grows to the height of 160 ft., and on the cicatrices of the fallen leaves, a resinous secretion is produced in great abundance, composed of about two parts of yellow resin, and one of a kind of wax, more brittle than bees' wax. This wax exudes also from the leaves, and is whitish, almost inodorous, except when heated, when it gives out a resinous odor. It is used by the inhabitants of the country in which it is produced for making candles, but is usually mixed with wax or tallow. It is probable that the wax palm would succeed well in the south of Europe, as its native climate is

not dissimilar. The usual method of obtaining the wax is by felling the tree. Each tree yields about 25 lbs. The wax is scraped off, melted, and run into calabashes. The timber of this palm is very hard and durable; the leaves are used for thatching, and the fibers for cordage. The tree is a beautiful one, with a stately stem, and a head of large pinnate leaves.—In some of the northern provinces of Brazil, wax is obtained from the carnahuba palm (q.v.).

WAX-SCULPTURE. The use of wax for sculpture is believed to be of very ancient origin; and not only have the tombs of southern Italy yielded many specimens of the portraits of the deceased modeled in wax, but many fine bronzes in antiquarian collections bear evident marks of having been modeled in wax by the process called cire-perdue. This consists in producing a model in wax, and then coating it with clay or other material in a soft state; this is allowed to harden; and the wax is then melted out by heat, and the molten metal poured in. A very fine cast of the wax-figure is thus obtained; but, of course, the wax-model of the artist is lost, after the first copy is taken; hence, such specimens are very highly prized by connoisseurs. During the 14th and 15th c., the art of modeling in wax, or ceroplastics, was much practiced, especially in Italy and in Germany, by many of the first artists, even Michael Angelo not excepted; and many of their original works in wax are still preserved. They were chiefly, however, in low relief, although very fine statuettes were also produced by men of great eminence.

WAX-TREE, *Vismia*, a genus of plants of the natural order *hypericaceæ*, having a 5-parted calyx and 5 petals, generally covered with soft hairs on the inside. All the species yield a yellow viscid juice when wounded, which, when dried, becomes somewhat similar to gamboge. The species are natives of the tropical parts of America.

WAX-WING, *Bombycilla*, a genus of birds of the family *ampelidæ*, or chatterers (q.v.), having a short, straight, elevated bill, with a very wide gape, as in the fly-catchers, but without bristles; both mandibles notched at the tip; the wings rather long, broad, and pointed; the legs short; the toes long, with sharp and curved claws. The name wax-wing is derived from a very peculiar character, which the wings exhibit; some of the secondaries and tertiaries terminating in horny expansions of the shaft, resembling small pieces of red sealing-wax. The species are few, but widely diffused over the colder parts of the northern hemisphere. The only European species is the European Wax-wing, or Bohemian Chatterer (*B. garrula*), which is found in summer in the arctic regions of Europe, Asia, and America, migrating southward in winter, sometimes as far as the shores of the Mediterranean; most abundant in America, during winter, about the great lakes and the northern part of the valley of the Mississippi. It is found also in Japan. It is only an occasional winter-visitant of Britain. In some winters, numerous flocks are seen: in other winters, and more generally, none at all. It is in severe winters that this bird is most frequently seen in Britain, and in the more southern parts of Europe. It is gregarious in winter, and the flocks are often large. It feeds on insects and worms, seeds, berries, and other fruits. It is a handsome bird, nearly as large as the song thrush; a reddish gray, with a black patch on the throat, and a black band on the forehead; the tail-coverts brownish orange; the primaries, secondaries, and tail-feathers tipped with yellow, two white bands on the wings; the lower parts silvery gray. The head is surmounted by an erectile crest of brownish orange feathers. The song of the wax-wing is a weak whistling, bearing a little resemblance to that of the thrush. It is easily tamed. The flesh is said to be delicate food.—The American Waxwing, or cedar bird (*B. cedrorum* or *Carolinensis*), is a very similar, but smaller species, found only in North America, from Canada to Central America, less migratory, and never visiting arctic regions. The general color is reddish olive, passing into purplish cinnamon in front, and into ash-color behind; the chin black; no white on the wings; the lower parts yellow. It is crested like the European wax-wing. Great flocks of cedar birds collect in the end of summer. They feed on berries, and are particularly fond of those of the red cedar. The cedar bird is extremely voracious, and when food abounds, sometimes gorges itself so much, that it may be taken by the hand, It is in much esteem for the table.—Another species is found in Japan. See illus., Larks, vol. VIII.

WAXWORK, a common name for *celastrus scandens*, a climbing shrub, also called staff tree, and shrubby bittersweet. The genus comprises about eighteen species, one in the United States, the others chiefly in Asia. *Celastrus scandens*, or shrubby bittersweet, flourishes in moist soils from Canada to South Carolina, and w. of the Mississippi river, climbing upon rocks and trees to a height of 20 ft. or more; leaves alternate, ovate-oblong, pointed, finely serrate, from 2 to 5 in. in length, dark green above, lighter below; flowers dicœcious, of a greenish color in terminal racemes. Calyx five parted, bell shaped; petals five, marginal toothed; stamens five on the edge of the calyx tube; ovary three-celled, styles united, stigma three lobed. Fruit globular, about the size of a large pea, opening by three valves when ripe. They are of a rich orange color, and when fully open, expose a beautiful crimson berry.

WAXY DEGENERATION is a morbid process in which the healthy tissue of various organs is transformed into a peculiar substance, allied in some respects to amyloid compounds, and in others to albuminous substances. Organs affected by this

degeneration have a certain resemblance in consistency and physical character to wax. They may be cut into portions of the most regular shape, with sharp angles and smooth surfaces; and the thinnest possible slices may be removed by a sharp knife for microscopical examination. Such organs are abnormally translucent, increased in volume, solidity, and weight. Usually, the first parts affected by this degeneration are the small blood-vessels, the middle or muscular coat being first changed. Subsequently, the secreting cells become similarly affected. When a solution of iodine is brought in contact with such tissues, a very deep violet red color is produced; and this deep red color is alone a sufficiently characteristic test. Although amyloid degeneration is common to many tissues and organs, the parts most frequently affected are the spleen, liver, and kidneys. This morbid condition in one or more organs is the expression of a general pathological state, the conditions and relations of which are as yet but little known.

WAY, in law, denotes the right of a person or persons to pass over land of another, or the path or road over which such right may be exercised. Ways are either private or public. A private right of way is derived by grant, express or implied. If one convey part of his land to another, and cannot reach the part reserved except over the part conveyed, a right of way over the latter is impliedly reserved. This is called a way of necessity. As to another method of obtaining a right of way, see art. PRESCRIPTION. Intermediate between public and private ways are *quasi* public ways, such for instance as the inhabitants of a t. have immemorially used from their t. to a market. Such a right cannot be now created, but must be the result of an ancient custom. A highway is created where a person has expressly or presumptively dedicated a portion of his land to the public, or it may be created by statute.

WAYCROSS, town and co. seat of Ware co., Ga.; on the Waycross Air Line and the Plant System railroads, 96 miles s.w. of Savannah. It is principally engaged in the shipment of naval stores and lumber, and has a high school, national bank, and daily, weekly, and monthly periodicals. Pop. '90, 3364.

WAYLAND, the Smith (Ang.-Sax. VELAND; old Norse, VÖLUNDR; Ger. WIELAND), was, according to the old German saga (the principal traits of which are already contained in the older Edda, but which is related in the most detailed form in the Viltinasaga), a son of the sea-giant Wate, a nephew of king Wilkinus, and of the sea-nymph Wac-hilt. His father had bound him, at first, apprentice to the celebrated smith, Mimi, then took him across the sea to the most skillful dwarfs, from whom he not only soon learned all their science, but far surpassed them.* He afterward dwelt a long time in Ulfdaler (the wolf's valley, which, by comparison with other sagas, appears to correspond to the Greek labyrinth) along with his two brothers—Eigil, the best archer, to whom the oldest form of the Tell legend attaches; and Slagfidr, whom the saga has not further characterized. The brothers here met three swan-nymphs, and lived with them for seven years, when they flew away to follow battles as Walkyries (q.v.). Afterward, Wayland came to king Nidung, who made him lame, by cutting the sinews of his feet, and put him in prison, for which Wayland revenged himself by putting the king's two sons to death, and violating his daughter Beadohild, who afterward gave birth to Wittich, a powerful champion of the German hero-legends. Wayland then flew away in a feather-robe, which he himself manufactured, and which his brother Eigil had tried first, but was precipitated to the ground. Skillfully putting together and supplementing the various old legends, Simrock has produced the saga of Wayland, as a whole, in his poem *Wieland der Schmied* (Bonn, 1835), and in the 4th part of his *Heldenbuch* (Stuttg. 1843). The legend was a favorite one among all the Germanic nations, as is shown by the frequent allusions to it in Scandinavian, Anglo-Saxon, English, and German poems, as well as by the numerous fragments yet extant in oral tradition throughout all Teutonic countries. The German poems to which the Viltinasaga appeals, which were in existence up to the 13th c., have been utterly lost. Even beyond the bounds of Germany, old French poems and traditions tell of Gallans the smith. See Depping and Michel, *Veland le Forgeron* (Par. 1833). The legend of Wayland is in fact one of those myths common to the Indo-Germanic family. Besides the German tradition, it is found most distinctly among the Greeks, in the different stories of Dædalus, Hephæstus, Erichthonius, etc. Next to Jacob Grimm's profound discussion in the *German Mythology*, Kuhn has pointed out in the best manner the signification and ramifications of the myth in his treatise, *Die Sprachvergleichung und die Urgeschichte der Germ. Völker*, in the *Zeitschrift für vergleichende Sprachforschung* (vol. iv., Berl. 1854).

WAYLAND, FRANCIS, D.D., LL.D., 1796–1865, b. New York, of English parentage; graduated at Union college, 1813; studied medicine and commenced the practice of it at Troy, but having joined the Baptist church in 1816 and devoted himself to the ministry, studied theology at Andover seminary; was tutor in Union college, 1817–21; pastor of First Baptist church, Boston, 1821–26; pres. of Brown university, 1827–55; after which was pastor of First Baptist church, Providence. He was celebrated as an instructor, preacher, and writer—a man of great wisdom and self-devotion. Among his published works are, *Elements of Moral Science; Elements of Political Economy; Elements of Intellectual Philosophy; Christianity and Slavery; Limitations of Human Responsibility; Life of Adoniram Judson, D.D.; Thoughts on the Present Collegiate System in the United States.* This last led, in 1849, to the adoption of the voluntary system at Brown university. His life has been written by his sons.

* The name Wayland is from a root signifying art, cunning; from which come Eng. *wile* and (through old Fr.) *guile.* Ang-Sax. *velan* means to fabricate.

WAYMOUTH, George, b. England, 1570; accompanied sir Fernando Gorges on an expedition along the Atlantic coast of North America, sailed up the Penobscot and Kennebec rivers, and persuaded some of the natives to return with him to England. In 1605, there was published, *A True Relation of the most Prosperous Voyage made this present year, 1605, in the Discovery of the Land of Virginia, and 60 miles up a most Excellent river, by Capt. George Waymouth, written by James Rosier, a Gentleman employed in the Voyage.*

WAYNE, a co. in s.e. Georgia, bounded on the n.e. by the Altamaha river, drained by the Satilla; 721 sq.m.; pop. '90, 7485. Co. seat, Jesup.

WAYNE, a co. in s. Illinois, drained by the Little Wabash river, the Skillet fork, and Elm creek; 720 sq.m.; pop. '90, 23,806. Co. seat, Fairfield.

WAYNE, a co. in e. Indiana, intersected by numerous railroads; 380 sq.m.; pop. '90, 37,628. Co. seat, Richmond.

WAYNE, a co. in s. Iowa, drained by the Chariton river, forming its n.e. border, the South Fork, and two branches of Locust creek; 525 sq.m.; pop. '90, 15,670. Co. seat, Corydon.

WAYNE, a co. in s. Kentucky, drained by the Cumberland river and its branches, 590 sq.m.; pop. '90, 12,852. Co. seat, Monticello.

WAYNE, a co. in s.e. Michigan, drained by the Huron, Rouge, and Detroit rivers, the latter, with lake St. Clair, forming its e. boundary, having lake Erie on the s.e.; 565 sq.m.; pop. '90, 257,114. Co. seat, Detroit.

WAYNE, a co. in s.e. Mississippi, 775 sq.m.; pop. '90, 9817. Co. seat, Waynesboro.

WAYNE, a co. in s.e. Missouri, drained by the Big Black, Castor, and St. Francis rivers; 800 sq.m.; pop. '90, 11,727. Co. seat, Greenville.

WAYNE, a co. in n.e. Nebraska, drained by affluents of the Elkhorn river; 444 sq.m.; pop. '90, 6169. Co. seat, Wayne.

WAYNE, a co. in w. New York, having lake Ontario for its n. boundary; 621 sq.m.; pop. '90, 49,729. Co. seat, Lyons.

WAYNE, a co. in central North Carolina, intersected by the Neuse river; 615 sq.m.; pop. '90, 26,100. Co. seat, Goldsboro.

WAYNE, a co. in central Ohio; 540 sq.m.; pop. '90, 39,005. Co. seat, Wooster.

WAYNE, a co. in n.e. Pennsylvania, having the Delaware river for its n.e. and e. boundary; 738 sq.m.; pop. '90, 31,010. Co. seat, Honesdale.

WAYNE, a co. in central Tennessee; 720 sq.m.; pop. '90, 11,471. Co. seat, Waynesboro.

WAYNE, a co. in s.w. West Virginia, having the Ohio river for its n. boundary; 445 sq.m.; pop. '90, 18,652. Co. seat, Wayne.

WAYNE, Anthony, an American general of the war of the Revolution, was born at Easttown, Penn., Jan. 1, 1745. His grandfather, a native of Yorkshire, commanded a squadron of dragoons at the battle of the Boyne, and emigrated to Pennsylvania. Anthony was educated at Philadelphia; at the age of 18, he was employed as a land-surveyor, and was selected by Benjamin Franklin to form a projected settlement in Nova Scotia. At the beginning of the American revolution (1775), he was married and settled on a farm in Pennsylvania, taking an active interest in politics, and became a member of a committee of safety, and studied military drill and tactics. At the outbreak of hostilities, he raised a regiment of volunteers, of which he was appointed colonel, and sent to Canada; where he covered the retreat of the provincial forces at Three Rivers. He commanded at Ticonderoga until 1777, when he was made brig.gen., and joined Washington in New Jersey; commanded the rear-guard in the retreat at Brandywine; led the attack at Germantown; captured supplies for the distressed army at Valley Forge; distinguished himself at Monmouth; was defeated at Paoli; but achieved the most brilliant victory of the war in the storming of Stony Point (q.v.), July 15, 1779. His courage and skill saved Lafayette in Virginia, 1780; and he aided in the siege of Yorktown, and commanded in Georgia. At the close of the war, rewarded by popular enthusiasm, and having, by his dash and audacity, acquired the sobriquet of "Mad Anthony," he retired to his farm at Waynesborough, and engaged in promoting the construction of roads and canals. In 1792, he commanded a successful expedition against the Indians of the north-western territories; where he remained, until 1796, as U. S. commissioner. He died at the garrison at Presque Isle (now Erie), Dec. 14, 1796.

WAYS AND MEANS, Committee of, a committee of the house of commons appointed to determine the modes of raising the money which the house—after resolutions reported from the committee of supply, and agreed to—has granted to the crown. Like the committee of supply, it is always a committee of the whole house. A chairman, elected by the committee of supply, but known as the chairman of the committee of ways and means, presides over both committees. One of the most important occasions for which the committee sits is to receive the budget, or annual financial statement of the year from the chancellor of the exchequer. The propositions of the government

regarding loans, duties, taxes, tolls, and any other means for raising revenue, are submitted to the consideration of the committee of ways and means in the shape of resolutions. The amount proposed to be raised must not exceed the sum granted in the committee of supply; and the chancellor of the exchequer is bound to satisfy the house, by a detail of the sums granted for the several services, that the amount of these sums will be a sufficient justification, in point of quantity, to the committee of ways and means to adopt such measures and impose such taxes as shall then be recommended. Such resolutions as are agreed to are adopted and embodied in bills, and in due time become law. See PARLIAMENT (*Supplies*).

In the United States this committee is a committee appointed from among the members of the house of representatives, by the speaker, to consider all proposed legislation or other matters relating to the revenue and the bonded debt of the U. S. The term is borrowed from British parliamentary usage. The first committee of W. and M. in the house of reps., was appointed, 1789; in 1795 it became a standing committee. The number of members, originally seven, was gradually increased to thirteen. Until 1865 the committee also considered the question of appropriations, but in that year this business was transferred to the committee on appropriations. Though it has thus been shorn of much of the power which formerly made its chairman the leader of the house of representatives, it is still a very important body, and its chairmanship is looked upon as the highest office in the gift of the speaker. The corresponding body in the senate is the finance committee, established, 1816; and measures reported by either committee obtain precedence over all other business.

WAYWODE, see WOJWODA.

WEAK FISH, the *cynoscion regalis*, a common fish of the family sciænidæ, abounding along the Atlantic coast of the United States. It has a pale, brownish color above, with a greenish tinge, grading into silvery along the sides and belly, and a variegated mottling with brown vermicular blotches. It is from 1 to 2 ft. long and is purely a salt-water fish; and from its shape and habit of taking the hook is in some places called salt-water trout.

WEAKLEY, a co. in w. Tennessee, drained by branches of the Obion river; 620 sq.m.; pop. '90, 28,955. Co. seat, Dresden.

WEALDEN FORMATION, a series of fresh-water strata belonging to the lower cretaceous epoch. Having been originally studied in the parts of Kent, Surrey, and Sussex called the Weald, this local name was given to the formation. It has been divided into two series, which do not differ very materially from each other, viz., Weald clay, 560 ft.; Hastings sand, 740; total 1300. The Weald clay consists of blue and brown clay and shale with thin beds of sandstone and shelly limestone. These strata were probably lake or estuary deposits, and contain the remains of the land flora and fauna, often in great abundance. The beds of limestone called Sussex marble, are almost entirely composed of a species of *paludina*, not very different from the common *P. vivipara* of English rivers. The clays are often laminated by thin layers, consisting of immense numbers of the shells of minute *cyprides*. But the most remarkable animal remains are those of the huge reptiles which lived on the land, tenanted the air, or abounded in the sea, such as the iguanodon (q.v.), hyleosaurus (q.v.), pterodactyl (q.v.), and the numerous species of turtles which have been described from these strata. The vegetable fossils belong chiefly to ferns, and to the gymnospermatous orders of conifers and cycads; the fruits of several species of both orders have been found; and in some places the rolled trunks of *endogenites* and *clathraria*, belonging to cycads, and of different species of coniferous wood, occur in enormous quantities, as at Brook Point, in the Isle of Wight, where the shore at low water is strewn with them.

The Hastings beds contain more sandstone and less clay than those of the upper Weald clays. The picturesque scenery of the High Rocks and other places in the neighborhood of Tunbridge, is weathered out of the beds of white sandstone belonging to this period. The remains of the huge Wealden reptiles abound in the sandstones of this division. The Tilgate forest-beds, where Dr. Mantell first found the iguanodon, and the rocks in the neighborhood of Hastings, are the best-known repositories of those remarkable fossils.

The deposition of the Wealden beds was followed by a gradual depression of the land when these fresh-water deposits were covered by the estuary beds of the newer *greensand*. The depression continued until the fresh-water and estuary strata formed the bottom of a deep sea, on which were deposited the immense beds of chalk and allied strata which form the bulk of the cretaceous series.

WEALTH, as a concept of political economy, means the stock of useful things, having value. For a discussion of some misleading uses of the term, see the article MONEY; and for an explanation of the economic theories in regard to utility and value, see VALUE. See also the article CAPITAL.

WEANING AND FEEDING IN INFANCY. The propriety of mothers nursing their own children is now so universally acknowledged, that it is the duty of the physician

less frequently to urge maternal nursing than to indicate those cases in which it becomes necessary to substitute another mode of rearing the infant. "Women," says Dr. Maunsell, "who labor under any mortal or weakening disease—as phthisis, hemorrhages, epilepsy—are obviously disqualified from the office of nurse. Some who are in other respects healthy, have breasts incapable of secreting a sufficient supply of milk. In other instances, the breast may perform its functions well, but the nipple may be naturally so small, or may be so completely obliterated by the pressure of tight stays, as not to admit of its being laid hold of by the child. These are actual physical hindrances to nursing. Again, women may, and, in the higher classes, frequently do, possess such extremely sensitive and excitable temperaments, as will render it imprudent for them to suckle their own children. Frightened and excited by every accidental change in the infant's countenance, and inordinately moved by the common agitations of life, such persons are kept in a state of continual fever, which materially interferes with the formation of milk both as to quantity and quality. Women, also, who become mothers for the first time at a late period of life, have seldom the flexibility of disposition or the physical aptitude for the secretion of milk, required to constitute a good nurse."—*A Treatise on the Management and Diseases of Children*, 4th ed., 1842, pp. 39, 40. In ordinary cases, the child should be put to the breast as soon as the latter begins to contain anything; and when the secretion of milk has fairly commenced, it will require no other food until the seventh or eighth month, provided the mother be a good nurse. During the first five or six months, the infant should be put to the breast at regular intervals of about four hours; afterward, when the teeth are beginning to appear, the child need not suck more than four times in the twenty-four hours, some artificial food being given to it twice during the same period. This at first may consist of soft bread steeped in hot water, with the addition of sugar and cow's milk; and subsequently a little broth, free from salt and vegetables, may be given once a day. The spoon is now the best medium of feeding, as the food should be more solid than could be drawn through the sucking bottle. The time of weaning should be that indicated by nature, when, by providing the child with teeth, she furnishes it with the means of obtaining its nourishment from substances more solid than milk. If the infant has been gradually accustomed to a diminished supply of maternal and an increase of artificial food, weaning will be a comparatively easy process; and much of that suffering both to parent and child will be spared, which commonly ensues when a sudden change is made. In ordinary cases, the period of weaning varies from the seventh to the twelve month; sometimes the child is kept to the breast for a much longer period, from the popular idea that lactation prevents pregnancy, but such unnaturally prolonged lactation is usually injurious to both mother and child.

In those cases in which it is inexpedient or impossible for a mother to suckle her own child, the choice of a wet-nurse becomes a subject of much importance. Upon this subject, Dr. Maunsell lays down the following important practical rules: "The great thing we have to look to is to ascertain that both the woman and her child are in good health; and of this we must endeavor to judge by the following signs: The woman's general appearance and form should be observed, and they ought to be such as betoken a sound constitution. Her skin should be free from eruptions; her tongue clean, and indicating a healthy digestion; her gums and teeth sound and perfect; the breasts should be firm and well formed—not too large or flabby—and with perfect, well-developed nipples. We should see that the milk flows freely, upon slight pressure; and we should allow a little of it to remain in a glass in order that we may judge of its quality. It should be thin, and of a bluish-white color; sweet to the taste; and when allowed to stand, should throw up a considerable quantity of cream. A nurse should not be old, but it is better that she should have had one or two children before, as she will then be likely to have more milk, and may be supposed to have acquired experience in the management of infants. Having examined the mother, we must next turn to the child, which should be well nourished, clean, and free from eruptions, especially on the head and buttocks. We should also carefully examine its mouth, to ascertain that it is free from sores or aphthæ. If both woman and child bear such an examination, we may with tolerable security pronounce the former to be likely to prove a good nurse."—*Op. cit.* pp. 44, 45. In one respect, we differ from this eminent physician. He holds that "the more recently the nurse's own confinement has taken place, provided she has recovered from its effects, the better." Supposing a nurse is required for a new-born infant, this rule holds good; but provided a nurse is required for an infant of three or four months old (for example), it is preferable to obtain a nurse whose milk is of that age. We believe it to be a general physiological law that the age of the milk should correspond to the age of the infant; that is to say, that an infant taken at any given age from its mother, before the normal period of weaning, should be provided with a nurse who was confined about the same time as its own mother.

A wet-nurse should be very much preferred to any kind of *artificial feeding;* but peculiar cases may occur in which it is impossible to procure a nurse; or an infant whose mother is incapable of nourishing it may be the subject of a disease that may be transmitted through the infant to the nurse. In these cases, a food must be provided as nearly as possible resembling the natural food; and this is naturally sought for among the food of animals. The milk of the cow is most commonly used, in consequence of its being

the most easily obtained; but ass's milk more nearly resembles human milk, as is shown from the following comparative analyses by Professor Playfair:

	Woman.	Cow.	Ass.
Caseine	1.5	4.0	1.9
Butter	4.4	4.6	1.3
Sugar	5.7	3.8	6.3
Ashes	0.5	0.6	...
Water	88.0	89.0	90.5

The most important difference between cow's milk and woman's milk is the great excess of caseine in the former. The former fluid may, however, be made to resemble the latter in composition in either of the following ways: (1) On gently heating cow's milk, a membrane of caseine forms on the surface; by removing two or three of these membranes as they form, we can reduce the quantity of caseine to the desired extent; or (2) we may dilute cow's milk with twice its bulk of pure water, and add a little sugar. This food should be administered at a natural temperature (of about 98°) through a sucking-bottle; and as the child grows older, it will soon be able to take natural cow's milk without inconvenience. The nature and importance of the mixture of milk and farinaceous food known as Liebig's soup for children, are described under Soup.

The rules regarding the times, etc, of feeding are similar to those laid down for suckling. Assuming that the infant, whether brought up at the breast or artificially reared, has been safely weaned, we have to consider what rules should be laid down regarding its food subsequently. For some months after weaning, the food should consist principally of semi-fluid substances, such as milk thickened with baked flour, or pap, to which a little sugar should be added. Light broths may also be administered, especially in the occasional cases in which milk seems to disagree; and bread and butter may be tried in small quantity. We shall conclude this article with the following "model of a suitable diet for children," which cannot be too strongly impressed upon the minds of all young mothers: "A healthy child, of 2 or 3 years old, commonly awakes hungry and thirsty at five or six o'clock in the morning, sometimes even earlier. Immediately after awaking, a little bread and sweet milk should be given to it, or (when the child is too young to eat bread) a little bread-pap. The latter should be warm; but in the former case, the bread may be eaten from the hand, and the milk allowed to be drunk cold, as it is well at this meal to furnish no inducement for eating beyond that of hunger. After eating, the child will generally sleep again for an hour or two; and about nine o'clock it should get its second meal, of bread softened in hot water, which latter is to be drained off, and fresh milk and a little sugar added to the bread. Between one and two, the child may have dinner, consisting, at the younger ages, of beef, mutton, or chicken broth (deprived of all fat), and bread. When a sufficient number of teeth are developed to admit of chewing being performed, a little animal food, as chicken, roast, or boiled mutton, or beef, not too much dressed, should be allowed, with a potato or bread, and some fresh, well-dressed vegetable, as turnips or cauliflower. After dinner, some drink will be requisite; and a healthy child requires, and indeed wishes for nothing but water. Light, fresh table-beer would not be injurious to a child of 4 or 5 years old, but it is unnecessary. Between six and seven o'clock, the child may have its last meal of bread steeped in water, etc., as at nine o'clock in the morning. A healthy child which has been in the open air during the greater part of the day, will be ready for bed shortly after this last supply, and will require nothing more till next morning. Similar regimen and hours may be adopted throughout the whole period of childhood; only as the fourth or fifth year approaches, giving, for breakfast and supper, bread and milk without water, and either warm or cold, according to the weather or the child's inclination. The supply of food upon first awaking in the morning may also be gradually discontinued, and breakfast be given somewhat earlier." See Sterilized Food.

WEARE, Meshech, 1713–86; b. N. H.; graduated at Harvard, 1735; studied law and carried on a successful practice. He was a member and speaker of the colonial legislature, commissioner at the Albany colonial congress, 1754; chief-justice of the N. H. supreme court in 1777; and president of the state from 1776 until the end of the war, and again in 1784. He displayed great vigor during the revolution in raising and equipping troops.

WEASAND is a name sometimes given to the windpipe or trachea (q.v.).

WEASEL, *Mustela*, a genus of quadrupeds of the family *mustelidæ* (q.v.), having a very elongated body; short feet, with toes quite separate, and sharp claws; four molar teeth on each side above, and five below. The Common Weasel (*M. vulgaris*) is a native of almost all the temperate and cold parts of the northern hemisphere, except the most arctic regions. Its range does not extend quite so far n. as that of the ermine. It is the smallest of the *mustelidæ* of the old world, not exceeding 2½ in. in height, and 7½ in. in length, from nose to tail; the tail about 2½ in. long, and terminating in a point, not so bushy as that of the stoat or ermine. The female is smaller than the male. The head is large; the ears short, broad, and rounded, the whiskers long. The color is reddish-brown on the upper parts, sides, legs, and tail; the throat and belly white. The eyes are small, round, and black, with a very keen expression, to which the whole habits of the animal correspond. It is nimble and active, bold, and yet wary. It may often be seen peeping curiously from a hole in a wall,

but vainly does the school-boy attempt to strike it with a stone. Catching it is out of the question for him, and so far well, for it is ready to bite severely. It is a most persevering hunter, its scent as keen as its sight, quarters the ground like a dog, and wearies out animals larger and apparently much stronger than itself. It preys on mice, rats, voles, small birds, and other small animals, sometimes even on hares and rabbits, robs birds' nests, devouring the young birds or sucking the eggs, and is occasionally troublesome in poultry-yards, killing young chickens. It climbs walls and trees with great agility, and does not hesitate to plunge into water in pursuit of the water-rat. It sometimes begins by abstracting the blood of the animal which it has killed, and generally devours the brain; but when food is abundant, it carries the body to its retreat, where a considerable quantity of prey is often found, the weasel preferring to eat it in a half-putrefied state. The weasel generally sleeps during the day, and is most active at night. It has a disagreeable smell, which is strongest in hot weather, or when it has been pursued or irritated. It is capable of being tamed when taken young, and becomes docile and gentle. The female weasel makes a nest of straw-leaves and moss for her young which are produced in spring, four or five in a litter; often in a crevice of a bank, or in a hollow tree. The fur of the weasel is an article of commerce in some northern countries, and weasel-skins are exported in considerable quantity from Siberia to China. The weasel sometimes, but rarely, becomes white in winter, like the ermine.—The ermine (q.v.), or stoat, is another species of weasel.—America has several species of weasel, of which one (*M. pusilla*) is rather smaller than the common weasel of Europe, and has a shorter tail. It is abundant in the northern parts of the United States, and its range extends far to the north. In the United States, it remains brown all winter; but in the fur-countries it becomes white. See illus. Whale, etc., vol. XV.

WEATHER is the condition of the atmosphere at any time in respect of heat, moisture, wind, rain, cloud, and electricity; and a change of weather implies a change in one or more of these elements. From the direct bearing weather-changes have on human interests, they have from the earliest times been closely watched, so that the causes by which they are brought about may be discovered, and their approach predicted with some confidence. The craving in the public mind for this knowledge is strongly attested by the weather prognostics of every language, which, with much that is shrewd and of considerable value, embrace more that is vague, and not a little positively absurd.

It is not necessary here to refer to Moore, Zadkiel, and other almanac-makers of that class, except as proving by their mere existence a wide-spread ignorance of even the most palpable elements of physical law. Prognosticators of higher pretensions repeatedly appear before the public, and it is curious to note how their predictions are laid hold of by the newspapers, and scattered broadcast over the country. Among this class was Mathieu de la Drome, whose predictions of storms and rains made so much noise, that the emperor Napoleon requested the celebrated Leverrier to examine the grounds on which his predictions were founded. The exposure was complete. One of his principal predictions was based entirely on a high *average* of the rain-fall at a particular season. On examining the rain-fall of the particular years from which the average had been taken, it was found that the excess was entirely due to an unprecedentedly heavy rain which occurred in one of the years at that season. One of the most remarkable predictions of recent times was made by an Irish nobleman in reference to Sept., 1865, which turned out to be in accordance with the prediction—dry, warm, and fine, beyond precedent for that month. The celebrity of this prediction has, however, been greatly reduced by other predictions made since, which the event did not verify.

The changes of the moon were long, and in many minds still are, regarded as supplying the elements of prediction. In order to test the real value of the moon's changes on the weather, the Greenwich observations of 50 years were carefully examined, and it was found that the number of instances in which the weather was in accordance with the prognostication was one instance less than those in which the weather was different. When brought to the test of accurate examination and figures, the theory of the moon's changes on the coming weather is by this, as well as by similar investigations of old records of the weather, proved to be a delusion; but since most people have a bias toward forgetting the unsuccessful and remembering the successful prognostications, the theory may continue to be accepted, until a sounder knowledge of the natural laws are more generally diffused.

For some years Mr. Thomas du Boulay predicted the general character of the weather of each summer from the weather-conditions which prevailed during the week of the spring equinox preceding, supposing that the general character of the weather of the next six months is already settled, and that it only requires the necessary skill to read its features, since these will remain generally constant till autumn. For a few years he speculated in grain on the faith of the predictions, which turned out pretty correct. Latterly, however, his predictions were not verified.

The truth is, that no prediction of the weather can be made, in the British islands at least, for more than about two days beforehand. Any attempt at a longer prediction is illusory. We would here refer to the article Storms, as showing the possibility and mode of making real predictions of the weather. Almost all the weather-changes of Europe begin from

westward, and pass over Great Britain, following a generally easterly course. Unsettled or bad weather is accompanied with a low barometer; elsewhere, the barometer is higher. Suppose that from weather-telegrams received, it is seen that everywhere in Europe barometers are high, no storm is imminent and generally none is likely to happen for about two days at least. But if, on the following morning, barometers begin to fall a little in the west of Ireland, and an easterly wind begins to blow over Great Britain and Norway, and a s.e. wind over France; then, seeing the winds blow toward the lowest barometer, or rather a little toward the right of it, the presumption is that a storm of greater or less severity is coming up, the center of which is likely to pass over England. This ought, therefore, to be closely watched; and if the winds keep in nearly the same direction, or veering slowly toward the s. and w., increase in force, and barometers in the west of Ireland fall rapidly, a great storm is portended, of the approach of which warning should be at once issued. But if, on the contrary, the winds do not increase in force, and the barometer fall only slightly, or cease to fall, the storm has either passed considerably to the n. of the British islands, or its approach will be delayed for some time; and hence no immediate warning may be necessary.

It is our proximity to the Atlantic that makes it impossible to predict the weather beyond two days at the utmost. In Norway and the Baltic, and places toward the east of Europe, the weather may be predicted for a longer time owing to the more easterly situation of these places. In America also, where storms advance chiefly from w. to e., gales and unsettled weather are predicted to places on the sea-board in the east some days before.

The collecting of this information by the telegraph is a work which, owing to the expense, governments only can accomplish; and from its public importance, it is an incumbent duty which they should discharge for the benefit of the sea-faring and agricultural population. A good deal may, however, be done by each one for himself, by observing his barometer, the winds, and the face of the sky—especially the cirrus cloud—the most elevated and delicate of the clouds. But ere these simple observations can be turned to account, and made the basis of an intelligent prediction, some knowledge of the general features of storms (q.v.) is indispensable. These specially—(1) Storms have a circular area; and (2) advance in an easterly direction, bearing a low barometric pressure with them. (3) Winds blow from a high to a low barometer, the observer, standing with his back to the wind, having always the low barometer to his left in the northern hemisphere, and (4) with a force proportioned to the difference of the pressure, or to the steepness of the barometric gradient. (5) Storms are first noticed in the upper regions of the atmosphere, or in the region of the cirrus cloud. (6) In front of the storm the air is warm and humid; in the rear of it, cold, or cool and dry. With such observations, requiring only a barometer intelligently interpreted, particularly if hills form part of the landscape, the character of the weather may be foreseen for one day, or even on occasions longer.

To the agriculturist and horticulturist, not high winds but hails, heavy rains, frosts and fine weather are what are required to be known. Such forecasts have been issued by the signal service officer in the United States, were also begun in France by Leverrier shortly before his lamented death, and are gradually being introduced over the continent of Europe, with great advantage to those national interests. But though no prediction of the weather for weeks or months beforehand can be made with any pretensions to trustworthiness, yet guesses or surmises may be formed not without some value. All observation goes to prove that predictions based on solar or other astronomical causes are without foundation, and that averages based on terrestrial observations are the only guides in the matter. Of this class are the interruptions which occur in the regular march of temperature in the course of the year. Thus, cold weather generally prevails from the 11th to the 14th of April—that is, the period of the "borrowing days" (O.S.), and in the second week of May; and these, with some other cold and warm periods,* are almost co-extensive with the northern hemisphere of the globe. Hence, then, at these times, when the weather becomes cold or warm, it may be predicted that such weather will last for several days. Again, if, after a long-continued prevalence of s.w. winds, the n.e. wind should set in, it is highly probable that easterly winds will prevail for some time; so that, if the season be winter, a continuance of frost, and perhaps snow, may be looked for; but if midsummer, the weather will become dry, warm, and bracing, But suppose easterly winds have been unusually predominant in autumn, and

* I have examined the temperature of Scotland for a number of years and have shown (*Jour. of Scot. Meteorolog. Soc.*, Nos. xiii., xiv., xvi.) that the following interruptions occur from year to year with very rare exceptions, in the annual march of the Scottish temperature:

Six cold periods	1. 7th to 10th February. 2. 11th to 14th April. 3. 9th to 14th May. 4. 29th June to 4th July. 5. 6th to 11th August. 6. 6th to 12th November.
Three warm periods	1. 12th to 15th July. 2. 12th to 15th August. 3. 3d to 9th December.

Buchan's Handy Book of Meteorology.

south-westerly winds begin to prevail in the end of November or the beginning of December, it is most probable that the weather will continue exceptionally mild, with frequent heavy storms of wind and rain till about Christmas.

A good beginning has been made in India by Mr. Blanford in predicting the character of the monsoon season, it having been shown by him that abnormal distributions of atmospheric pressure which happen to prevail about its commencement, tend to perpetuate themselves during the season. Since the distribution of the rains depends on the distribution of atmospheric pressure, forecasts of the coming monsoon have been issued, which thus proceed from a scientific basis, and the event has shown them to have been remarkably successful. It may be predicted that as systematic observation advances, the power to predict the character of the coming season will be extended to higher latitudes. See METEOROLOGY, WIND, SIGNAL SERVICE.

WEATHERING, a slight inclination given to the top of a cornice or molding, to prevent water from lodging on it.

WEAVER-BIRD, *Ploceus*, a genus of bird of the finch family (*fringillidæ*), of a group or sub-family (*ploceinæ*), to most of which the name weaver-bird is extended. The name has reference to the remarkable structure of the nests of these birds, which are woven in a very wonderful manner of various vegetable substances, and are objects of great interest. The *ploceinæ* are natives of the warmer parts of Asia, of Africa, and of Australia; none being found in Europe nor in America. The species are numerous. They are small birds, with a strong conical bill, the ridge of which is slightly curved, the tip entire. The claws are large and very long. The wings are pointed, the first quill remarkably short. There is great diversity in the form and appearance of the nests constructed by different species. One of the best-known species is the PHILIPPINE WEAVER (*P. Philippinus*), the baya (q.v.) of India. Many of the other weaver-birds construct nests pretty much on the same plan with this—pouches elongated into tubes, entering from below; those of some are kidney-shaped, and the entrance is in the side. They very generally suspend their nests in the same way from the extremeties of branches, and often prefer branches which hang over water, probably as affording further security against monkeys, squirrels, snakes, and other enemies. Social habits are very prevalent among them, and many nests of the same species are often found close together. Some of them attach the nest of one year to that of the year preceding, as the *ploceus pensilis* of Madagascar, which sometimes thus makes five nests in succession, one hanging to another. Some of the African species build their nests in company, the whole forming one structure. Thus, the SOCIAL or REPUBLICAN weaver-bird of South Africa (*ploceus socius* or *philotærus lepidus*) constructs a kind of umbrella-like roof, under which 800 or 1000 nests have been found, the nests like the cells of a honeycomb, and arranged with wonderful regularity. An acacia with straight, smooth stem, such as predaceous animals cannot easily climb, is often selected by the bird-community. When the situation is chosen, the birds begin by constructing the roof, which is made of coarse grass, each pair afterward building their own nest, which is attached to the roof. As new nests are built every year, the weight of the structure often becomes so great as to break down its support. *Textor erythrorhynchus* is a bird of the weaver group, which is commonly seen in South Africa accompanying herds of buffaloes, and feeding on the bots and other insects which infest them, alighting on their backs to pick them out of the hide. The bird is often of great use to the buffalo in another way, by giving warning of the approach of an enemy. The whydaw birds (q.v,) or widow birds, likewise belong to the group of *ploceinæ*.

WEAVING, the art by which threads or yarns of any substance are interlaced so as to form a continuous web. It is perhaps the most ancient of the manufacturing arts, for clothing was always a first necessity of mankind. The methods by which weaving is now accomplished have been explained under loom (q.v.); it therefore only remains to describe the variations which may be effected by ingenious applications of the powers of the loom; and as these are almost endless, some of the more common and easily understood will be chosen. The simplest form of weaving is that employed in making the mats of uncivilized nations. These consist of single untwisted fibers, usually vegetable, arranged side by side to the width required, and of the length of the fibers themselves, which are tied at each end to a stick, which is so fixed as to keep the fiber straight, and on the same plane. Then the weaver lifts up every other of these longitudinal threads, and passes under it a transverse one, which he first attaches by tying or twisting to the outermost fiber of the side he commences with, and afterward in the same way to that on the other side, when it has passed through the whole series. The acquisition of the art of spinning threads of any length enables more advanced nations to give great length to the warp, or series of threads which are first arranged, and to pass the weft or transverse thread backward and forward by means of a shuttle, without the necessity of fixing at the sides. The mechanical appliances already described under LOOM aid these operations to an amazing extent. That kind of weaving which consists of passing the weft alternately over and under each thread of the warp is called *plain* weaving; but if the weaver takes up first one and then two threads alternately of the warp series, and passes the weft under them for the first shoot of his shuttle, and raises those which were left down before for the second shoot, he produces a cloth with a very different

appearance, called twill (q.v.), many varieties of which may be produced by varying the numbers missed or taken up—as, for example, one and three, instead of one and two.

There are few arts which require more patience or skill than weaving. As many as from one to two thousand threads often constitute the warp; and these threads may be so varied in quality (see YARN) as to produce many varieties of fabric. From that cause alone there are almost infinite variations. Many may be produced by the order in which the threads are lifted for the passage of the weft—that of itself can also vary as much or more in its quality and other circumstances, so that the inventive genius of the weaver finds incessant opportunities for its display, and nice arithmetical calculations are required in estimating and allotting the numerous threads to the endless variety of patterns which are constantly passing through the looms. A really practical knowledge of weaving can only be obtained by working with looms, and studying such technical treatises as Watson's *Theory and Practice of the Art of Weaving*, and some of the elaborate treatises by the French weavers.

There is no branch of manufacture in which inventions and improvements are more rapidly succeeding each other than in weaving; but, as a rule, they are of minor importance, and rarely affect the general principles of the process. In 1867, however, the novelty of *convex* weaving by machinery was introduced, and although only at present applied to one or two purposes, seems to promise a wide application to clothing generally, and many other purposes.

Out of the numerous attempts that have been made during the last ten years to weave by machinery a convex surface, such as is required in several articles of clothing, hardly one, up to the present time, has succeeded. This failure has been owing partly to deficiencies in the various inventions of this kind, and partly to the costliness of carrying them out. At last, after long and patient trials, a patent convex weaving-loom has been invented that not only answers all the purposes of the hand loom, hitherto exclusively used, but also possesses the advantage, which is absolutely necessary in a country where labor is scarce, of doing ten times the amount of work in the same space of time. With the hand-loom, one man can make, at the very utmost, only four pair of stays in a day, whereas the new-invented convex weaving machine turns out 40 pair daily. The superior lightness and flexibility of woven stays, and their perfect freedom from hard seams, have increased to a very large extent the demand for this class of goods. Up to the present moment, hand-labor alone has been employed in France and Würtemberg, two countries where they have been most extensively manufactured. In the United States, however, where the high wages for hand-labor have necessitated the most extensive use of machinery, this system could not be adopted with any possibility of pecuniary success; and, in consequence of this fact, a loom for weaving of stays and other convex goods had to be invented. This loom, which was constructed under the superintendence of M. Opper, for the convex weaving company in New York, does the work automatically and to perfection.

The principle of a constant length of travel for the shuttle was adopted for the sake of simplicity; but, as it is necessary, in weaving the gores, that the weft-thread should pass through only a part of the breadth of the warp, the Jacquard has been employed for the purpose of taking up the portion of the warp required to be woven in that part. It is impossible by mere verbal description to give any adequate notion of this ingenious machine without seeing it in operation.

Bonelli's loom is an ingenious attempt to substitute for the costly perforated cards of a Jacquard loom an endless band of paper covered with tinfoil, on which the required pattern is traced with a varnish, rendering the parts thus covered non-conducting. This band of paper passes under a series of thin metallic teeth, each connected with a small electro-magnet, and these magnets act on a series of small pistons. According as these teeth come in contact with the metallic surface or the varnish, so is a series of holes in a perforated plate closed or opened when an electric current is passing. The perforations in the plate correspond to the punched holes in the cards of a Jacquard, and act in the same way upon its needles. See JACQUARD LOOM. Bonelli's loom, though it was perfect enough for practical work in 1860, has not yet been brought into use. It is fully described in the *Society of Arts' Journal*, Jan. 6, 1860.

WEBB, a co. in s. Texas, having the Rio Grande for its w. boundary, separating it from Mexico; 1680 sq.m.; pop. '90, 14,842, of American birth, with colored. Co. seat, Laredo.

WEBB, ALEXANDER S., b. N. Y., 1835; educated at West Point, and appointed to the artillery. He was stationed in Florida and on the frontier, and was for 4 years assistant professor of mathematics at West Point. At the beginning of the war of the secession he aided in the defense of Fort Pickens. He was at the first battle of Bull Run, was attached to the army of the Potomac in the peninsula campaign of 1862, and was appointed brig. gen. of volunteers in 1863. At Gettysburg he led a brigade, where he was wounded. In 1864 he commanded a brigade in the battles of the Wilderness, and was dangerously wounded. Returning to the service early in 1865, he was Meade's chief of staff till the close of the war. Since 1869 he has been president of the college of the city of New York. He has published *The Peninsula; McClellan's Campaign of 1862* (1882), and has written magazine articles on war topics.

WEBB, Charles Henry, b. N. Y., 1834. When a young man he visited California, and was the founder and editor of *The Californian*. He has since written sketches and humorous articles under the pseudonym of "John Paul." He has also written several burlesque dramas, and is the inventor of an "adding machine."

WEBB, George James, b. Mass., 1805; an eminent composer and teacher of music, professor for several years in the Boston academy of music. He has published *American Glee Book; Common School Songster; The Vocal Class Book for Schools; Massachusetts Collection of Psalmody; Orthophony; Cantica Ecclesiastica;* and with William Mason (whose daughter he married) some musical publications. He died 1887.

WEBB, James Watson, b. Claverack, N. Y., 1802; entered the U. S. army in 1819 as 2d lieut. of artillery, was stationed in the west, and in 1827 resigned his commission. In 1829 he founded the *Morning Courier and New York Enquirer*, by uniting the *Enquirer* with the *Courier*, which he had then owned for two years; and was its editor and proprietor for about thirty years. He was appointed, 1843, engineer-in-chief of the state of N. Y., with rank of maj.-gen.; appointed, 1861, minister and envoy-extraordinary to Brazil, where he remained until 1869, with the exception of an absence in Europe, in which he negotiated the secret treaty with the French emperor for the removal of French troops from Mexico. After his return from Brazil, W. resided in New York till his death, 1884. He pub. *Altowan, or Adventures in the Rocky Mountains* (1846); *Slavery and its Tendencies* (1856).

WEBB, Captain Matthew, 1840–83; b. Shropshire, England. He went to sea at an early age and became capt. of a merchantman; first attracted notice by jumping from a Cunard steamer during a storm to save a man who had fallen overboard, for which he was awarded a gold medal by the Royal Humane soc. He accomplished the feat of swimming the English channel from Dover to Calais, a distance of 25 m., 1875. He was drowned while attempting to swim the Niagara whirlpool rapids, 1883.

WEBB, Samuel Blatchley, 1753–1807; b. Wethersfield, Conn.; educated under the supervision of his step-father, Silas Deane, he was early taught, and deeply imbibed, the political principles of American independence. Excited by the news from Lexington, young Webb left Wethersfield, a lieutenant in Captain Chester's company, for Bunker Hill. For his discretion and valor in that battle he was made a lieut.-col., and private secretary to Gen. Washington. He wrote the order announcing in New York July 9, 1776, the declaration of independence, and refused to receive a letter from lord Howe, directed to George Washington, Esq. He fought bravely on Bunker Hill and Long Island, at White Plains, Trenton, and Brandywine. In 1777 Col. Webb raised and equipped the 3d Connecticut regiment, but in that year was taken prisoner and not exchanged till 1780. He then received, as brevet brig-gen., the command before held by Baron Steuben. At his home in Wethersfield, in May, 1781 (the house is still standing), he entertained General Washington and Count Rochambeau in their important conference. In 1783 he was one of the sixteen officers who formed the society of the Cincinnati.

WEBB CITY, a city in Jasper co., Mo.; on the Kansas City, Fort Scott, and Memphis, the Missouri Pacific, and the St. Louis and San Francisco railroads; 6 miles n. of Joplin. It is noted for its extensive lead and zinc mining interests, and has a national bank, high school, electric light and street railroad plants, and several daily and weekly newspapers. Pop. '90, 5043.

WEBER, a co. in n. Utah, having the Great Salt lake for its w. boundary; drained by Weber river; containing a part of the Wasatch range of mountains; 650 sq. m.; pop. '90, 22,723. Co. seat, Ogden.

WEBER, Albrecht Friedrich, b. Breslau, 1825; studied in Breslau, Bonn, and in Berlin with Bopp, became an eminent Sanskrit scholar, visited England and France in 1846. In 1856 he was appointed extraordinary professor of ancient Indian languages and literature at Berlin; in 1867 full professor. He published *Indische Studien* (17 vols., 1849–85), containing information in relation to the metrical system of Indian antiquity. He has translated Indian dramas, and edited the *White Yajur-Veda* (3 vols., 1849–59). He was an active collaborator on the great Petersburg Lexicon. Among his later writings are *Die Griechen in Indien* (1890), and *Vedische Beiträge* (1894–5).

WEBER, Karl Maria von, a musical composer of high eminence, was b. at Eutin in Holstein, Dec. 18, 1786. Musical and dramatic talent had been hereditary in his family for some generations; his father, by turns officer in the army of the palatinate, finance minister of the elector of Cologne, music-director to the prince bishop of Eutin, and head of a company of strolling players, led a somewhat irregular and checkered life. Young Weber showed early a genius for music, but his instructors were often changed, in consequence of his father's change of residence. The teachers to whom he owed most were Hauschkel at Hildburghausen, Michael Haydn at Salzburg, and Valesi and Kalcher at Munich. His father's impatience and want of judgment were injurious to him in many ways, particulary in the efforts made to bring him before the public prematurely as a musical prodigy. At the age of 13 he composed an opera called *Die Macht der Liebe und des Weins*. When but 14 his second opera, *Das Waldmädchen*, was

brought out, without much success at first; but was afterward far better received than he himself thought it deserved. The next effort of the young opera composer was *Peter Schmoll und seine Nachbarn*, composed at Salzburg in 1801, and performed at Vienna with but indifferent success. At Vienna he became acquinted in 1803 with Joseph Haydn and the abbé Vogler, and studied for some time under the latter. In 1804 he left Vienna, to be conductor of the opera at Breslau, and while resident there composed the greater part of his opera of *Rübezahl*. We next find him, in 1806, with prince Eugene of Würtemberg at his court of Carlsruhe in Silesia, where he composed two symphonies and three concertos. In 1807 he went to Stuttgart, as private secretary to duke Ludwig, becoming also musical instructor to his children; and while there he composed the opera of *Silvana*, and a cantata called *Der erste Ton*, besides overtures, choral pieces, and piano-forte works. Getting into disfavor and pecuniary embarrassments, the result of his father's recklessness, he was dismissed the court of Würtemberg, and took up his residence successively in Mannheim, Heidelberg, and Darmstadt, at which last place he composed his operetta of *Abu Hassan*. He then made a musical tour through Germany, during which his concerts were everywhere well attended. From 1813 to 1816 he was director of the opera at Prague, which he entirely remodeled; and during his residence in the Bohemian capital composed *Kampf und Sieg*, and numerous other songs, including that noble national series from Körner's *Leier und Schwert*, which had no little influence in rousing patriotic sentiment during the war of liberation.

In 1817 he was invited to form a German opera at Dresden; and there during the remainder of his life, he held the post of *kapellmeister* to the king of Saxony. To this period belong his most important compositions, including *Preciosa*, *Der Freischütz*, *Euryanthe*, and *Oberon*. None of these works, however, was first brought out in Dresden. The music to Wolff's *Preciosa*, the subject of which is taken from a novel by Cervantes, was first produced on the Berlin stage, where it made a powerful impression. The author's *chef-d'œuvre*, the opera of *Freischütz*, the libretto or which was written by the composer's friend, Friedrich Kind, also first saw the light in the Prussian capital in 1822. It was a great success; its novelty and beauty, as well as the deep thought contained in it, excited an extraordinary sensation throughout Germany, which soon extended to France and England. *Euryanthe*, produced in Vienna in 1823, was not quite so warmly received. Bearing more the impress of labor and cultivation, and less that of the composer's natural vein of romance, it has never been in such general favor as its predecessor. *Oberon* was written in prospect of a visit to London to a libretto supplied by Mr. Planché. When Weber set out for England, he was already struggling against mortal disease. On Mar. 8, 1826, he appeared at Covent Garden theater as conductor of a selection from *Freischütz;* and on April 12 following he also conducted, on the first appearance of *Oberon*, with applause on both occasions incessant and uproarious. At his benefit concert on May 26, he was hardly able to go through the duty of conductor; and on June 5 he was found dead in bed in the house of sir George Smart, whose guest he was. He was interred in the Roman Catholic church, Moorfields; but in 1844 his body was removed to Dresden; and a statue of him by Reichel was erected in 1860 in front of the Dresden theater. Weber was married in 1818 to Carolina Brandt, an operatic singer of some note, daughter of Brandt the violinist, by whom he left a family.

The verdict of posterity, as well as of his contemporaries, has placed Weber in the first rank of musical composers. He was the first to use those bold effects of harmony and modulation whose introduction forms an era in the history of music. In his operas, the spirit of the romantic school appears in its brightest and most captivating form; and the overtures are masterpieces of imagination, each presenting an outline of the work to which it belongs. Besides the above operas and songs, his musical works are numerous, comprising concertos for the piano-forte, clarionet, oboe, bassoon, and violoncello—symphonies and overtures, one of the most beautiful and characteristic of them being the overture to the *Beherrscher der Geister*. Among his posthumous writings is an autobiography. His life has been written by his son, Baron Max Maria von Weber, (trans. by Simson). See also Jähn's *W.* (1873), and *W.* by Benedict, (1880).

WEBER, Wilhelm Eduard, b. 1804, Germany; educated at Halle. In 1825, in association with his brother, he published *Die Wellenlehre*. He became assistant professor of natural philosophy at Halle in 1827, and professor of physics at Göttingen in 1831. He was removed from his position at Göttingen in 1837 for having protested against the violation of the constitution. He held the chair of physics at Leipsic, 1843–49, when he was restored to his former position at Göttingen. His researches on terrestrial magnetism in connection with Gauss are well known. He died 1891.

WEBSTER, a co. in s.w. Georgia, drained by Kinchafoona creek; 225 sq.m.; pop. '90, 5695. Co. seat, Preston.

WEBSTER, a co. in central Iowa, drained by the Des Moines and Lizard rivers; 720 sq.m.; pop. '90, 21,582, chiefly of American birth, with colored. Co. seat, Fort Dodge.

WEBSTER, a co. in w. Kentucky, having the Green river for its n.e. boundary; 340 sq.m.; pop. '90, 17,196. Co. seat, Dixon.

WEBSTER, a parish in n.w. Louisiana, drained by bayou Dorcheat; containing lake Bistineau in the s. portion; formed out of parts of Bossier and Claiborne counties; 609 sq.m.; pop. '90, 12,466. Parish seat, Minden.

WEBSTER, a co. in north central Mississippi, organized as Sumner in 1874; 430 square miles; pop. '90, 12,060. It is drained by Big Black river. The surface is rolling and well wooded, the soil producing corn, cotton, and potatoes. Co. seat, Walthall.

WEBSTER, a co. in s.w. Missouri; drained by the Niaugua river, the James river, and Finley creek; 630 sq. m.; pop. '90, 15,177. Co. seat, Marshfield.

WEBSTER, a co. in s. Nebraska, drained by the Republican river; 576 sq. m.; pop. '90, 11,210. Co. seat, Red Cloud.

WEBSTER, a co. in central West Virginia; 415 sq. m.; pop. '90, 4783. Co. seat, Addison.

WEBSTER, a town in Worcester co., Mass.; on the Boston and Albany and the New England railroads; 16 miles s. of Worcester. It was incorporated in 1832; contains several villages, a high school, public library, national and savings banks, electric light plant, and about 10 churches; and is principally engaged in the manufacture of cotton and woolen goods, and shoes. Pop. '90, 7031.

WEBSTER CITY, city, co-extensive with Boone township, and co. seat of Hamilton co., Ia.; on the Boone river and the Chicago and Northwestern, the Crooked Creek, and the Illinois Central railroads; 80 miles n. of Des Moines. It has national banks, high school, valuable mineral springs, coal mines, iron furnaces, and several daily and weekly newspapers. Pop. '90, 2829.

WEBSTER, DANIEL, an American statesman and jurist was born in Salisbury (now Franklin), New Hampshire, Jan. 18, 1782, and was the second son of Ebenezer Webster (q.v.), a farmer and the justice of the county court and Abigail Eastman. Salisbury was at that time a frontier settlement, and schools were poor, but the boy was instructed by his mother, and after a few months' study at Exeter Academy in 1797, and under Rev. Samuel Wood, of Boscawen, he entered Dartmouth College, where he partly supported himself, and soon became first in his class, distinguishing himself in classics and English literature. He graduated in 1801, and entered the law-office of Thomas W. Thompson, of Salisbury, afterwards U. S. senator. From January to September, 1802, he was principal of the Fryeburg academy, Maine, then continued his studies till 1804, when he removed to Boston, to complete them under Christopher Gore, afterwards governor, and in 1805 was admitted to the Suffolk County bar. He commenced practice at Boscawen, but in 1806 was admitted to the superior court of New Hampshire and settled in Portsmouth, where he quickly distinguished himself.

The war of 1812 called into public life the strongest men of both political parties, and Webster, having adopted and advocated the principles of the party opposed to the war, was elected to represent the people of New Hampshire in congress. His reputation for thorough acquaintance with public affairs, domestic and foreign, preceded him and secured him influential positions on the most important committees. His speeches for the repeal of the embargo, and the increase of the navy, and on the great financial questions which then agitated and divided the nation, evidenced a comprehensive and deep insight into the principles involved, and the immediate necessities of the nation, as well as a firm adherence to the measures of the party he represented. They were imbued with such a spirit of lofty patriotism, and uttered with such manifest sincerity, that they secured for him, in congress and through the country, universal respect.

He was re-elected in 1814, and during the succeeding sessions supported the charter of the bank of the United States, and introduced a resolution requiring payments to the treasury to be made in specie or its equivalents. In 1816 he made Boston his permanent home, where he practised steadily for nearly seven years, and became known as one of the foremost jurists and advocates of the country, by his argument in the contest between Dartmouth College and the state legislature (1818), the validity of Stephen Girard's will, and the trial of the Knapps at Salem for the murder of Knapp. In 1820 he was chosen a member of the committee to revise the constitution of the state ; in 1822 was elected to Congress from Boston. Orations at Plymouth, Mass., on the Pilgrims, in 1822, on the laying of the corner-stone of Bunker Hill monument, in 1825, and on its completion in 1843, and his eulogy on Adams and Jefferson in 1826, gave him a more than national fame for eloquence. While in congress, he increased his reputation as a statesman by a speech on the Greek revolution, and by opposing the increase of protective duties. As chairman of the judiciary committee he reported and carried through the house a complete revision of the criminal law of the United States. Re-elected in 1824, he supported John Quincy Adams as a candidate for the presidency, and advocated a convocation of the Congress of Panama for the consolidation of the Spanish American republics. In 1826 he was re-elected to Congress, but in 1827 was transferred to the senate succeeding Elijah J. Mills, and retained his seat by re-election till 1841. During this term of office he favored the protective tariff of 1828, and in 1830 delivered his now famous speeches in reply to those of Robert Y. Hayne, of South Carolina, affirming the doctrine of nullification, and attacking New England.

In 1832 he favored the renewal of the charter of the United States bank, and supported Henry Clay as a presidential candidate, and while opposed to President Jackson's financial policy, defended the latter's "force bill" directed against the South Carolina "nullifiers ;" and in 1833 opposed Calhoun's defense of nullification, arguing that the union of states was a government and not a league. In that same year he spoke and

voted against Clay's Compromise tariff, and secured the passage of resolutions condemning President Jackson's removal of the deposits from the bank of the United States. Mr. Webster became the leader of the Whig party, organized in 1834, and his political aspirations were increased by a tour through the west in the summer of 1833, where he aroused much enthusiasm, and by his nomination for the presidency in 1836 by the legislature of Massachusetts. During the financial crisis of 1837, he made one of his most elaborate speeches, in opposition to the "sub-treasury" system of the administration. In 1839 he visited England, Scotland, and France, and was received with much respect and admiration in court-circles. In 1840 Webster was nominated for the presidency by the Massachusetts Whigs, but was not generally acceptable, and withdrawing his name, he took an active part in securing the election of Harrison, who appointed him secretary of state in 1841. This office he retained under President Tyler, until 1843, and displayed great ability and tact in the negotiation of the Ashburton treaty of 1842. Declining a re-election to the senate, Mr. Webster resumed his law practice in Boston, spending his summers at Marshfield, where he had bought an estate in 1833. In 1844 he was again nominated for the presidency, but the choice of his party was given to Clay, whom Webster nevertheless supported. In 1845 he re-entered the senate as Choate's successor, where he opposed the annexation of Texas and the prosecution of the war with Mexico. The disappointment at not receiving the Whig nomination for the presidency in 1848 bore heavily upon Mr. Webster, but he gave a cordial support to President Taylor's administration. He now devoted his senatorial efforts to the preservation of the union by the advocacy of compromises on the slavery question, and on Mar. 7, 1850, condemned the refusal of certain states to comply with fugitive slave law. This inconsistency on the part of one whose attitude towards slavery and compromise with slave states had been continuously hostile, excited great indignation and sorrow in the north, and hastened the decline of Webster's popularity. In 1850 he became again secretary of state under Fillmore, and managed with great skill various international disputes with Austria, Spain, and Great Britain. In 1851, July 4, he delivered an address on the completion of the laying of the corner-stone of the extension of the capitol, and in 1852 argued the celebrated Goodyear India-rubber patent case at Trenton. He was a Whig candidate for the presidential nomination in 1852, but was defeated by General Scott, and signified his disappointment by advising his supporters to vote for Pierce. In May, 1852 he was thrown from his carriage, at Marshfield, and though he returned to his duties at Washington, his health declined, and resigning his office he returned to Marshfield, where he died, Oct. 24.

Mr. Webster had a commanding figure, a large head, and deep-seated lustrous eyes, a swarthy complexion, and a powerful and beautiful voice. He was indolent by nature, yet was athletic and fond of outdoor life and sports. His manners were impressive but cold, in spite of a strong sense of humor that enlivened his conversation. He was an affectionate father, husband, and friend; but was extravagant in his way of living, and was drawn by his passions into excesses. Although not actively connected with any religious body after attaining his majority, he was a firm believer in Christianity, and directed that a statement to that effect should be carved upon his tombstone. He was twice married: in 1808 to Grace Fletcher, of Hopkinton, N. H. (d. 1828); and in 1829 to Caroline Bayard Le Roy, of New York City (d. 1882). His second son, Edward, a major of volunteers, died in the city of Mexico during the Mexican war, and he lost a daughter that same year. One son, Fletcher, survived, who was secretary of legation to China in 1843; was surveyor of the port at Boston, 1850–61, and who, serving in the union army as colonel, was killed at the battle of Bull Run.

See *The Speeches, Forensic Arguments, and Diplomatic Papers of Daniel Webster* (12th ed., 1864); *Private Correspondence of Daniel Webster* (5th ed., 1864); Harvey's *Reminiscences and Anecdotes of Daniel Webster* (1877); the Life by George Ticknor Curtis (1869), and by Lodge (1884).

WEBSTER, Ebenezer, 1739–1806; b. N. H. · a soldier under Amherst in the French war. Settling in Salisbury, now Franklin, N. H., he kept a tavern, and had a farm until the outbreak of the revolutionary war, when he led a company of militia to join the continental army at Cambridge. He served through the war, at whose close he was a col. of militia. He served in both houses of the New Hampshire legislature, and from 1791 till his death was judge of the Hillsborough co. court of common pleas.

WEBSTER, Horace, 1794–1871; b. Vt.; graduated at West Point, 1818, and was commissioned in the infantry. He was assistant professor of mathematics at the military academy for seven years; in 1825 resigned his commission and became professor of mathematics and philosophy in Geneva (now Hobart) college. In 1848 he was made president of the New York free academy, now known as the college of the city of New York. From 1852 to 1869 he acted as professor of moral, political, and intellectual philosophy, as well as president, and in the last named year became professor *emeritus*.

WEBSTER, John, b. England, late in the 16th c.; the associate in play-writing of Rowley, Marston, Dekker, Drayton, and others. His best dramas are *The White Devil* (1612); and *The Duchess of Malfy* (1623).

WEBSTER, Noah, American author and philologist, was born in Hartford, Conn., Oct. 16, 1758. His father, whose farm lay in the western part of the town, now con-

stituting West Hartford, was descended from John Webster, one of the original settlers of Hartford, and his mother was descended from Governor Bradford of Plymouth Colony. He fitted for college under Rev. Nathan Perkins, D.D., and entered Yale in 1774; served under his father, a captain of militia, during the excitement caused by Burgoyne's expedition in 1777; then returned to college to graduate in 1778. During the period 1779–81, he taught school in Hartford and studied law, but receiving no encouragement to practice, opened, in 1782, a classical school at Goshen, N. Y., where he began the preparation of school books, and in 1783 returned to Hartford and published in parts, 1783–85, a spelling-book, grammar, and reader under the title of *A Grammatical Institute of the English Language.* The first part was the basis of the famous spelling-books subsequently published, and of which more than 80,000,000 copies had been sold up to 1880. He also published Governor Winthrop's *Journal;* contributed in 1783 to the *Connecticut Courant* a series of papers signed Honorius in defense of the soldiers' pay-bill; published in 1785 *Sketches of American Policy,* advocating the formation of a new constitution, and in 1786 traveled in the south to procure the enactment of state copyright laws, the confederation not having the requisite powers. He also lectured in a number of eastern cities on the English language. In 1787 he became superintendent of an Episcopal academy in Philadelphia, and when the Constitutional Convention ended published a pamphlet entitled *Examination of the Leading Principles of the Federal Constitution.* In Dec., 1787, he established in New York *The American Magazine,* but losing heavily, discontinued it after a year's trial and returned to Hartford in 1789. After some years of successful practice as a lawyer he returned to New York in 1793, where he started a daily newspaper, *The Minerva,* and a semi-weekly edition of *The Herald* for the support of the national administration. These names were afterwards changed to *Commercial Advertiser* and *New York Spectator.* In 1795 he wrote for his paper a series of able articles under the signature of Curtius in defense of Jay's treaty with England, concluded the previous year. In 1798 he removed to New Haven, and published in 1799 *A Brief History of Epidemics and Pestilential Diseases* (2 vols., Hartford); in 1802, *Historical Notices of the Origin and State of Banking Institutions and Insurance Offices* and *Rights of Neutral Nations in Time of War;* in 1806, *A Compendious Dictionary;* in 1807, *A Philosophical and Practical Grammar of the English Language,* and began the preparation of his *American Dictionary of the English Language.* After devoting ten years to the study of the English language he began his dictionary anew, spent two months in Paris in 1824 and eight at Cambridge, England, continuing his philological studies; and returned to America in 1825 to complete his work. In 1828 an edition of 2500 copies was published, and was followed by one of 3000 copies in England.

During the years 1812–22 Mr. Webster resided at Amherst, Mass., where he aided in founding Amherst College. He was for several years president of its board of trustees, and also represented Amherst in the state legislature. He had previously represented New Haven in the Connecticut legislature and had been a judge of one of the state courts. He returned to New Haven in 1822 and received from Yale College in 1823 the degree of LL.D. In 1840–41 a second edition was published, and in 1843 Mr. Webster revised the appendix. He died in New Haven, May 28, 1843. In 1848, a third edition of the dictionary appeared and in 1859 a fourth (pictorial), both edited by his son-in-law, Prof. Chauncey A. Goodrich; in 1864 a fifth edition, edited by Prof. Goodrich and Prof. Noah Porter, was published, and a sixth edition appeared in 1880. The word "American" on the title-page gave place to "International" in the edition of 1891.

Mr. Webster published *Dissertations on the English Language* (1789); *The Revolution in France* (1794); *Letters to Dr. Priestly* (1800); *Origin, History, and Connection of the Languages of Western Asia and of Europe; Letters to a Young Gentleman Commencing His Education* (1823); *Manual of Useful Studies* (1832); *History of the United States* (rev. ed., 1838); *A Collection of Papers on Political, Literary, and Moral Subjects* (1843); also revised editions of the Bible (1833) and of the New Testament (1839). His *Synopsis of Words in Twenty Languages* (about 1817) has never been published. See the memoir by Goodrich prefixed to the later editions of the dictionary, and the Life, by Scudder (1882).

WEDDAHS, or VEDDAHS, descendants of the original inhabitants of Ceylon, who were conquered and nearly exterminated by the Singhalese, 543 B.C., under Wejaga, the first Singhalese king. They inhabit chiefly the great forests of the interior, and also the most inaccessible parts of the central table-land.

WEDDERBURN, JAMES, 1500–64; b. Scotland; edited with his brother Robert a work entitled *Ane Compendious Buike of Godly and Spirituall Sangs, collectit out of Sundrie Partes of the Scripture, wyth sundrie of uther Ballates changed out of Prophane Sangs for avoyding of Sinne and Harlotrie.* This was the principal psalm-book used in Scotland. It was re-published by sir. J. G. Dalyell in his *Scottish Poems of the Sixteenth Century.* To Wedderburn is attributed also *The Complaynt of Scotland,* said to be the only classic work in old Scottish prose.

WEDDING ANNIVERSARIES, GIFTS IN COMMEMORATION OF. The names given to the several anniversaries of a marriage are said to be of quite ancient origin, and arose from the gift which was regarded as the most suitable offering from the husband to the

wife. In modern times, however, these anniversaries are made the occasion of many pleasant gatherings of friends, in which all who so desire, may present to the married couple the gifts supposed to be suitable to the day.

First anniversary, Paper.
Second anniversary, Straw.
Third anniversary, Candy.
Fourth anniversary, Leather.
Fifth anniversary, Wooden.
Seventh anniversary, Floral,
Tenth anniversary, Tin.
Twelfth anniversary, Linen,
Fifteenth anniversary Crystal.
Twentieth anniversary, China.
Twenty-fifth anniversary, Silver.
Thirtieth anniversary, Pearl.
Thirty-fifth anniversary, Coral.
Fortieth anniversary, Emerald.
Forty-fifth anniversary, Ruby.
Fiftieth anniversary, Gold.
Seventy-fifth anniversary, Diamond.

The Diamond Wedding is usually celebrated at sixty years of married life, instead of waiting until the seventy-five years have expired. The others that are most frequently celebrated are the Paper, Wooden, Tin, Crystal, Silver and Gold.

WEDGE, one of the mechanical powers, and in principle a modification of the inclined plane. The power is applied by pressure, or more generally by percussion to the back, thus forcing the edge forward. The wedge is employed for such purposes as the splitting of wood, the fastening firmly of the handle of an axe, the raising of a ship in a dry dock, etc. The investigation on statical principles of the mechanical advantage of the wedge is extremely unsatisfactory, the power, which is scarcely ever a "pressure," being always assumed to be one, and the enormous friction on the sides of the wedge being generally neglected; the theoretical result thus arrived at is that the pressure applied at the back: the resistance or weight: $\frac{1}{2}$ width of back of wedge: length of side. In the application of the wedge to the splitting of wood in the direction of the fibres, the split generally extends some distance in advance of the edge of the wedge, and the action of the latter is then a combination of the action of the wedge with that of the lever; in fact, this compound action is found more or less in all applications of the wedge as a cutting or splitting weapon, and tends further to complicate the statical investigation of its mechanical properties. The best and simplest illustrations of the single wedge are axes, nails, plugs, planes, chisels, needles, and all sharp-pointed instruments.

WEDGWOOD, Josiah, the creator of British pottery as an art, was b. at Burslem in Staffordshire, in the year 1730. His father was a potter, and very early he was set to work at the same business. His education seems to have been of the scantiest. After an abortive attempt to settle himself at Stoke with a partner named Harrison, he returned to his native place, and there commenced business as a potter. From the first, his ardor for the improvement of the manufacture was conspicuous. His first efforts were directed to the refining of the material, and soon he succeeded in producing a beautiful cream-colored porcelain, which became popularly known as queen's ware, queen Charlotte having much admired it, and extended her patronage to the manufacturer. Subsequently other improved materials were produced. The attention of Wedgwood was not less assiduously directed to consideration of form and decoration; he busied himself in emulating the grace of the antique models; and the celebrated sculptor, Flaxman, was employed to furnish designs to him. In this way what he found a rude and barbarous manufacture, he raised to the level of a fine art; and he found his reward in the speedy amassing of an immense fortune. In 1771, he removed his works some little way from Burslem; and to the new site he gave the fanciful name Etruria, as that of the country of old most celebrated for the beauty of its ceramic products. Here he built himself a splendid mansion; and here, in 1795, he died.

Apart from his eminence in the art to which he mainly devoted himself, Wedgwood was a man of considerable culture. Natural philosophy, in particular, he studied with much success. He was a fellow of the Royal Society, as also of the society of Antiquaries; and to the *Philosophical Transactions* he from time to time contributed papers. He likewise interested himself deeply in all matters of public concernment; and mainly through his influence it was that the Grand Trunk canal, uniting the waters of the Mersey, the Trent, and the Severn, was carried out.

Full particulars as regards this remarkable man may be found in two lives of him published in 1865, one by Eliza Meteyard, the other by Llewellyn Jewett. See also Eliza Meteyard's *Memorials of Wedgwood* (1875), and *Wedgwood Handbook* (1875).

WEDGWOOD WARE, a beautiful kind of pottery invented by Josiah Wedgwood in 1775. It consists of flint, Potter's clay, carbonate and sulphate of barytes, and zaffre, or some other coloring material. It is also called jasper ware. The beautiful classical designs on the earliest productions of this manufacture were many of them executed by Flaxman, and are very highly valued.

WEDNESDAY, the fourth day of the week, the *Dies Mercurii* of the Romans, the *Mittwoch* (mid-week) of the modern Germans. The name Wednesday is derived from the northern mythology, and signifies Woden's or Odin's day. The Anglo-Saxon form was *Wôdanes dag*, the old German *Wuotanes tac*. The Swedish and Danish is *Onsdag*.

WEED, *Lymphangeitis*, or a shot of grease, consists in inflammation of the large absorbent glands and vessels situated between the horse's thighs. Rarely, it attacks the corresponding structures between the fore-limbs. It occurs in round-limbed, indifferently bred, hard-wrought horses; appears particularly after a day or two of rest, after exposure to cold, or during imperfect action of the bowels; and is said to depend upon more blood being produced than is required to replace the natural waste of the body. It is identified by lameness, tenderness in the groin, and fever. The horse must be bled, have a full dose of aloes, and when the pain and tenderness are great, ten drops of Fleming's tincture of aconite in water every two hours; the limb should be bathed for at least six or eight hours continuously in hot water, and then rubbed dry and kept warm. The subsequent swelling will be reduced by saline draughts, diuretics, rubbing of the limb, and exercise.

WEED, Stephen H., 1834–63 ; graduated at West Point in 1854, and was appointed to the artillery. He took part in the Florida war and the Utah expedition. He was made capt. in the artillery in 1861, was attached to the army of the Potomac in 1862, and served through the peninsular campaign, showing great gallantry at Antietam and Chancellorsville. Soon after the latter battle he was made brig.gen. of volunteers. He was killed at Gettysburg at the head of a brigade of regulars in the 5th corps.

WEED, Thurlow, American journalist, was b. at Cairo, N. Y., Nov. 15, 1797, and at the age of 10 years was cabin-boy on a sloop on the Hudson river; at 12 he was an apprentice in the printing-office of Mr. Croswell, at Catskill; then lived for a short time in a backwoods settlement, but at 14 returned to printing. He was a volunteer in the war of 1812, and at the age of 21 established a newspaper in western New York, and during the anti-masonic excitement, was elected to the state legislature, 1826–27, where his peculiar and almost unrivaled abilities as a political manager or "wire-puller" were early recognized. In 1830 he settled at Albany, the state capital, and commenced the publication of the *Evening Journal*, an anti-Jackson, whig, or republican paper, which became the organ of the party, and of the state government when its party was in power. Declining all offices for himself, except the profitable one of state printer, he is supposed to have exercised almost supreme influence in nominations and appointments, and to have secured the choice of Presidents Harrison and Taylor ; was through his whole career, the friend and adviser of Mr. Seward. In 1861 he was sent in a semi-diplomatic capacity to Europe, and on his return was presented with the freedom of the city of New York, where he became part proprietor and one of the editors of the *New York Times*, and subsequently editor of the *Commercial Advertiser*. In 1866 he published *Letters from Europe and the West Indies*. After a serene old age, he d. 1882.

WEEDON, George, b. Fredericksburg, Va., about 1730; at the outbreak of the revolutionary war was commissioned lieut.-col. in the Virginia troops. At Brandywine he was at the head of one of Greene's divisions, and to him is ascribed the honor of stopping the British pursuit and saving the patriot army. He also served with credit at the battle of Yorktown and elsewhere. He died subsequent to 1790.

WEEDS, the name given to all those plants which grow wild in cultivated grounds, and injure the crops; which they do both by choking them, and by exhausting the soil. Those weeds which are annuals or biennials, as charlock, yellow rattle, and melilot, may gradually be got quit of by merely cultivating, for a succession of years, such plants as are to be cut before the seeds of the weeds are fully ripe. Perennial weeds, such as couch grass, can only be removed from the ground by repeated and careful tilling; and for this purpose, crops which require much hoeing are advantageously planted, and recourse is had to summer fallowing in fields, and frequent weeding in gardens. Thistles and other large weeds are frequently pulled in corn fields before the corn comes into ear, and to prevent their seeding, they are cut in pastures. Sedges and rushes, which spring up in great abundance in damp grounds, disappear on thorough draining. Leafy crops which thickly cover the soil, prevent the growth of many weeds by the exclusion of air and light. Weeds which have been rooted up form excellent compost for manure. Those which make their appearance in fallow grounds serve for green manuring when they are plowed down.

WEEK (Goth. *Vico;* Old High-German, *Wehha* = order, cycle (?); Lat. *Vicis;* Gr. *Hebdomas, Sabbaton;* Heb. *Shabua*, from *Sheba*, seven) designates generally a period of seven days. It was probably first instituted as a kind of broad subdivision of the periodical month, corresponding to the four quarters of the moon, or about 7⅜ days. Although found as a civil institution among some nations at the earliest time—e.g., with the Hindus, Assyrians, Persians, etc., it is only with the Jews that we see a religious signification given to the concluding or seventh day of that period itself. Both their cosmogony and legislation are connected with it. The Sabbath (q.v.) is emphatically the day of rest, while seven weeks after the Passover, the Pentecost or feast of weeks takes place, etc. (see Seven). It is doubtful whether it was through the Jews that this com-

putation of weeks was introduced to the Egyptians, but it is certain that the latter at an early period counted seven periodical days, naming them according to the seven planets then assumed. The application of the names of the planets to the days of the week in the order they now stand, originated in this way: It was an astrological notion that each planet in order presided over an hour of the day, the order, according to their distances from the earth, being, on the geocentric system, Saturn, Jupiter, Mars, the sun, Venus, Mercury, the moon. Assuming Saturn to preside over the first hour of Saturday, and assigning to each succeeding hour a planet in order, the 22d hour will fall again to Saturn, the 23d to Jupiter, the 24th to Mars, and the first hour of the next day to the sun; in the same way, the first hour of the following day falls to the moon, and so on. From Alexandria this seven-days' week was imported, together with the names of the individual days, to the Greeks—who previously divided their months into three decades—and to the Romans, about the time of Christ. Rome had previously counted her periods by eight days, the eighth day itself being originally called *Nundinæ*—a term later applied to the whole cycle—as returning *nono quoque die*, when the country people were in the habit of coming to town for the purposes of business, and chiefly to inquire after public news, the changes in government and legislation, vacant places, and the rest. But the seven days' cycle soon found great favor among the Romans, owing partly, perhaps, to the spread of Egyptian astrology, although the change was not officially introduced before Constantine. It is certain that the Jewish name Sabbath came into use in Rome, and from Rome it spread to all the Romanic languages, even into the German. It survives in the Italian *Sabbato*, the Spanish *Sabado*, the French *Samedi* (*Sabbati dies*), and the German *Sambaztac*, which afterward became *Samstag*. In the same manner, the Latin *septimana* (the Greek *hebdomas*) had become the modern designation for week in the Italian *settimana*, Span. *semana*, French *semaine*, and even in the Irish *sechtmaine*. The *Codex Theodosianus* is the first document which adopts the term *septimana* in the meaning of weeks. The Jews, as well as the early Christians, had no special names for the single days, but counted their number from the previous Sabbath, beginning with Sunday, as the first after the Sabbath, and ending with Friday, as the sixth after the previous, or eve (*Ereb*) of the next Sabbath. After a very short time, however, young Christianity, which in the same manner had endeavored to count from the *feria secunda*, or second day after Sunday, to the *Septima* (or Saturday), had to fall back again upon the old heathen names, previously introduced in Gaul, Germany, etc., by the heathen Romans. The Sunday, or *dies Solis*, alone was changed in many of the Romanic languages in accordance with the new creed. It was called *Kyriake*, *dies Dominicus*, or *Dominica*, the day of the Lord, a term which in Italian became *Domenica*, in Spanish *Domingo*, and *Dimanche* in French. The Germanic *Frôntac* (from *frôn* = *dominicus*) occurs but once. It is very curious to notice how the names of the five days of the week which followed those named after the sun and moon, became Germanized, as it were, or the names of the originally imported gods translated into those of the Germanic divinities. Thus, the day of Mars became that of Ziu (see Tyr). Mercury became Wodan; and the fourth day was called after the latter, in Dutch, English, and Scandinavian; while in Germany it was simply called the middle of the week = *Mittwoch*. The day of Jupiter became the day of Thor = Thursday, *Donnerstag;* while the *Dies Veneris* was transformed into the day of Freya, the wife of Odin (Wodan). The day of Saturnus, retained under this name in some northern tongues, became a *langardage*, or bathing-day, in others; while in upper Germany it remained a Sunday-eve (*feria ante dominicam*) or *Samstag* (see above). From recent discoveries of Assyriologists, it seems certain that the Assyrians, and through them probably the other Semitic nations, derived their week of seven days from the Accadians or early Turanian inhabitants of Babylonia, who also observed the seventh day as a day of rest. To this remarkable people are also to be traced the planetary names which we still give to the days of the week. The Arabs, like the Jews, count their days (beginning and ending with sunset) by sevens, without giving them planetary names. Greeks, Slaves, and Finns also count their days from Sunday, instead of naming them. The French revolution altered the seven-days' week into a decade of 10 days; but the new computation introduced in 1793 was abrogated again in 1805. The "weeks of years" in Hebrew prophetical poetry (like the Roman *annorum hebdomadæ*) indicates cycles of seven years.—See Ideler's *Chronologie* (1831); Grimm's *Deutsche Mythologie* (1835); and Lenormant's *La Magie chez les Chaldéens* (1874).

WEEKES, Henry, 1807–77; b. England; studied sculpture at the Royal academy. He was long an assistant of Chantrey. Among his works are statues of Charles II., Bacon, Latimer, Ridley, Cranmer, and others. He became a member of the academy in 1863, and was professor of sculpture there from 1873.

WEEKS, Feast of (Gr. *Pentecoste* = fiftieth, Heb. *Shabuoth*, also called feast of harvest, day of the first-fruits, etc.), the second of the three great *regalim* or pilgrim feasts of the Old Testament, was celebrated seven weeks, or forty-nine days, after the passover. As the latter was the feast of the barley harvest, so the former was that of the wheat-harvest. The first two loaves of the new crop were offered up on the day of the festival—leavened, and containing about 3½ quarts each (the Mishnah speaks of their being 7 in. by 3), together with a peace-offering of two lambs. Besides this, a great burnt and sin offering—the former consisting of seven lambs, a bullock, two rams, to-

gether with the appropriate meat and drink offerings; the latter of one kid—were added, according to Leviticus (xxiii. 18); while Numbers (xxviii. 27) increases the number of the bullocks to two, and only mentions one ram—a number more in accordance with the regulations for the other festive sacrifices. The Jewish tradition, however, considers the animals mentioned in the later passage as an additional sacrifice; and Josephus has indeed added both up, except in as far as the rams are concerned, of which he only gives two. Tradition has given to this feast, which originally was only intended to represent the solemn closing of the harvest, a new significance by making it the anniversary of the Sinaitic legislation, which indeed must have taken place in the first days of the third month. But the pentecost, which is always fixed in the Jewish calendar on the 6th of Sivan, could not, before the establishment of astronomical computation, fall always on the same day, but must needs have fallen between the 5th and 7th of that month. Moses himself nowhere fixes the date of this festival as he does with the others. The Karaites, instead of referring the "morning of [after] the Sabbath" of Lev. (xxiii. 15) to the 16th of Nisan, take it literally, and celebrate the festival always on a Sabbath. The uncertainty of the lunar calculation and observation among the Jews of the dispersion, caused them also to add one day to this festival—a usage still retained at present. There seems to have been more of the character of a harvest-home inherent in this festival than in the passover, which partook particularly of the character of a large and solemn family-gatheriug. For the Christian adoption of this festival, see PENTECOST.

WEEKS, ROBERT KELLEY, 1840–76; b. New York; graduated at Yale coll., 1862, and at the law school of Columbia coll., 1864, but mainly devoted himself to literature, and published *Poems* (1866), *Episodes and Lyric Pieces* (1870), *Twenty Poems* (1876)—works full of high promise. A collection of his poems in one vol. was published posthumously, 1880.

WEENIX, JAN BAPTIST, the elder, 1621–60; b. Amsterdam; studied at Utrecht, and with Nicholas Mojert, whose style of painting he followed. He also lived four years at Rome. Though but 39 years of age at his death, he produced pictures in every department of painting, historical, portrait, animal, landscape, and marine. His son JAN, the younger, 1640–1719, was also a painter of merit, and excelled in hunting and sporting pieces.

WEEPING TREES are trees with remarkably elongated and pendulous branchlets, generally mere varieties of species which ordinarily have a different habit, as the weeping birch, weeping ash, and weeping willow, which are varieties of the common birch, common ash, and white or Huntingdon willow. The weeping birch occurs in a wild state in some places in the Highlands of Scotland, and is a characteristic ornament of the landscape. Trees intermediate in their habit between the weeping birch and the common variety are of very frequent occurrence. Weeping trees are much esteemed for ornamental purposes, and are not only very beautiful in themselves, but as a contrast to other trees in lawns and pleasure-grounds. They are therefore carefully propagated in nurseries. The weeping ash is often grafted on the common ash, but the result is seldom very satisfactory, the art of the gardener forcing itself too much upon attention. A tendency to the weeping habit of elongated and pendulous branchlets is manifested in some kinds of trees, as the tendency to vary into a very opposite habit, with the branchlets drawn up close together (var. *stricta* of botanists), appears in others, of which the Swedish juniper and the Irish yew are familiar examples.

WEERT, an unwalled t. in the Netherlands, province of Limburg, 15 m. w.n.w. of Roermond, on the ship-canal from Maastricht to 's Hertogenbosch. Pop. abt. 8000. There are several good schools, a collegiate institution, town-house, churches, and market-places. In the church of St. Martin is the grave of the count of Hoorn, who was beheaded at Brussels, in 1568, for adhering to the prince of Orange in the struggle for religious and political freedom. A beautiful promenade leads to another church, outside the town, n. of which are the ruins of the old castle.

WEEVER, or STING-FISH, *Trachinus*, a genus of acanthopterous fishes of the family *uranoscopidæ*, also called *trachinidæ*. In this family the ventrals are composed of a spine and five jointed rays, and are generally situated before the pectorals. The scales are cycloid, or wanting. The eyeballs are capable of being raised in a remarkable manner out of their sockets, and of being retracted again to the level of the orbits. The species frequent the bottom of the sea. They are often furnished with barbels, and have also a peculiar membranous filament under the tongue, which they can protrude at pleasure. In the genus *trachinus* the head is compressed, the eyes are placed high and close together; there is a long sharp spine on the hinder part of the gill-cover. There are two dorsal fins; the second dorsal and the anal are long; the ventrals are close to the throat. Two species are found on the British coasts, the GREATER WEEVER or STING-BULL (*T. draco*), and the LITTLE WEEVER or VIPER WEEVER (*T. vipera*). The former attains a length of nearly one foot; the latter seldom of more than four or five inches. The general form is long, narrow, and compressed; the little weever is proportionally deeper in body than the greater weever. The head of both is short, compressed, flat between the eyes, and rough on the summit; both dorsals and the anal fins are spiny; and in both the gill-cover is furnished with a strong and sharp spine, which is directed backward, and can be appressed to the body, but which is also capable of being made to stand out

so as to present its point to an adversary. Both species are of a yellowish brown color. They inhabit parts of the sea having a sandy bottom, and often partially bury themselves in the sand, but are ready to move off with great celerity if disturbed. They can live long out of the water; and if left by the retiring tide suffer no inconvenience. If assailed they can, by a sudden bending of the body, make use of one of the strong spines of the gill-covers against the assailant; and the wound thus inflicted is so severe as to lead to the opinion that the spine is coated with a venomous exudation. Naturalists, however, generally supposed the popular opinion to be erroneous, and the severity of the wound to be merely owing to the laceration effected by the spine, until it was discovered by Dr. Günther, in 1864, that poison-glands existed in connection with spines of some South American fishes of the family *siluridæ*. A peculiar stinging sensation attends a wound by a spine of a weever, which extends far up the arm, if the wound has merely been in a finger, and is much more severe than the pain of a wasp-sting. There is also a groove in the spine, which has perhaps something to do with the conveyance of the poison; but no poison-gland has yet been proved to exist. In France the fishermen are required, under a penalty, to cut off the spines of weevers before selling them. Weevers are esteemed for the table.

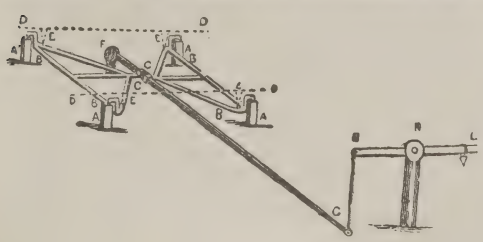
WEEVIL, *Curculio*, a Linnæan genus of insects, now forming the tribe *rhynchophora*, of the order *coleoptera*, and section *tetramera*. They are remarkably characterized by the prolongation of the head into a beak or snout, at the extremity of which the mouth is placed, and from which the club-shaped antennæ spring. Some of them have straight antennæ; but the greater number have the antennæ *geniculated*, or bent forward at the second joint. The species are very numerous, and are distributed over all parts of the world. They all feed on vegetable food, both in their larval and in their perfect state; and some of them are notable for the mischief which they do in the former state to the young shoots, leaves, fruits, and seeds of plants. They are diurnal insects, many of them very small, but others of considerable size. They are slow, timid, and defenseless; although the long hard beak suggests to those ignorant of its real nature and of their habits an idea of danger in handling the larger species. Many of them are of very dull and uniform color; but some are among the most beautiful of the coleoptera—resplendent with the finest hues, and brilliant as gems. Such is the well-known diamond beetle (q.v.) of South America. The larvæ of weevils are soft, white, and footless, with very convex rings, hard heads, and horny jaws. The perfect insects are often found on leaves and in flowers of the particular kinds of plants on which they and their larvæ feed. *Rhynchites betuleti*, a weevil often very injurious to vineyards, constructs a nest for its larvæ by rolling up the leaf of the vine, piercing the roll as it proceeds, and depositing eggs between the folds in the inner part of the roll. The larvæ feed upon the leaf, which the parents further adapt for their use by cutting the leaf-stalk half through, so that the leaf hangs down, and by the time they are ready to change into the chrysalis state, it drops off, or is blown off by the wind, when they bury themselves in the ground to wait for the return of spring. Other trees, as the pear-tree, are infested by weevils which destroy their leaves in a similar manner; the leaves of some, as of the peach, often suffer injury from weevils, which devour them, like caterpillars, without rolling them up; and turnips are subject to the ravages of certain small species of weevil, which proceed in the same manner. Some species of weevil gnaw young shoots. The shoots of fruit trees, and young grafts, are sometimes destroyed by weevils, which bore into them by means of their beak, and make a small chamber in the center, in which an egg is deposited, being pushed into its proper place by the beak. The shoot is then cut through a little lower down, and the parent weevil may be seen climbing upon it, when the operation is nearly completed, to make it fall by her weight, and returning again to her work, if it is not yet ready to fall. She lays about two eggs a day, but continues her operations for many weeks, so that much destruction is effected. The larva feeds on the pith of the fallen shoot, and deserts it when ready to become a chrysalis, to bury itself in the ground.—The larva of a large species of weevil (*calandra palmarum*) inhabits palm-trees in South America, feeding on their central part, and is eaten and esteemed as a delicacy. When roasted, it almost melts into grease; but its flavor is said to be remarkably fine. This weevil is black; about an inch and a half long; its larva is between two and three inches long. Another species (*calandra saccharı*) is very destructive to the sugar-cane. Its larva is also eaten in the West Indies and Guiana.—The wood of pines and firs is the food of certain kinds of weevil, so that plantations suffer severely from their ravages. Thousands of acres of pines in the southern states of America have been destroyed by a weevil (*hylobius pales*), not much more than a quarter of an inch in length; and some of its congeners in other countries are scarcely less destructive, as *hylobius abietis* in Europe. There are many species of weevil which attack leaf-buds and flower-buds. Thus *anthonomus pomorum* infests the apple-tree, depositing its eggs in the flower-beds, and cutting off the prospect of fruit. *Anthonomus pyri* is equally injurious to the buds of pear-trees. Some species of *rhynchites* lay their eggs in fruits—as apples and plums—at an early stage of their growth, cutting the fruit-stalk, that the fruit may fall to the ground. The European nut-weevil (*balaninus nucum*) lays its eggs in young hazel-nuts, upon which the larvæ feed as the nuts grow; a nearly allied species attacks, in like manner, the hazel-nuts of America, and another

infests acorns. The pea-weevil (q.v.) feeds upon peas; and other leguminous plants have their peculiar species, which devour their seeds. The corn-weevil (q.v.) is very destructive to wheat, and other similar species to maize, rice, and other kinds of grain. See illus., BUTTERFLIES, BEETLES, ETC.,

WEFT, or WOOF, the thread which, in weaving, is passed by the shuttle backward and forward through the warp. See WEAVING.

WEIGELA, a shrub brought from China, and named *Weigela rosea,* after Weigel, a German botanist. The correct botanical name is, however, *diervilla,* this generic name having the precedence, but the plant is commonly known by the name *weigela.* There are two native plants, known as bush honeysuckle. The northern species, *diervilla trifida,* is common in the middle and northern states, extending to Hudson's bay and to the Rocky mountains. It grows from 1 to 4 ft. high; leaves oblong-ovate and having petioles; pale yellow flowers, usually three on a stalk, from the axils of the upper leaves. The southern species, the *d. sessilifolia,* grows along the southern Alleghanies, and has sessile leaves. The list of varieties of the foreign species is long, and the colors vary from white to deep rose. This genus differs from *lonicera* in having a nearly regular corolla and a many-seeded, two-valved pod.

WEIGHING-MACHINES. The great majority of weighing-machines are founded upon the principle of the lever (q. v.), the chief exceptions being the various forms of the spring-balance (q. v.), to which might be added (though in such cases the term "machine" is quite inapplicable) some of the methods employed to determine specific gravity, time of oscillation, etc. The simplest and primitive form of weighing-machine is the balance (q. v.) with equal arms, which can be adapted either to the maximum of accurate weighing or to the most rapid equiponderance. But as this machine necessitates the *placing* in one scale of weights equal to the weight of the goods, it was soon found to be more convenient to employ a lever with unequal arms—the goods to be placed in the scale attached to the short arm, and therefore equipoised by less weights, the ratio of the weights in the two scales being in proportion to the ratio of length of the arms. On this principle the *steelyard* (see BALANCE), the *bent lever balance* (see BALANCE), and the *cart-steelyard* are constructed. But the convenience of equipoising a greater weight by one much less is counterbalanced by a considerable diminution in accuracy—one of the causes of error being the greater liability to flexure of the longer arm of the lever; and another, the necessity, for convenience' sake, of having the arm which is affected by the goods to be weighed as short as possible—the latter of itself reducing the accuracy of the steelyard to that of a symmetrical balance, whose arms are each equal to the short arm of the steelyard. However, on behalf of the steelyard, there is again the advantage of rapid equipoise. Each of these machines is variously constructed, the modifications having reference either to convenience of use, or to the species or weight of the goods to be weighed; an example of the former is the equal-armed balance, made in an inverted manner, with the scales above, and the rods which connect the scales with the beam so united as to preserve their perpendicularity during oscillation; and the latter is appropriately illustrated by the form of cart-steelyard given in figure. The dotted lines, DD, DD, indicate the grooved plates on which the wheels rest; E, E, E, E are the four points supporting the wheel-plates on the two triangular levers, CBB, CBB; the triangular levers are supported by the hooked extremities of their bases, B, B, B, B, upon fixed supports, A, A, A, A; while their vertices, C, C, are attached to a lever, FG, whose fulcrum is at F; G is attached by a chain to H, the extremity of a lever of the first kind, whose fixed support is at K, and on whose other arm (graduated) the weights for equipoising the cart and its load are placed. The machine is thus seen to be compound, consisting of the two triangular lever pieces, of a simple lever of the second, and of one of the first kind; the weight L, if sufficient, raising H, and with it G, and thence raising C, and so balancing the downward pressure of the cart and its load at E, E, E, E. Automatic weighing machines, that are set in motion by dropping a small coin in a slot, have lately become familiar to the American public. Torsion balances in which the twisting of a wire takes the place of a pivot have come into use recently and are remarkably sensitive.



WEIGHTS AND MEASURES. For the proper carrying on of mercantile transactions, and for many other purposes, it is necessary that there be fixed and readily accessible standards of magnitude, of weight, and of value. The lengths implied by the names *a foot, a hand, a cubit, a fathom,* are far too indefinite to have long continued to satisfy the wants of civilized nations; and in every country, by common consent, or by the action of government, determinate measures have been agreed upon. These measures, left almost to chance, have been different from one nation to another, even from county to

county, sometimes from town to town, and still more awkwardly, often from one trade or guild to another.

Any one can appreciate the inconvenience of such a want of uniformity, for, in every transaction extending beyond his own sphere, he has to take account of the change of measure, the change of weight, the change of money, perhaps of all three at once. We all see and allow that there ought to be only one system of weights and measures in one country; that one bushel in Winchester, another in New York—one acre in England, another in Scotland, and a third in Ireland; that troy weights, avoirdupois weights, and all the other local, conventional, and trade variations which abound in the British dominions, form an aggregate of unbearable confusion, leading to endless mistakes and ceaseless quarrels. It is not more difficult to extend our observation, and perceive that if one system be advisable for one country, a universal cosmopolitan system would be no less advantageous for the whole world.

The only practical method of establishing a system of measures is to construct standards of reference, and to preserve these carefully in some public place. In order that these standards may not be worn and injured by too frequent use, it is convenient to have authenticated copies deposited in the various towns, so that all dealers and artificers may have ready access to them, and so that all makers of weights and measures may be without excuse for errors in their workmanship.

To set up a standard of measure seems to be a very simple matter—the authorities have only to fix upon the proper length of a yard, to have a piece of wood or of metal made to that length, and to cause it to be properly marked and preserved. For common purposes this seems to be quite enough: however, experience soon shows the inconvenience of this simple plan, for, by repeated contacts, the ends of the yard-measure get worn. Instead, therefore, of making a rod just a yard long, they make it a little longer, and upon it form two fine marks a yard distant from each other, and hold this distance to be the true standard. By this expedient the effects of wearing are got rid of; copy after copy can be compared with the original, without deterioration of the standard.

But use is not the only cause of deterioration: wood decays or is worm-eaten, and metals are liable to oxidation, so that the material has to be carefully chosen. This is not all. Every substance which has been examined is found to change its size with a change of temperature; the standard bar is shorter in winter than in summer, and the change, though it be so small as to be of no moment to the haberdasher, the wright, or the mason, is enough to cause great trouble to those engaged in very accurate work. Hence, in the selection of the substance to be used for the standard bar, we must have an eye to smallness of expansion as well as to durability. The substances available, taken in the order of their expansibility, are: *deal, glass, platinum, gold, silver, iron, brass, copper.* Deal may be put aside as wanting in durability, and the choice may be said to lie between glass and platinum, neither of which is much acted on by the air, or by the vapors which are found in the atmospheres of large towns. The fragility of glass and the costliness of platinum are objections; but the latter is a mere trifle when a national standard is concerned. Platinum, then, seems to be the best substance.

The standard measure for the British empire is a brass rod, into which two pins of gold are inserted; the upper surfaces of these are sunk to the half thickness of the bar, and a small dot is made in the middle of each. The distance between the centers of these dots, taken when the temperature is at 62° Fahr., is declared to be the true yard.

In the same way as the standard of measure so must the standard of weight be established. A piece of heavy metal is made of the desired weight, and is duly authenticated. The preservation of the standard of weight is a matter of very considerable difficulty. Every occasion on which it is used, each removal of dust from its surface, the actions of the oxygen of the air and of the products of combustion which are always floating about, produce a sure though slow waste; and all that can be done is to retard this waste as much as possible. Perhaps a lump of platinum would make the best standard; but its softness is a decided objection.

In the use of a standard of weight another matter has to be taken into consideration. The apparent weight of any substance is less than its true weight by the weight of as much air as is displaced by it. Now, the density of the air is not constant—air, when warmed, expands very much more than any solid body; and therefore a piece of metal appears to weigh more in warm than in cold weather. Not only so, air is rendered more dense by an increase of pressure, and so, when the barometer is high, all heavy bodies become apparently lighter; when the barometer sinks they appear to become heavier. Thus the apparent weight of the standard pound is continually changing. If we accurately adjust two weights of brass when the barometer is low and the air warm, and afterward compare them when the barometer is high and the weather cold, we can perceive no change, for, though each has lost weight, they have lost alike. But if we had adjusted a weight of iron to a weight of platinum in light air, and again compared them in dense air, the change would have been at once seen. For, since a pound of iron is more bulky than a pound of platinum it displaces more air, and its apparent weight undergoes a greater change than does that of the platinum. Fortunately, these changes are too small to have any perceptible influence on mercantile transactions, yet they are sufficient to create the necessity for it being enacted that the standard weight must be held as true when the air is in a specified state as to warmth and pressure. The stand-

ard brass pound, which serves for the British empire, is to be used when Fahrenheit's thermometer is at 62°, and the barometer is at 30 inches. (See note.)

The thought naturally arises, what if, in the course of time, the original standards be lost or destroyed?

Time was when a seed of wheat gathered from a well-ripened ear served sufficiently well to define a grain weight; and even now the eastern jewelers weigh their gems against the *carat* or carob-bean, the hardness and uniformity of which seem to justify the selection of it. But for the extended purposes of modern commerce, and particularly for the more delicate requirements of scientific research, it is indispensable that we find some unchanging object of comparison; and none can be preferred to the earth itself as the most universally acceptable and as the best defined. For the purposes of geographers and navigators, the circumference of the earth is divided into degrees and minutes, the length of one minute being the geographical or nautical mile; and it certainly would have been convenient if the common or statute mile had agreed with this. The dimensions of the earth are now known with a precision far greater than is needed for ordinary purposes; the entire length of the circumference of a meridian circle being 131,236,000 of our standard feet, so that the length of a nautical mile is 6,075 ft. and about 9 in.; and it is highly probable that subsequent and more accurate measurements will not alter this determination more than an inch or two either way. It is usual to divide the minute into 60 seconds, so that a second of the earth's circumference is 101.25, and thus if our standard foot had happened to be one-eightieth part longer than it is, there would have been exactly 100 ft. in a second, and 6,000 ft. in a nautical mile. When we reflect on the disparity of the foot used by different nations, and recollect that 100 Vienna ft. make 103.6 English, as many Amsterdam feet 92.7, as many Berlin feet 99.2, we can hardly help regretting that our forefathers had not happened to hit upon the exact 100.

The ancient Greeks were fond of dividing into sixties; this division still continues in our scales for angles and for time; and it is worthy of remark, that if we divide the whole circumference of the earth into 60 parts, each of these into 60, and again each into 60, we arrive at a distance of 607.5 English feet. Now, the length of the ancient Greek stadium or furlong is stated to be 606¼ ft. by some writers; and if deduced from measures of the Roman mile, is between 605 and 613 ft.; so that if we desire a cosmopolitan standard, we can hardly do better than go back to the ancient Greek *stadium* or the Chinese *li*, corrected to suit the more accurate determination of modern times: this would bring us to the geographical foot, one-hundredth part of a second of the earth's meridian.

The standard of weight is readily connected with the standard of measure. Some substance which can be easily obtained pure is chosen, and a definite bulk of it is weighed. Distilled water is universally selected for this purpose; and in the British system the weight of one cubic inch of pure water is declared to be 252.458 grains when it is at the temperature of 62° Fahr.

It has long been known that water does not continue to contract as it is cooled; the contraction becomes less and less as the temperature approaches to 41° or 39° Fahr.; and the water, when cooled more, begins to expand, and continues to grow more bulky until it be on the point of freezing. On this account it has been proposed, and without any doubt it would be the best plan, to take water when at its greatest density as the standard for comparison, because then an error of a degree in temperature will produce no perceptible error in the weight.

The operation of verifying the standard of measure by comparing it with the size of the earth is necessarily an expensive and a complicated one, only to be attempted under the auspices of a wealthy government, or with the concurrence of several nations; and it is desirable to find out something more local and more easily obtained wherewith to compare our measures. The length of the pendulum (q.v.) has been proposed; and, on account of a very simple and beautiful property of pendulums, the comparison can be readily made. If we imagine an excessively minute heavy body to be suspended by a thread so fine that the weight of the thread may be neglected, the compound so formed is called a simple pendulum; and the question becomes, what must be the length of such a pendulum in order that it may vibrate from side to side in, say, one second of time? Now, it is clear that we cannot obtain this length by direct experiment, since we cannot construct such a pendulum. M. Biot tried to approximate to it by using a small ball of platinum hung by a very fine wire. However, it is known that if a heavy rigid mass be suspended by a knife-edge, and if its vibrations be made in the same time with those of a simple pendulum, then if we place another knife-edge at a distance from the first equal to the length of the pendulum and reverse the ends, the compound pendulum will again vibrate in the same time as before. Hence we have a very simple method of comparison. Having constructed a strong bar with two knife-edges at a known distance from each other, say at the distance of a yard, let us then, by many trials, filings, and scrapings, so adjust it as that the times of vibration shall be alike for the two knife-edges, and, finally, let us count how many vibrations such a pendulum makes per day, and then we shall have a means of verifying our measure.

The act of parliament which fixes our present weights and measures enacts that the length of a pendulum vibrating in one second of mean solar time is 39.13929 in.; now the lengths of pendulums are proportional, not to the times in which they vibrate, but

to the squares of those times; and so if we know the length of one pendulum, and the number of vibrations it makes per day, we can calculate what ought to be the length of another to vibrate a given number of times. A convertible pendulum having the distance between its knife-edges exactly 36 in. ought to make 90088.42 vibrations per day.

When only a degree of accuracy sufficient for commercial and ordinary purposes is aimed at, the above process is by no means difficult; but when extreme precision is wanted, the operation is attended with many and very great difficulties; it involves considerations which would hardly have been expected. In the first place, our experiments are made in air, and the buoyancy of the air lessens the actual weight of the pendulum; that buoyancy has to be allowed for, and therefore it is declared that the above length is that of a pendulum vibrating in a vacuum. Next, since the earth has a diurnal motion on its axis, every substance placed on it has a centrifugal tendency which goes to modify what otherwise would have been its gravitation; this centrifugal tendency produces the earth's oblateness, and causes a variation in the intensity of gravitation from one latitude to another. A stone is actually heavier in Edinburgh than it is in London. This change in gravitation cannot be measured by a balance, because the weights at each end of the balance are changed alike; but is seen at once in the going of a clock; for a pendulum regulated to go truly in London is found to go too fast when taken to a higher latitude, and to lose time when carried nearer to the equator. Hence, the enactment that the pendulum must be swung in the latitude of London. And again, the attraction which the earth exerts upon bodies placed near it diminishes with their distances, being inversely as the squares of the distances; hence, a clock carried from the bottom to the top of a hill loses time perceptibly, and so it is necessary to have the additional enactment that the pendulum be swung at the level of the sea.

In addition to these niceties, there are others connected with the manipulation, such as the parrallelism of the knife-edges, their bluntness, the extent of the area of oscillation, and the stability of the supports, so that altogether the exact measurement of the length of the seconds pendulum is a matter of very great complexity. All these difficulties and troubles notwithstanding, we may hold that for all practical purposes, our system of weights and measures—and it may be added, the systems of all other civilized nations—is perfectly well established, whether it be regarded as derived from the dimensions of the earth, or from the intensity of gravitation.

No system of measures can ever claim to be of universal application from which geographical dimensions are excluded. It is essential that the unit of measure bear some simple relation to the earth's circumference, for otherwise the operations of the surveyor will not accord with those of the geographer. the only question, therefore, in regard to the establisment of a cosmopolitan system, is as to the number of parts into which the earth's circumference is to be divided. Now, the denary system of numeration has already asserted its supremacy; one by one the schemes followed by different nations have given way to it, and their very languages have been modified by its influence; sufficient traces remain to show how extensive these modifications must have been. The *three-score and ten* is not yet forgotten in English, nor the *quatre-vingt dix neuf* in French. In many trades the counting is still in dozens and grosses; yet our merchants count their interest, their discount, and their dividends in cents. The surveyor divides the foot on his leveling staff into tenths, hundredths, and thousandths; he makes his Gunter-chain of 100 links. The astronomer no longer divides the second into sixty thirds, but into hundredths; he gives his equinoctial time in decimal fractions of the day, and he makes the arguments for the planetary disturbances in thousandth parts of the whole revolution. There is no single instance in which the decimal system, once adopted, has been abandoned. An English statute, the weights and measures act, 1878, has been passed, which, while making no material change so far as mercantile matters are concerned, places the system on another and most unsatisfactory foundation. The standard of length is still the distance between the same two gold pins, but the standard of weight is now declared to be a platinum pound avoirdupois to be weighed *in vacuó*. The act contains no instructions as to how this is to be compared with any weight in air, nor does it narrate any connection between the brass weight of 5,760 grains in air, with the platinum one of 7.000 grains *in vacuo*. Further, the whole of the old act is repealed, so that there is now no connection between the standards of measure and of weight, nor between these and any natural or recognizable quantity. We are thus carried back to the rudest of all foundations, an arbitrary weight and an arbitrary measure. The fruits of laborious scientific research are put aside.

Weights and measures have, since the year 1824, been in great measure regulated by statute. The statute 5 Geo. IV. c. 74 was passed to enforce uniformity in the weights and measures used in various parts of Great Britain and Ireland; and a standard yard was defined as being then in custody of the clerk of the house of commons, and it was enacted that all superficial measures should be computed and ascertained by the said standard yard. The act also described how, if the said standard yard were to be lost or destroyed, another was to be made. So the statute defined a standard brass weight of one pound troy, and a standard gallon. That statute was altered by a subsequent statute of 5 and 6 Will. IV. c. 63, and inspectors were authorized to be appointed by justices of the peace, who had power to examine and stamp weights and measures.

It was enacted that any contract, bargain, or sale made by any weights or measures unauthorized by the act should be wholly void, and every such weight might be seized by the inspector, and forfeited. One or two exceptions were made by the act—such as weights above 56 lbs.; wooden or wicker measures used in the sale of lime; glass and earthenware jugs or drinking-cups, though represented as containing the quantity of any imperial measure, or any multiple thereof, and these are not illegal, though incorrect. The act 41 and 42 Vict. c. 49, to consolidate the body of existing law on the subject, insists on uniformity in the use of imperial weights and measures, defines the standards of weight, length, and capacity as specified in the note on the previous page, gives the penalties for unjust measures, regulates the stamping and verification of weights and measures, and prescribes how the law should be administered. See GRAM, LITER, METER; METRIC SYSTEM.

WEIMAR, a small but interesting t. of Germany, capital of the grand-duchy of Saxe-Weimar-Eisenach, and residence of the grand-duke, 59 m. s.w. of Leipsic by railway. It stands in a pleasant valley on the left bank of the Ilm; but the environs are in no way remarkable, and the town itself is irregularly and rather poorly built. Though the residence of the court, and finding its subsistence in providing for the wants of distinguished visitors, Weimar carries on neither trade nor manufactures, and seems a dull provincial-looking town. The luster conferred upon Weimar by the residence here, at the close of the 18th and the earlier portion of the 19th centuries, of Goethe (q.v.), Schiller (q.v.), Herder (q.v.), and Wieland (q.v.), at the court of Karl-August (see SAXE-WEIMAR-EISENACH), has faded since that group was broken up by death; and now the interest of the town is almost wholly derived from its monuments, traditions, and associations. The town church (*stadtkirche*), dating from the year 1488, has an altar-piece by Cranach, and contains a number of memorable tombs, among which are those of the brilliant soldier, Bernhard (q.v.) of Weimar, and of Herder, the philosopher and critic. The ducal palace is a handsome building, some of the apartments of which are decorated by frescos illustrating the works of Goethe, Schiller, Herder and Wieland. The public library contains busts of these men of genius; and a number of relics, as the gown worn by Luther when a monk, and Gustavus Adolphus's leather belt, pierced by the bullet that caused his death at Lützen. The houses of Goethe, Schiller, and Herder are still pointed out. The two former of these poets lie interred in the grand-ducal burial-vault. The park and gardens of the palace, within which is the summer residence of Goethe, are much esteemed as a promenade. Pop. '80, 19,944; '95, 26,670.

WEIR, or WEAR—called also a dam, and in the n. of England and s. of Scotland a cauld—a structure placed across a river or stream for the purpose either of diverting the water into a mill-lade, of raising the level of the surface of the river and thereby increasing its depth for the purpose of navigation, or of providing the means of catching salmon and other fish. There is also the waste-weir, for the purpose of preventing a reservoir embankment being overtopped by floods; and the gauge-weir, for the purpose of computing the quantity of water flowing over it, from a measurement of the difference of level between the crest of the weir and the surface of the still water above it. The word is also sometimes used, though perhaps not quite correctly, to denote a training-wall or other structure parallel with the general line of a river, for the purpose of remedying or preventing loops or sinuosities. A weir may—according to the purpose for which it is intended, to the nature of the materials at command, or to other circumstances—be formed either of stone, timber, or brushwood, or a combination of any two. It is generally placed obliquely across the stream, in order to make the length of its crest considerably greater than the width of the channel, and thereby prevent the water in floods from rising to so great a height as it would do with a shorter crest, to the risk of damaging the adjoining low lands, and probably putting the mills above in backwater. In such cases the mill intake or the navigation lock, as the case may be, is generally placed at the down-stream end of the weir. Much obliquity, however, makes the current to impigne against and cut into the side of the river opposite the lower face of the weir, and to prevent that effect weirs are sometimes made of the shape of two sides of a triangle, or rather of that of an hyperbola, with its apex pointing up stream, which arrangement is peculiarly applicable to the case of there being an intake for a mill on each side of the river, and the apex is a very suitable place for a fish-pass or ladder. Not unfrequently, when at a wide part of the river, the weir is placed at right angles across, and with a slight curve upward; and a natural shelf of rock is often very advantageously made use of for either a mill or fishing weir, the low parts being made up where necessary with stone or timber.

The down-stream face of a weir is generally a pretty flat slope of stone "pitched" or set on edge, and with its toe, or lower edge, either sunk into rock, or protected from being underwashed by a row of timber-sheeting piles, and frequently also by an apron of timber-planking. The slope is either straight, or made with a hollow curve, so as to check the tendency of the water to acquire increasing velocity as it descends; and it is frequently divided into panels by timber-framing, so as, in the event of a portion of the pitching being washed out, to lessen the risk of the whole of it being carried away. The up-stream face is generally a slope dipping into the water, and protected by stone pitching, but it is sometimes a perpendicular wall. In order to render an ordinary sloping

weir water-tight, sometimes there is under the crest or coping a row of well-jointed and close-driven timber sheeting piles; but those being liable to decay, without their decay being visible, a better, though a more difficult and expensive arrangement, is to build a perpendicular wall of water-tight masonry under the crest. In either case, generally there is the additional precaution taken of having a wall of pounded clay on the upstream side of the wooden or stone barrier; and sometimes a mere wall of pounded clay alone, in the center of the weir, is trusted to, as the sole means of making it water-tight; but the latter is not a satisfactory arrangement.

WEIR, Julian Alden, b. West Point, N. Y., in 1852; son of Robert W., and younger brother of John F. (both members of N. A.). He studied painting with his father, and took a studio in New York, devoting himself especially to portrait painting. For some years he resided in Paris, where his heads have attracted considerable attention. He has exhibited at the National acad., New York, "A Brittany Interior," 1875, "At the Water-Trough," and "Study of an Old Peasant," 1877. His "A Breton Interior" appeared at the Paris exposition, 1878.

WEIR, Robert Walter, 1803–89; b. N. Y.; studied art in Italy, and returned to this country in 1827. He was for four years, 1830–34, professor of perspective in the national academy of design, and in 1832 became instructor in drawing at West Point, where he held a professorship, 1846–74. His best pictures are: "Embarkation of the Pilgrims" (now in the capitol rotunda at Washington), "View of the Hudson from West Point," "Indian Captives," "Landing of Hendrik Hudson," and "Columbus before the Council of Salamanca." John F., his son, is also a painter of some note, and is professor of painting and design at the Yale school of fine arts.

WEISBACH, Julius, 1806–71; b. Germany; educated at Freiberg, Göttingen, and Vienna. In 1833 he was called to the chair of applied mathematics in the Freiberg academy. His principal work is *Lehrbuch der Ingenieur-und-Maschinenmechanik*, (1854).

WEISHAUPT, Adam. See Illuminati.

WEISMANN, Dr. August, eminent German biologist, was born in 1834. His father was professor of philology in the Lyceum, at Frankfort-on-Main. The son studied medicine at Göttingen from 1852–56. The following year he visited the Universities of Vienna and Paris, and later that of Giessen, where he became interested in Leuckart's lectures in zoölogy. From 1860–62 he acted as physician-in-ordinary to Archduke Stephan, of Austria, at Castle Schaumburg, near Ems. Impaired eyesight forced him to suspend all microscopic work during the next 10 years. A warm admirer of Darwin, whom he has aptly called the Newton of biology, Dr. Weismann became a close student of his theory of evolution, and between 1868 and 1876 published *Studies in the Theory of Descent*, which commanded instant attention among scientists. In the preface to the English translation of this work, which appeared in 1882, Darwin wrote: "At the present time there is hardly any question in biology of more importance than the nature and cause of variability (in individuals)." Since the death of the great English scientist, however, Dr. Weismann has developed his theory of descent on purely original lines, and in the face of strong opposition on the part of the Darwinian school of to-day. It may be said that he conceives the germ-plasm as the basis of heredity, or, to use a simple illustration, it is the eggs that have been forming the hens, and not the hens the eggs. In all animals above those consisting essentially of a single cell, this continuity of life (from individual to individual in genealogical series) is confined to the generative cells, and it is the other, or somatic cells alone that are necessarily mortal. He denies the transmission to a descendant of any quality, including contagious disease, acquired by individual after birth, and challenges the Darwinian view that certain individuals develop parts and organs more than others, and then transmit to their descendants. Sexual reproduction he regards as a stupendous organization, by which nature is ever mixing together, and forming new combinations of the hereditary qualities of a whole species. Dr. Weismann's principles are now generally accepted by the foremost scientists of Germany, where he has occupied the chair of zoölogy in Freiburg University since 1866, but in England the heated controversy which arose on the promulgation of his germ-plasm theory is still active, thanks to Herbert Spencer and others (see *Contemporary Review*, 1893–95); on the other hand, he is not without followers there, too; witness Benj. Kidd, author of *Social Evolution* (1894). Among his principal writings and essays are *On Heredity, Life and Death; The Continuity of the Germ-Plasm; The Significance of Sexual Reproduction; On the Number of Polar Bodies and their Significance in Heredity, etc.*; also *Essays on Heredity and Kindred Biological Problems* (1889), and *Germinal Selection* (1895).

WEISSENFELS, a t. of Prussia, in the government of Merseburg, and 25 m. w. of Leipsic, on the Saale. Pop. '90, 23,779.

WELBY, Amelia B. (Coppuck), 1819–52; b. Ky.; married George B. Welby, a Louisville merchant in 1838. Her first poetical efforts appeared in the Louisville *Journal* over the signature of Amelia. Collections of her poems were published, 1844, 1850.

WELCKER, Friedrich Gottlieb, one of the most distinguished scholars of Germany, was b. in the year 1784 at Grünberg, in Hesse-Darmstadt; studied at Giessen; was appointed one of the masters of the gymnasium there in 1803; and in the year 1806, traveled to Rome, where he remained two years. Here he became acquainted with the celebrated Danish archæologist, Zoega, whose life and essays he afterward published.

and by whose example he was stimulated to that subtle appreciation of the works of ancient art which appears everywhere in his works. On his return from Italy, he was appointed to a professorship of ancient literature, first in Giessen, then in Göttingen, and finally (1819) in the newly erected Prussian university of Bonn, which continued to be the scene of his scholarly activity till his death in 1868.

Welcker belonged to that class of scholars who, since Heyne and Wolf, have given such a lofty inspiration, such a philosophical significance, and such a historical comprehensiveness to those studies which, for want of a better name, we are forced still to designate philology. But philology in this country generally means the history and philosophy of language; with the Germans, as it did originally with the Alexandrian Greeks, it means, the sympathetic understanding and the imaginative reconstruction of the life and thought of famous ancient peoples, based on the critical treatment of ancient documents, or the tasteful appreciation of the monuments of ancient art. It is needless to say that this "philology" is a very different thing from the minute verbal and metrical preciseness which was long the leading characteristic of scholarship in this country. For however important these minutiæ may be in their place, they are manifestly valuable only as means to an end; and even when the end has been steadily kept in view, it cannot be denied that some of our greatest intellects have spent more of their strength on these subsidiary matters than their importance deserves. In Welcker, Otfried Müller, and other German scholars of the first class, we see a general reaction against this narrow school; and a reaction which was sure to prosper, as it was based on thorough academic training, and had learned to neglect no trifle and despise no minute point which could be made subservient to higher purposes. If it was the fault of German scholarship generally that it was too professional and too academic, it is the praise of Müller, Welcker, and the school to which they belong that they have bridged over the gulf which separates learning from life, and inspired the dry bones of tradition with a spirit which makes them intelligible to the present, and significant of the future. The long academic career of Welcker was distinguished by an uninterrupted course of scholarly activity. Many of his works are tracts and essays on archæological subjects without external unity, but all exhibiting a remarkable combination of extensive and accurate learning, fine taste, delicate sensibility, and sound judgment. We can only note here his three most important works of a larger compass. The first is the *Æschylean Trilogy* (1824), in which the organic connection and sequence of the Greek dramas are set forth with a richness of constructive detail not altogether free from that fanciful and problematic element which is one of the most distinguishing characteristics of German scholarship. The second is the *Epic Cycle* (1835–49), a work which has done great service to the right appreciation of early Greek literature, by taking Homer out of that region of mysterious isolation in which he had been previously allowed to remain. The third, and perhaps his greatest work is the *Götterlehre*, or Greek Mythology (1857–62), which embraces all that is good, and rejects all that is bad in the wide German literature of this subject, with a delicate tact and a just discrimination as valuable as they are rare. Of all Welcker's works, this is the one that would most probably bear with credit the ordeal of an English translation.

WELD, a co. in n. e. Colorado, bounded by the territorial lines of Wyoming and Nebraska; drained by the South Platte river and its affluents; 4075 sq.m.; pop. '90, 11,736. Co. seat, Greeley.

WELD, or Woold, also called Dyer's Rocket, Dyer's Weed, and Yellow Weed (*reseda luteola*), is a plant of the same genus with Mignonette (q.v.), a native of waste places in England, very common in Germany and in many parts of Europe. It has an upright stem; 2 to 3 ft. high; lanceolate, undivided leaves; and long racemes of small yellow flowers, with 4-partite calyx and prominent stamens. It is used for dyeing. In order that it may yield a good dye, it requires to be cultivated with care. The best is grown in France, England, and Holland; and that produced about Cette, in France, is preferred to all others. Good weld must have flowers of a beautiful yellow or greenish color, and abound in leaves; that which is small, thin-stemmed, and yellow, is better than that which is large, thick-stemmed, and green; that which grows on dry sandy soils is better than that produced on rich and moist soils. It was formerly cultivated to a much greater extent in Britain than it is at present, and was also more used by dyers than it now is. Weld is still, however, a valuable dye-stuff. It serves equally for linen, woolen, and silk, dyeing not only a rich yellow, but, with proper management, all shades of yellow, and producing a bright and beautiful color. Stuffs previously dyed blue are, by means of weld, changed to a very pleasing green. Large quantities of weld are imported from France.

WELD, Angeline Emile (Grimke). See Grimke, Angelina.

WELD, Theodore Dwight, b. Conn., 1803; entered Hamilton college, but did not graduate. He also entered Lane theological seminary, but withdrew to Oberlin, as did all the students except six, on the suppression by the trustees of the anti-slavery society in the former seminary. He lectured on abolition till 1836, when, having lost his voice, he became editor of some of the publications of the American anti-slavery society. In 1854 he organized a school in New Jersey; ten years later he settled in Massachusetts, where he still (1881) resides. Besides many pamphlets for the anti-slavery society, he has written *The Bible Against Slavery*, and *American Slavery as it is.*

WELDE, Thomas, 1590–1662; b. England; graduated Cambridge, 1613; minister at Tarling, Essex; came to America, 1632; was the first pastor of the church at Roxbury; opposed the religious views of Anne Hutchinson at her trial, 1637; aided Eliot and Mather in the preparation of the *Bay Psalm Book;* went to England with Hugh Peters as agent for the colony, but did not return; was pastor of a church at Gateshead, but ejected for non-conformity, 1662. He published *A Short Story of the Rise, Reign, and Ruin of the Antinomians, Familists, and Libertines that infested the Churches of New England.*

WELDING, the process by which some substances are united together in a softened state. It is generally applied to such metals as malleable iron, two pieces of which, heated to redness, may be made to unite by applying them together and beating with a hammer. Other substances, such as horn and tortoise-shell, can be welded by first making separate pieces soft by heat and pressing them together, which causes so intimate a union that no traces of the junction remain after cooling.

WELLAND, a co. in s. Ontario, Dominion of Canada, having the Niagara river for its e. boundary and lake Erie on the s.; 257 sq. m.; pop. '91, 25,132. It is drained by the Welland river, and intersected by the Welland canal. Co. seat, Welland.

WELLES, Edward R., d.d., b. N. Y., 1830; graduated Hobart college; ordained in the Protestant Episcopal church, 1857; minister of a church at Red Wing, Minn.; prominent in general convention; consecrated bishop of Wisconsin, 1874. D. 1888.

WELLES, Gideon, 1802–78; b. Conn.; educated at Norwich university, and called to the bar. He was originally a democrat; was editor of the Hartford *Times*, 1826–37; and an adherent of Gen. Jackson. He served in the legislature, 1827–35, was postmaster of Hartford during Van Buren's administration, and comptroller of the state, 1842–46. He joined the republican party upon its foundation; was the head of the Connecticut delegation to the republican national convention in 1860, and was secretary of the navy, 1861–69.

WELLESLEY, a province on the w. coast of the Malay peninsula, opposite the island of Penang; bounded n. by Quedah, e. by Siam, w. by the strait of Malacca. Several native states on the s. lie between it and the British province of Malacca. The province is 45 m. long and 8 wide, containing an area of about 270 sq. m.; pop. abt. 108,117, mostly Malays. It is under the lieutenant-governor of Penang, and is one of the Straits Settlements. Surface undulating; soil very fertile; climate hot. A large part of the province is cultivated, chiefly by Europeans and Chinese, who raise rice, sugar, and tapioca. Good roads have been made by the English into the interior, which is reached also by the Perak and other rivers. The province was settled by a British colony in 1800.

WELLESLEY, Richard Colley Wellesley, Marquis, k.g., English statesman, was b. at the town residence of his family, Grafton street, Dublin, June 20, 1760. The family of Wellesley was one of Saxon origin, belonging to the county of Sussex, and was among the most ancient in Ireland, one of them having gone from England as standard-bearer to Henry II., who gave him large grants of land in Meath and Kildare. William de Wellesley was in 1334 summoned to parliament as baron Noragh, and was high in favor with Edwards II. and III. The name (originally *Welesley* or *Welseley*) was written Wellesley till the 16th c., when it became abbreviated into Wesley. Mr. Garrett Wesley of Dangan, county Meath, married Miss Colley of castle Carbery; and on the decease of his son without issue the estates were bequeathed to his cousin, Richard Colley, who thereupon assumed the name of Wesley. The Colleys, originally Coweys, were also of ancient descent, and came originally from Rutlandshire. Richard Colley, who thus succeeded to the Wellesley estates, though in no way related by blood to the earlier Wellesley family, was created baron Mornington. His eldest son received (1760) the dignities of viscount Wellesley and earl of Mornington, and enjoyed the still more enviable distinction of being the father of the marquis Wellesley, the subject of this notice, and of Arthur, first duke of Wellington, by his marriage with the eldest daughter of Arthur, first viscount Dungannon. Wellesley's father, the first earl of Mornington, although chiefly known for his talents as a musical composer, was a man of great abilities. Wellesley received his education at Eton, and afterward at Christchurch, Oxford, at both which seats of learning his fame stood high. An eloquent speech was made by him at Eton as early as 1778; and in 1780 he gained the university prize for the best composition in Latin verse, in which he excelled through life. His father having died in 1781, Wellesley, on attaining his majority, took his seat in the Irish house of peers, took upon himself the pecuniary obligations of his father, and placed the estates under the management of his mother, who survived her husband for nearly half a century. The debts of the first earl were liquidated, but Wellesley was unable to preserve the family possessions. He was one of the original knights of St. Patrick when the order was founded by George III. in 1783. It appears, from a correspondence between Pitt and the duke of Rutland, that at the age of 24 he had convinced both statesmen that he was destined to distinguish himself, and to render the public essential service. Dissatisfied with the limited field of distinction which Ireland afforded him, he obtained in 1784 a seat in the British house of commons as member for Beeralston. In 1786 he became

one of the lords of the treasury, when he was elected for Saltash. Being unseated on petition, he obtained a seat for Windsor, and became a favorite of George III. Accident directed his attention to India, and in 1795 he became one of the unpaid members of the board of control. In Oct., 1797, he received a seat in the house of lords as baron Wellesley; and, at a most eventful period, was selected to go to India as governor-general. Four powers then divided the sovereignty of India—the British; Tippoo Sahib; the nizam; and the Mahrattas, comprehending Scindiah, Holkar, and the rajah of Berar; and the w. of India was the scene of invasion by Zemaum Shah. Tippoo hated the English, and meditated their expulsion from India; and the troops in the service of the nizam and the Mahrattas were officered by Frenchmen. When Wellesley arrived at Calcutta, in May, 1798, Egypt had been conquered by Bonaparte; and the native powers of India, incited by the French, were unfriendly to British rule. His first operation was one of great boldness. Disregarding the remonstrances of the Madras council, he ordered the Nizam to disband 14,000 men, surrounded them with a British force, secured the 124 Frenchmen by whom they were officered, and sent them instantly to Europe. Having annihilated French influence, he began the reduction of the empire of Mysore. On Feb. 3, 1799, he ordered Gen (afterward lord) Harris to march with an army of 20,000 men direct from the coast upon the Mysore capital. He himself removed to Madras, to be near the scene of this eventful operation. In one short month the fortress of Seringapatam was taken, Tippoo Sahib slain and his dominions partitioned. Having thus in fifteen months destroyed French influence, struck terror into the native princes, and overthrown the most inveterate enemy of British rule in India, he returned to Bengal. Up to this period he had been the earl of Mornington; he was now (Dec., 1799) created by the king marquis of Wellesley, and received the thanks of parliament. The East India company offered him £100,000 of the prize-money realized at Seringapatam, but he refused, disdaining to be enriched out of military spoil. He afterward accepted an annuity of £5,000 voted him by the court of proprietors. His next step was to place the territories of the nabob of the Carnatic under the administration of the company, in consequence of the treachery of that prince. He also concluded a treaty with Persia, to which he attributed "the fall of Zemaum Shah, the confusion of the Afghan government, and the repression of the annual project of invading Hindustan from Cabul"—then, as since, the nightmare of Indian statesmen. In 1801 he sent a force of 7,000 men up the Red sea to assist in wresting Egypt from the French. The expedition, under Gen. Baird, reached Egypt, and effected a junction with the army from England; but the French had already surrendered. In 1802, in consequence of differences with the court of directors, he tendered his resignation; but was induced to continue in office until January, 1806. The Mahratta war broke out; the battles of Laswaree, Assaye, Argaum, and Delhi were fought; and Scindiah, the Berar rajah, and Holkar were stripped of their dangerous influence and reduced to submission. A large accession of territory rewarded the gallantry of the army, and in 1805 Wellesley returned to England, after the most brilliant administration ever known in India. He had outshone even the native princes in the pomp and splendor of his progresses. He built the palace of Calcutta; founded and patronized the college of Indian literature; stimulated every attempt of natives and Europeans to bring to light the vegetable, mineral, and physical treasures of the "golden peninsula;" and inaugurated those important financial reforms which in a brief period raised the revenue of the company from 7 to more than 15 millions sterling. On his return he was received with every mark of respect and approval by the directors; but as matter of course there were many complaints that his administration had been oppressive, especially toward the native powers; and articles of impeachment were even presented to the house of commons, though they were rejected with contempt. He now prepared to enter anew upon a parliamentary career. George III. wished him to be one of the secretaries of state in the Portland cabinet, but he declined the offer. He went to Spain as ambassador-extraordinary in 1809; landed at Cadiz on the day the battle of Talavera was fought, and on Nov. 2 met his brother, the duke of Wellington, at Seville. In Dec., 1809, he was appointed secretary of state for foreign affairs; and in 1810 was elected a knight of the garter. He was favorable, both in and out of office, to the repeal of the penal laws affecting the Roman Catholics; and when, in Jan., 1812, the prince regent refused to agree to a concession of Roman Catholic claims, Wellesley resigned his seat in the cabinet. During the first ten years of the administration of lord Liverpool he remained in opposition. He protested against the insufficiency of the means placed at the disposal of the duke of Wellington, and did not cease to demand that he should be assisted to the utmost extent of the national credit and resources, until the duke had crossed the Pyrenees at the head of his victorious army, and brought the war to an end before Toulouse. When the settlement of the affairs of Europe was being arranged in 1815, Wellesley protested against the neglect of commercial interests, but without effect. He now began to ally himself with the more liberal section of the conservatives, who looked up to Mr. Canning as their leader, and accepted the office of lord-lieutenant of Ireland. Conciliation was to be the principle of his government, but he held office for 5 years without effecting any material amelioration, owing to the difficulties arising out of the state of the penal laws. He was recalled from Ireland by his brother when he took office in 1828. In 1830 Wellesley accepted the post of lord-steward of the household from earl Grey; and in 1833, in the

seventy-fourth year of his age, he again proceeded to Ireland as viceroy, where he remained until sir R. Peel's administration of 1834. In 1835, on the restoration of the whig party, he accepted the post of lord-chamberlain, which he only held for a few months. In 1837 it became known to the directors of the East India company that he was in straitened circumstances and deriving little, if any, advantage from their annuity of £5,000 per annum; they therefore resolved that a sum of £20,000 should be vested in trustees for his benefit. In 1841 it was further resolved that his statue should be erected in the court-room, as a mark of the admiration and gratitude of the East India company. He died at Kingston house, Knightsbridge, on Sept. 25, 1842, and, in compliance with his will, was buried in the vault at Eton college chapel. An authentic record of his Indian administration was undertaken by Mr. Montgomery Martin, under the direction and at the expense of the East India company, and published, in 1836, in 5 vols. 8vo, entitled, *Dispatches, Minutes, and Correspondence of the Marquis Wellesley, during his Administration in India.* A thin 8vo vol., issued in 1838, contains *Dispatches and Correspondence of the Marquis Wellesley during his Mission to Spain.* The marquis published several pamphlets on various occasions: *Substance of a Speech in the House of Commons on the Address in* 1794*; Notes Relative to the Peace Concluded with the Mahrattas; Letters to the Government of Fort George Relative to the New Form of Government established there; Letters to the Directors of the East India Company on the India Trade;* etc. He was twice married, but left no issue, and the marquisate became extinct at his death; the earldom, etc., went to his next brother, but afterward reverted to the second duke of Wellington, as son of the great duke, who was third brother.

WELLESLEY COLLEGE, situated in the town of Wellesley, 15 m. w. of Boston on the Boston and Albany railroad, was founded by the late Henry F. Durant, a lawyer of Boston. It was incorporated in 1870, and opened in 1875. The principal building stands on elevated land in the midst of grounds 300 acres in extent. It is in the form of a double Latin cross, 475 ft. long and 150 ft. wide in its greatest dimensions, and is of the Renaissance order of architecture. Three other buildings accommodate especially work in art, music, and chemistry. Stone hall and seven cottages are for dormitory purposes. The college provides courses leading to the degrees of B.A. and M.A. The requirements for admission include mathematics, Latin, and two other languages, or one other language and a science. Of the course leading to the B.A. degree only about one-fifth is required, the remainder is elective. The library contains over 46,000 volumes. The teaching force for 1896–97 numbers 76; students, 723. Presidents, Ada L. Howard, 1875–82; Alice E. Freeman, PH.D., L.H.D., 1882–87; Helen A. Shafer, M.A., 1888–94; Julia J. Irvine, M.A., LITT.D., 1894.

WELLING, JAMES C., b. N. J., 1825; graduated at Princeton, 1844; in 1848 became New York correspondent of the Washington *National Intelligencer*, with which he was connected as associate and principal editor until 1866. From 1867 to 1870 he was principal of St. John's college, Annapolis; for a short time professor of belles-lettres at Princeton, and in 1871 was made president of Columbian university, D. C. He d. 1894.

WELLINGBOROUGH, so called from the medicinal springs in its vicinity, is a town in the co. of Northampton, Eng., 10½ m. e.n.e. of the town of that name. It carries on a considerable trade in corn, boots, and shoes. Pop. '91, 15,068.

WELLINGTON, a co. in central Ontario, Dominion of Canada, drained by the Grand river; 1358 sq. m.; pop. '91, 72,716. Co. seat, Guelph.

WELLINGTON, a small market t. in the co. of Somerset, 7 m. s.w. of Taunton, at the foot of the Blackdown hills, one of which is crowned by a monument commemorative of the battle of Waterloo. The town gives title to the duke of Wellington. Blankets, serges, and other woolen goods and earthenware are manufactured. Pop. '91, 6808.

WELLINGTON, a small market-t. of Shropshire, 10 m. e. of Shrewsbury, at the foot of the Wrekin, on the Shrewsbury and Shropshire canal. The town forms the junction of several railways. It is situated in a populous mining and agricultural district, with coal and iron mines, iron works, limestone quarries, and wire-mills in the vicinity; while, in the town, there are smelting-furnaces, nail-works, and malt-kilns. The spacious public market, with town-house and assembly-room, cost about £20,000. Pop. '91, 5831.

WELLINGTON, a t. of New Zealand, the chief town of a "provincial district," and since 1865 also the capital of the whole colony, the residence of the governor, and place of meeting of the "general assembly," or colonial parliament. Wellington was the first settlement of the New Zealand company, and was planted under the direction of col. Wakefield, with a band of pioneer colonists, in 1840. The town is beautifully situated on a bay of port Nicholson, itself an inlet of Cook's strait, on the southern coast of the North Island. The surrounding country is richly wooded, but the dense forests have begun to yield to the axe of the settler. The harbor is a fine expanse of water, 6 m. long and 5 broad, and has an excellent wharf, affording accommodation to ships of any tonnage, and considered one of the best in the Australian colonies. Since the removal of the seat of government hither, the town has made very rapid progress; it possesses a

number of good public buildings; a handsome pile has recently been erected for the use of the house of representatives and legislative council. The streets are generally spacious, and have good dwelling-houses. Wellington possesses a cathedral, together with 20 other places of worship, in connection with the Episcopalians, Presbyterians, Methodists, Roman Catholics, and Jews, freemasons' hall, public library, several banks, three theaters, and extensive waterworks. The industries include flour and saw mills, tanneries, foundries, brick kilns, breweries, etc. In 1866 a regular line of steam-packets was established between Sydney, Wellington, and Panama. Wellington is also connected by steamers with all the principal ports of New Zealand. Pop. '96, 37,441, or with suburbs, 41,758.

WELLINGTON, Arthur Wellesley, Duke of, K.G., one of England's greatest generals, was the third son of Garrett, first earl of Mornington, and brother of the marquis Wellesley (q.v.). He was born May 1, 1769, at Dangan castle, Ireland, and completed his military education, a few years before the French revolution, in the military college of Angers, in France. He entered the army as ensign in the 41st regiment in 1787, and became lieut.col. of the 33d in 1793. In 1794 he embarked in command of the 33d regiment to join the duke of York's army in the Netherlands. In this, his first term of actual service, he commanded 3 battalions on the retreat of the army through Holland, and distinguished himself in several repulses of the French. In 1796 he accompanied his regiment to India, where his brother, the marquis Wellesley, shortly afterward arrived as governor-general. He commanded the subsidiary force of the nizam, when the reduction of the Mysore was decided upon, and his division defeated Tippoo Sultan's right flank at Mallavelly. At the assault and capture of Seringapatam, he commanded the reserve in the trenches. He was appointed to the command in Mysore, and took the field (1800) against Dhoondiah Waugh, a Mahratta freebooter, who was defeated and slain. He was named second in command of the expedition which sailed from India to assist the English army in Egypt, but was prevented from embarking by illness. It was in the Mahratta war of 1803 that the young general won his first fame. After besieging and capturing Ahmednuggur, Wellington, with only 4,500 men, came upon the combined Mahratta forces, 40,000 or 50,000 strong, and not waiting for a larger British force that was on its way, won the brilliant victory of Assaye (q.v.). The victory of Argaum followed, and the great fort of Gawulghur, supposed to be impregnable, having been taken in December, the Mahratta chiefs sued for peace, after one of the most extraordinary campaigns on record. Wellington was made K.C.B. and received the thanks of the king and parliament. In 1805 he returned to England, and in November commanded a brigade in lord Cathcart's expedition to Hanover. In 1806 he obtained a seat in the house of commons for Newport, Isle of Wight, and in April, 1807, was appointed chief-secretary to Ireland, the duke of Richmond being lord-lieutenant. He held a command in the army under lord Cathcart in the expedition against Copenhagen in 1807, and after the affair at Kioge, negotiated the capitulation of Copenhagen. He received the thanks of the house of commons in his place, and returned to Ireland. In 1808 he commanded an expedition which sailed from Cork, being the first division of the British army sent out to assist in the expulsion of the French from Spain and Portugal. He landed at Corunna, and offered his aid to the army and people of Galicia; but the offer being declined, he finally landed (Aug., 1808) with 10,000 troops at the mouth of the river Mondego, in Portugal. The whole of the n. of Portugal was then in arms against the French. The affairs of Obidos and Rolica were quickly followed by the battle of Vimieira, in which he defeated Junot, who lost 3,000 men and 13 pieces of cannon. After this event Wellington signed the armistice which led to the convention of Cintra (q.v.). He subsequently gave evidence generally in favor of this convention at the court of inquiry (Nov. 22). Being superseded in the command of the army by men who were only his superiors in military rank and seniority, he returned to England. For the battle of Vimieira, he again in his place, received the thanks of the house of commons. On the death of sir John Moore he returned to re-assume the command of the Peninsular army, previous to which he resigned the office of chief-secretary of Ireland. He arrived at Lisbon and assumed the command April 22, 1809. He had now to contend with Soult and Victor, who had entered Portugal at the head of a veteran army, and were in possession of its finest northern provinces. Oporto had been taken by Soult, and Wellington was anxious to bring him to action at once, in order that he might not make his retreat unharmed. The passage, at Villa Nova, of the Douro, a wide, deep, and rapid river, in the face of a formidable enemy, who had removed every boat and barge to the opposite side of the river, was one of the boldest and most successful operations of the war. Wellington entered Oporto the same day, and followed the French army. He was now, by a decree of the prince-regent of Portugal, marshal-gen. of the Portuguese army. The French had fallen back to a point where re-enforcements were to meet them; and on July 27 and 28, 1809, the enemy, commanded by Victor and Sebastiani, were defeated by the British under Wellington at Talavera. The slaughter on both sides was terrible in this desperate, almost hand-to-hand, conflict. Wellington was unable to follow up his victory owing to the non-co-operation of the Spanish army under Cuesta and the want of supplies, and the junction of Soult, Ney, and Mortier in his rear, compelled him to fall back upon Badajoz. The thanks of parliament were voted for the victory of Talavera, and sir Arthur Wellesley was created (Sept. 4, 1809) a peer by the

titles of Baron Douro of Wellesley and Viscount Wellington of Talavera, with a pension of £2,000. In May, 1810, the French collected under Massena in such superior force in his front that he fell back upon Busaco, where he made a stand. Here the French (Sept. 27) made two attacks upon his position, but were repulsed with great slaughter. After this he retreated to Torres-Vedras (q.v.), to the occupation of which line of defense and his judicious method of maintaining it, the ultimate success of the Peninsular war may be chiefly attributed. Massena, being unable to find subsistence for his army, began his retreat to Santarem, followed by Wellington, who pursued the French in their retreat along the line of the Mondego. In April, 1811, he received the thanks of parliament for the liberation of Portugal. Spain, however, was now subdued by the French. The Spanish armies were annihilated, and it was of the last importance that Wellington should be able to keep his rear open to the Tagus. Wellington, having invested Almeida, Massena attempted to relieve it, but was skillfully repulsed at Fuentes de Onoro, May 3 and 5. The fall of Almeida followed, and Wellington ordered Badajoz to be invested. At this time he had great reason to complain of the want of support and re-enforcements from England. He had only the force which had followed Massena from Torres-Vedras, diminished by 9,000 men, *hors de combat*, in so many sanguinary encounters. Writing to Marshal Beresford, he said: "I inclose a dispatch from lord Liverpool [then at the head of the home government]; I believe they have all gone mad." The siege was carried on with vigor; but learning that Soult and Marmont designed to join their armies into one, in order to relieve Badajoz, and his own inadequate force not justifying him in risking a battle, he raised the siege and retired to the frontiers of Portugal. He next laid siege to the strong fortress of Ciudad Rodrigo; and on the night of Jan. 19, 1812, it it was carried by storm, and the garrison made prisoners. For this achievement he was created by the regency a grandee of Spain, with the title of duque de Ciudad Rodrigo. He again received the thanks of parliament and a further pension of £2,000 a year, and was advanced in the British peerage by the title earl of Wellington. He next marched toward Badajoz, invested it in March, and carried it by storm, April 6, after a frightful carnage; the allies losing nearly 5,000 men. In June he advanced to Salamanca, captured the convents there, which had been fortified by the French, and drove Marmont to the Douro. On July 22 he gained at Salamanca one of his greatest military triumphs. Marmont extended his line, with the view of turning Wellington's right: but the latter, perceiving that the enemy had thus weakened their left and center, vigorously assailed the weak points, and, after an obstinate resistance, put the whole army to rout. Ammunition, stores, 2 eagles, 11 pieces of cannon, and 7,000 prisoners were the trophies of victory. The loss of the allies was only about 700 killed and 4,000 wounded. Marmont lost an arm, and four French generals were killed. Wellington received the order of the golden fleece, entered Madrid, was made generalissimo of the Spanish armies, and was advanced in the British peerage by the title of marquis of Wellington. The thanks of parliament were again voted to him, together with the sum of £100,000, to be laid out in the purchase of lands to be settled on him, his heirs, and successors. In September he marched to Burgos, but, failing to capture it, he again retreated to the frontiers of Portugal. Wellington visited Cadiz and Lisbon, where he was received by the whole population. In May he marched his army into Spain in two columns, and on June 21 gained, at Victoria, another signal victory over the French, commanded by king Joseph, assisted by marshal Jourdan. The enemy lost 151 pieces of cannon and all their ammunition. The king's private carriage, letters, etc., fell into the hands of the victors. In exchange for the bâton of Jourdan, which was found on the field, the prince regent forwarded to Wellington the bâton of a field-marshal of England. By this splendid and important series of victories he had reached the summit of martial glory. The deliverance of Spain from the French was now certain. His infantry were soldiers who would, in his own words, "go anywhere and do anything;" and even the invasion of France itself seemed to his countrymen to be no longer chimerical. He pursued the French army to France by Pamplona. He failed, July 25, to carry San Sebastian by assault, but gained another decisive battle over Soult at the Pyrenees, and the French army retreated into France. A second attempt to carry San Sebastian by assault was successful, but it cost Wellington 2,300 in killed and wounded. He now crossed the Bidassoa, and invaded France. Pamplona surrendered. After the passage and battle of the Nivelle, and the passage of the Nive, the victorious army of Wellington was attacked, Dec. 10 to 18, on the left and right, by Soult, who was defeated. Leaving two divisions to blockade Bayonne, Wellington followed Soult with the rest of the army. On Feb. 27, 1814, he defeated Soult at Orthes, and crossed the Adour. The affairs of Aire and Tarbes were followed by the passage of the Garonne; and, on April 10, Wellington consummated this series of brilliant victories by again defeating Soult under the walls of Toulouse. The allied Russian and German armies having entered Paris, and Napoleon having signed his abdication a few days before, this last battle would not have been fought, but for the non-arrival of news of the events of Paris. In a few weeks Wellington was in Paris, presenting the trophies of his brilliant campaign to the allied monarchs. He was created, May 3, Marquis of Douro, and Duke of Wellington in the British peerage, and received an additional grant of £400,000. He received for the twelfth time the thanks of parliament for his services, and on his arrival in England was greeted with the utmost enthusiasm. On June 28 he took his seat for the first time

in the house of lords. He next returned thanks at the bar of the house of commons, and was addressed by the speaker. He was appointed ambassador-extraordinary to the court of France in July, 1814, whence he proceeded to the congress of Vienna. Napoleon having escaped from Elba, the congress was abruptly broken up. Wellington was appointed commander of the British forces on the continent of Europe, and from Vienna joined the army at Brussels. It appeared probable that Napoleon would make a bold advance into Belgium, and its defense was assigned to an Anglo-allied army under Wellington, and a Prussian army under Blücher. The battles of Ligny (q.v.) and Quatre Bras (q.v.) were succeeded on June 18, 1815, by the great battle of Waterloo (q.v.). Here the grand and decisive blow was struck; here for the first and last time the emperor and the great English general met and measured swords, and here the power of Napoleon was finally crushed. The allied armies, under Wellington and Blücher, marched upon Paris; the French army evacuated Paris under a convention; and Louis XVIII. entered Paris the very day after the English army. Marshal Ney was brought to trial. He relied upon the terms of the capitulation of Paris, and appealed in vain to Wellington, who denied that the French king was bound by the convention—a reading which it is impossible to justify, as sir A. Alison has shown in his *History of Europe*. At the request of the allied sovereigns Wellington took the command of the army of occupation, and resided in Paris from 1815 to 1818. Two attempts were, during this period, made upon his life: gunpowder was placed in his cellar for explosion; and one Cantillon discharged a pistol into his carriage; for which attempt at assassination Napoleon I. left the miscreant a bequest in his will. When the allied armies evacuated France in 1818 the emperors of Russia and Austria, and the king of Prussia, created Wellington a field-marshal of their armies. He was created prince of Waterloo by the king of the Netherlands. The gratitude of the British nation was, meanwhile, enthusiastically manifested. Statues were raised to his honor in the metropolis. Parliament voted £200,000 in addition to former grants; and the mansion and estate of Strathfieldsaye were purchased, to be held by Wellington and his heirs. The office of master-general of the ordnance, now abolished, but then comprehending the control of the artillery branch of the service, was conferred upon him. At the coronation of George IV., in 1821, he officiated as lord high constable of England. In October he attended George IV. to the field of Waterloo. In 1822 he represented Great Britain at the congress of Verona, where he ineffectually exerted his influence to prevent the invasion of Spain by a French army, in support of absolutist principles. In 1826 he went on a special embassy to St. Petersburg, when he induced the emperor Nicholas to act in common with England and other powers, as mediators in the quarrel between Turkey and Greece. On his return he was appointed constable of the tower. In 1827 he succeeded the duke of York as commander-in-chief of the army, and was made col. of the Grenadier Guards.

From this period his political career may be said to begin. When Mr. Canning received the commands of George IV. to form an administration, Wellington, with six other members of the Liverpool administration (including lord Eldon and Peel), resigned office. In the explanation which he gave, he emphatically denied that he had entertained the ambition of himself filling the post of first-minister; and said he felt his incapacity for such an office so strongly that he should have been "mad" if he had coveted it. In Aug., 1827, after Mr. Canning's death, he again accepted the command of the army, which he resigned on being called upon by George IV. (Jan. 8, 1828), to form an administration. Of strong tory politics, he was, nevertheless, the first minister to cede to the growing popular power. The test and corporation acts were repealed, and the removal of the Catholic disabilities was the first measure proposed by Wellington in the following session, upon the ground of the formidable attitude of the people of Ireland and the danger of civil war. This measure involved him in a bloodless duel with the earl of Winchelsea. The French revolution of 1830 appears to have influenced him in making a firm stand against reform in parliament, in the same proportion that it raised the demands of the people; and when the struggle of continental Europe to emancipate itself from arbitrary government strengthened the popular cry for "parliamentary reform," he chose the earliest moment to declare the unalterable perfection of the representative system of the country, and the determination of his government to resist all measures of parliamentary reform. His unpopularity became excessive; and, anticipating a defeat in the house of commons, on Mr. Brougham's proposition for reform in parliament, Wellington resigned office, and was succeeded by earl Grey. He had meanwhile become lord-warden of the Cinque Ports. Under the administration of earl Grey, Wellington held no office. He strenuously opposed the reform bill, and a London mob broke the windows of Apsley House, and hooted and pelted him in the streets. In Jan., 1834, he was elected chancellor of the university of Oxford. Upon the enforced resignation of lord Melbourne, in Nov., 1834, he was sent for by William IV. He declined to take the premiership, and was intrusted by the king with the whole charge of the government, and the seals of the three secretaries of state, until sir R. Peel could arrive from Rome. Peel constructed a conservative government, in which Wellington took the office of foreign secretary. In April Peel resigned, and henceforward Wellington ceased to take a prominent share in the civil government of the country. He gave a generous welcome to Soult, who represented France at the coronation of queen Victoria, and was received with great cordiality by the people on this occasion. In Aug., 1839, a grand

banquet was given to him at Dover, as lord-warden of the Cinque ports, on which occasion lord Brougham proposed his health in a brilliant eulogium. In 1841 he accepted a seat in the cabinet of sir R. Peel without office. In 1842 the queen visited him at Walmer castle, and in the same year he was re-appointed to the command of the forces. In 1845 he doubted the policy of repealing the corn laws; but in conformity with his usual practice of considering "how the queen's government was to be carried on," he determined to stand by sir R. Peel in his attempt to abolish them. Wellington not merely consented to remain in the cabinet, but accepted the higher office of president of the council in lieu of the post of lord privy seal. When the bill came up to the lords, Wellington, with great emotion and earnestness, warned the peers not to reject the bill, and never to separate themselves from both the crown and the house of commons. His speech made a great impression, and the bill passed a second reading by a considerable majority. He retired with the Peel government in July, 1846. After this event, he may be said to have withdrawn from political strife, nor is it to be denied that his share in the repeal of the corn laws cast a halo of popularity around the remainder of his life. In 1848 he called attention to the unsatisfactory state of the national defenses in a letter to sir J. Burgoyne. As commander-in-chief he directed great preparations to be made to prevent a Chartist outbreak on the 10th of April. His last speech in the house of lords was delivered in support of the militia bill, when he declared that England had been carrying on war in all parts of the world with an insufficient peace establishment. On Sept. 14, 1852, he was seized at Walmer castle with an epileptic fit, became speechless, and died the same afternoon. His remains were honored by a public funeral. The body, after lying in state at Chelsea hospital, was removed to the Horse Guards; and, on the morning of Nov. 18, was borne through the streets of London to St. Paul's cathedral where it rests by the side of that of lord Nelson. The funeral pageant was witnessed by a countless multitude. His *Dispatches*, published by Col. Gurwood, in 12 vols., are the proudest monument of his glory; they exhibit him as a commander who overcame countless difficulties by honesty, sagacity, singleness and constancy of purpose, and devotion to duty. Throughout his long career he appears the same honorable and upright man, devoted to the service of his sovereign and country, and just and considerate to all those who served under him. As a general he was cautious, prudent, and careful of the lives of his men; but when safety lay in daring, as at the battle of Assaye (q.v.), he could be daring in the extreme. He enjoyed an iron constitution, and was not more remarkable for his personal intrepidity than for his moral courage. The union of these qualities obtained for him the appellation of the "iron duke," by which he was affectionately known in his later years. His parliamentary oratory was plain, and to the point. He spoke without fluency or art, yet his strong sense and practical sagacious judgment gave him great weight with his brother-peers. His tastes were aristocratic; and his aids-de-camp and favorite generals were almost all men of family and high connections. Altogether, he was the very type and model of an Englishman; and in the general order issued by the queen to the army he was characterized as "the greatest commander whom England ever saw." He married, in 1806, the second daughter of the third earl of Longford, and by her (who died in 1831) he left two sons—Arthur Richard, the second duke (who also inherited the earldom of Mornington), and Charles, deceased, whose son—Henry Wellesley—is now the possessor of the title.

Gurwood's *Dispatches of the Duke of Wellington*, 12 vols.; Gurwood's *General Orders of Duke of Wellington*, 1809–18; Napier's *History of the Peninsular War;* Alison's *History of Europe;* Thibaudeau, *Histoire de l'Empire;* Thiers, *Histoire de l'Empire;* marquis of Londonderry's *Narrative of the Peninsular War*, 1808–13; Gleig's *Life of Arthur, Duke of Wellington;* Bourrienne's *Mémoirs sur Napoleon;* Las Casas, *Mémorial de Ste-Hélène; La Vie de Wellington*, by Brialmont; *Speeches in Parliament of Duke of Wellington; Sir R. Peel's Memoirs*, by his literary trustees; *Supplementary Dispatches and Memoranda of Field-marshal Arthur, Duke of Wellington*, edited by his son, the duke of Wellington, in 14 volumes, 1858–75; also, in continuation of the above, *Dispatches, Correspondence, and Memoranda of Field-marshal Arthur, Duke of Wellington*, in eight volumes, 1867–80. A recent sketch of Wellington is that of General Lord Roberts, *The Rise of Wellington* (1895).

WELLINGTO'NIA, a genus of trees, of the natural order *coniferæ*, of which only one species is known, *W. gigantea*, the greatest of all pines, and indeed by far the largest tree of temperate climates. The genus is nearly allied to *sequoia* and *taxodium*. The foliage is very similar to that of an arbor vitæ, the leaves being very small, like scales, and closely appressed to small slender branchlets. The leaves of young plants are longer and somewhat needle-shaped. The branches divide into very numerous small branchlets. The flowers are generally solitary and terminal, the male and female flowers distinct but on the same tree. The cones of the *W. gigantea* are ovate, from 1½ to 2 inches long, by 1½ inches broad, single, or in opposite pairs, rarely clustered, the scales wedge-shaped, with about four seeds under each. The *W. gigantea* has a columnar stem, with branches only on the upper half of it, the branches of comparatively small size, and not forming an umbrageous head. The stem attains a height of 300 ft., and sometimes more, perfectly straight and erect. One tree is known, 321 ft. in height; and near it lies a larger one, which has fallen, and which was broken against another large tree in its

fall, its diameter where it was broken, 300 ft. from its base, being 18 feet. Another tree is 102 ft. in circumference at the base. The W. is found only in a limited district in California, on the Sierra Nevada, at an elevation of 4,000 to 5,000 feet above the sea. It was discovered in 1850 by Mr. Dowd, who, being engaged in deer hunting, came with astonishment into the midst of a group of these trees, now known as the mammoth trees of Calaveras. In this locality, within an area of 50 acres, are 123 large trees, 20 of which exceed 25 ft. in diameter at the base, and are therefore about 78 ft. in circumference. A tree which was felled was 302 ft. in height, and 96 ft. in circumference at the ground. It was sound to the center. Its age may be guessed at something like 3,000 years. It was calculated to contain about 500,000 cubic feet of timber.

WELLS, a co. in n. e. Indiana, drained by the Wabash river; 357 sq.m.; pop. '90, 21,514. Co. seat, Bluffton.

WELLS, an ancient city and municipal and parliamentary borough, in the county of Somerset, pleasantly situated at the foot of the Mendip hills, 15 m. s.w. of Bath. It is a clean and cheerful town, with runlets of water flowing through each principal street. The cathedral, a remarkably beautiful edifice, dating from the first half of the 13th c., is for the most part in early English; but its west front, one of the noblest façades in the kingdom, and which is enriched with 300 statues, is in Gothic. The bishop's palace, originally founded in 1088, is surrounded by a moat supplied from the abundant source of St. Andrew's well—from which the town is said to derive its name—and by lofty walls. There are no manufactures, and the trade is chiefly retail. Pop. '91, 4822.

WELLS, Charles, b. England, about 1798. His name is mentioned by Keats in one of his sonnets as that of an intimate friend. Under the name of "H. L. Howard," Wells published a volume called *Stories after Nature* (prose) in 1822, and in 1824, *Joseph and his Brethren, a Scriptural Drama.* These met with no success, and he abandoned the profession of literature. Within the last twenty years, however, the drama has been extravagantly praised by critics of the Swinburnian school. In 1876 the poem was republished with a critical introduction by Mr. Swinburne.

WELLS, David Ames, d.c.l., b. Mass., 1828; graduated at Williams college, 1847, and at the Lawrence scientific school, 1857. Mr. Wells has devoted much study to questions of political economy and government; was commissioned by the U. S. government to inquire into and publish reports on questions of taxation and revenue, 1865–70; has delivered courses of lectures on political science at Yale college; and has published pamphlets in favor of free trade and on other economical subjects. In 1876 he was a candidate for congress on the democratic ticket, but was defeated. His degree of d.c.l. was received from Oxford university. He is a leading advocate of free trade.

WELLS, Horace, 1815–48; b. Vt.; studied dentistry in Boston, and practiced it for a time there till 1836, when he removed to Hartford, Conn. He had already conceived the idea that some anæsthetic might be used in dentistry to prevent pain. He had thought of the employment of nitrous oxide gas for that purpose as early as 1840. Four years later G. Q. Colton lectured in Hartford, and gave nitrous oxide gas to several persons, who were rendered unconscious of pain. The next day Wells had a tooth extracted without pain under the influence of the gas, and he used it successfully in several cases the same year, and it was used by other dentists in Hartford. Early in 1845 he communicated his discovery to Drs. Hayward, Warren, W. T. G. Morton, C. T. Jackson, and others in Boston, and extracted a tooth from a patient to whom the gas had been given before the Harvard medical school. In 1846 Dr. Morton obtained a patent for anæsthetics against the remonstrance of Wells. After a visit to Paris, where he communicated his discovery to the French medical societies, and on his return to America, he published *A History of the Discovery of the Application of Nitrous Oxide Gas, etc.* (1847). The dispute as to his discovery and constant experiments upon himself with chloroform, produced mental alienation. He was arrested in New York, accused of throwing vitriol on the clothes of women in the street, and he committed suicide.

WELLS, Samuel Roberts, 1820–75; b. Conn.; in 1844 admitted as a partner into the publishing-house of O. S. & L. N. Fowler. He was an enthusiastic phrenologist; lectured much on phrenology, in this country and Great Britain: was editor of the *Water-Cure Journal*, 1850–62, and of the *Phrenological Journal* from 1863 till his death. Among his works are *New Physiognomy*, and *How to Read Character*.

WELL-STAIRCASE, a winding staircase with an aperture left in the center, called the *well*, by which light and air are admitted.

WELSER, the name of a famous extinct patrician family in Augsburg. Julius Welser was knighted by the emperor Otto I. for his services in the war against the Hungarians. His son, Octavian Welser, settled in Augsburg, and from him descended the patrician family, which always held important posts in the council of that town. Bartholomew Welser, privy councilor of the emperor Charles V, was so wealthy that he could vie with the Fuggers (q.v.) in munificence. With the emperor's permission, in 1526, he fitted out three ships in Spain, which, under the command of Ambrose Dalfinger of Ulm, sailed for America, and took possession of the province of Caracas.

which the emperor gave Welser in pledge. Twenty years after this, the Welsers gave up their possession voluntarily, and it reverted to Spain.—The most famous of the family was the niece of Bartholomew Welser, PHILIPPINE WELSER, a daughter of his brother, Franz Welser, born about 1530. She had received an excellent education from her clever mother, and was exceedingly beautiful. On the occasion of a diet of the empire at Augsburg in 1547, she was seen by the archduke Ferdinand, the second son of the subsequent emperor, Ferdinand I., who fell in love with her. The young girl firmly rejected all the advances of this fiery youth of 19, and refused to have any relation with him excepting by marriage. They were therefore married in 1550, without the knowledge of his father, or of his uncle, Charles V. His father, on hearing the news, was exceedingly angry, and for a long time his son did not venture to appear before him. Even in other countries, this misalliance made a great noise. In the meanwhile, the loving couple enjoyed the greatest domestic happiness, and Philippine enchanted every one that knew her by her intelligence and kindness of heart. It was only after eight years that his father was reconciled. Philippine, in disguise, herself handed him a petition, and by her deportment on the occasion, as well as her beauty, disarmed the angry father. He forgave his son, declared his children legitimate, and raised their mother to be markgraven von Burgau. This happy marriage lasted 30 years. Philippine died at Innsbrück in 1580.

WELSH, HERBERT, b. Philadelphia, 1851; son of John, U. S. minister to Great Britain; and nephew of William: graduated at univ. of Penn., 1871; well known as an earnest advocate of the rights of Indians; author of numerous pamphlets and articles upon the Indian question. He visited the Sioux reservations, in 1882, and soon after published his convictions that the holding of land in severalty the education of Indian children, and the extension of law to the reservations, constituted the true solution of the problem. These views he eloquently upheld in lectures and addresses; and owing to his efforts the Indian Rights assoc. was established in Philadelphia, 1883, which society has had an important influence both upon public opinion and upon the Indian bureau at Washington. As the sec. of this assoc. Mr. W. was instrumental in securing the appropriation for the starving Piegans in Montana, in 1885, and the revocation of the executive order issued by Sec. Teller, throwing open to settlement the Crow creek and Old Winnebago reservations. His works are: *Four Weeks among some of the Sioux Tribes of Dakota and Nebraska in* 1882; *Report of a Visit to the Great Sioux Reserve in* 1883; *Report of a Visit to the Navajo, Pueblo, and Hualapais Indians of New Mexico and Arizona in* 1884.

WELSH, JOHN, b. Philadelphia, 1805. He was educated in Philadelphia, and became one of the prominent merchants of that city. He was elected pres. of the Centennial board of finance, 1873, and was re-elected at each subsequent meeting. His services were recognized by the subscription of $50,000 as a testimonial from his fellow-citizens, which was applied, at his request, to the establishment of the John Welsh professorship in the univ. of Penn. He was appointed minister to England, 1878, which position he filled for two years. He d. 1886.

WELSH, WILLIAM, 1810–78; b. Penn.; brother of John, who was minister to England, 1878–79; engaged in business in Philadelphia and acquired wealth. He filled many local positions of trust and honor, was a director of Girard college, and a member of the Indian peace commission of Grant's administration.

WELSH LANGUAGE AND LITERATURE. The Celtic languages are divided into two groups, Gaelic and Cymric. To the latter of these the Welsh belongs, and has even given name, as forming the most important member of the group, which comprises besides, Armorican (spoken in Bretagne) and Cornish (now extinct). A controversy has been waged concerning the nature and closeness of the intimacy existing between the Gaelic and Cymric tongues, but the question may now be considered settled by the researches of the Rev. Richard Garnett (*Gentleman's Magazine*, May, 1839), who found, on examining the monosyllabic words in the introductory part of Neilson's *Irish Grammar*, that out of 270, no fewer than 140 were identical in sense and origin with corresponding Welsh terms, that 40 were cognate, an equal number borrowed from Latin, Saxon, etc., and that only 50 were peculiar to the Gaelic. Nevertheless, it is not to be supposed that the affinity is as close as that which exists between English and so-called Scotch. It is rather (according to Mr. Garnett) such as exists between Icelandic and German. A Welshman cannot understand a Highlander or an Irishman; he cannot even understand a Breton (as used to be believed), though the language of the latter is undoubtedly Cymric. Most extraordinary hallucinations were formerly current in regard to the antiquity of the Cymric tongues. Pezron, the Breton investigator, gravely affirmed that Welsh and Armoric (which he considered the same) had been "the language of the Titans, that is, the language of Saturn, Jupiter, and the other principal gods of heathen antiquity." The Rev. Joseph Harris, editor of the *Seren Gomer*, remarked in 1814 that "it is supposed by some, and no one can disprove it, that Welsh was the language spoken by Adam and Eve in Paradise." The *fact*, on the other hand, is, that of the two branches of Celtic, the Cymric is less ancient than the Gaelic, and that among the Cymric tongues the Cornish is probably older than the Welsh. (See Norris, *Ancient Cornish Drama*, Oxford, 1859.) But preposterous as the views of most patriotic Welshmen are on this subject, it is undoubtedly true that the Welsh is one of the oldest living languages in Europe, and that it possesses a literature reaching back to

remoter times than that of any modern tongue except Irish. The most striking peculiarities of the language are the abundance of its grammatical permutations, and its facility in forming derivatives and compounds. Of the former, two examples may be given by way of illustration. The Welsh word for "father" is *tad;* for "my" *fy.* But you cannot say for "my father," *fy tad.* After *fy,* every word beginning with *t* must change the *t* to *nh;* and therefore the correct phrase is *fy nhad.* So after *ei, tad* becomes either *dad* or *thad,* according as *ei* means "his" or "her." The rules of permutation are almost endless, and, in the opinion of such Welsh scholars as are not Welshmen, useless, nothing being gained in point of euphony or expressiveness. The Welsh affirm that their language is exceedingly harmonious, and it would serve no good purpose to dispute the assertion; but foreigners ignorant of the tongue, and associating no definite ideas with the words that issue from a Welshman's lips, generally fail to realize the fact, and consider it in this respect—though not in others—distinctly inferior to Gaelic. The language, or rather the structure of sentences and the phraseology, exhibits a certain stateliness, or even grandiloquence, characteristic, indeed, of uncivilized nations. One thing specially deserves notice. The Welsh people are profoundly attached to, and familiar with it. It is not dying out, like Irish or Scotch Gaelic. It has a genuine literary, as well as oral existence even now, and though the changes it has undergone since the days of Taliesin are numerous and great—so great, indeed, that no modern unlettered Cambrian can understand a word of the early poetry of his country—yet it is essentially the same tongue that Cæsar and Agricola heard, and is consequently to be regarded with veneration as the solitary living link that unites those distant ages with our own.

There are extant, says Owen Pughe, some thirty old treatises on Welsh grammar and prosody. The most important of these is one composed by Geraint (880 A.D), revised by Einion (1200 A.D.), and regularly privileged by the sovereigns who then exercised authority in Wales. It was first printed by the Welsh MS. society in 1856, under the editorship of the Rev. J. Williams ab Ithel. Among English grammars of the Welsh language, the best is said to be that by the Rev. Thomas Rowland (2d ed., 1857); among dictionaries, that of Owen Pughe, entitled *Geiriddur Cymraeg a Saesoneg, a Welsh and English Dictionary* (2 vols. 1793; 3d ed. 1861, *et seq.*). It is, however, only a Welsh-English dictionary; the most satisfactory English-Welsh dictionary is that published by Daniel Silvan Evans (2 vols. Denbigh, 1852–1858).

The literature of Wales has been arranged into four periods: the *first* extending from the earliest times of the Norman conquest (1066 A.D.); the *second,* from the Norman conquest to the English reformation (*circa* 1536 A.D.); the *third,* from the English reformation to the beginning of the reign of George III. (1760 A.D.); and the *fourth,* from 1760 to the present day. To what date the oldest specimens of Welsh literature ought to be assigned, has been the subject of sharp dispute. These specimens are in verse and are rhymed. The chief of their alleged authors, with their supposed periods, are Aneurin (510–560 A.D.), Taliesin (520–570 A.D.), Llywarch *Hen,* or "the Old" (550–640 A.D.), and Myrddin or Merlin (530–600 A.D.). According to Pinkerton (see his preface to *Barbour*) and Laing (*Dissertation on Ossian*), they are not authentic; but the vindication of their authenticity, first by Sharon Turner in 1803, and afterward and more critically, by Mr. Stephens of Merthyr-Tydvil, in his *Literature of the Kymry* (1849), and Mr. Nash, in his *Taliesin, or the Bards and Druids of Britain* (1858), is considered conclusive. The last two of these writers, however, may almost be said to meet their opponents half way. Of the seventy-seven poems ascribed to Taliesin in the *Myvyrian Archæology of Wales* (a collection of all the most celebrated works in Welsh literature, 500–1400 A.D.), which appeared in 1801—under the auspices of Mr. Jones, Mr. Edward Williams (better known as "Edward of Glamorgan"), and Dr. Owen Pughe—Mr. Stephens considers fifty-seven to be demonstrably spurious, and only twelve to be probably genuine, that is, belonging to the age of Taliesin. Mr. Nash enables us to form an independent judgment on the point, for he translates some fifty of these poems; and we find that, instead of their exhibiting an antique Welsh character, they abound in allusions to mediæval theology, and frequently employ mediæval Latin terms. It is certainly unfortunate for the reputation of the "chief of the bards," that the specimens of his which *are* considered to be genuine possess exceedingly small poetic merit. The life of this famous but apparently over-rated genius is, of course, enveloped in legend. He is said to have been the son of a certain St. Henwg, and to have been educated at the college of St. Cadog. His life was spent successively at the courts of Urien Rheged, Gywddno, prince of Cardigan, and king Arthur, and his sepulcher is shown near Aberystwith. It is still called *Bedd Taliesin* (Taliesin's grave). Of the poems whose authorship is ascribed to Aneurin, a prince of the Cumbrian Britons, the most notable is that entitled *Gododin,* in which he pathetically laments a defeat of his countrymen by the Saxons. It is reckoned authentic. (Several English translations of the *Gododin* have been published, and a translation of the whole works of Aneurin was published by Mr. Probert in 1820). Llywarch Hen, also a Cumbrian warrior, is regarded as the finest and most poetical of all the semi-historical Welsh bards. Tradition reports that he lived to the age of 150. The burden of his verse is the miseries of old age, on which he descants with melancholy eloquence. (See *The Heroic Elegies and other Pieces of Llywarch Hen, Prince of the Cumbrian Britons,* with a literal translation by William Owen, 1792). The pieces ascribed to Merddyn, in the *Myvyrian*

Archæology, are in all probability spurious. Besides the names already mentioned, other poets of the first period are Gwyddno, Gwilym ab Don, Golyddan, etc.

The earliest specimen of Welsh prose now extant is the collection of the laws of king Hywel dda, or Howel the good (died 748 A.D.)—a work of great value in illustrating the manners and morals of early Welsh times, but it is very uncertain when or by whom the collection was made. The oldest extant MS. belongs to the 12th century. The latest and most critical edition (Welsh and English) is that published in 1841 by the record commission, and edited by Aneurin Owen, son of Dr. Owen Pughe. Another work, entitled *The Wisdom of Cadog the Wise* (a collection of proverbs pretending to be by a St. Cadog, who flourished in the 6th c., and was a friend of Taliesin), is of such doubtful authenticity that its claim can only be noticed in our sketch.

Second Period, 1066–1536.—A few years after the date of the Norman conquest, a new spirit was imported into Welsh poetry by the influence of Gruffydd ab Cynan, prince of North Wales, and Rhys ab Tewdwr, prince of South Wales, particularly of the former. Gruffydd had been born during his father's exile in Ireland, and was brought up in that country, where he appears to have acquired a familiarity with both the native Celtic literature and that of the Dano-Norse invaders. In the year 1100 he held a great Eisteddvod at Caerwys in North Wales, which was numerously attended by Irish bards and musicians. For the next 300 years, Wales is rich in native bards, a fact that conclusively refutes the tragic story of Edward I. having caused them all to be slain, lest their patriotic songs should stir the Welsh to renew the struggle for independence. Nearly 60 names occur in the *Myvyrian Archæology* between 1120 and 1380. The first is that of Meilyr (1120–60), whose best piece is entitled *The Death-bed of the Bard*. Meilyr's son, Gwalchmai ab Meilyr (1150–90), who is said to have accompanied Richard cœur de lion to Palestine, is a superior poet to his father. Fourteen of his productions are extant. Gwalchmai's son, Einion (1170–1220), also figures as a poet. Forty pieces are ascribed to Cynddelw (1150–1206), a contemporary of Gwalchmai, of which probably the most interesting is *The Death-bed of Cynddelw*. He has also some verses addressed to prince Madog or Madoc of Powys, whom enthusiastic Welshmen conceive to have discovered America before Columbus. Other bards of this second period are Llywarch ab Llewellyn (1160–1220); Hywel (1140–70), a brother of prince Madoc, and writer chiefly of erotic odes; Owain Cyveilioc (1150–97), also of princely rank, whose *Hirlas*, or the *Long Blue Horn*, is a great favorite with more than Welshmen; and above all, *Davydd ab Gwilym* (*circa* 1340–1400), who has been compared to Ovid, to Petrarch, and to Burns. In his verses, Welsh poetry undergoes a change—the bardic or Scaldic spirit disappears, and a more humane, if less patriotic spirit takes its place. Davydd sings of love and of social amusements; he was likewise a fierce satirist, though at times very penitent and pious; while, to complete his resemblance to the Scottish poet, and also to justify the biblical name he bore, he showed an unmistakable predilection for illicit love. Davydd's poems were first published in Welsh, with a biography of the author by Owen Jones and Owen Pughe (1789). An English translation of some of them by Mr. A. Johnes appeared in 1834. Besides the poets already mentioned, the following names are in high repute: Iolo Goch, the friend and bard of the famous Owen Glendower, who is said to have lived to the age of 120; Sion Cent ("John of Kent"), a name given him from Kent-church, in Hereford, where he resided (1380–1410), and who, having adopted the opinions of the Lollards, ultimately attained the reputation of a wizard; and Lewis Glyn Cothi, who flourished during the wars of the roses, and was bard to Jasper, earl of Pembroke, son of Owen Tudor and the widow of Henry V.

Prose.—The oldest Welsh chronicler of the second period is Caradoc, a monk of Llancarvan, who flourished in the first half of the 12th century. His work narrates in Welsh the history of his native country from the death of Cadwallader, 689, to the times of Caradoc himself. It is a dry, illiterate affair, like the Anglo-Saxon Chronicle. Contemporary with Caradoc was the famous Geoffrey of Monmouth (q.v.), bishop of St. Asaph, who died in 1154. He, however, though a Welshman, wrote in Latin, and belongs, therefore, rather to the general literature of England than to Welsh literature. His *Chronicle* commences with the fall of Troy, and ends with the death of Cadwallader, so that it forms an introduction to that of his friend Caradoc. In it the legend of Arthur first assumes that romantic and chivalrous form in which modern readers are familiar with it. It is impossible here to enter into a discussion of the question where the materials of the Arthurian romance were first accumulated; suffice it to say, that evidence preponderates in favor of their Welsh origin. To this *second* period must also be assigned that charming collection, the *Mabinogion*, or Children's Tales, of which a MS. volume of more than 700 pages is preserved in the library of Jesus college, Oxford, and is known as the *Red Book of Hergest*, from the name of the place where it was discovered. A beautiful edition of this work in Welsh and English, with preface and notes, was published in 3 vols. (1838–49) by lady Charlotte Guest. The age of these tales, which relate principally to Arthur and the Round Table, is doubtful. The transcription in the *Red Book of Hergest* belongs probably to the 15th c.; but the date of their composition may be safely held to be much earlier, perhaps somewhere in the 13th century.

The *Triads* may also be here noticed. They are collections of historical facts, maxims ethical and legal, mythological doctrines and traditions, and rules for the structure

of verse; all expressed with extreme brevity, and regularly disposed in groups of three. They were a very popular species of composition among the Welsh, and are of all ages. Examples occur in the poems of Llywarch Hen, but the greater part are found in transcripts and miscellanies of the 16th and 17th centuries. The "historical" triads are especially puzzling. They occur in a so-called collection, made by one Thomas Jones of Tregaron, about the close of the 16th century. This Jones was originally, it seems, an eminent robber—a Welsh "Rob Roy;" but in his later years he reformed, married an heiress, and became a justice-of-peace for the co. of Brecon. The peculiarity of his "collection" is, that it gives a totally different account of the origin of the Britons from Geoffrey of Monmouth, bringing them from a "summer land" (supposed to be Constantinople or the Crimea) over a sea called the "Hazy Sea." The question arises, and has not been settled: Whether are we to suppose Jones the fabricator of these "triads" or his account of the origin of the Britons the genuine record of an ancient tradition? In favor of the former hypothesis, unfortunately, is the circumstance that there is no trace of such an ancient tradition in the anterior literature of Wales.

Third Period (1536–1760).—This and the remaining period may be briefly sketched. The most notable fact in its commencement is the comparative ease with which the reformation made its way among the Celts of Wales. The Celts of the Highlands remained for a time, and those of Ireland remain to this day, obdurate adherents of the old faith; but those of Wales, on the whole, swiftly accepted the new religion. The art of printing had been in operation in England for more than half a century before it was applied to the Welsh language. The first book printed in the Welsh or any Celtic language was an almanac, with a translation of the Lord's prayer and the ten commandments (Lond. 1546). The author, William Salesbury, was a scholar and a zealous Protestant. In 1547 he published the first dictionary of English and Welsh, and executed the greater part of the first translation of the New Testament into his native tongue (Lond. 1567). In 1588 appeared the earliest translation of the whole Bible into Welsh. The author was a Dr. William Morgan, afterward bishop of St. Asaph's. A revised edition of this, in 1620, by Dr. Parry, Morgan's successor in the bishopric of St. Asaph's, is the translation still in use among the natives of the principality. Contemporary with Salesbury, but an adherent of the old faith, was Dr. Griffith Roberts, who lived on the continent, and published at Milan a Welsh grammar in 1567. Another contemporary was Dr. John David Rhys, whose principal work, *Cambrobrytannicæ Cymræcæve Linguæ Institutiones et Rudimenta*, is a treatise on Welsh grammar. The suspicious Thomas Jones of Tregaron, possible *author*, rather than collector of the "historical" triads, was a friend of Rhys, and died about 1620. In 1603 Capt. Myddleton, one of the first three persons who smoked tobacco in England, published a metrical version of the Psalms in Welsh, partly executed while cruising about in the West Indies. The most celebrated poets of the *third* period are the Rev. Rees Prichard, vicar of Llandovery (1579–1644), whose *Canwyll y Cymry* (Candle of the Cambrians) is a metrical version of his professional homilies or sermons, the eloquence of which had previously won for him a great reputation as a preacher; it is still popular, the 20th edition having appeared as late as 1858: Huw Morus, or Hugh Morris (1622–1709), author of a variety of pieces, which his countrymen consider unsurpassed in humor, pathos, and even sublimity—an edition in 2 vols. appeared at Wrexham (1823), under the title of *Eos Ceiriog* (the Nightingale of Ceiriog): and Goronwy Owen (1722—*circa* 1780), a gifted bard, but likewise an incurable drunkard, whose principal poems are contained in the first volume of a book entitled *Diddanwch Teuluaidd* (Domestic Amusement, Lond. 1763). Of the prose writers, the only noteworthy are Ellis Wynne (d. 1734), author of the *Bardd Cwsg* (Sleeping Bard, 1703), a series of visions of hell and Hades, written with great beauty of style; and the Rev. Moses Williams (1685–1742), an antiquarian scholar of high merit, whose *Repertorium Poeticum*, or list of Welsh poems and catalogue of Welsh books, is very valuable.

Fourth Period (1760 to present time).—Various causes co-operated to give a new impetus to Welsh literature after the accession of George III. Among these, the most powerful were the establishment of periodical publications, the institution of patriotic societies, and the spread of Methodism. The first important production of this period is entitled *Some Specimens of the Poetry of the Ancient Welsh Bards translated into English* (Lond. 1764), by Mr. Evans, curate of Llanvair Talyhaern, in Denbighshire. The next name deserving of mention is that of Owen Jones (1741–1814), who, though engaged in mercantile occupations all his life, managed, by his enthusiasm and liberality, to quicken and extend the public interest in Welsh literature. In 1771 he founded the *Gwyneddigion* (society of the "men of Gwynedd"), which gave prizes for the best performances on the Welsh harp, and the best Welsh poems. In 1801–1807, he caused to be published at his own expense, under the editorship of Owen Pughe and Edward Williams, three volumes of the *Myvyrian Archæology*, so called in honor of himself, who had assumed the bardic name of Myvyr, from his native vale in Denbigh. Owen Jones was, however, rather a Welsh Mæcenas than a Welsh *littérateur*. The next names of importance are those of the editors just mentioned—Owen Pughe and Edward Williams. The former (1759–1835), according to Southey, was a "muddy-minded man;" nor is the fact that he was a follower of Joanna Southcott, and one of her twenty-four elders, adverse to this description of his intellect. Be this as it may, Owen Pughe is the great Welsh lexicog-

rapher; his dictionary of Welsh (1793–1803) contains 100,000 words illustrated by 12,000 quotations. He also translated *Paradise Lost* into Welsh, in which work he threw off the chains of Welsh alliteration, an innovation generally acknowledged to be an improvement. Edward Williams (1745–1826), better known as Iolo Morganwg, is probably the finest Welsh genius of the fourth period. Southey knew him, and liked him greatly. His principal productions are *Salmau yr Eglwys yn yr Anialwch* (Psalms of the Church in the Desert); but an *Ode on the Mythology of the Ancient British Bards in the Manner of Taliesin* (1792), accompanied by notes and specimens of "triads," containing the metaphysical and religious doctrines of the old Druidical bards, provoked a long-protracted controversy. Morganwg said that he had copied them from a MS. collection of a Welsh poet, *anno* 1560, which was in his possession, and affirmed that the collection was of very great antiquity. He was often asked to produce it, but always declined; and Welsh critics of the stricter sort have now ceased to believe in its existence. The three associates in the publication of the *Myvyrian Archæology* had each one son, and all of these have become eminent in connection with the literature of their native country. Taliesin Williams (1787–1847), son of Edward Williams, wrote poetry both in Welsh and English; Aneurin Owen (1792–1851), son of Owen Pughe, among other works, published an important collection of the *Laws of Wales;* while Owen Jones, son of Owen Jones, the Welsh Mæcenas (died 1874), had a high reputation as on architect, the Alhambra at Sydenham being a favorable specimen of his professional talents. The fourth period of Welsh literature is naturally richer in critical than in creative works. Among Welsh antiquaries may be mentioned the Rev. Edward Davies (1756–1831), author of *Celtic Researches* (1804) and *Mythology of the Druids* (1809): the Rev. Thomas Price (1787–1848), author of the *Hanes Cymru a Chenedl y Cymry* (1836–1842), a history of Wales and of the Welsh nation from the earliest times to the death of Llewellyn; an admirable work, comprehensive, critical, and literary (Price was an ardent and voluminous writer, contributing to no fewer than 15 periodicals at the same time); and the Rev. John Williams ab Ithel, rector of Llanymowddwy in Merioneth, and editor of the *Cambrian Journal.* In 1856 he edited, for the Welsh MS. society, the *Grammar of Edeyrn, the Golden-tongued,* said to be composed about 1270; in 1860 the *Brut y Tywyrogion,* or chronicle of the princes: and in 1861 (*et seq.*), *The Traditionary Annals of the Cymry,* reprinted from the *Cambrian Journal.* Williams is a rather credulous and uncritical writer, but a scholar of undoubted merit. Probably the ablest recent Welsh scholar was the late Mr. Thomas Stephens of Merthyr-Tydvil, a man at once patriotic and honest, enthusiastic and critical. To him, above all others, Englishmen desirous of obtaining some clear and credible knowledge of Welsh literature, ought to apply. His principal works are *Studies on British Biography,* and *Literature of the Cymry in the Twelfth and following Centuries.* The enlightened views of Stephens have met with great acceptance among such English scholars as have paid attention to the subject of Welsh history and literature.

The poetry of the fourth period is not remarkable. The principal names are—David Richards of Dolgelly (1751–1827), author of a sort of epic on the Trinity—a very unsuitable subject for an epic—and a paraphrase of the history of Joseph: David Thomas of Caernarvon (1769–1822), who was very successful at the Eisteddfods: David Owen of Givion (1784–1841), whose poems were collected and published under the title of *Blodau Arfon* (Flowers of Arvon): the Rev. Daniel Evans, a collection of whose pieces was published at Llandovery in 1831, under the title of *Gwinllan y Bardd* (The Poet's Vineyard): the rev. Walter Davies (1761–1849), also great at Eisteddfods: the Rev. James Hughes (1779–1846): the Rev. William Rees of Liverpool, anthor of a spirited paraphrase of the Book of Job, etc.: and the Rev. William Williams of Caernarvon, author of *Grawn Awen* (The Treasure of the Muse), etc.

A good deal of indifferent Welsh prose has been written during this period on religious subjects, owing to the spread of Methodism among the Welsh, but it may profitably be overlooked by a foreigner; and with a glance at the history of Welsh periodicals and societies, we close our brief survey of the subject. The first Welsh periodical, edited by the Rev. P. Williams and Evan Thomas, appeared about 1770, and was entitled *Yr Eurgrawn Cymraeg* (The Welsh Treasure), but the first that attained any measure of success was the *Seren Gomer* (Star of Gomer), which was published at Swansea (1814). In 1831 *Y Drysorfa* (The Treasury) was commenced, under Calvinistic auspices: in 1836 *Y Diwygiwr* (The Reformer), and *Y Dysgedydd* (The Teacher); 1833–41, *Y Gwladgarwr* (The Patriot), more a literary than a theological magazine, and tolerably clever; *Yr Haul* (The Sun), a journal advocating the interests of the established church; and *Y Traethodydd* (The Essayist), commenced at Denbigh (1845), distinctly the best literary organ in Wales. In 1879 above 60 daily or weekly newspapers appeared in the principality; of these about a dozen were published in Welsh. There are also about the same number of monthly or weekly magazines or periodicals, helping to keep alive the ancient speech; and two quarterlies in the Welsh language, but on general subjects. There are besides Welsh magazines conducted in English. The *Cambrian Register*, the *Cambro-Briton*, the *Cambrian Quarterly Magazine*, and the *Cambrian Journal*, each of which appeared for a series of years, dealt almost exclusively with Welsh subjects. A Welsh Encyclopædia (*Encyclopædia Cambrensis—Y Gwyddoniadur Cymreig*) was begun under the editorship of the Rev. John Parry of Bala, in 1856. The *Archælogia Cambrensis*, the journal of the Cambrian archæological association, began to appear in 1846. The

Enwogion Cymru (1862) of the Rev. Robert Williams is a useful biographical dictionary of eminent Welshmen.

The leading Welsh societies, literary and antiquarian, that have existed, or still exist, are the Cymmrodorion, established in London in 1751, which lived for 30 years; the Gwyneddigion, also established in London in 1771, but extinct some 20 years ago; a second Cymmrodorion (1820–43); the society for the publication of ancient Welsh MSS. (founded at Abergavenny, 1837); and the Cambrian institute, founded in 1853. The Eisteddfod, the annual national "sitting" for the encouragement of bardism, music, and general literature, dates from the end of the 4th century. The meeting lasts three or four days, a president and conductor are appointed for each day, and it is attended by thousands of persons of all classes. Prizes and medals are given for the best poetical, musical, and prose compositions, for the best choral and solo singing, and singing with the harp. On the last day, the great event of "chairing" the fortunate bard takes place.

WELSH ONION, or CIBOL, *Allium fistulosum*, (see ALLIUM), a perennial plant, a native of Siberia. It has fistular leaves and no bulb. Its leaves appear very early in spring, and are then used in soups and salads. Its flavor more resembles that of garlic than of the onion. It has been long cultivated in kitchen-gardens in Britain, and perhaps deserves more attention than it receives, because it is ready for use before any similar plant in spring. The seed is sown in spring or summer; leaves fit for use are produced in the following spring, and the bed continues to be productive for a number of years. The name Welsh onion is from the German *Wälsch*, and merely indicates a foreign origin.

WELSH RABBIT (incorrectly supposed to stand for *Welsh rare-bit*), is an article of food borrowed, as the name indicates, from the Welsh. It consists of cheese, grated or cut in small bits, and toasted in a frying-pan. To this is added a small quantity of milk, and the whole is poured over slices of toasted bread. Ale is sometimes used instead of milk. The name is undoubtedly humorous in its origin, like "Cape Cod turkey" for a cod-fish.

WELWITSCHIA, a remarkable plant discovered by Dr. Welwitsch at Mossamedes, on the w. coast of Africa, in 1863, and named after him by Dr. J. D. Hooker, the celebrated English naturalist. Its reproductive organs place it among the *gnetaceæ*, a small family related to the conifers. It is never over a foot high, while its trunk may be 5 or 6 ft. in diameter. The seed-leaves, or cotyledons, which soon perish in most plants, continue to grow in Welwitschia, and are the only leaves it ever has, even if it lives for more than a century. All the growing parts of the plant are the very short, broad trunk, which rests upon a strong, tapering root, and the seed leaves abovementioned, which grow to be 6 ft. long, and from 2 to 3 ft. wide; green, very thick and leathery, and spreading out upon the ground; often torn and split by the winds. As the trunk increases each year in diameter, the leaves are left inserted in a circular groove, between the upper portion of which and the upper surface of the leaves, the flower-stalks spring. They are from 6 to 12 in. high, much branched, and bearing at the end of each branch a cone of scarlet scales, which overlap each other in four rows, each containing a flower. These cones grow to be about 2 in. long, and 1½ in. in diameter. This great natural curiosity grows upon a stony, sandy plateau, between 300 and 400 ft. above the level of the sea, in a region where there is seldom any rain. Sometimes the whole surface of the ground is almost covered with these plants, varying from a few inches in diameter to several feet. The plant is believed to live over 100 years.

WEN'CESLAS OR WENZEL, Emperor of Germany, 1361–1419; son of Charles IV., whom he succeeded in 1378. He at first was friendly to the cities, but afterward abandoned their cause. About 1390 he canceled all debts due to Jews upon payment to himself of from 15 to 30 per cent of the amount. In 1394 the Bohemian nobles organized a conspiracy, arrested him, and confined him at Prague; but he was released by the influence of the German princes. Having joined with France to demand the abdication of Popes Boniface IX. and Benedict XIII., and the election of a new pope, he was deposed by some of the German princes in 1400, and Rupert of the palatinate was chosen to succeed him. Soon afterward his brother Sigismund arrested him, and imprisoned him in Vienna; and in 1410 he resigned his rights as emperor to Sigismund. He showed some friendship for Huss.

WENDISH LANGUAGE, THE, is a Slavonic dialect, the sole survivor of the numerous dialects spoken by the Slavs who were overwhelmed by the Germans in the Middle Ages. As a sample of those dialects it is of great linguistic value. It may itself be subdivided into two dialects, Upper Wendish, resembling Czech or Bohemian, and Lower Wendish, resembling Polish. Phonetically Wendish is almost as rich as the Polish. It has three numbers in declension and conjugation, seven cases in declension, and a large number of tenses. It is fast becoming Germanized, and may in time disappear.

WENDS (from the same root as to *wend*, to *wander*, and signifying the wandering or roving border tribes), the name given by the Germans to a branch of the Slaves (q.v.) which, as early as the 6th c., occupied the n. and e. of Germany from the Elbe along the coast of the Baltic to the Vistula, and as far s. as Bohemia. They were divided into several tribes, which were successively subdued by the Germans, and either extirpated

or gradually Germanized and absorbed, although remnants of them are still here and there to be found. In a narrower sense, the name of Wends is given to those remnants of the Slavic population of Lusatia who still speak the Wendic tongue, and preserve their peculiar manners and customs. They number about 150,000. A collection of Wendic songs was published by Haupt and Smaler (2 vols., Grimma, 1843–44). The Wends, like the other subject Slavic tribes, were, in early times, cruelly oppressed by their German masters; in recent times their lot has been more tolerable.

WE'NER, LAKE, the largest lake in the Scandinavian peninsula, and after the lakes Ladoga and Onega in Russia, the largest in Europe, is situated 150 m. w.s.w. of Stockholm, and about 30 m. inland from the Cattegat. It is over 110 m. in length, and varies from 15 to 48 m. in breadth, is 309 ft. in greatest depth, and lies 150 ft. above sea-level. Area 2290 sq. miles. From the n. shore a peninsula extends southward into the middle of the lake; and from the southern shore a peninsula extends northward to within about 15 m. of the point of the northern peninsula; the portion of the lake lying to the w. of these peninsulas receives the name of Dalbo lake. Of the numerous rivers that feed the lake, the chief is the Klar, from the n., and its surplus waters are discharged into the Cattegat by the river Göta. It is connected by a canal with lake Wetter, by means of which the Göta canal, lake Roxen, etc., inland communication is established between the Cattegat and the Baltic sea. The lake is rich in fish; it is often visited by sudden gusts of wind, and is in many places too shallow for navigation.

WENLOCK, a parliamentary and municipal borough in the county of Salop, 12 m. s.e. of Shrewsbury. Pop. of parliamentary borough '91, 15,703. The principal buildings in Much Wenlock are the church, a building of considerable antiquity, bearing traces of Saxon and Norman architecture; and the town-hall, a venerable and interesting structure, decorated internally with elaborate oak carvings of the time of Charles II. There are also a savings-bank and a public library and reading-room. The extensive ruins of Wenlock abbey afford a rich treat to antiquaries. The abbey was founded in the year 680, and was the parent church of Paisley abbey, Scotland. The remains have been carefully preserved from further dilapidation by the owner, J. Milnes Gaskell, esq., formerly M.P. for the borough, who converted a portion of them into an occasional residence for himself. Wenlock is an ancient municipality, with separate quarter-sessions, and is the first borough that acquired the right by charter of representation in parliament.

WENLOCK GROUP, an important series of rocks of upper Silurian age, which are largely developed in the neighborhood of Wenlock. The group is divided into an upper and lower series. The upper, known as the Wenlock limestone, consists of a considerable thickness, sometimes reaching 300 ft. of a gray sub-crystalline limestone, so hard that it has withstood the weathering which has removed the softer shales above and below it. It forms a ridge parallel to that of the Aymestry limestone, running for 20 m. n.e. to s.w. through the south-eastern portion of Shropshire. Sometimes it contains huge concretionary masses of crystalline carbonate of lime, locally named "ball-stones;" in other places, it becomes thin and flaggy. It abounds in fossils, especially in corals, crinoids, mollusca, and trilobites. The lower Wenlock series consists of 1400 ft. of Wenlock shale, and 150 ft. of Woolhope limestone and grit. The Wenlock shale is generally a dark gray, almost black argillaceous rock, often containing elliptical concretions of impure earthy limestone. It is worked in some places for flagstones and slates. The Woolhope limestone and grit consists of gray argillaceous nodular limestones resting on fine shales. In Denbighshire it appears as a coarse grit, often of great thickness, and producing a very barren soil. The fossils of the lower Wenlock beds are of a similar character to those of the upper series.

WENS are encysted tumors, much more common on the scalp than in any other situation, though occasionally observed on the face, shoulders, etc., and consisting of obstructed sebaceous glands, which enlarge by the internal pressure of their accumulated secretions. The closed orifice may be often noticed in the form of a small dark point, and in that case the duct may sometimes be gradually enlarged by the gentle introduction of a probe or director, and its contents pressed out. By this treatment they may, at all events, be kept from being unsightly, and will sometimes shrivel up and disappear. If this treatment fail, and the patient finds the tumor so annoying that he insists upon its removal, it must be exterminated with caustic or the knife. In consequence of the well-known dangers (especially erysipelas) that frequently follow cutting operations of the scalp, the caustic treatment is generally preferable. The most prominent part of the wen must be thoroughly cauterized with nitric acid or potash, which will lead to the formation and separation of a slough, which will lay open the tumor, which may then be left to empty itself and wither, or may be emptied by pressure, and cauterized within. As a general rule, wens are better left alone, unless they can be emptied by simple pressure, as severe operations on them are frequently attended with danger.

WENTLETRAP, *Scalaria*, a genus of gasteropodous mollusks, of the family *turritellidæ*. The shell is spiral, with many whorls, the whorls deeply divided, and not always close together, crossed by remarkably elevated ribs, the aperture round and rather small. The animal is furnished with a proboscis, and has the eyes placed on an external convexity, the foot short and oval. About 100 species of this genus are known. Those which have the whorls close together are called false wentletraps by shell-collectors;

those in which they are not contiguous are known as true wentletraps. Of the former, some are found in northern seas, as *scalaria communis* on the coasts of Britain and of continental Europe, and *S. Grœnlandica* on those of North America. *S. Grœnlandica* is particularly abundant on the banks of Newfoundland, and forms part of the food of the cod. The *true* wentletraps are all natives of the seas of warm climates. Some of them are very beautiful. A species found in the s.e. of Asia, and known as the PRECIOUS WENTLETRAP (*S. pretiosa*), was once in such esteem among shell collectors that an extremely fine specimen is said to have been sold for 200 guineas; and an ordinary price was from three to five pounds. This shell may now be purchased for a few shillings. It is from 1½ in. to 2 in. long, snow-white, or pale flesh-colored, with eight separated—but not widely separated—whorls.

WENTWORTH, a co. in central Ontario, having lake Ontario for its e. boundary, drained by the head-waters of Welland river and other small streams; 489 sq.m.; pop. '91, 78,606. Co. seat, Hamilton.

WENTWORTH, BENNING, 1696–1770; b. N. H.; graduated at Harvard college in 1715. He engaged in mercantile pursuits and acquired an ample fortune. He was appointed a member of the council in 1734, was frequently a member of the assembly, and was royal gov. of New Hampshire, 1741–67. The town of Bennington, Vt., was named after him. He was a benefactor of Dartmouth college, to which he gave the site for its buildings. His grants of land in s. Vermont involved a long dispute with New York.

WENTWORTH, JOHN, 1719–81; b. N. H.; called to the bar; served in the colonial legislature, 1768–75, and was its speaker in 1771. He was active on the patriotic side during the revolutionary movement; was chairman of the correspondence committee; president of the convention of 1774, and a member of the council, 1776–81. He was judge of the Strafford co. (N. H.) court of common pleas, 1773–76, and of the supreme court, 1776–81.

WENTWORTH, Sir JOHN, LL.D., 1737–1820; b. N. H.; graduated at Harvard, 1755. In 1765 he was sent to England to present petitions from his native province, and in 1767 was made governor of New Hampshire and "surveyor of the king's woods in North America." As governor, he gave a charter to Dartmouth college, and endowed it with nearly 45,000 acres of land. The dislike of the revolutionary party became intense against Wentworth in 1774 on account of his assisting Gage in his fortifications, and he fled to England. After peace was declared he returned to Nova Scotia, and became, 1792, lieut.gov. of the province. His baronetcy was given him in 1795.

WENTWORTH, JOHN, JR., 1745–87; b. N. H.; son of John. He graduated at Harvard college in 1768, and at once began to take part in public affairs. He was a member of the committee of safety, and of the legislature during the revolution. He served in the continental congress, 1778–79; was a member of the council, 1780–84, and state senator from 1784 till his death.

WENTWORTH, JOHN, LL.D.; b. N. H., 1815; graduated at Dartmouth college, 1836, and was for many years editor of the Chicago *Democrat*. In 1843 he was elected to congress from the district which includes Chicago, and served six terms, leaving the old democratic party on the organization of the republican party. He was elected mayor of Chicago twice, and was a member of the Illinois constitutional convention of 1861. He d. 1888.

WENTWORTH, WILLIAM, about 1615–97; b. England. He was the first of the extensive family of that name in this country. In 1639, in company with Rev. John Wheelwright and others, he entered into an agreement for a settlement at Exeter, N. H., and afterward resided at Wells, Me., and at Dover, N. H. He was a ruling elder and preacher.

WERDAU, a t. of Saxony, on the river Pleisse, 40 m. s. of Leipsic. It has important industries, including manufactures of woolen fabrics, chemicals, machinery, playing-cards etc. Pop. '90, 16,259.

WERDEN, a t. of Rhenish Prussia, on the Ruhr, 17 m. n.e. of Düsseldorf. Pop. '80, 7,590, employed in the manufacture of cloth, linen, and silk, and alum and coal-mining.

WERDEN, REED, b. Penn., 1818; graduated at the Philadelphia naval academy, and became a midshipman, 1834. At the outbreak of the civil war he was a lieut., and in the Roanoke island and New Berne naval contests he commanded the *Stars and Stripes*, fighting his ship with great gallantry. In 1866 he was made capt.; in 1871, commodore; and in 1875, rear-admiral. He d. 1886.

WEREGILD (Ang.-Sax., *wer*, man; and *geld*, satisfaction), a composition by which, according to the custom of the Anglo-Saxons, Franks, and other Teutonic people, homicide and other heinous crimes against the person were expiated. There was an established progressive rate of weregild for homicide, varying at different times and among different Teutonic tribes, from the weregild of the *ceorl*, or peasant, to that of the king. In the time of Tacitus, the weregild for homicide among the Germans was due to the relatives of the deceased; that for other crimes one-half to the injured party, and one-half to the state. The sum paid to the relatives in case of homicide, also known as the *man-wyrth*, seems to have been looked on as the equivalent of the dead man's value.

As the power of the community or king increased, the exaction of retribution for the death of its members was considered to be the duty of the state as well as of the relatives, and the principle of division was applied to homicide as well as minor crimes; each payment being a separate full equivalent for the value of the deceased; the one to appease the feud, the other to make atonement to the state. This double weregild is recognized in the compensation for the death of a king by the laws of the Mercians and Northumbrians. In the days of Edward the elder the weregild had become a much more complicated penalty, the composition for homicide consisting of four different payments, two of which, the *fight-wite*, or penalty for a breach of the peace, and the *weregild*, went to the king as head of the state; while a sum called the *halsfang* was paid to the kindred to loosen the hand of the avenger of blood, and the *manbote* was given to the overlord to compensate him for the loss of a vassal. The graduated scales of weregild in use among the different Teutonic nations throw much light on the gradations of society at the period. It does not appear that among the nations who recognized the principle of weregild, the relatives were bound to accept a compensation for their kinsman's slaughter, in place of appeasing the death-feud by blood; the latter practice was often resorted to instead. It was only through the exertions of archbishop Theodore that Egfred, the Christian king of the Angles of Northumbria, adopted the alternative of accepting a weregild for his brother slain in battle by the Mercians, in place of demanding the blood of the slayer. A similar principle to that of weregild for homicide seems to have been recognized by the Celtic nations, and there are traces of it in the Mosaic code.

WERE-WOLF (Ang.-Sax. *wer*, a man), a man-wolf, a man who, either periodically or for a time, is transformed, or transforms himself into a wolf, becoming possessed of all the powers and appetites of a wolf in addition to his own, and being especially remarkable for his appetite for human flesh. The belief in the transformation of men into wolves or other beasts of prey has been very widely diffused; there is perhaps no people among whom some evidence of its former prevalence does not exist. It is not yet extinct, even in Europe. In many of the rural districts of France, the *loup-garou* (the latter part of the word is a corruption of the Teutonic *wer-wolf*) is still an object of dread. This superstition lingers too among the country-people of northern Europe, and a particular form of it flourishes vigorously among the Bulgarians, Slavonians, and Serbs, and even among the more intelligent inhabitants of Greece. See Vampire. Its details vary in different countries and districts. The definition given above includes only the commonest and the best marked of its incidents. Probably it has not yet entirely disappeared in any country whose rural districts are infested with wolves or other wild animals; and manifestations fitted to suggest it may be occasionally observed in the mad-houses of most countries. See Lycanthropia. The animal whose shape is taken, as already stated, is not always, though usually, a wolf; it was probably always the animal most formidable, or considered most inimical to man. In Abyssinia it is the hyena.

Occasional notices of lycanthropy, as it is called, are found in classical writers; and lycanthropy, as there described, was the change of a man or woman into a wolf, so as to enable the man or woman to gratify an appetite for human flesh, either by magical means, or through the judgment of the gods, as a punishment for some dire offense. Sometimes the transformation was into the shape of a dog or a bull. Ovid, in his *Metamorphoses*, tells the story of Lycaon, king of Arcadia, who, when entertaining Jupiter at a banquet, resolved to test his omniscience by serving up to him a hash of human flesh. The god, to punish him for this, transformed him into a wolf. Herodotus describes the Neuri as sorcerers who had the power of taking once a year, for several days, the shape of wolves; and the same account of them is given by Pomponius Mela. Pliny relates that, in Arcadia, every year, at the festival of Jupiter Lycæus, one of the family of Antæus was chosen by lot, and conducted to the brink of the Arcadian lake, into which, after having hung his garments upon a tree, he plunged, and was transformed into a wolf. Nine years after, if alive, he returned to his friends, looking nine years older than when he disappeared. Some notices of lycanthropy are to be found in Petronius; and allusion to it is also made by Virgil in the 8th *Eclogue*. Marcellus Sidetes tells us of men who, every winter, were seized with the notion that they were dogs or wolves, and lived precisely like these animals, spending the night in lone cemeteries. This disorder attacked men chiefly in the beginning of the year, and was usually at its height in February. It is worth while observing that the classical instances of lycanthropy mostly refer to Arcadia, a pastoral country, whose inhabitants suffered greatly from the ravages of wolves.

In Norway and Iceland, it used to be believed that there were men who were "not of one skin." Such men could take upon themselves other shapes than that of man, and the natures corresponding to the shapes which they assumed; they had the strength and other powers of the animal whose shape they bore, as well as their own. It was believed that the change of shape might be effected in one of three ways: simply by putting on a skin of the animal; by the soul of the man deserting the human body—leaving it for a time in a cataleptic state—and entering into a body borrowed or created for the purpose; or, without any actual change of form, by means of a charm, which made all beholders see the man under the shape of the animal whose part he was sustaining.

The two former were the common modes of transformation; at any rate, the sagas are full of illustrations of them; while illustrations of the third mode are comparatively rare. Nothing of the man remained unchanged except his eyes; by these only could he be recognized. Odin had, and freely exercised, the power of varying his shape. When men changed their shape to prey upon their kind, they always took the form of a wolf. It was believed that many had the power of thus transforming themselves; and great was the popular dread of were-wolves. Perhaps the best stories of were-wolves which are to be found are contained in the northern sagas. Scarcely anywhere did the belief in them go so deep into the minds of the people as among the northern races. In connection with it, notice may be taken of what is called the "Berserkr rage," which appears to have been a peculiar form of mania. The Berserkr yelped like dogs, or wolves rushing into conflict, bit their shields with their teeth, and committed terrible atrocities while the paroxysms of their disease were upon them. Berserkr has been rendered "bare-skinned;" others make it mean "wolf-skin-coated" (why not "bear-skin-coated?").

Olaus Magnus states that in Prussia, Lithuania, and Livonia, though wolves were very numerous and troublesome, the ravages of the were-wolves were regarded as much more serious. Every year at the feast of the nativity at night, the were-wolves assembled in great numbers at appointed places, and proceeded to look out for human beings, or tame animals, upon which they could glut their appetites. If they found an isolated house, they entered it, and devoured every human being and tame animal it contained; after which—showing that they were not common wolves—they drank up all the beer or mead. Similar testimony with regard to Livonia is given by bishop Majolus, who adds, that the transformation into the wolf-form continued for twelve days.

Instances of persons being changed into wolves by way of punishment, were freely believed in the middle ages; for example, St. Patrick was believed to have changed Vereticus, king of Wales, into a wolf; and there was an illustrious Irish family which had incurred the curse of St. Natalis, every member of which, male and female, according to the popular belief, had to take the shape of a wolf, and live the life of a wolf for seven years.

In the 15th and 16th centuries, the belief in were-wolves was, throughout the continent of Europe, as general as the belief in witches, which it had then come to resemble in many respects. It gave rise to prosecutions almost as frequent as those for witchcraft (q.v.), and these usually ended in the confession of the accused, and his death by hanging and burning. It was calculated to inspire even greater terror than witchcraft, since it was believed that the were-wolves delighted in human flesh, and were constantly lying in wait for solitary travelers, and carrying off and eating little children. The were-wolves, like the witches, were now regarded as servants of the devil, from whom they got the power—often exercised by anointing with a salve—of assuming the wolf's form; and it was believed that great numbers of them trooped together to the Devil's Sabbath. The stories of mutilations and other mishaps befalling them in the wolf-state, by which, when they resumed the human form, they were identified as were-wolves, exactly resemble the stories told of witches. In Sept., 1573, we find a court of parliament sitting at Dole, in Franche-Comté, authorizing the country-people to take their weapons, and beat the woods for a were-wolf, who had already—thus went the recital—"carried off several little children, so that they had not since been heard of, and done injury to some horsemen, who kept him off only with great difficulty and danger to their persons." Throughout Europe, the judicial cognizance of witchcraft and of lycanthropy ceased at the same time. In Great Britain, where wolves had early been exterminated, the were-wolf was only known by rumors coming from abroad; but the belief that witches could transform themselves into cats and hares, which did prevail, was precisely analogous to the belief in were-wolves, especially in its later forms.

The later forms of this strange belief were obviously sophisticated. In its earlier shape, three things are to be noticed—the power ascribed to the were-wolf of transforming himself, either by changing the shape of his own body, or projecting his spirit into another body; his appetite for human flesh; his taking the shape and nature of the animal held to be most malicious against man—the wolf. As to the first of these, all that can here be done is to point to its connection with the doctrine of transmigration (q.v.), and to add that it has been one of the commonest of human beliefs. As to the second, is it unlikely that in the early times in which the superstition had its origin, the appetite for human flesh may have been common enough to spread terror through whole districts? It is, at least, not improbable that every race of men has had an experience of cannibalism; and it may well have been that, in occasional cases, especially under conditions of disease, the taste for human flesh survived the general practice of using it. Modern Europe affords many unquestionable examples of this taste existing and being indulged in the midst of comparative civilization. There can be no doubt that some of the unhappy multitude put to death as were-wolves had really murdered and eaten the flesh of human beings. But secret murders, unaccompanied by cannabalism, would tend to support a popular belief in cannibalism. We have not to go out of our own age for proofs of the existence of men afflicted with a homicidal tendency: and in times when the means of detecting crimes were very imperfect, it is conceivable that the murders committed by one or two such persons would spread terror, and give support to a superstitious theory throughout a large district. The Maréchal de Retz, who lived

in the time of our Henry VI., had caused to be stolen and put to death by torture, under the most inhuman circumstances, many hundred children—he confessed on his trial that he murdered 120 in a single year. (A memoir of Gilles de Laval, Maréchal de Retz, has been compiled from authentic documents by P. J. Lacroix, the eminent French antiquary.) Perhaps no society has ever been free from men similarly constituted, and acting similarly according to their opportunities. As to the third point, if it be granted that a certain practice of, or general suspicion of cannibalism existed among a people who believed in the power of transformation, it is easy to understand how the cannibal, getting his victims by stealth, was supposed to indulge his inhuman appetite under the guise of the animal most unfriendly to man. And the existence of a form of mania in which the madman had the hallucination that he was changed into a wolf, yelled like a wolf, lived in many respects like a wolf, was calculated strongly to confirm the belief in men-wolves. In conjunction with the mischief done by real wolves, this itself may be thought almost enough to have given origin to the superstition. The hallucination of having undergone transformation into a wolf from time to time, seems to have been one of the commonest by which weak and crazed brains were possessed during the period when the hunt for were-wolves was kept up. The literature of this subject, though abundant, is for the most part fragmentary, and mixed up with other matters. A good account of the subject will be found in *The Book of Were-Wolves*, by Sabine Baring-Gould (Lond. 1865).

WERGELAND, Henrik Arnold, 1808–45; b. Norway; educated at Christiania university. He entered the ministry, but withdrew from it in 1834, the sentiments uttered in his poem called *Creation, Man and the Messiah* being thought inconsistent with his profession. He then studied medicine. In 1840 he was made keeper of the national archives. His dramatic and lyrical productions were long popular in Norway.

WERMLAND, a län in s.w. Sweden, adjoining Norway; drained by the Klar river; 7285 sq.m.; pop. '93, 250,935. It contains lake Wener, which has an area of some 2,000 sq.m., the third largest lake in Europe. Iron mines in this län are the richest in Sweden. The surface is mountainous. Capital, Carlstad.

WERNER, Abraham Gottlob, a celebrated mineralogist and geologist, b. at Wehrau, on the Queiss, in Upper Lusatia, Sept. 25, 1750. His father was director of a smelting-work, and he was thus led almost in childhood to the study of minerals. After some time spent at the mineralogical academy of Freyberg, he went to Leipsic, where he studied natural history and jurisprudence. Here, at the age of 24, he published his first work on mineralogy, a mere pamphlet on the external characters of minerals. In 1775 he was appointed professor of mineralogy, and curator of the mineralogical cabinet at Freyberg. In 1780 he published the first part of a translation of Cronstedt's *Mineralogy*, in his notes to which he gave the first outlines of the system which bears his name. In 1791 he published a *Theory of the Formation of Metallic Veins*, which was translated into English and French, and greatly extended his reputation. He was not, however, a voluminous author, but his views were diffused by his pupils, among whom were the most eminent German mineralogists of the time. In 1792 he was appointed councilor of mines in Saxony. He died at Dresden in 1817.

Werner's influence was very great in the promotion both of mineralogy and of geology. In his mineralogical system, minerals were distinguished and arranged chiefly according to their external characters; and mineralogists have now learned to depend much more than he did on their chemical constitution. In geology he did great service by arranging the facts already known, and guiding to proper methods of observation. His theory was extensively received for a time. It may be described as the opposite of the Huttonian theory, accounting for the present state of mineral substances in general by supposing them to have been dissolved or suspended in water; while the Huttonian theory ascribed almost everything to the action of fire. Werner's is sometimes called the Neptunian theory, while that of Hutton is styled the Plutonic. Modern geology recognizes a certain measure of truth in both, but rejects them alike in that character of completenesss or universality in which they were once advocated. Werner classified rocks into primary, transition, and secondary; and the terms are still sometimes used, although merely as convenient names.

WERNER, Friedrich Ludwig Zacharias, 1768–1823; b. Königsberg, Germany; studied law in that city, and in 1793 entered the Prussian civil service, holding office for twelve years in Warsaw and for two years in Berlin. In this time he produced four dramas, the most important being *Der 24ste Februar*, which shows a vivid imagination and considerable dramatic power. In 1809 he went to Rome, and two years later joined the Roman Catholic church. In 1814 he became a priest, preached in Vienna and elsewhere, making a great sensation by his peculiar eloquence. He remained in Vienna until his death. His collected works were published in 1841, and consist of eight dramas and many poems, hymns, and sermons.

WERNER, Karl, b. Germany, 1808; studied painting in Leipsic and Munich. He went to Rome in 1833, and resided there for the next 20 years. He afterward traveled through Spain, Scandinavia, and the east. Among his works are: "Venice in her

Zenith and Decline;" "The Lions' Court of the Alhambra;" and "Jerusalem and the Holy Land." His best work is in water-colors. He died 1894.

WERNIGERO'DE, a small walled t. of Prussia, in the government of Magdeburg, and 43 m. s.w. of the city of that name, stands at the northern base of the Brocken mountain. Its castle, the residence of the counts Stolzberg-Wernigerodé, comprises an extensive library and a zoölogical garden. It manufactures linen, cloth, and tobacco; and carries on copper-smelting and paper-making. Pop. abt. 9000.

WE'SEL, a strongly fortified t. of Prussia, on the Rhine, 32 m. n.n.w. of Düsseldorf. The Rhine, which here is joined by the Lippe, is divided by a fortified island, and crossed by a bridge of boats, protected on the left bank by a fort. Of its churches, the Willibrod Kirche was first opened in 1181. The industries include manufactures of soap, wire and cement. The citadel is defended by a considerable force. Pop. '90, inclusive of garrison, 20,724.

WE'SER (Lat. *Visurgis*), a river of Germany, formed out of the Werra, which rises in the Thuringer-wald, and the Fulda, rising in the Rhöngebirge, on the frontiers of Prussia and Bavaria. These streams, after a northern course, unite at Münden, in Hanover; and the united stream, the Weser, flows n. through Prussia, till, passing Bremen, it forms for about 40 m. the boundary between Oldenburg and Prussia, and enters the North sea by a wide but shallow estuary, much interrupted by sand. Entire length, 270 miles. It communicates with the Elbe by a navigable canal; but though considerably improved in this respect, the Weser is not of much use as a navigable stream. The principal trading town on its banks is Bremen.

WESLEY, JOHN, the founder of the Methodists (q. v.), was born at Epworth, in Lincolnshire, England, June 17, 1703. The family name was variously spelled Wesley and Westley, and is supposed to be the same with Wellesley, and to be derived from a place of that name near Wells. An Irish gentleman, Garret Wellesley, esq., of Dungannon, offered to make Charles Wesley, younger brother of John, his heir, on condition of his settling in Ireland, believing him to be of his own family. The offer was not accepted; and the estate of Mr. Wellesley went to another branch of the family, which was soon raised to the Irish peerage, with the title of earl of Mornington, and from which the duke of Wellington and the marquis of Wellesley sprung. The more immediate progenitors of John Wesley were ministers of the church of England, of Puritan principles. Some of them suffered for non-conformity. Bartholomew Wesley, the great-grandfather of John, was ejected from his living by the act of uniformity in 1662. John Wesley, the son of Bartholomew, was also deprived of his living, and was often fined, and several times imprisoned for preaching contrary to the law. Samuel Wesley, a son of this John Wesley, conformed to the church of England, but opposed the schemes of James II., refusing to be bribed by offers of preferment, which, on account of his erudition and talents, it was thought worth while to make to him. He supported the cause of the revolution, in circumstances of personal danger; and, in the beginning of the reign of William and Mary, was rewarded with the living of Epworth. He wrote an epic poem entitled *The Life of Christ*, and other similar works. He had a family of nineteen children. His wife Susannah Annesley, the daughter of an ejected minister, was a woman of remarkable intelligence and fervent piety, who devoted herself very much to the education, and particularly the religious education, of her children. His eldest son, Samuel, head-master of Tiverton school in Devonshire, was a tory and high-churchman, who strongly disapproved of the "new faith" and peculiar course of his brothers John and Charles. John Wesley was the second son of Samuel, or the second who grew up to manhood. In his infancy he had a narrow escape from being burned to death, when the parsonage of Epworth was burned by some of the parishioners in their rage against their pastor for his faithful reproving of their vices. Another remarkable story is connected with the parsonage of Epworth, and with the early years of John Wesley's life—the continued disturbance of the family throughout a considerable time, by loud knockings and other noises, which could not be accounted for, and which therefore were regarded as preternatural, although Mr. Wesley and his household were less affected by the strange visitation than perhaps its authors expected them to be, and persisted in residing in the parsonage, even making sport of "Old Jeffery," their unseen visitant, who "was plainly a Jacobite goblin, and seldom suffered Mr. Wesley to pray for the king and the prince of Wales without disturbing the family prayers."

John Wesley was a very diligent and successful student. The religious history of his college life belongs to the history of Methodism (see METHODISTS). After much conscientious hesitation as to his motives and fitness for entering the clerical profession, he was ordained deacon in 1725, and in 1726 he graduated as M.A., and was elected fellow of Lincoln college, Oxford. In the same year he was appointed Greek lecturer and moderator of the classes. He became curate to his father at Wroote, a small living which Samuel Wesley held along with that of Epworth, and while serving here, he was advanced to priest's orders in 1728. He returned to Oxford, and along with his younger brother, Charles, entered into those religious associations from which Methodism sprang. The intercourse of the brothers Wesley at this time with William Law, the author of the *Serious Call*, had a great influence on their opinions and conduct. They walked two or

three times a year from Oxford to visit Law at his house near London. In 1735, John Wesley was induced to go out to Georgia with general Oglethorpe, to preach to the Indians and colonists. His religious views at this time were strongly tinctured with asceticism. His intercourse with Moravians, who were his fellow passengers to America, and afterward his fellow-laborers in the colony, tended to stimulate his religious zeal. He attempted to establish a discipline in the colony, very different from that of the church of England at home, and failed in the attempt. The difficulties of his position were increased by an affair in which he became involved with the daughter of the chief magistrate of Savannah, whom he wished to marry; but on the advice of the Moravian bishop and elders, to whom he submitted the matter, he withdrew from her, and she very soon marrying another, Wesley refused her admission to the communion; upon which her husband raised an action at law, and Wesley, finding Savannah no suitable place for him, and, as he said, "shaking the dust off his feet," returned to England, having resided in America not quite two years. With religious zeal undiminished, he maintained an intimate connection with the Moravians in London. On May 24, 1738, some months after his return to England, he attended a meeting of a society in Aldersgate street, where, while one was reading Luther's Preface to the Epistle to the Romans, he experienced such a change of religious feeling that, notwithstanding all his previous zeal, he ever afterward regarded this as the time of his conversion. "I felt my heart strangely warmed," he says; "I felt I did trust in Christ, Christ alone, for salvation; and an assurance was given me, that he had taken away *my* sins, even *mine*, and saved me from the law of sin and death." Many who accept generally Wesley's views of conversion, doubt his opinion as to the date of his own. After this he visited the Moravian brethren at Herrnhut in Germany, made the acquaintance of Zinzendorf, and was introduced to the prince royal of Prussia, afterward Frederick the Great. Returning to England, he became associated with his old college companion, Whitefield, and after his example began, in 1739, the practice of open-air preaching. From this time, the history of Wesley's life becomes very much the history of Methodism. In 1740, he solemnly separated himself from the Moravians, finding that he differed from them in important points of doctrine; and in the same year the breach took place between Whitefield and him, which divided the Methodists into two sections, Calvanistic and Arminian. In the evangelistic work which he carried on in England, and in organizing the Methodist body, Wesley was indefatigable. He seldom traveled less than forty miles a day, usually on horseback, till near the close of his life, when he used a chaise. In 1752, he married a widow with four children, but the marriage proved an unhappy one, and a separation ensued. His health gradually declined during the last three years of his life, and after a short illness, he died in London, Mar. 2, 1791, in the 88th year of his age. His remains lay in state for several days in his chapel in the City road, dressed in the sacerdotal robes which he usually wore, with a Bible in his hand. Wesley was a voluminous writer. His writings are chiefly polemical and religious. His style in the pulpit was fluent, clear, and argumentative, not impassioned like Whitefield's; his countenance was mild and grave; and his manners agreeable, although he exercised a very imperial domination over the preachers of the Methodist body. He was a man of great benevolence, and gave away all his living to the poor. Probably no man ever exerted so great an influence on the religious condition of the people of England as John Wesley, and his influence has extended to the most remote parts of the world.—CHARLES WESLEY, his younger brother, b. at Epworth, Dec. 18, 1708, was associated with him in the whole Methodist movement. Having studied at Christ church, Oxford, and visited Georgia at the same time with his brother, he took an active part in the subsequent work in England. He was a clear and simple preacher, and a man of fervent piety, but of a disposition very far removed from asceticism. He is the author of a great number of hymns in use among the Methodists; some of which, however,, are among the best and most admired hymns in the English language, replete with pious feeling, and of lyrical power and sweetness almost unsurpassed. He died 1837. See *The Works of the Rev. John Wesley* (16 vols. Lond. 1809); *Life of the Rev. John Wesley, A.M.*, by Dr. Coke and Mr. Moore (Lond. 1792); *The Life of Wesley*, by Southey (2 vols. 1820; new ed. 1864); *The Life and Times of Wesley*, by Tyerman (1870); and *John Wesley and the Evangelical Reaction*, by Miss Wedgwood (1870).

WESLEY, or **WESTLEY**, SAMUEL, 1662–1735; b. England; was designed by his father, the Rev. John Westley, for the dissenting ministry, but early entered the church of England; studied at Oxford, supporting himself by teaching; was curate for a year in London, and the following year chaplain on board a man-of-war. He was subsequently curate for two years in London, and after the revolution was presented with the living of Epworth, Lincolnshire. He was the father of the renowned John Wesley, the founder of the denomination called Methodists. He published *The Life of Christ*, a heroic poem; *Elegies on Queen Mary and Archbishop Tillotson; History of the New Testament attempted in verse; History of the Old Testament;* a poem on the battle of Blenheim; a *Latin Commentary on the Book of Job;* a *Treatise on the Sacrament.*

WESLEYAN METHODIST CONNECTION OF AMERICA grew out of a separation from the M. E. church, the result of the connection of that church with slavery, and the arbitrary character of its government. The Revs. Orange Scott, J. Horton, and

Le Roy Sunderland withdrew in Nov., 1842, beginning at the same time the publication of a weekly paper, *The True Wesleyan*. In December following a number of other ministers also withdrew. Secessions of churches and ministers also took place in different northern states; the most extensive being in Michigan, where a conference was organized. A number of ministers and members also seceded from the Methodist Protestant church. The first local Wesleyan church was organized in Providence, R.I., in 1842.

In Feb., 1843, a convention of the seceders was held in Andover, Mass., where a basis of organization was partially agreed upon. This resulted in a call for a general convention, which was held in Utica, N. Y., commencing May 31, 1843. A form of church government was agreed upon, a "discipline" adopted, and about 3,000 members reported. The first general conference was held in Oct., 1844; the discipline was carefully revised, and the principles of the church clearly defined. About 6,000 members were reported. One great obstacle in the way of success at first was the want of church buildings. Societies were small, and generally far apart. They met with much opposition, but churches and parsonages were erected as fast as possible.

In 1866 several prominent ministers attempted to form a union with the Methodist Protestant church. But the discipline of the Wesleyans laid down certain principles of civil government, and required its members to vote in accordance with these principles—that the republic is a nation, that equal rights are to be accorded to all its citizens, and that all laws should conform to the Bible, the rule of practice for nations as well as individuals. The discipline also excluded from church-fellowship all members of secret societies. For the love of these principles the great body of the church refused to go into the union movement. The leaders, however, carried into the union a number of churches, with Adrian college in Michigan, and leaving the Book Concern at Syracuse, N. Y., practically bankrupt. The denomination seemed on the verge of extinction; but under the efforts of the Rev. Adam Crooks, who was appointed publishing agent and editor, the claims against the Book Concern were paid off in a few years. He also raised by subscription some $25,000 toward the erection of a new publishing house. In 1874, in the midst of his arduous labors, he was suddenly removed by death. Rev. D. S. Kinney was appointed his successor, and has been equally successful. He has raised additional funds, and in 1879 completed the new publishing house at Syracuse, a fine four-story brick building, at a cost of $35,000.

In 1879 some thirty changes were made in the discipline. The distinctive features of the connection are these: In doctrine they follow John Wesley; in government they are half-way between Presbyterianism and Congregationalism; in regard to civil government, they hold that God is the governor of nations, and that the sovereignty of Jehovah, and the supreme authority of his revealed will should be acknowledged by the constitutions of states and nations. Wesleyan Methodists oppose all kinds of oppression and monopoly, and exclude from their fellowship all members of secret societies. Their educational interests center in a flourishing institution of learning at Wasioja, Minn. At Syracuse, N. Y., they have publishing interests to the value of $65,000. They publish there the *American Wesleyan*, a weekly eight-page paper, the *Children's Banner*, semi-monthly, and the *Bible Standard*, a monthly magazine. They have nineteen yearly conferences, in which are 300 ministers, and 18,000 members; churches and parsonages to the value of $600,000.

WESLEYAN UNIVERSITY, in Middletown, Conn., founded by the Methodists in 1831, the oldest college of that denomination in the country. It has graduated 2000 students. It has an endowment of $1,200,000 and an annual income of $100,000. The buildings are the North and South colleges, Memorial hall, Rich hall and Judd hall, all of brownstone; Observatory hall and the Fayerweather gymnasium of brick. These buildings, most of which front an ample and well shaded campus overlooking the Connecticut valley and the surrounding country, are, with the grounds, estimated to be worth $670,000. The library contains about 46,000 volumes, and has an invested fund of $20,000 to secure its increase. The patronage of the institution is derived mainly from thirteen annual conferences of the Methodist Episcopal church, each of which chooses a member for the board of trustees. There are three courses of study of four years each: 1. the classical course, substantially that of the other New England colleges; 2. the Latin-scientific course; 3. the scientific course. The last two are designed particularly for advanced culture in science and modern languages and literature. In all three courses the work of the last two years is nearly all elective. Post-graduate courses are provided in the various departments. The chemical, physical and biological laboratories are extensive and well furnished. Experiments are carried on in the chemical and biological laboratories under the authority of the state and federal governments. The university since 1872 has been open to both sexes. In 1897 it had 34 professors and instructors and 307 students. President, Rev. Bradford Paul Raymond, D.D., LL.D.

WESSEL, JOHANN, called also *Gansfort*, a predecessor of Luther, was b. at Gröningen, 1419, taught philosophy at Cologne, Louvain, Heidelberg, and Paris, and died (1489) in his native town. On account of his learning, he was called *Lux Mundi* (light of the world); while his enemies, on account of his opposition to the scholastic philosophy, termed him *Magister Contradictionum* (master of contradictions). In his doctrine of justification by faith, he forestalled Luther, who esteemed him very highly. After his

death, a large portion of his writings were burned as heretical. Another portion appeared under the title of *Farrago Rerum Theologicarum*, of which Luther published an edition with a preface (Wittenb. 1522), but the most complete edition is that by Joh. Lydius (Amst. 1617). See Ullmann's *Joh. Wessel, ein Vorgänger Luther's* (Hamb. 1834), Bähring's *Das Leben Joh. Wessel's* (1846), and Friedrich's *Johann Wessel* (1862).

WESSEX. See HEPTARCHY.

WEST, BENJAMIN, Anglo-American painter, was b. at Springfield, Penn., Oct. 10 1738, of Quaker parentage, and with lack of opportunity or encouragement, surprised his friends by his skill in drawing at the age of seven years, and at nine painted a picture in water-colors, which, in some points, he declared in after-life, he had never surpassed. His first colors were made from leaves, berries, etc., and his brushes stolen from a cat's tail. Thus self-taught, at the age of 16 he practiced portrait-painting in the villages near Philadelphia, and painted for a gunsmith his first historical picture, "The Death of Socrates." While the society of Friends were discussing the propriety of his becoming a painter, he shocked their principles still more by volunteering in a military expedition in search for the remains of Braddock's army. At 18, he was painting portraits in Philadelphia, and later at New York, where, in 1760, he was aided by some generous merchants to go and pursue his studies in Italy. At Rome, he was patronized by lord Grantham, whose portrait he painted, became the friend of Mengs, and, as the first American artist ever seen in Italy, attracted much attention. He painted his "Cimon and Iphigenia," and "Angelica and Medora," and was elected member of the academies of Florence, Bologna, and Parma. In 1763, visiting England on his way to America, he was induced to remain in London, and in 1765 married Eliza Shewell, to whom he had been engaged before leaving America. His "Agrippina landing with the ashes of Germanicus," attracted the attention of George III., who was his steady friend and patron for forty years, during which time he sketched or painted 400 pictures. His "Death of Gen. Wolfe," painted in the costume of the period, against the advice of all the most distinguished painters, effected a revolution in historic art. For the king, he painted a series of 28 religious pictures for Windsor castle. His best-known works are "Christ healing the Sick," "Death on the Pale Horse," and the "Battle of La Hague." In 1792 he succeeded sir Joshua Reynolds as the president of the Royal academy, but declined the honor of knighthood. Through his whole career he was the generous friend, adviser, and patron of young artists. *The Life and Studies of Benjamin West* were compiled from materials furnished by himself, by John Galt, in two parts (Lond. 1816–20); and a biography of him is also given in Cunningham's *Lives of Eminent British Painters*. He died in London, March 11, 1820, and was buried with great pomp at St. Paul's cathedral. His wife died 1817. Two sons survived him.

WEST, NATHANIEL, D.D., 1794–1864; b. Ireland; studied theology with Dr. Chalmers; came to America, 1834; pastor successively of Presbyterian churches at Meadville, Pittsburg, and Philadelphia, Penn.; chaplain of U. S. hospital, West Philadelphia, 1862–64. He pub. *The Ark of God the Safety of the Nation; Popery the Prop of European Despotisms; Complete Analysis of the Holy Bible; The Overturning of Tyrannical Governments*. His topical analysis of the Bible has had, in various forms, a wide circulation.

WEST, SAMUEL, D.D., 1730–1807; b. Mass.; graduated Harvard college, 1754; ordained, 1764; preached at New Bedford several years; engaged actively in politics and wrote for the newspapers; was a member of the state constitutional convention; was a member of the academies of sciences at Philadelphia and Boston. He published an *Essay on Liberty and Necessity*, in reply to Edwards *On the Will*.

WEST, STEPHEN, D.D., 1735–1819; b. Conn.; graduated Yale college, 1755; taught school at Medford, Mass.; chaplain at Hoosick Fort, 1757; missionary to the Stockbridge Indians, as successor of Jonathan Edwards, 1758; pastor of the church, Stockbridge, 1759–70. He published *Essay on Moral Agency; Remarks on Edwards's Inquiry on the Freedom of the Will; Essay on the Scriptural Doctrine of the Atonement*, etc.

WESTALL, RICHARD, 1765–1836; b. England; apprenticed to an engraver, but became a painter. His best works are water-color drawings of classical subjects. His brother WILLIAM, 1781–1850, studied at the Royal academy, and published several works containing views of English and eastern subjects.

WEST BATON ROUGE, a parish in s.e. Louisiana, having the Mississippi river for its e. boundary, 210 sq. m.; pop. '90, 8363. Co. seat, Port Allen.

WEST BAY CITY, a city in Bay co., Mich.; on the Saginaw river, and the Michigan Central and the Grand Trunk railroads; opposite Bay City, the co. seat. The consolidation of Bay City, West Bay City, and Essexville village has been authorized by the legislature. Both cities have many commercial and local interests in common. West Bay City has about a dozen churches, several planing and flour mills, saw mills, sash mill, and steel and wood ship yards. The cities are connected by bridges across the river and by electric railroads, and have electric lights, national and state banks, and daily and weekly newspapers. Pop. of West Bay City, '90, 12,981.

WESTBOROUGH, a tp. in Worcester co., Mass., on the Boston and Albany railroad, where are manufactories of straw goods, shoes, spring beds, and sleighs, besides a state reform school. The tp. includes the pleasant vill. of Westborough, where are a water-cure

establishment and the Willow Park seminary, churches, and good educational and banking facilities. Pop. of tp. '90, 5195.

WEST BROMWICH, a large and rapidly increasing t. of South Staffordshire, one of the most important towns in the great manufacturing and mining district known as "The Black Country," five m. n.w. of Birmingham. A few years ago West Bromwich was a mere village on a barren heath, and it owes the rapidity of its growth mainly to the rich mines of coal and iron in the vicinity, and to the industries to which these give rise. Very many canals and three railways run through the parish. There are numerous churches, schools, and other important establishments. Pop. '91, 59,489.

WESTBROOK, a former town in Cumberland co., Me.; city charter granted in 1889, and accepted in 1891; on the Presumpscot and Stroudwater rivers and the Portland and Rochester railroad; 6 miles n.w. of Portland. It contains two large villages, electric light and street railroad plants, the latter connecting with Portland, high school, Memorial, circulating, and Cumberland Mills libraries, weekly newspaper, and manufactories of ginghams, silk, paper, cotton, lumber, and other articles. The city has good water-power, capable of much larger development. Pop. '90, 6632.

WEST CARROLL, a parish in n.e. Louisiana, near Arkansas; formed 1877; intersected by Bayous Bœuf and Macon; 380 sq. m.; surface partially covered by forests; soil fertile; chief production, cotton. Pop. '90, 3748. Parish seat, Floyd.

WESTCHESTER, a co. in s.e. New York, having the state line of Connecticut and Long Island sound on the e.; bounded on the w. by the Hudson river, drained by the Croton and Bronx; pop. '90, 146,772, chiefly of American birth, includ. colored. Large portions of the co. were annexed to New York city in 1873 and 1895. It is crossed by ridges of hills, and has extensive quarries of marble, and mineral springs. Its agricultural products and manufactures are important. Co. seat, White Plains.

WEST CHESTER, borough and co. seat of Chester co., Pa.; near the Brandywine river, and on the Pennsylvania and the Philadelphia, Wilmington, and Baltimore railroads; 27 miles w. of Philadelphia. It contains a state normal school, co. hospital, Darlington female seminary, Villa Marie convent, public library, Marshall Square park, Paoli monument, electric light and street railroad plants, waterworks supplied from Chester creek, about 12 churches, and national and private banks. Pop. '90, 8028.

WESTCOTT, Brooke Foss, D.D., b. England, 1825; graduated, Cambridge, 1848; ordained, 1851; assistant master of Harrow school, 1852–69; examining chaplain to the bishop of Peterborough, 1868; canon of Peterborough cathedral, 1869; Regius Professor of divinity at Cambridge, 1870; consecrated bishop of Durham, 1890. He has published *Elements of Gospel Harmony; History of the Canon of the New Testament during the first Four Centuries; Characteristics of the Gospel Miracles; Introduction to the Study of the Gospels; The Bible and the Church; The Gospel of the Resurrection; History of the English Bible.* He contributed to Smith's *Bible Dictionary*, and is one of the revisers of the New Test.; and, with Dr. Hort, issued, 1881, a revised Greek New Testament text.

WESTERBOTTEN, a län in n. Sweden, on the Gulf of Bothnia, adjoining Norway; about 24,000 sq. m.; pop. 1895, 133,336. Capital, Umea.

WESTERLY, a town in Washington co., R. I.; on the Pawcatuck river, and the New York, New Haven, and Hartford railroad; 44 miles s.w. of Providence. It was originally known as Misquamicutt, and was incorporated as the fifth town in the colony in 1669. Westerly is widely noted for its extensive granite quarries and its manufactories of cotton and woolen goods, and printing-presses. The town contains several villages, of which Westerly is the most important, and has electric light and street railroad plants, Soldiers' memorial building, public library, national and savings banks, and daily and weekly newspapers. Pop. '90, town, 6813.

WESTERN AUSTRALIA, a British colony, and the western section of the great island-continent of Australia, embraces the whole of that island w. of the 129th meridian. Its extreme length from n.e. to s.w. is 1370, its average breadth is 650 m., and its area is estimated at 975,920 sq. m. Pop. '96, 122,420. This colony was formed in 1829, and in 1851 had only 5886 inhabitants; but within recent years a considerable number of emigrants have been sent out under the auspices of the government emigration board. Western Australia was formerly named *Swan River Settlement*, from the river Swan, which joins the Indian ocean, after watering a considerable district in the extreme s. w. Of the whole vast area, this district in the s.w. is now, as formerly, the only portion inhabited. There, mountain ranges rising in elevation from the coast inland, run parallel with each other from s. to. n., the highest summit being 5000 ft. above sea-level. The climate is agreeable and salubrious; the soil, both on the coast and in the interior, is light and dry. Bands of fertile land, suitable for the culture of the vine, olive, and fig, occur in the middle districts. Rivers, of which the Swan is the chief, abound; but are not of much use for navigation. Magnetic iron ore, lead, copper, and zinc ores are found in large quantities. Gold is found at Kimberley, Yilgarn, and several intermediate points. Other staple products are pearls and pearl shells, wool, timber, sandal-wood and guano. The colony has had a limited representative government since 1870, but in 1890 the imperial parliament gave it a new constitution, by which a parliament of two houses was constituted, the Legislative Council, or upper house, having 21 members, the Legislative Assembly or lower house, 33 members. The capital is Perth, with an estimated population of (1895) 19,533; the chief port Fremantle, pop. about 9500. Other important towns are Albany, Geraldton, Roebourne, York, etc. W. A. is a "crown colony," having a governor named by the crown.

WESTERN BRANCH, a magisterial dist.; Norfolk co., Va. Pop. '90, 9590.

WESTERN EMPIRE, that portion of the Roman empire of which Rome was the capital, and which comprised (besides Italy), Gaul, Britain, Spain, Africa, Pannonia, Illyricum, and Dalmatia. The partition was made upon the death of Theodosius in 395. His younger son, Honorius, took the western empire—his eldest son, Arcadius, the eastern, whose capital was Byzantium. See BYZANTINE EMPIRE. Between 395 and 476—when Romulus Augustus, better known by the name of Augustulus, was deposed by Odoacer—the western empire had 12 emperors, Honorius (d. 423); Joannes, 425; Valentinian III., 455; Maximus, 455; Avitus, 457; Majorian, 461; Severus, 465; Anthemius, 472; Olybrius, 472; Glycerius, 473; Julius Nepos, 474; and Romulus Augustus. Through the whole period, however, the emperors had little power; actual leadership was with the generals of the armies. Province after province was lost. In 418 the Goths established an empire in Gaul and Spain. The Vandals soon afterward overran Sardinia, Sicily, and other portions. Britain was given up in 451. Dalmatia and Gaul were seized within the next 20 years by Marcellinus and Ægidius respectively; and Rome was almost the only part of the western empire left in 476.

WESTERNORRLAND, a län or province in e. central Sweden, on the gulf of Bothnia; 9837 sq. m.; pop. '95, 217,220. The province is traversed by the Adals, Indals, and Angerman rivers and is moderately fertile. Capital, Hernösand.

WESTERN RESERVE, a tract of land in n.e. O., reserved by Connecticut as a foundation for its school fund, when, 1781, she ceded to the Union all the charter rights claimed by her in the n. w. territory—a narrow strip of land running from the w. boundary of Conn. westward to the Pacific ocean—from which Ohio and other states were subsequently formed. The reserved tract in Ohio contained abt. 3,667,000 acres. It extended 120 m. westward from the Penn. boundary line, was bounded on the n. by Lake Erie and on the s. by 41° n. lat. In 1786 this cession was accepted by congress, and in 1800 an act of congress authorized the pres. to deed to Conn. the title to this W. R. on condition that Conn. would surrender all claims to its jurisdiction. In 1802, on the admission of O. as a state, Conn. lost even this shadowy fiction of a title, but the name W. R. still clings to the soil and is perpetuated in the local nomenclature of public and private institutions. Its settlers were largely from Conn., and its population has been noted for morality and thrift. It was one of the earliest centers of anti-slavery sentiment, has always been active in the interests of education, and has been a stronghold of various moral reforms.

WESTERN RESERVE UNIVERSITY, Cleveland, Ohio, comprises Adelbert college, the college for women, the law school, graduate school, medical college and dental school. Adelbert college was founded at Hudson, Ohio, in 1826. It was removed to Cleveland in 1882. The medical college was founded in 1842. A preparatory school is in Hudson. The value of buildings and property is about $2,500,000. Among the great donors are Amasa Stone and John L. Woods. The university is non-sectarian. The history of the instruction and teaching force has many great names. Among them are Laurens P. Hickok, Elihu Loomis, Clement Long, Charles A. Young, Samuel C. Bartlett and Nathan P. Seymour. In 1896–7 there were 152 professors and instructors and 610 students. President, Charles F. Thwing, D.D., LL.D.

WEST FELICIANA, a parish in s.e. Louisiana, having the state line of Mississippi for its n. boundary, Thompson's creek on the e., and the Mississippi river on the s. and w.; 365 sq. m.; pop. '90, 15,062. Co. seat, St. Francisville.

WESTFIELD, a town in Hampden co., Mass.; on the Westfield river, and the Boston and Albany and the New York, New Haven, and Hartford railroads; 9 miles w. of Springfield. It was incorporated in 1669, and contains the villages of Westfield Centre, East Farms, Mundale, Middle Farms, Little River, and West Farms. The principal industries are the growing and curing of tobacco, and the manufacture of whips, cigars, steam-heaters, bicycles, coffin trimmings, piano legs, organs, and paper. The town has the western state normal school, high school, public library, several national and savings banks, waterworks supplied from Montgomery mountain, electric lights, nearly a dozen churches, and weekly and monthly periodicals. Pop. '90, 9805.

WESTFIELD, a town and village in Chautauqua co., N. Y.; on the Lake Shore and Michigan Southern, and the New York, Chicago, and St. Louis railroads; half a mile s. of Lake Erie, 17 miles s.w. of Dunkirk. It has an academy, Keeley institute, Union school with library, the Patterson library, electric lights, gravity system of waterworks, national bank, woolen, flour, and paper mills, tannery, and large grape-growing interests. Pop. '90, town, 3401; village, 1983.

WEST HOBOKEN, a town in Hudson co., N. J.; opposite New York, and 2 miles w. of Hoboken. It has a public park, electric lights and street railroads, several public and parochial schools, a trust and savings bank, St. Michael's monastery, Dominican convent, several large silk mills, brush and pen-holder factories, and weekly newspapers. Pop. '90, 11,665.

WEST INDIES are already described under Antilles (q.v.). See also the names of the islands themselves—Jamaica, Cuba, Martinique, etc.; as well as the European countries that possess them—Great Britain, Spain, France, Netherlands, etc.

WESTINGHOUSE, GEORGE, Jr., inventor; b. Schenectady, N. Y., 1840; son of a manufacturer of agricultural implements. He was graduated at Cornell university, 1861;

enlisted in the navy as engineer on the ship *Mustcrah*, and, later, in a cavalry company, and while repairing railroads wrecked by confederate raiders, devised a frog for replacing cars. This was patented at the end of the war, and in 1867 he went to Pittsburgh to superintend its manufacture. Soon after he invented the well-known air-brake, and in all has taken out nearly 1,200 patents, including some of the most important connected with the distribution of electricity for light, and the control of electric currents. He was also the pioneer in Pittsburgh and elsewhere in the general introduction of natural gas for fuel purposes, and its distribution, by a system of underground non-explosive pipes, to mills, dwellings, etc.

WEST LOTHIAN. See LINLITHGOW.

WESTMACOTT, Sir RICHARD, R.A., an eminent sculptor, the son of Richard Westmacott, also a sculptor in his day of some little note, was b. in London in 1775, and died Sept. 1, 1856. He was educated in London, and in 1793 proceeded to Rome, where he was in some sort a pupil of Canova ; made rapid progress, and carried off the highest prizes, including a gold medal offered by the pope. He was elected a member of the academy of Florence, but in 1797 returned to London, where, shortly after, he was married to a daughter of a Dr. Wilkinson, then of some medical celebrity. In 1805 he became an associate of the royal academy ; in 1816, an academician. Twenty-one years afterward the honor of knighthood was bestowed upon him. Previously, in 1827, he had succeeded Flaxman as professor of sculpture at the academy, in which capacity he continued to officiate till his death. Among his works are statues in Westminster of Pitt, Fox, Percival, and Addison, and monuments to Abercromby and Collingwood in St. Paul's cathedral.

WESTMACOTT, RICHARD, R.A., son of the foregoing, was b. in London in 1799. After being carefully educated under his father in the art which might seem to run in the family blood, he was sent to Rome in 1820 to prosecute his studies further. In Italy he passed six years; and after his return to London, he gradually won a reputation for himself as one of the ablest sculptors of the day. Besides being eminent in his art, he likewise made himself known as a man of considerable literary and general attainment; and in 1837 he had the honor to be elected a fellow of the royal society. In the year following, the academy recognized his more special claims by assuming him as an associate; and in 1849 he attained the rank of royal academician. On the death of his father, he was appointed to succeed him in the professorship of sculpture, a post which he filled with distinguished ability and acceptance. He died in 1872.

WEST MAHONOY, a township in Schuylkill co., Penn. Pop. '90, 4743.

WESTMANLAND, a län in s.e. Sweden, about 2500 sq. m.; pop. 1890, 136,977. The surface is mountainous. Iron, copper, and silver are mined. Capital, Westeras.

WESTMEATH, an inland co. of the province of Leinster, Ireland, bounded on the n. by the counties of Cavan and Meath, on the e. by Meath, on the s. by the King's county, and on the w. by Roscommon. It lies between n. lat. 53° 8′ and 53° 48′; and w. long. 6° 54′ and 7° 55′. Although not mountainous, its succession of hills and valleys afford much agreeable scenery. It contains good limestone quarries, and marble, copper, and lead also occur. The county contains numerous large lakes, such as Derravaragh, Owel, Ennel, Lene, etc. Pop. '91, 65,109.

WESTMINSTER, THE CITY AND LIBERTY OF, now forms part of the English metropolis. It is bounded by Temple Bar on the e., the Thames on the s., Chelsea and Kensington on the w., and Marylebone on the north. The early history of Westminster is that of the abbey, still the most interesting of its public buildings. In early times, that part of Westminster which adjoins the Thames was surrounded by a branch of the river, so as to form an island called Thorney Island, from its being covered with brush-wood. Here, on the site of the present abbey, Sebert, king of the East-Saxons, is said, in the 7th c., to have built a church. It is supposed to have been replaced by an abbey called Westminster, to distinguish it from the cathedral church of St. Paul's, called, originally, Eastminster. The first edifice erected on the site of which we have any certain account was one built of stone by Edward the Confessor in 1065. The Pyx House, a low apartment, 110 ft. long by 30 ft. wide, vaulted and divided by a certain range of eight plain pillars with simple capitals, is nearly all that remains of it. The principal parts of the existing abbey were built by Henry III. In 1220 he erected a chapel dedicated to the virgin, and a quarter of a century later he took down the old abbey of the confessor, and erected the existing choir and transepts, and the chapel of Edward the Confessor. The remainder of the building was completed under the abbots, the western parts of the nave and aisles having been erected between 1340 and 1483. The w. front and its great window were the work of Richard III. and Henry VII. The latter pulled down the chapel to the virgin, erected by Henry III. at the e. end, and built the chapel known as Henry VII.'s (see illus., CATHEDRALS), completing the interior of the abbey as it now stands; the only important addition made since then having been the upper parts of the two western towers, which were the work of sir Christopher Wren. The whole building forms a cross. Its extreme length, including Henry VII.'s chapel, is 511 ft.; its width

across the transepts is 203 feet. The width of the nave and aisles is 79 ft.; of the choir, 38 ft.; and of Henry VII.'s chapel, 70 feet. The height of the roof is 102 ft., a loftiness unusual in English churches. It is the interior of the abbey which has at all times excited the most enthusiastic admiration. The harmony of its proportions, and the "dim religious light" of the lofty and long-drawn aisles, leave on the mind impressions of grandeur and solemnity which churches of greater size fail to produce. The abbey was at one time the burying-place of the English kings, and it has become a national honor to be interred within its walls. It is crowded with tombs and monuments. The chapel of Edward the Confessor, at the e. end of the choir, contains his shrine erected by Henry III., the altar-tombs of Edward I., Henry III., Henry V., and Edward III. The canopy of that last mentioned deserves especial notice. It is considered to be one of the greatest works in wood extant, and equal to anything in the best age of mediæval art. Against the altar-screen in this part of the church stand the two coronation chairs. One, the king's chair, incloses the stone brought by Edward I. from Scone, on which the Scotch kings were crowned. The other, the consort's chair, was constructed for the coronation of Mary, wife of William III. Both are still used for coronations. Most of the English kings, from the time of Henry VII. down to that of George III., were buried in Henry VII.'s chapel, and there accordingly are the tombs of queen Elizabeth and Mary queen of Scots. The most remarkable monuments in other parts of the church are those in the e. aisle of the southern transept, known as "poets' corner," where many of the most eminent British poets have been buried. There, monuments are erected to Chaucer, Beaumont, Drayton, Cowley, Dryden, Milton, Gray, Prior, Shakespeare, Thomson, Gay, Goldsmith, Addison, and Ben Jonson. In the n. transept are the monuments of Pitt, Fox, Chatham, Canning, and Wilberforce. Elsewhere are the monuments of the great engineers and inventors—Telford, Watt, and Stephenson.

After Dean Stanley (q.v.) became connected with the abbey in 1864, plans were adopted to restore and improve the interior, and services conducted in it have attracted much public interest; more especially the anniversary of the foundation, celebrated on Dec. 28, 1865, and the mission sermon delivered by Prof. Max Müller on Dec. 3, 1873, when the dean of an abbey asserted his right to allow a layman to preach there.

South of the abbey are the Pyx house, chapter-house—since 1866 restored under the direction of sir Gilbert Scott—cloisters, and the building occupied by Westminster school, formerly the monks' dormitory, etc. Westminster School was founded by queen Elizabeth for the education of 40 boys known as queen's scholars, who are prepared for the universities. Other persons send their sons to it, and it has long been one of the leading English public schools.

The city of Westminster sprang up round the abbey, and the English kings, in consequence of the jealousy with which they regarded the privileges claimed by the citizens of London, early took up their abode there. Before Edward the Confessor began to build his new church at Westminster, the residences of the English kings had been the Roman fortress in London, or the Saxon city of Winchester. The king, to superintend the building of the church, took up his abode in the palace. William Rufus, in 1097, erected a palace between the abbey and the Thames. Its chief apartment was a banqueting hall, which, becoming ruinous in the time of Richard II., he pulled down, and erected in 1397–99, on the same site, and indeed on the same foundations, the great hall which still exists. It is 90 ft. high, and 290 ft. long, by 68 ft. wide internally, and is roofed by 13 great ribs of timber, combined with a mechanical skill which has not been excelled in any work of the present age. The roof of Westminster hall is the finest specimen of the purely English art of forming a Gothic roof of wood: with the exception, perhaps, of the hall of justice at Padua, it is the largest roof in Europe unsupported by pillars. The law courts were established at the hall in 1224, and they continue to be held in buildings which rest on the northern side of the building, and open into it by side-doors. These law-courts, as an excrescence and out of place, are to be removed to the new buildings now being erected near Lincoln's Inn Fields.

The old houses of parliament which adjoined the hall, and like it lay between the abbey and the Thames, were burned to the ground in 1834. It was then determined to erect a new building on the same site, but on a much grander scale. The designs of sir Charles Barry for "the new palace of Westminster" were selected as the best, and the work was begun in 1840. The building is the most magnificent erected in Gt. Britain for many centuries. It may be roughly said to form a parallelogram, 900 ft. long by 300 ft. in width. The principal rooms are the House of Lords and the House of Commons, which occupy the centre of the building, and run on the line of its greatest length. They are separated by an "octagon hall," with a diameter of 70 ft. between the walls. From this hall, one corridor runs n. to the house of commons, and another s. to the house of lords, beyond which are the royal apartments at the extreme s. of the building. The entrance to the "octagon hall" is by a passage known as St. Stephen's Hall, which communicates by flights of steps with an entrance in the e. front, and also with Westminster Hall, which, included in the new building, forms its northern vestibule. The state entrance of the queen is at the south-western extremity, and is, of course, in direct communication with the royal apartments. The building is surmounted by lofty spires and towers. In the centre, above the octagon hall, rises the central tower, 300 ft. high. At each corner there are towers; at the s.w. the Victoria Tower, 346 ft. high; at the n.w. the

clock-tower, surmounted by a belfry spire 320 ft. high. The clock has four faces, each 30 ft. in diameter; and it strikes the hours on a bell weighing 9 tons and known as Big Ben. The appearance of the eastern front is still marred by the buildings occupied as law courts, and it is believed that, on their removal, the picturesque outline of the palace, seen from the n.e., will for the first time prove all the merit of the architect's designs. The chief subject of regret in connection with the edifice is, that the stone of which it was built, a magnesian limestone from Yorkshire, has rapidly decayed, and that it has, in consequence, been found impossible to protect the rich ornaments of the exterior from the influence of the atmosphere. Many public improvements have been carried out recently in Westminster, the chief being the construction of the Thames embankment, opened July 13, 1870, which forms a broad and magnificent thoroughfare between the houses of parliament and Somerset house; and the erection of the Indian and foreign offices at the eastern extremity of St. James's park, and thrown open to parliament in December, 1873. See *Historical Memorials of Westminster Abbey* (3d edition, Lond., 1869); *Dedication of Westminster Abbey*, by Dean Stanley; *The Memorials of Westminster*, by Rev. Mackenzie E. C. Walcott (1851).

WESTMINSTER, Hugh-Lupus Grosvenor, Duke of, b. London, 1825; son of Richard, second marquis; succeeded to the marquisate in 1869, and was created Duke in 1874. His vast landed estates won for him the reputation of the wealthiest of English nobles. He was a member of parliament for Chester, 1847-69, and is a member of the liberal party.

WESTMINSTER ASSEMBLY OF DIVINES and Westminster Standards. See Creeds and Confessions.

WESTMORELAND, a co. in s.w. Pennsylvania, having the Alleghany river for its n.w. boundary, the Conemaugh and Kiskiminetas rivers on the n. and n.e., the Pennsylvania canal on the n. border, drained by the Youghiogheny and other streams; 1035 sq. m.; pop. '90, 112,819. Co. seat, Greensburg.

WESTMORELAND, a co. in e. Virginia, having the Potomac river on the e. separating it from Maryland, the Rappahannock river on the w., the birthplace of Washington, James Monroe, and Richard Henry Lee; 170 sq. m.; pop. '90, 8399. Co. seat, Montross.

WESTMORELAND, a co. in s.e. New Brunswick, Dominion of Canada, bounded by the strait of Northumberland and the bay of Fundy; 1284 sq. m.; pop. '91, 41,477. The Petitcodiac river forms part of its s.w. boundary. Co. seat, Dorchester.

WESTMORELAND, a co. in the n.w. of England, bounded on the e. by Yorkshire, on the s. and w. by Lancashire, and on the n. by Cumberland and Durham. Area, 783 sq. m. Tillage is mostly confined to the valleys. There is some lead mining; the manufactures of Westmoreland are unimportant, being for the most part confined to the spinning of wool, the manufacture of hosiery, and the weaving of coarse woolen stuffs. Pop. '91, 66,098. The surface is almost wholly mountainous, the chief summit being Helvellyn (3055 ft.) partly in Cumberland. The other more important summits are Loughrigg fell, Bowfell, Crossfell, and High street and Langdale pikes. Lakes remarkable for their beauty occur. The chief are Windermere (q. v.), partly belonging to Lancashire; and Ullswater (q.v.), between Westmoreland and Cumberland. Moorlands are numerous and extensive; but along the courses of the Kent in the s., and the Eden in the n.—the principal streams—there are tracts of fertile land. The climate is mild and moist, often with much snow in winter, the deep wreaths of which frequently prove fatal to travelers on the mountain tracks. The soil is mostly a dry gravelly mold, favorable to the culture of turnips, of which great crops are produced. Rich pasture-lands abound, and cattle, mostly of a large size, are extensively reared. The county town is Appleby.

WESTON, a co. in n.e. Wyoming; 4830 sq. m.; pop. '90, 2422. Co. seat, Newcastle.

WESTON, Thomas, b. England, in the last quarter of the 16th c.; a London merchant, who advanced £500 for Plymouth colony in 1620. Two years later he began a settlement of his own at Wessagussett (Weymouth), coming over himself. His colonists proved to be a thriftless set; most of them went to Plymouth, and Weston himself soon returned to England. He died after 1624.

WESTPHALIA, a province of Prussia, lies between Holland, Hanover, Brunswick, Hesse-Nassau, and the Rhine province. Its area is 7802 English sq. m., with a pop. '95, of 2,701,420, who, with the exception of about 20,000 Jews (1890), are of the purest German descent. Of the population 1,250,603 were, in 1890, Catholics, and 1,152,985 Protestants. Westphalia is divided into three districts—Münster in the n.w., Minder in the n.e., and Arnsberg in the south. The e. of the province presents vast plains covered with grain, while the n.w. exhibits an uninterruptedly flat expanse of uncultivated land. The climate is generally temperate. The chief rivers are the Weser (q.v), the Ems, the Lippe, and the Roar, or Ruhr, each of which is navigable for a considerable part of its course. Its chief agricultural products are rye, oats, wheat, buckwheat, potatoes, pulse, garden vegetables, hemp, and a very fine grade of flax. The prosperity of Westphalia is chiefly due to its mineral treasures, especially coal and iron. The chief of the industrial products are iron, and articles of iron, steel, and copper from the forges of Arnsberg; while manufacturing industry embraces flax-spinning and linen-weaving, machine-making, and many other branches. The exports consist of these products, and of

meat, especially hams. The capital, Münster (q.v.), had, till 1818, a university, now a higher academy, and is the seat of the supreme Catholic and Protestant religious authorities.—Westphalia derives its name from the Westfalen, a section of the great Saxon people, who migrated hither from the banks of the Elbe soon after the Christian era; and after the subjugation of the Saxons by Charlemagne, the deposed leader, Wittekind, was allowed to remain *duke of the Engern and West-falen*. At this time, the country called Westphalia (and occasionally denominated *Sauerland*) comprised all Germany between the Weser, Rhein, and Ems; and soon after, it was subjugated by the dukes of lower Saxony, and held by them till, on the rebellion of Henry the Lion in 1179, the electoral archbishop of Cologne extended his sway over it. It then became one of the circles of the empire, and belonged to the Cologne electorate till 1802, when most of it was given to the Hesse-Darmstadt family. In 1807 arose the *kingdom of Westphalia*, which, besides a portion of Westphalia, also included electoral Hesse, Hanover, Brunswick, and portions of upper Saxony. This kingdom, erected by Napoleon as a preliminary to its incorporation into France, was given to his youngest brother, Jerome, who made Cassel his capital, and, despite the large French garrisons with which the country was burdened, and the extensive contributions in men and money which it was forced to pay to Napoleon, succeeded, by the establishment of the code Napoleon, and by showing in various other ways his strong desire to promote the welfare of his new subjects, in acquiring their esteem. But the oppressive conscriptions and taxes for the behoof of the French army and treasury gradually increased in amount, and excited such resentment, that Jerome's life was several times threatened. The king repeatedly remonstrated with Napoleon, but without the slightest effect; and despite his efforts, the "continental system" was introduced into his states. In 1813 Jerome was chased from Cassel by the Russians; and though he returned for a few days, the defeat of Leipsic forced him to take shelter in France. By the treaty of Vienna, the states which had been joined to Westphalia to form the kingdom, were restored to their former possessors, and Westphalia itself, with the exception of a portion which had been annexed to Hesse-Darmstadt, was united to Prussia.

WESTPHALIA, Treaty of, also known as the *treaty of Münster*, was concluded at Münster and Osnabrück (towns in the circle of Westphalia) in 1648, and in putting an end to the thirty years' war (q.v.), restored tranquillity to Germany, established a new system of political equilibrium in Europe, and became the basis of all subsequent treaties down, till the French revolution. The minor states of Germany had long desired a cessation of hostilities; and as early as 1638 plenipotentiaries from France, Sweden, and the empire had assembled at Hamburg; but it was not till several years after, that all parties agreed to Münster and Osnabruck as the places and to Mar. 26, 1642, as the time of meeting of the congresses. Ferdinand, however, was very loath to commit himself to a definite negotiation till the success of his arms, the hope of succor from Spain, or a change in the French policy, should give him less the position of a beaten opponent willing to accept almost any terms; and he accordingly temporized from time to time till his hopes of succor had vanished. In 1644, the congresses opened, the two places of meeting having been chosen to avoid any rivalry between France and Sweden for supremacy, to prevent any collision between the Swedish representatives and the pope, and to separate the Catholics from the Protestants. The representatives of France, the empire, Spain, and the Catholics of Germany, met at Münster under the mediation of the pope and those of Sweden, the empire, and the Protestants of Germany, under the mediation of the king of Denmark; the representatives of Spain, Portugal, the United Provinces, Savoy, Tuscany, Lorraine, Mantua, and Switzerland being also present; so that this congress included all the great European powers except Britain, and almost all the minor powers. As the conflict was still carried on with undiminished vigor, the inclination of fortune to one side was the signal for excessive demands, which were met on the other side by evasive proposals; and it was not till Torstensohn's decisive campaign of 1644–45 that negotiations commenced in earnest, and the representatives made specific propositions. The successes of Turenne and Wrangel, in southern Germany, and the capture of Prague by the Swedes under Königsmark in July, 1648, at length overcame all the emperor's dilatoriness, and, the Osnabruck representatives having arrived at Münster a few days before, the treaty was finally signed at Münster, Oct. 24, 1648. Its terms, as regards the Germanic empire, were as follows: The sovereignty and independence of the different states of the empire were fully recognized, and liberty was given them to contract any alliances with each other, or with foreign powers, if these were not against the emperor or the empire; all religious persecution in Germany was forbidden; the treaty of Passau and the religious peace of 1555 were confirmed; and with respect to the secularization of ecclesiastical benefices, everything was to remain in Austria as it was in 1624 (hence called the *normal year*), and in the Palatinate, Baden and Würtemberg as it was in 1618; the power of putting under the ban of the empire was only to be exercised with consent of the diet; and the Reformed were put on a footing of equality as to privileges with the Lutherans. The territorial changes were as follows: The Lower Palatinate was restored to the eldest son of the unfortunate "Winter king" (Frederick V., elector palatine), and an eighth electorate was created in his favor, but the Upper Palatinate and Cham were given to Bavaria, on condition that,

should the two states become united, one electorate was to be abolished (as happened in 1777, see BAVARIA); part of Alsace was ceded to France; Upper Pomerania, Rugen with Stettin, Gartz, Damme, Golnau, the isle of Wollin, Peine, Schweine, and Divenau in Lower Pomerania, Wismar, the secularized archbishopric of Bremen as a duchy, and the bishopric of Verdun as a principality, were obtained by Sweden as fiefs of the empire, with three deliberative voices in the diet, and an indemnification of 5,000,000 crowns to be paid by the empire; Brandenburg obtained, as compensation for its cessions in Pomerania, the secularized archbishopric of Magdeburg as a duchy, and the bishoprics of Halberstadt, Minden, and Camin; Hanover and Mechlenburg were compensated for their share in these cessions by secularized church lands; and Hesse-Cassel obtained the rich abbacy of Hirschfeld, with 600,000 thalers. The independence of the United Provinces was recognized by Spain, and that of Switzerland by the empire. The pope's agent, Fabio Chigi (afterwards Pope Alexander VII.), protested vigorously against the liberal alienation of the possessions of the church, and withdrew; and the king of Denmark's mediation being stopped by his war with Sweden in 1644, the treaty was concluded under the sole mediation of the republic of Venice, and France and Sweden became guaranties for its execution. France, Sweden, and the Protestants were the only gainers by this treaty, which, by weakening the great central authority of the empire, destroyed its unity, allowed France, as one of the guarantees, a pretext for continual interference with its internal affairs, and gave the *coup de grace* to the independence of the remaining free cities of the empire.

The treaty of Westphalia is one of the most important international compacts in the history of Europe. It formed the basis of international relations down to the Congress of Vienna in 1815. In it there was a distinct recognition of the principle of the balance of power. As a result of it France became the chief nation of the Continent, taking the place formerly occupied by Spain, and Sweden took rank as the chief northern power. It marks the close of the period of religious wars. Henceforth European contests were mainly for political ends.

WEST POINT, a U. S. military reservation in Orange co., N. Y. It is the site of the U. S. Military Academy; on the w. bank and in the s. angle of a bend in the Hudson river, where it breaks through the Highlands; 52 m. n. of New York City; 94 m. s. of Albany. The West Shore railroad passes by tunnel under the parade ground and the Hudson river steamboats stop daily at this place. In 1775 fortifications were erected on Constitution Island, in the n. angle of the river bend, and at Forts Montgomery and Clinton at the mouth of Pooplopen's creek, 4½ m. to the s. In 1777 the British captured and demolished these fortifications, but new ones were begun, 1778, under the supervision of Gen. Putnam, by Lieut.-Col. Radière, who was relieved by Gen. Kosciusko. They had cost $3,000,000 by 1780, and were never finished. Fort Putnam, 596 ft. above the river, was the principal one, and below it were Forts Webb, Wyllys and Meigs, also a new Fort Clinton in the n.e. angle of the plateau. Batteries and redoubts were erected at other points, and in addition a boom and massive iron chain were stretched from the point to Constitution Island. In 1779 Washington established his headquarters here, and in 1780, Aug. 5, Benedict Arnold took command, fleeing on the 25th, on the capture of André, and the exposure of their plot. In 1790 the U. S. government bought a tract of 2100 acres, and in 1824 the remainder; the state relinquishing jurisdiction over a part in 1826 and over the rest in 1875. The pass in the river is a noted feature of American scenery. W. P. has a strong natural position, being protected on the s. and n.w. by rocky heights, 500–1500 ft. high, and on the river side by an almost perpendicular wall. Only one fort, Clinton, has been restored, and this but partially. The academy stands on a plateau about 180 ft. above the river. The main buildings are on the s. side; the houses of the instructors and officers on the w.; the barracks, storehouses, etc., on the n.w., comprising what is called Camp Town. The principal buildings are the academic building, barracks, mess hall, observatory and library, ordnance museum, and the chapel, with its memorial tablets. Among interesting monuments are the statue of Gen. Sedgwick, the monument to Maj. Dade and his command, and that to Kosciusko, erected by the cadets of 1828. A small ledge along the steps leading to the river is called Kosciusko's garden. West Point foundry is situated n. of Constitution Island at Cold Spring. See UNITED STATES MILITARY ACADEMY.

WEST PRUSSIA. See PRUSSIA.

WEST SPRINGFIELD, a town in Hampden co., Mass.; on the Connecticut and Agawam rivers and the Boston and Albany railroad; 1 mile w. of Springfield. It was incorporated in 1774, and contains the villages of West Springfield Centre, Ashleyville, Riverdale, Tatham, Amostown, Prospect Hill, Mittineague, and Merrick. It has a high school, public library, repair shops of the Boston and Albany railroad, and several churches, and is principally engaged in market gardening and the manufacture of paper. Pop. '90, 5077.

WEST SUPERIOR, a local and business designation of a portion of the city of Superior, Douglas co., Wis., having no legal interests distinct from SUPERIOR (q. v.).

WEST TROY, a former village in the town of Watervliet, Albany co., N. Y.; on the Hudson river and the Delaware and Hudson railroad. In 1896 the town, with the villages of Green Island and West Troy, was chartered as a city, under the name of WATERVLIET (q. v.).

WEST VIRGINIA, the 22d state in order of admission, lies between lat. 37° 40′ and 40° 30′ n., and long. 77° 40′ and 82° 40′ w.; and is bounded n. by Pennsylvania and Maryland, e., s.e. and s. by Virginia, and w. by Kentucky, from which it is divided by the Big Sandy river and Ohio, from which it is separated by the Ohio river. Its greatest length n. and s. is about 240 m., its greatest breadth, 160 m.; land area, 24,645 sq. m.; gross area, 24,780 sq. m., or 15,859,200 acres.

The arms of West Virginia consist of a rock bearing on its face "June 20, 1863," the date of the inauguration of its first governor. On either side the rock stand a farmer and a miner with their implements of labor. Below the rock are two rifles crossed under a liberty cap. The motto is "*Montani semper liberi*," meaning "Mountaineers are always freemen." The popular names of the state are the "Panhandle State" and the "Mountain State."

History.—West Virginia became a state as a result of the breaking out of the civil war in 1861. Up to that period it had formed the w. and n.w. portion of the commonwealth of Virginia. When the commonwealth seceded, however, the people of the western portion protested, and in May, 1861, met in convention to denounce the ordinance and order an election the following October to decide upon the question of organizing a new state embracing 39 counties, to be called the state of Kanawha. The votes of these counties were nearly unanimous, and a constitution was prepared and ratified by the people in May, 1862. Shortly afterward the consent of the Virginia legislature was given for the formation of the new state, the name of which in the mean time had been changed to that it now bears, and on Dec. 31 congress provided for its admission, upon the ratification by the people of the proposed amendment to the constitution abrogating its provision that no slave or free colored person should come into the state for permanent residence. The amendment was ratified March 26, 1863; on May 28 state officers were elected; and immediately after the admission of the state, June 20, the state government was inaugurated at Wheeling, the chosen capital. The military operations that had taken place within the territory of the new state had occurred in 1861, when the confederate forces were driven out. Immediately after the state was admitted to the union it provided the union army with 26,540 men. The state then comprised 48 counties; but four more were added after the war, and since then its progress in education, commercial enterprise, and railroad development has been rapid and notable. In 1870 Charleston was made the capital; in 1875 Wheeling again became the seat of government, but in 1885 Charleston was made the permanent capital. For map of West Virginia, see Virginia.

Topography, Flora, Fauna, etc.—Much of the state is mountainous, being traversed by ridges of the Appalachians, such as the Cheat, Laurel, Greenbrier, Cancanon, Cowpasture, Flat Top, Rich, Briery, Gauley, Birch, Sewell, and Meadow Mountains, which are generally fertile to the top and well wooded. The country slopes w. to the valley of the Ohio, and excepting the Potomac, which forms a part of the boundary between the state and Maryland, and its affluents, the rivers of West Virginia are tributary to the Ohio. The most important of these flowing directly into that river are the Big Sandy, Guyandotte, Great Kanawha, Little Kanawha, and Monongahela, all of which are navigable. The geology and mineralogy of the state comprises eozoic rocks in Jefferson county, on the eastern edge; lower silurian limestone and Medina sandstone; soft shales and clay slates; and coal measures that cover more than 16,000 sq.m., which contain every quality of cannel, splint, coking, block, and bituminous coal yet discovered, and all of them in thick and easily worked veins. Salt also, a usual deposit in the coal measures, is found in springs of great strength and purity of brine, and at numerous points on several of the rivers already mentioned are several large salt works. Common tufa, hydraulic, and building limestones, fire-clay, potter's clay, glass sand, ocher, barytes, black oxide of manganese, and saltpeter are found in abundance, and zinc, copper, and lead in moderate quantities. The soils of the state may be classed as clay soils, which contain 75 per cent and over of clay; sandy soils, containing 75 per cent of sand; and loams, composed of clay and sand mixed in about equal proportion. The last, however, is said to be the characteristic soil, and the greater part of the coal-measures are covered by it. The principal forest trees are the white, black or water, blue, green, and mountain ash; the aspen, beech, water-beech, black and red birch, fetid and sweet buckeye; cedar, wild-cherry, chestnut, Kentucky coffee tree, cottonwood, dogwood, and witch elm; black and southern balsam, fir, and the hemlock, spruce, the black or sour gum, and the sweet gum, three species of hickory, the magnolia, persimmon, sumach, holly, locust, linden, red maple, red mulberry, twelve species of oak, the poplar, sycamore, black walnut, and butternut. Altogether over 9,000,000 acres are covered with forests. The wild animals found in the state include the panther, wild-cat, lynx, wolf, black bear, raccoon, opossum, elk, deer, rabbit, and hare. The climate is generally free from extremes of heat or cold. In the highland sections the air is pure and healthful and favorable to persons having pulmonary diseases. The mean annual temperature has been found to be 56.4°, and the rainfall about 44.2 inches. The state is famed for its mineral springs, among which are those at Berkeley, that once belonged to the estate of Lord Fairfax, and are the oldest pleasure resort in the south; the Greenbrier White Sulphur Springs, believed by the Shawnee Indians to be a fountain of health, and now a favorite resort for tourists; the Capon Springs; the Red Sulphur Springs, said to be like those of Eaux Bonnes in the Pyrenees; and the Parkersburg Mineral Wells.

Industries.—About two-thirds of the population are engaged in agriculture. The annual production of wheat exceeds 4,000,000 bushels; of corn, 21,000,000; of

oats, 3,800,000, besides large quantities of hay, tobacco, potatoes, sweet potatoes, hemp and flax, wool and live stock. This state ranks fourth in the production of coal, its coal fields covering 16,000 acres, and producing over 11,000,000 tons annually. In the production of coke it ranks second, producing over 1,285,000 tons annually. The U. S. census of 1890 reported for West Virginia, 2376 manufacturing establishments, employing $28,118,030 capital and 21,969 persons, paying $8,330,997 for wages and $23,729,089 for materials, and having a combined output valued at $38,702,125. The principal manufactures are iron and steel, lumber and planing mill products, flour and grist mill products, and iron and steel nails and spikes. Wheeling is sometimes called the "Nail City;" the first glass works were established there in 1820. Large quantities of fine pottery are also made. Parkersburg, in the petroleum region, has large refineries and other factories; Charleston, in the Kanawha Valley, is the center of the salt industry; Martinsburg has railroad shops, and bromine is made in large quantities at Clifton.

Railroads. — The principal railway systems are the Baltimore and Ohio, the Chesapeake and Ohio, and the Norfolk and Western, and there are also several local lines. The total length of railroads is over 2000 miles; capital, $43,000,000; funded debt, $26,000,000; total investment, $76,000,000; cost of roads and equipments, $69,500,000; net earnings, $1,250,000. Several narrow-gauge lines are also operated in the mountain regions. Whatever foreign commerce the state has is carried on by way of New Orleans. In 1896 an important undertaking was planned in the New river section of the state. This was the building of the Glenjean, Lower Loup Creek, and Deepwater railroad and involves the construction of a bridge over the Kanawha at Deepwater.

Banks. — On Oct. 31, 1896, there were 33 national banks in operation, with capital, $3,451,000; deposits, $7,128,282; reserve, $1,799,581; and outstanding circulation, $1,236,082; and 59 state banks, with capital, $3,265,550; deposits, $10,352,562; and resources, $15,496,391.

Religion, Education, etc. — The leading religious denominations are well represented; the strongest denominations numerically being the Methodist Episcopal, Baptist, Methodist Episcopal South, Roman Catholic, United Brethren, Methodist Protestant, Presbyterian South, Disciples, Presbyterian North, Baptist Colored, and Dunkard.

The free-school system, though of recent origin, is in efficient operation. The supervision and management of the schools are vested in a state superintendent, elected every four years; county superintendents, elected every two years; and district boards and trustees. The constitution prohibits the teaching of white and colored children in the same school, and provision is made for separate schools for the colored. In 1896 the school population was 285,600; enrollment, 215,665; average daily attendance, 141,081; public school buildings, 5475; value of public school property, $3,227,140; expenditure for public education, $1,793,650. There were about 6500 public school teachers. The private school enrollment was estimated at about 2000. There are public normal schools at Concord Church, Fairmont, Farm, Fayetteville, Glenville, Huntington, Shepherdstown, and West Liberty, and private ones at Harpers Ferry and Summersville. The higher institutions are the state university at Morgantown; West Virginia College (F. W. Bapt.), Flemington; Bethany College (Christ.), Bethany; Barboursville college (M. E., S.), Barboursville; an agricultural and mechanical college for white students, at the state university; West Virginia colored institute, at Farm; and Storer college (Bapt.), an industrial and normal school for colored students, at Harpers Ferry. For the defective classes there are a state institution for the deaf, dumb, and blind, at Romney, and a state reform school at Pruntytown. In 1897 there were 178 periodicals of all kinds.

Government, etc. — The constitution of the state gives the right of suffrage to all male citizens 21 years old, with the usual exceptions, who have resided in the state one year, and the county 60 days, preceding the election; and only qualified voters are entitled to hold any state, county, or municipal office. The governor, state superintendent of free schools, auditor, treasurer, and attorney-general are elected by the people for the term of four years.

The governor's salary is $2700. The legislature, having biennial sessions, consists of a senate of 26 members and a house of delegates of 71 members. The sessions begin in January and are limited to 45 days. The state elections are held in November. The judicial power is vested in a supreme court of appeals consisting of four judges, thirteen circuit courts, and fifty-five county courts. The state penal and charitable institutions are a penitentiary at Moundsville, hospitals for the insane at Weston and Spencer. The United States government has buildings at Wheeling, Clarksburg, Parkersburg, and Charleston. The national guard of the state has an authorized strength of 1438 officers and men, and an actual strength of 871. The total liable to military duty is 121,604. A law enacted in 1872–73 forbids the retail sale of intoxicating liquors without license, and provides for the collection of damages by the families and friends of drunkards. Wilful desertion for three years entitles the petitioner to a divorce, provided he or she has resided one year in the state. The registration of voters is prohibited by the constitution in this state. New ballot laws based on the Australian system (q. v.) were adopted in 1891.

The electoral votes have been cast as follows: 1876, Tilden and Hendricks, 5; 1880, Hancock and English, 5; 1884, Cleveland and Hendricks, 6; 1888, Cleveland and Thurman, 6; 1892, Cleveland and Stevenson, 6; 1896, McKinley and Hobart, 6.

Finances. — The 1890 United States census report gave the state debt, $184,511; county debt, $1,197,462; municipal debt, $1,132,188; school district debt, $18,299; total combined debt, less the sinking fund, $2,532,460; debt per capita, $3.32. In 1896 the

assessed valuation was $215,669,932; public debt, none. The legal and only rate of interest is six per cent., and the penalty for usury is forfeiture of excess of interest. Judgments and notes outlaw in ten years, open accounts in five years.

POPULATION.—In 1860 this amounted to 376,688; in 1870, to 442,014; in 1880, to 618,457, including 25,760 colored and 18,223 of foreign birth. In 1890 the population was 762,794—32,690 colored, 15 Chinese and 9 Indians, and its relative rank was 28. There are 55 counties; for pop. 1890, see Census Tables, Vol. XV. The largest cities were Wheeling, 34,522; Huntington, 10,108, and Parkersburg, 8408.

WETMORE, PROSPER MONTGOMERY, 1798–1876; b. Conn., went into business in New York. He began to write for the periodicals when 18 years of age and soon became a figure in the literary and artistic society of New York. His *Lexington, with other Fugitive Poems*, appeared in 1830. Eight years later he published, with a memoir, an edition of the poems of James Nack, and in 1847 *Observations on the Origin and Conduct of the War with Mexico*. He served in the legislature, where he was chairman of the committee on colleges and academies.

WETS. A popular name for any party or body of voters opposed to prohibition (q.v.). See PARTY NAMES (*Drys*).

WETSTEIN, the name of a Swiss family illustrious for the talents and learning of its members, originally from Kyburg, in the canton of Zürich. Among the more noteworthy are—(1.) JOH. JAKOB WETSTEIN, born at Basel in 1594, who was first in the service of the Venetian state. In 1620 he became a member of the supreme council of his native town; represented Switzerland at the peace of Westphalia (1648); was raised to the rank of a noble in 1653, and died in 1666.—(2.) JOH. RUD. WETSTEIN, son of the preceding, was born at Basel in 1614, and died there in 1683, professor of theology. He was a great opponent of the introduction of the *Formula Consensus*, and assisted Suicer in drawing up his *Thesaurus Ecclesiasticus*.—(3.) JOH. RUD. WETSTEIN, son of the preceding, born at Basel in 1647, and died there in 1711; also professor of theology, favorably known as an early editor of Origen.—But the most distinguished member of the family is JOH. JAK. WETSTEIN, son of Joh. Rud. Wetstein, the younger, who was born at Basel, Mar. 5, 1693. After a thorough study of the classics, Hebrew, philosophy, and mathematics, he was made a PH. D. at the age of 16. Four years later, he became a minister, and gave himself up to the study of the New Testament. In 1717 he began to give lessons in theology at the university of Basel, and continued to do so until 1730, when (being suspected of Socinianism) he was forced to leave Switzerland. He sought an asylum in Holland, where the Remonstrants appointed him professor of theology at Amsterdam in 1733. He died there Mar. 23, 1754. Wetstein's great work is his edition of the New Testament, with prolegomena, a collection of various readings, and Latin notes (2 vols., Amst. 1751–52). Its publication marks an epoch in the history of New Testament criticism. Semler reprinted the prolegomena with additions.

WETTE, DE. See DE WETTE.

WETTER, LAKE, after lake Wener (q.v.), the largest lake in Sweden, lies in Gothland, about 25 m. s.e. of lake Wener in direct line. It is 70 m. long, 13 m. in average breadth, has an area of 850 sq.m., is 370 ft. in greatest depth, and is 300 ft. above the level of the Baltic. It receives about ninety small tributaries, though its waters have only one outlet, the Motala river, which, flowing eastward, maintains the communication of the lake with the Baltic. Its waters are clear, and of a beautiful green color, and it is surrounded by lofty romantic shores, almost unbroken by bays. It is remarkable for an irregular alternation of risings and fallings, and for an occasional undulation, which is so rapid and violent as to break the thick sheet of ice with which it is covered in winter. An intricate chain of small lakes, continued westward by the Göta canal, connects lake Wetter with lake Wener, and thus with the Cattegat. Lake Wetter contains few islands, and of these the chief is Wisingsö, 7 m. long by 1¼ m. broad.

WETTERHORN (Peak of Tempests), a lofty mountain of the Bernese Oberland, Switzerland, on the e. side of the Grindelwald, and about 10 m. s.e. of the lake of Brienz. From the path by which it is ascended, it rises in one vast precipice of alpine limestone, seeming to threaten the traveler. The three peaks of the Wetterhorn are respectively 12,149, 12,166, and 12,110 ft. high.

WETZEL, a co. in n. West Virginia, having the Ohio river for its n.w. boundary; 550 sq.m.; pop. '90, 16,841, chiefly of American birth, with colored. Co. seat, New Martinsville.

WETZLAR, a small t. of Rhenish Prussia, charmingly situated on the Lahn, 40 m. n. of Frankfort-on-the-Main. Part of its old cathedral is said to date from the 11th century. Wetzlar is notable as the scene of the *Sorrows of Werther*. Pop. '90, 8144.

WEXFORD, a co. in n.w. Michigan, drained by the Manistee river and its branches; containing lake Otisgo and other small lakes; 580 sq.m.; pop. '90, 11,278, chiefly of American birth, with colored. Co. seat, Cadillac.

WEXFORD, a maritime co. of the province of Leinster, Ireland, is bounded on the n. by the county of Wicklow, on the e. by the English channel, on the s. by the Atlantic, and on the w. by the counties of Waterford, Kilkenny, and Carlow. Its greatest length n. and s. is 55 m., and its greatest breadth e. and w. is 34 miles. The total area comprises 900 sq. m., or 576,588 acres. Pop. '81, 123,854, of whom 112,710 were Catholics, 10,015 Episcopalians, and the rest Protestants of other denominations. The coast-line of Wexford, which extends from Kilmichael point to the estuary of the Suir, Waterford harbor, is irregular, and very dangerous for shipping. From the above-named point to Wexford harbor there is no opening for navigation; and as Wexford harbor, besides being intricate and dangerous, is also obstructed by a bar, it offers little security in boisterous weather; but considerable improvements have lately been made. The coast from the southern headland of Wexford harbor, Rosslare point, to the mouth of the Suir, presents a succession of bays and headlands. The headland called Carnsore point is the s.e. extremity of Ireland. Parallel with the northern coast-line, at a distance of a few miles, is a range of sandbanks; and the southern shores are beset by outlying rocks and islets, which, although somewhat guarded by light-houses and light-ships, frequently prove fatal to shipping. The greater part of the surface is tolerably level, but some detached hills rise to considerable elevation. The mountains of the border are much more elevated, the highest point of the Blackstairs being 2409 ft.; and of mount Leinster, 2610. There are few lakes, and these of small size. The principal river is the Slaney, which for some distance is the boundary between Wexford and Carlow, but enters Wexford near Newtownbarry, whence it flows by Enniscorthy into the sea in Wexford harbor. In its geological structure, Wexford belongs to the eastern clay-slate tract, which stretches in a south-westerly direction from the n. of Wicklow to the Atlantic, and which extends across the level districts as far as the granite range separating Wexford from Carlow. Granite is found in the s.e. of the county, and in some of the detached hills, as are also beds of greenstone. Silver was formerly raised near a place called Clonmines, where traces of an ancient mine are still seen, and galena has been found in the same place. Copper ore, plumbago, and asbestos are also found. The climate is said to be singularly temperate, and the district is more suitable for agriculture than the counties of Carlow and Kilkenny, although inferior in fertility. Oats and barley are the principal crops. The breeds of live-stock have been recently so much improved that Wexford has carried off first prizes at various cattle shows. There are but few and inconsiderable manufactures, and the trade is chiefly in the export of agricultural produce, especially barley; butter, cattle, pigs, poultry, and eggs are also exported in large quantities. Wexford is divided into ten baronies. Of these the barony of Forth is very remarkable as having preserved, from the 12th c. down to the very last generation, a dialect of English quite peculiar, as well as many peculiar usages and social habits. The principal towns are Wexford (q.v.), Enniscorthy, New Ross, and Gorey; and Duncannon is noticeable for its ancient fort and interesting historical associations. The maritime position of Wexford laid it open early to the incursions of the Danes, to whom the name Wexford, or Weisford, is traced by antiquaries. It was the first landing-place of the English in the invasion, and formed part of the tract granted to them by MacMurrough. By the marriage of Strongbow with Eva, MacMurrough's daughter, it came into his hands; and after the partition of his lands among his daughters at his death, Wexford underwent many changes of masters. During the civil wars which followed 1641, Wexford was the scene of frequent contests; and in the more recent insurrection of 1798, it formed the theater of the only formidable conflicts of the peasantry with the regular troops. There are numerous relics of antiquity, Celtic as well as Anglo-Norman, in almost every part of the county. Upward of a hundred castles are still traceable, and many ecclesiastical remains, of which the monasteries of Dunbrody, Tintern, Ross, and some others are not unworthy of the best days of mediæval architecture. Wexford returns two members to parliament.

WEXFORD, capital of the county of that name, a seaport, and parliamentary and municipal burgh, is situated at the mouth of the river Slaney, 82 m. s. from Dublin, with which it communicates by the Wicklow, Wexford, and Waterford railway now completed. The town is situated on the south-western shore of the estuary of the Slaney, which is known as Wexford harbor, and along which the quay extends nearly 1000 yards, forming a spacious and not inelegant terrace. Behind this the town extends in two nearly parallel streets. There are two Protestant and three Catholic churches. Of the latter, two are modern and handsome structures. One of the former, St. Selsker's, is ancient, part of its walls dating from the English invasion. There are also a Presbyterian, a Methodist, and a Quaker meeting-house; a convent of Franciscan friars, five nunneries, a Roman Catholic college, and National, Christian Brothers', and conventual schools. Besides the union workhouse, there are also an infirmary and a fever hospital. The only manufactures of any importance pursued are those of distillation and the grinding of corn. The position of Wexford for export trade, favorable in itself, is much marred by the shallowness and intricate character of the channel of the Slaney, which has the further disadvantage of being obstructed by a bar. Great improvements have been made, a patent slip and dock have been constructed, steamers are employed in the export of cattle and provisions, and an active shipping trade is carried on. The Wexford fisheries also have long been reckoned among the most valuable on the eastern coast. The town is extremely ancient, and was occupied by the Danes as one of their strongest settlements. From the time of the invasion, it became an English stronghold against the

native population. During the civil wars of 1641, it was occupied by the confederated Catholics, but was taken by Cromwell in 1644. The insurgents of 1798 also had possession of it for a short time. Pop. '91, 11,500.

WEYER'S CAVE, in Augusta co., Va., is on an offshoot from a branch of the Blue Ridge mountains. It is so called from Bernard Weyer, by whom it was discovered in 1804. It is a stalactite cavern, next in importance to Mammoth and Wyandotte caves. Its largest apartment, Washington's hall, is 250 ft. long, and more than 90 ft. high.

WEYLER, Valeriano, Spanish soldier, b. 1836; served during the Carlist war and against the Moors. Later he held a command in Cuba under Valmaseda, during the rebellion of 1868–78, and is charged with having shown great cruelty toward the insurgents—a charge which he has repeatedly denied, although declaring himself in favor of severity toward the rebels. After serving as captain-general of Catalonia in Spain, he was sent in January, 1896, to take the place of General Campos as captain-general of Cuba. Before starting out he declared that his policy would be to unite liberal political offers with vigorous military measures. For a brief account of the history of the revolt during his term of command, see the article Spain. He was recalled in 1897 and replaced by General Blanco.

WEYMAN, Stanley John, English novelist of the romantic school, was born at Ludlow, Shropshire, August 7, 1855. He was educated at Shrewsbury and Christ Church, Oxford. He read for the bar, was called in 1881, and practiced until 1889, when his first romance was published, *The House of the Wolf* (1890); *The New Rector*, a modern novel, appeared in 1891; *The Story of Francis Cludde* in 1891, and in 1893 he published *A Gentleman of France*, the work which established his fame as a romanticist, and which has been translated into several languages. In 1894 he wrote *The Man in Black*, *Under the Red Robe*, and *My Lady Rotha*, and in 1895 *The Red Cockade*.

WEYMOUTH, a town in Norfolk co., Mass.; on the Weymouth Fore river, and the New York, New Haven, and Hartford railroad; 12 miles s.e. of Boston. It was incorporated in 1635; contains nine villages; and has national, savings, and co-operative banks, electric lights and street railroads, about 15 churches, high school, Tuft's public library, and manufactories of boots, shoes, tacks, boxes and caskets. Pop. '90, 10,866.

WEYMOUTH-and-MELCOMBE-REGIS, a seaport, a fashionable watering-place, and a municipal and parliamentary borough of Dorsetshire, on a bend of the coast facing the s.e., and at the mouth of the river Wey, 4 m. n. of the isle of Portland, and 8 m. s. of Dorchester by railway, 7 in a straight line. A projecting point, called the Nothe, separates the two quarters—the old town of Weymouth lying to the s. of it, the modern town, Melcombe-Regis, extending to the n. and facing the sea. The two quarters communicate by means of a bridge with a swing in the middle, to permit the passage of ships. The old town is uninteresting in appearance; Melcombe-Regis, elegantly built, stands on a narrow peninsula, with the sea on the e., and an estuary on the w. side. Its chief features are the sea-terrace and esplanade, the latter adorned with a statue of George III., who largely patronized Melcombe. The harbor has 14 ft. of water at full tide, and in the bay there is good anchorage in seven or eight fathoms. Portland harbor, recently completed, will be a source of great trade to the town. Weymouth-and-Melcombe-Regis is the seat of traffic to the Channel islands. Pop. '91, 13,769.

WHALE, the popular name of the larger cetaceans, particularly of all those belonging to the families *balænidæ* and *physeteridæ* or *catodontidæ*. The latter family has already been noticed in the article Cachelot, and some of the species of *delphinidæ*, also sometimes called whales, have been described in separate articles, as the Caaing Whale and the Beluga. The *balænidæ* alone remain to be described now. In this family, the head is of enormous size, as in the *catodontidæ*, but is entirely destitute of teeth, instead of which the palate is furnished with an apparatus of *baleen*, or *whalebone*, for the purpose of straining out of the water the small crustaceans and acalephæ, which form the food of these whales. Rudiments of teeth, however—dental pulps—appear in the fetus of the whale—sixty or seventy on each side of each jaw, but they are re-absorbed into the system, and the plates of whalebone are not produced from them but from the integuments.

The fibrous structure of baleen, or *whalebone*, its elasticity, and its heaviness are well-known. The plates of it in the mouth of a whale are very numerous, several hundreds on each side of the mouth, and they are very closely placed together, so that the mouth is filled with them; the whole quantity in the mouth of a large whale sometimes amounting to nearly two tons in weight. They are suspended from the roof of the mouth; none proceed from the lower jaw. They extend on each side from the middle line of the palate, like the barbs of a feather; those in the middle of the mouth are longest. The base of each plate is embedded in the substance of the membrane that covers the palate, while its edge forms a loose fringe, composed of fibres or pliant bristles. The vast mouth being opened, water is taken in; and the small animals which enter with it being retained for food, the water is allowed to escape by the sides of the mouth.

The tongue is a soft thick mass, not extending beyond the back of the mouth. The gullet of whales is very narrow; it is said to be not more than an inch and a half in diameter even in a large whale, so that only very small animals can pass through it. The

head of whales occupies from a third to a fourth of the whole length. The skull is unsymmetrical, the right side being larger than the left. The flesh is red, firm, and coarse. The skin is naked, with the exception of a few bristles about the jaws, and its surface is moistened by an oily fluid. The lower surface of the true skin extends into a thick layer of *blubber*, an open network of fibers in which fat is held. The blubber is from a foot to two feet in thickness, the whole mass in a large whale sometimes weighing more than thirty tons, and serves the purpose of keeping the animal warm, as well as of making the specific gravity of the whole body much lighter than it would otherwise be, and of resisting the pressure of the water in the great depths to which it often descends.

The skin of whales is always infested with parasites; mollusks adhere to it; certain kinds of cirrhopods burrow and live in it; and crustaceans, such as the whale-louse, attach themselves to it, and feed upon it.

It has been attempted to calculate the age of whales from the transverse lines on the plates of baleen, and in this way it has been computed that they attain the age of 800 or 900 years, each transverse line being assumed to indicate an annual check of growth. but it is evident that there is no good ground for the assumption on which such calculation proceeds.

In the genus *balæna* there is no dorsal fin, nor elevation of the back corresponding to it, as in some of the family. The belly is smooth, not plaited, as in the other genera of the family. The most important species, and indeed the most important of all the whales, is that known as the RIGHT WHALE, or GREENLAND WHALE (*B. mysticetus*). It inhabits the seas of the northern parts of the world, and abounds chiefly in the arctic regions. It is sometimes seen on the coasts of Britain, and even in more southern latitudes. It attains a size of sixty or seventy feet in length. The body is thickest a little behind the *flippers*, or pectoral fins, tapering conically toward the tail, and slightly toward the head. The tail is five or six feet long, and from twenty to twenty-five feet broad; formed of two diverging lobes, broadest almost where they are united, but with a slight indentation. The pectoral fins are eight or nine feet long, and four or five feet broad. The mouth is fifteen or sixteen feet long. The eyes, which are situated on the sides of the head, about a foot above and rather behind the angels of the mouth, are not larger than those of an ox; but the sense of sight seems to be acute, at least in the water. The iris is white. The blow-holes are situated on the most elevated part of the head; they are from eight to twelve inches long, but of comparatively small breadth. The upper parts are velvety black, the lower parts white. The upper parts, in very old whales, sometimes become piebald, the black being mixed with white and gray. The period of gestation is uncertain; one young one is produced at a birth, and is from ten to fourteen feet in length when born. The mother displays great affection for her offspring, of which whale-fishers sometimes take undue advantage, harpooning the young one—itself of little value—in order to secure the mother. Suckling is performed at the surface of the water, and the mother rolls from side to side, that she and the young one may be able to breathe in turn. The usual rate of progress in swimming is about four or five miles an hour, and whales often swim not far beneath the surface of the water, with the mouth wide open to take in water from which to sift food. The whale is capable, however, of swimming with much greater rapidity, and when harpooned, it often descends to a great depth in a few seconds. Its tail is extremely powerful, and a single blow of it is sufficient to destroy a large boat, or toss it and its crew into the air, so that the whale-fishery is attended with no little danger. Whales usually come to the surface to breathe at intervals of eight or ten minutes, but they are capable of remaining under water for half an hour or more. When they come up to breathe, they generally remain on the surface about two minutes, during which they blow eight or nine times, and then descend. The noise which they make in blowing is very loud, and the spout of spray ejected ascends several yards into the air, appearing at a distance like a puff of smoke. They often assume, as if in sport, a vertical position, with the head down, and flap the surface of the water with the tail, making a sound which is heard two or three miles off. The Greenland whale is not properly gregarious, being generally found alone or in pairs, except when numbers are attracted to particular feeding-grounds, as is sometimes the case in the bays and inlets of northern coasts.

It was formerly supposed that the Greenland whale was an inhabitant of the southern as well as of the northern parts of the world; but the SOUTHERN or CAPE WHALE (*B. australis*) is now regarded as a distinct species, the head being smaller in proportion than that of its northern congener, and the color a uniform black. It attains the length of 50 or 60 feet. It is usually found in comparatively shallow water near coasts. It occurs not only in the colder parts of the southern hemisphere, but throughout its temperate regions, and its range extends into the tropics. It has been taken even as far n. as Japan. Its capture is prosecuted to a considerable extent, particularly on the coasts of south Africa and New Zealand, although this whale-fishery is not nearly so important as that of the northern seas. Several other species of *balæna* have been described, but they are imperfectly ascertained and characterized, specimens not often coming under the observation of competent naturalists in a perfect state. The *nordkaper* of the Icelanders has by some naturalists been described as a distinct species, although it is more generally regarded as a variety of *B. mysticetus*. It differs, however, from the common variety in having the body more slender and the head propor-

tionally smaller; the upper jaw very round, deep and broad; and the plates of baleen comparatively short. It is of a gray color; the lower part of the head of a brilliant white. It is said to be more active and more fierce than the common whale, so that its capture is attended with greater danger.

The species of the genus *megaptera* are called HUMP-BACKED WHALES, and by whale-fishers ordinarily *hump-backs*. They have a rudimentary dorsal fin, in the form of an elevation of the back. There are several species, but some of them are very imperfectly known. *M. longimana*, so called from the length of the pectoral fins, is found in the North sea, and is included in the British fauna. *M. Americana*, the BERMUDA HUMP-BACKED WHALE, occurs chiefly about the Bermudas, from which its baleen is extensively imported. Another species, *M. pæskop*, occurs at the cape of Good Hope.

The genus *balænoptera, physalus*, or *rorqualus* is distinguished by having a dorsal fin. See RORQUAL.

All the species of these genera are objects of pursuit to whale-fishers, although the Greenland whale is that which they prefer.

Important as the whale is to civilized man, both for the oil and the whalebone which it yields, it is still more important to the rude natives of arctic regions, as the Esquimaux and Greenlanders, who use its oil for food as well as for burning, and to whom its flesh also is a chief article of food; while its bones and baleen are used for making tents, sledges, boats, harpoons, and spears; the sinews supply a substitute for twine or thread; and the membranes are used instead of glass for windows. There is no essential difference in the way in which the capture of whales is prosecuted by the rudest tribes and the most civilized nations. The whale-fishers approach the whale in boats, and attack it by harpoons to which lines are affixed, following up and repeating the attack, until its strength is exhausted, taking advantage of the necessity which it experiences of coming at intervals to the surface to breathe, and finally killing it with lances, which are thrust into the most vital parts.

In its most simple form, the harpoon is an iron spear about 5 ft. in length, with a much flattened point, having sharp cutting edges, and two large flattened barbs. Many modifications have been made, the most important perhaps being the gun-harpoon. The ordinary harpoons are attached to a long line at the opposite end to the barbed point, and when the boat is near enough to the whale, the man whose duty it is darts or plunges the weapon with all his force into the animal's side. In its fleeing from the attack, the line is rapidly drawn out of the boat, until the creature is tired, and rises to the surface for air. The boat follows, keeping as much of the line as possible, until, exhausted by pain and loss of blood, the animal succumbs. It will be seen that much depends upon the sharpness of the blade-like edges of the barbs, and their power to hold when in; hence many ingenious devices of movable barbs have been contrived, which close on the shaft of the instrument in going into the animal's flesh, but open outward as soon as there is any strain on the shaft. The gun-harpoon is a short bar of iron with the barbed spear at the end, and a ring with chain for the attachment of the line; this is fired from a small swivel cannon attached to the whaler's boat. However well the harpoon may be fixed in the animal's body, its death and capture are still very difficult matters to accomplish, and take much time. To obviate this, a very ingenious expedient was suggested by sir R. Christison, the eminent toxicologist of Edinburgh university, that glass tubes containing prussic acid should be so placed in the shaft of the harpoon that the moment the cord or line was pulled tight they would be broken in the animal's body, and occasion instant death. This plan has been tried with great success, but has met with opposition from the whale-fishers, who have a prejudice against using a poison which they see has such deadly effects. Another mode of employing prussic acid is to inclose a glass tube containing it, in a hollow rifle bullet about 4 in. long, which is fired from a rifle made for the purpose, the bullet containing also an explosive substance connected with a fuse, which is kindled as the rifle is fired, so that the bullet bursts immediately after penetrating the whale, and spreads its deadly contents through the flesh. The bullet is made of zinc, because it breaks into fragments more angular than any other metal. The success of this method has been found to be perfect, but sailors object to its use, dreading to touch the carcass of a whale which has been killed by so powerful a poison, for a whale struck by a bullet charged with prussic acid only disappears for about five minutes, and rises to the surface dead. Strychnia has been used instead of prussic acid, and with similar results.

The lance used for killing the whale has generally a blade 5 or 6 in. long, and 2½ or 3 in. broad, with sharp cutting edges, and a long wooden handle.

The ships fitted out for the northern whale-fishery are generally screw-steamers, of from 400 to 600 tons burden. To protect them from injury by ice, they are fortified with an additional series of planks, iron plates, and a *false* or *ice* stem, on the sides of which are *ice-knees*—angular blocks of wood filling up the concavity formed by the stem and fore-planks. The stern is also defended by *ice-plates* of half-inch iron; and many timbers and stanchions are added in the interior of the vessel, great strength being a more important requisite than fast sailing. Each ship has generally six or seven boats, *carvel-built*, from 23 to 28 ft. in length, each capable of carry 6 or 7 men, with 7 or 8 cwt. of whale-lines, etc. The crew of a whaler consists of 40 or 50 men, each of whom, from the master to the boys, generally receives, in addition to his fixed wages, a gratuity

for every whale caught, and a certain sum for every ton of oil produced by the cargo. Each boat carries 2 harpoons and 6 or 8 lances. When the ship arrives in the vicinity of a whaling-ground, a look-out is stationed at the mast-head. As soon as a whale is discovered, the boats are lowered, and a competition ensues among their crews, all exerting their utmost strength to reach the whale first. The harpooner is ready, as soon as the boat is sufficiently near the whale, to hurl his harpoon with all his force; the crew instantly back the boat, and the whale generally plunges in terror to a great depth, sometime carring out more than 200 fathoms of line. It remains below for 20 minutes or more, and when it rises, the boats hasten to it again; it is stuck with a second harpoon, and probably, instead of at once descending, it strikes violently with its tail, to destroy its enemies, when great caution is requisite. It cannot now remain long below the surface, and when it comes up, probably spouts blood through the blowholes. When it is lanced, it sometimes dies almost at once, but sometimes there is a terrific struggle—the water is lashed into foam, and dyed with blood. It not unfrequently happens that instead of dying at the surface of the water, the whale descends, and does not rise again, so that it is lost to the whaler. The carcass of the whale is towed by the boats to the ship, and made fast to the ship's chains. The process of *flensing* is then commenced. Some of the crew, having their boots armed with iron spikes, to prevent them from slipping, descend upon the carcass, and cut into the blubber with *blubber-spades*, removing a broad strip or *blanket* of skin, 20 or 30 ft. long, which is hoisted to the deck by means of a hook and tackle. Great cubical pieces of blubber, of half a ton or a ton in weight, are then cut out, and hoisted on deck. In this way, the process is carried on, the whale being turned over and over, that every part may be reached; till in three or four hours, the whole mass of blubber is removed from it—probably amounting to 20 or 30 tons. Meanwhile others of the crew have descended into the mouth of the whale, and removed the baleen. The remainder of the carcass is then flung adrift, and sometimes sinks, but often swims, in consequence of incipient putrefaction, to afford food for bears and fishes. The blubber, after being received on deck, is cut into smaller cubical pieces, and subjected at leisure to a process by which the cellular tissue is separated from it. This is called *making-off* or *trying out;* and to accomplish it, the blubber is heated in a large pot, and afterward strained, the scraps or cracknels from one pot serving as fuel for another, and the ship being made filthy with smoke, soot, and grease. The product is finally stored in casks, to be conveyed home, and boiled for oil. A ton of blubber yields nearly 200 gallons of oil. A single whale often yields blubber and whalebone to the value of $3500 or $4000.

The Norwegians sent vessels to Greenland for the whale-fishery in the 9th century. They had previously prosecuted it on their own coasts, and the Norman settlers on the bay of Biscay carried it on there, whales inhabiting that bay in considerable numbers, till, through the eager prosecution of the fishery, they became so few that about the 15th c. it became unprofitable, and was relinquished. In 1261 a tithe was laid upon the tongues of whales brought into Bayonne, they being then highly esteemed for food. The French, Spaniards, and Flemings early began to fit out vessels for the northern whale-fishery; the English entered upon it with great spirit in the end of the 16th c., and about the same time the Dutch, Danes, and Hamburgers. The British Muscovy company obtained a royal charter, giving them a monopoly of the whale-fishery of the coasts of Spitzbergen, on the pretense of its having been discovered by sir Hugh Willoughby, although, in fact, it was discovered by the Dutch navigator Barentz. Other nations were not disposed to acknowledge the claims of the English; the Dutch in particular sent out a strong fleet, between which and the ships of the Muscovy company an engagement took place in 1618 and the English were defeated. The Spitzbergen bays and seas were afterward divided into fishing-stations, allocated to the whalers of the rival nations. No nation now asserts a claim to the exclusive right of whale-fishing in any quarter.

The English for some time prosecuted the whale-fishery sluggishly and with incompetent means; the Dutch carried it on with great vigor and success. During the latter half of the 17th c. the Dutch furnished almost all Europe with oil. In 1680 they had 260 ships and about 14,000 men employed in the whale-fishery; but from that time the Dutch fishery began to decline. In 1732 Great Britain attempted to encourage the whale-fishery by a bounty of 30s. a ton to every ship of 200 tons engaged it it, which was raised in 1749 to 40s., reduced to 30s. in 1777, and again raised to 40s. in 1781. The object of the bounty was not only to encourage the trade, but to make it a nursery for seamen. Ships, however, were fitted out rather for the bounty than for the capture of whales, and during the next five years after the reduction of the bounty in 1777 the number of ships employed in the trade was reduced from 105 to 39. After 1781 it rapidly increased, and continued to increase although the bounty was reduced. The bounty was finally altogether withdrawn in 1824; yet in 1815, when the British whale-fishery was in its most flourishing condition, only 164 ships were engaged in it. The Dutch whale-fishery had in the meantime almost entirely ceased, owing to the national calamities consequent on the French revolution. The British whale-fishery is still prosecuted, although not nearly to the extent that it was fifty years ago. The French whale-fishery has in like manner declined. The Americans are at present more actively engaged in the whale-fishery than any other nation. The New England colonies entered upon this enterprise at a very early period, at first merely by boats on their own coasts, which, however, were deserted by whales before the middle of the 18th c., and ships then began to be fitted out for the

northern seas. For a number of years, however, the American whale-fishery also has been declining, owing to the scarcity of whales, and because substitutes for whale-oil and whalebone have been found. New Bedford, Massachusetts, is the greatest whaling-port in the world.

WHALEBACK. The name of a new type of freight-steamer which discards masts and sails, and, instead of bulwarks, has sides rounded, so that waves in striking take no hold. Whalebacks were developed from barges of similar shape used on the great lakes, and known as "pigs." In 1891, the first whaleback built for ocean traffic made a voyage to Liverpool, where it attracted great interest. This was the *Charles W. Wetmore*, built on Lake Superior, with a length of 265 ft., beam 35 ft., depth 24 ft., register 1075 tons, and with a freight capacity of 3000 tons. She makes 10 knots per hour, and burns only 12 tons of coal a day. It is said that the whalebacks are much steadier in a storm than steam vessels of the ordinary type, while the cost of building is one third less. So slight is the motion of a whaleback in an ordinary sea, that it is said that when the hatches on the *Wetmore* were removed in Liverpool, the footprints of the men who had been engaged in lading it at New York were still visible in the grain.

WHALEBONE. The baleen plates which take the place of teeth in the mouths of the baleen whales (see WHALE), constitute the whalebone of commerce. They vary in length from a few inches up to ten, and even in rare instances 12 feet. Their chemical constitution is albumen hardened by a small proportion of phosphate of lime. Their color is usually of a bluish black, but in some species they are striped longitudinally with bands of a whitish color; and they terminate at the point in a number of coarse black fibers of the baleen, which fibers are also found more or less down both sides of the blade. These fibers are much used by brushmakers. There are three principal kinds in the market, and they are generally known as *whale-fins*. The first is the *Greenland*, or Davis's strait and North sea fins; second, the South sea, or black fish-fins; third, the n.w. coast, or American whale fins. Whalebone requires some preparation before being fit for use; this, however, is very simple. It is first trimmed—that is, all the hairs are removed from the point and edges of each blade; and generally the surface of each flat side is scraped. The blades are then boiled in water for several hours, until they become soft enough to be cut easily with a common knife. The workman then cuts them into lengths fitted for the purposes to which they are to be applied. They are chiefly used in thin strips, such as stay-bones and umbrella-ribs, and can be easily split for such purposes, owing to their lamellar structure. Generally the boiling is combined with a dyeing process, to make the whalebone perfectly black.

WHANG-HAI', or YELLOW SEA, an important inlet of the Pacific ocean, washes the n. part of the e. coast of China, and is bounded on the w. by the Chinese provinces of Shang-tung and Keangsu, on the e. by the peninsula of the Corea and Japan. It terminates on the n.w. in the gulfs of Pe-chih-li and Leao-tong, and opens out in the s.e. into the Tung-hai or Eastern sea. It is more than 600 m. long, and over 400 m. in average breadth. Near the land its waters are of a lemon color, owing to the yellow sand brought down by the river Whang-ho, which empties into it.

WHANG-HO, HOANG-HO, or YELLOW RIVER, one of the principal rivers of China, about 2,900 m. in length, and the area of its basin being not less than 700,000 sq. miles. It rises in a marshy plain lying between the Bayan-kara and Kwanlun mountains, in a lake called Ala-nor, in lat. 35° 30′ n., long. 95° 30′ e. Its course is so crooked that after it leaves Ala-nor, it turns first s. 30 m., then e. 160, then westward 120, winding about the gorges of the Kwanlun, then n.e. into the province of Kansuh, next it proceeds northward for 430 m., till it is bent eastward by Inshan, on the edge of the table-land, where it incloses within its great bend the country of the Ortous Mongols. At the Peh-ling it is deflected s. where it divides the provinces of Shanse and Shense for 500 miles. At the south-western corner of Shanse, it receives its largest tributary, the Wei-ho, 400 m. in length. In some parts of its eastern course it is above the great plain through which it passes. The embankments requisite for averting inundations are a source of never-ending expense to the government, and their yielding to floods a frequent cause of desolation to extensive districts of country. Dr. Macgowan announced some years ago, in the *North China Herald*, that this wayward and turbulent stream had suddenly shifted its course, turning off near Kaifung-foo in a north-easterly direction, discharging its waters into the rivers of Chihle, which disembogue in the gulf of Pehchele, the mountainous province and promontory of Shantung intervening between its former and its present mouth, a distance by coast-line of about 500 miles. More recently, it was announced that the old bed of the Yellow river, for more than 200 m. from its mouth, was a belt of sand, which, since 1853, has been, to use the Chinese term applied to it, "as dry as dust." The change seems to have been gradual.

WHARF—WHARFINGER. The space along a harbor or navigable stream, arranged to receive a vessel's cargo, is called a wharf. It is usually built out beyond the lowest ebb of the tide, so that vessels may come up along-side, and discharge or receive cargo. A wharf is commonly built by driving down piles and covering them with plank. At common law, the soil of tide-waters below high-water mark belonged to the crown; in this country it belongs to the states, who have the power of regulating the erection and use of wharves. A wharf built without the sanction of the state, is a pub-

lic nuisance. But the right may be granted to others; thus, the shore of Manhattan island has been ceded to the city of New York by the state of New York. The person who is the owner or keeper of a wharf is called a WHARFINGER. His liability is that of an ordinary bailee for hire. His charges for landing or loading goods are called wharfage. Being matters of public interest, wharfage rates can be regulated by statute. A wharfinger has a lien on the goods for his balance.

WHARTON, a co. in s.e. Texas, having the San Bernard river on the n.e., drained by the Colorado; 1100 sq.m.; pop. '90, 7584, chiefly of American birth, inclu. colored. Co. seat, Wharton.

WHARTON, FRANCIS, D.D., LL.D., b. Philadelphia, 1820; graduated, Yale college, 1839; practiced law, Philadelphia; prof. of logic and rhetoric in Kenyon college, Ohio, 1856–63; rector of St. Paul's church (Prot. Episcopal), Brookline, Mass., 1863; prof. in Cambridge Episcopal seminary, 1866; editor of *Episcopal Recorder.* He published a *Treatise on the Criminal Law of the United States; Treatise on Medical Jurisprudence; State Trials of the United States during the Administrations of Washington and Adams; Treatise on the Law of Homicide in the United States; Treatise on Theism and Modern Skepticism.* He contributed to many periodicals, and edited volumes of law reports. He d. 1889.

WHARTON, HENRY, 1664–95, b. Norfolk, England; graduated at Cambridge university, 1684. He took orders in the church of England and was assistant to Cave in the compilation of the *Scriptorum Ecclesiasticorum Historia Literaria* (1688). He also wrote several biographical and theological works, the best known of which is *Anglia Sacra.*

WHARTON, PHILIP WHARTON, Duke of, was the son of Thomas, marquis of Wharton, an eminent member of the whig party in queen Anne's reign, and lord-lieutenant of Ireland from 1708 until after the fall of the Godolphin administration in 1710. Macaulay says he was licentious and corrupt; but the faults of his Irish administration were largely redeemed by his appointment of Addison as chief-secretary. George I. made him lord-privy seal and marquis of Wharton in 1715, but he died three months afterward. His son, Philip, born 1698, was educated at home by his father, who aimed at making him a great orator, a whig in politics, and a Presbyterian in religion. In a boyish freak, he contracted a clandestine marriage at the Fleet with the daughter of Maj-Gen. Holmes. The shock is said to have killed both his parents. Wharton soon parted from his wife, and in 1716 went abroad with a French Huguenot tutor, to be brought up according to his father's dying instructions, in strict Presbyterian principles, at Geneva. He contracted debts, spurned the restraints of his tutor, and ran away to Lyons. He visited the pretender at Avignon, and, it is said, accepted from him the title of duke of Northumberland. He next visited Paris, and, after various extravagances, set out for Ireland, where, although he had not yet reached his 19th year, he was allowed to take his seat in the house of peers. He soon displayed such splendid abilities in debate, and supported the government with so much zeal, that, although still under age, he was, Jan. 20, 1718, raised to the highest rank in the English peerage. He did not take his seat in the English house of peers until 1720. Here he opposed with much warmth the government measure on the South sea bill, and the bill of pains and penalties against bishop Atterbury. His affairs became hopelessly involved by his extravagance, so that although he had succeeded to an estate of £16,000 a year, he was soon compelled to accept a yearly allowance of £1,200 from his creditors. He set up a political paper, called the *True Briton,* in 1723; and lost no occasion of speaking, as well as writing, against the ministry and the court. In 1724 he set out for Vienna, and then visited Madrid, where he was served with an order from the privy seal to return home. He treated the order with contempt, and afterward went to Rome, and appeared openly at the court of the pretender, from whom he accepted the order of the garter. He now assumed the title of duke of Northumberland. In 1727 he fought with the Spaniards and against his countrymen at the siege of Gibraltar. This last mad act lost him his English title and estates, and led to his conviction under a bill of indictment for high treason. He refused to make his submission to the government; and the rest of his life was passed in France and Spain, at one moment squandering his precarious supplies of money in drunkenness and luxury, and at another suffering the extremest poverty. He died in a miserable condition at a Bernardine convent in Catalonia, May 31, 1731. His brilliant talents and wasted life were sketched by Pope in his Moral Essays, in the lines beginning—

Wharton, the scorn and wonder of our days.

The *Life and Writings of Philip, late Duke of Wharton,* were published in 1732 (Lond. 3 vols. 8vo); and another two-volume publication, entitled *The Poetical Works of Philip, late Duke of Wharton, and of the Duke's Intimate Acquaintance,* appears, with the exception of the title-page and a prefixed biography of Wharton, to have been printed in 1727. This publication, however, contains little that is even attributed to the duke.

WHATCOM, a co. in n.w. Washington, having the gulf of Georgia for its w. boundary, drained by the Skagit river, containing mount Baker, a peak of the Cascade range, 10,827 ft. in altitude; 2468 sq. m.; pop. '90, 18,591, chiefly of American birth; with colored. Co. seat, New Whatcom.

WHATELY, Richard, Archbishop of Dublin, was born in Cavendish square, London, Feb. 1, 1787, and was the fourth son of Dr. Joseph Whately of Nonsuch park, Surrey, prebendary of Bristol, vicar of Widford, and lecturer at Gresham college. He was sent in due time to a private school at Bristol, from which, in 1805, he passed to Oriel college, Oxford. He took his bachelor's degree in 1808, taking a second class both in classics and in mathematics. He got the English-essay prize in 1810. In the following year he was elected a fellow of Oriel college, which at that time ranked among its fellows not a few men destined to play a considerable part in the world, and already remarkable for their attainments and intellectual activity—e.g., Arnold, Keble, Pusey, and the elder Newman. In 1815 he became one of the tutors of his college; and about this time he wrote (originally for the *Encyclopædia Metropolitana*) what he afterward expanded into his popular treatises on logic and rhetoric. In 1821 he married a daughter of W. Pope, esq., of Hillingdon, Middlesex. In the same year he published two works; the one a volume of sermons on *The Christian's Duty with respect to the Established Government and the Laws;* the other a work which is among the most celebrated and characteristic of his writings: this was *Historic Doubts relative to Napoleon Bonaparte.* Its object was to throw ridicule upon the criticism to which the Gospel narratives were subjected by skeptical writers, by applying the same kind of criticism to events within the memory of all the world, and starting doubts as to whether these events had occurred. This *jeu d'esprit* with a purpose created a great sensation. It has been translated into several foreign languages. In 1822, Whately was presented to the living of Halesworth, in Suffolk. In the same year he delivered the Bampton lectures at Oxford, taking for his subject the "Use and Abuse of Party Feeling in religion." In 1825 he was oppointed by lord Grenville principal of St. Alban's hall, which, under his energetic rule, quickly lost the bad character it had long sustained in the university. In 1829 he was appointed professor of political economy; but he was destined not to hold this office long enough to do more than deliver an introductory course of lectures. In 1831 lord Grey's government, at the instance of lord Brougham, appointed him archbishop of Dublin and bishop of Glendallach. Afterward, in 1846, his episcopal charge was enlarged by the addition of the bishopric of Kildare.

During the ten years preceding his appointment to the archbishopric, Whately had been incessantly writing and publishing, chiefly upon theological and ecclesiastical subjects. He belonged to the liberal school in religion and in politics; he was opposed, that is, to high church or Catholic views in theology, and to toryism in politics. He had taken a keen interest in the political questions of the time, and especially had made himself conspicuous in the university by his advocacy of Catholic emancipation, of which the party in the church which had most sympathy with the theology and ecclesiastical system of the Roman church were the most determined opponents. When sir R. Peel, after his change of views on the emancipation question, voluntarily submitted himself for re-election to the university, Whately, though a liberal, came forward to support him, and was one of the most active of those who endeavored to prevent his rejection. His *Essays on some of the Peculiarities of the Christian Religion* appeared in 1825; his *Elements of Logic,* in 1826; the *Elements of Rhetoric,* in 1828; his *Essays on some of the Difficulties in the Writings of St. Paul,* etc., also in 1828; his *Thoughts on the Sabbath,* in 1830; and in the same year, the *Errors of Romanism traced to their Origin in Human Nature.* His *Introductory Lectures on Political Economy* were published in 1831. By this time his writings, and the great activity and ability which he displayed in his various public functions, had placed him among the foremost men of the university, and had also got him rank among the most remarkable thinkers and writers of his time. Though many distrusted him as a liberal, questioned the soundness of some parts of his theology, or thought his manners too eccentric, and his habit of mind too peculiar, for one who was to rule over others, nobody questioned that his abilities and reputation were equal to the high position bestowed upon him by lord Grey.

As archbishop of Dublin, Whately was very active in all matters of importance, social and ecclesiastical, and showed a deep interest in every question affecting the welfare of Ireland. He was one of the original members of the board of national education, and continued a member till 1853, when he retired, in consequence of a departure, as he thought, having been made from the principles on which, up to that time, the national education had been carried on. He was perhaps the most active member of the board, and the success of the national system was in a great measure owing to him. He and members of his family were always foremost in supporting well-devised charitable schemes. His liberality was, in fact, unbounded, though an opposite impression prevailed among those who did not known him, because he wrote and spoke strongly against casual benevolence, and used to say he had never given a penny to a beggar. As archbishop, his rule was firm and judicious. A slight disregard of etiquette was about the worst thing ever alleged against him: he was not disposed to make much difference between a rector and his curate. His activity as an author was not stifled by his energetic discharge of his public duties; indeed, he seems to have been always either writing a book, or affording literary help to others. Besides many charges, sermons, and a few pamphlets, his *Kingdom of Christ Delineated,* one of the most remarkable of his works; his *Introductory Lectures to the Study of St. Paul's Epistles;* his *English Synonyms;* and his annotated edition of Bacon's *Essays*—perhaps the best example of good editing in the English

language—belong to this period of his life. A work published anonymously in 1855, *Scripture Revelations respecting Good and Bad Angels*, has been generally ascribed to Whately.

He died on Oct. 8, 1863. The world's esteem and the regard of his friends for him had been growing to the last. In early life, there was much about him to shock the fastidious, and some things which might hurt the sensitive; but his peculiarities softened and wore off as he advanced in years. At Oxford he was noted for his rough unceremonious manners, for which (together with his dress) he was nicknamed the white bear; and for the plain speaking and rough ridicule with which he would overwhelm an opponent in an argument. He was remarkable, too, for his fondness for athletic sports, which he indulged with a perfect indifference to the minor proprieties. He used to say that his abrupt and careless and seemingly unfeeling ways were a recoil from the painful shyness for which he had been remarkable in his youth. Those who knew him, however, made light of his peculiarities; and few things about him are more pleasing than his firm belief in the merits of his friends, and the number, the warmth, and the permanence of his friendships. He had great talents for conversation, and was famous for his bon-mots, happy repartees, and conversational pleasantries of every kind. His writings are not so much remarkable for subtlety of thought or novelty of view as for strong logic, acuteness, felicity of arrangement and exposition, and the frequency and homely force of his illustrations. He had the happy power of building up materials which might be old into a new, commodious, and almost a beautiful structure. He did nothing for mere ornament's sake: though his imagination was abundantly fertile, it was used only to illuminate his argument; his images are seldom impressive for their beauty, though admirably fitted for didactic purposes. His theological works have been charged with a "cold rationalistic" tendency, and with being wanting in reverence; and it has been inferred, though perhaps too hastily, from some passages in his writings, that he was heretical on the subject of the Trinity. The *Historic Doubts*, the *Essays on the Peculiarities of the Christian Religion*, the *Errors of Romanism*, and the *Kingdom of Christ*, are perhaps the most valuable and characteristic of his writings.—The *Life and Correspondence of R. Whately, D.D., etc.*, by his daughter, E. Jane Whately, was published at London in 1866. It is an interesting, though in some respects a partial, and in some degree an inadequate, memorial of Dr. Whately. As might be expected, the "white bear" side of his character is kept in the shade: but few examples are given of the coarse but racy conversational wit which was one of the archbishop's claims to distinction among his contemporaries. And it is scarcely possible to gather from it what his exact position was in theology or in literature, though the letters which form a great part of it, give a very fine impression of the qualities which distinguish his works.

WHEAT, the most valuable, and, next to maize, the most productive of all the cereal grasses. The genus *triticum*, of which the species are popularly known either as *wheat* or *wheat-grass*, is distinguished by a spike with many-flowered spikelets, without stalks, and seated one on each notch of the rachis, their sides directed to the rachis, which is zigzag; and two glumes, of which the lower is either awned or awnless; the outer paleæ of each floret having at the top a notch, in the center of which is the terminal point, sometimes prolonged into an awn, or, in some species, with many florets tapering into an awn without a notch. A number of species are found in Britain, of which *T. repens*, well known as couch grass (q.v.), is the most common; but the seeds of none of them are of any value. The native country of the cultivated wheat has generally been supposed to be the central part of Asia; but a discovery was made not many years ago by M. Fabre of Agde, in the s. of France, that the *ægilops ovata*, a grass of the regions near the Mediterranean, and of the w. of Asia, becomes transformed by cultivation into wheat. The announcement of this discovery was at first received with much doubt, although the possibility of the transformation had been suggested by previous botanists; but it has been confirmed by subsequent observations and experiments. The genus *ægilops*, as hitherto recognized by botanists, is distinguished from *triticum* chiefly by its more numerous awns, the glumes of *Æ. ovata* being generally terminated by 3 or 4 awns, prolongations of their ribs, and the *paleæ* by 2 or 3 short awns. The awns of grasses, however, afford very uncertain characters, being extremely liable to disappear through change of circumstances; and among the cultivated varieties of wheat, every farmer is familiar with some that are awned or *bearded*, and some that are beardless, having scarcely a trace of awn. In the wild *ægilops*, the ear is also much more easily broken from the rachis than in wheat. In cultivation, the *Æ. ovata* very soon loses the awns of its paleæ and of the lateral ribs of its glumes, and thus assumes the characters of wheat, the ears at the same time losing their fragility, the grain also increasing in size, while the floral envelopes are proportionaly diminished, the leaves become larger, and the stem stronger. From seeds of the *Æ. ovata* sown in a garden in 1838, M. Fabre obtained wheat of fair quality in 1846. Prof. Buckman, of the royal agricultural college, repeated the experiment in England. His first sowing was in 1855, and notwithstanding the disadvantages of cold seasons and a cold situation on the Coteswold hills, he found the spikelets much modified in 1859, the warm summer of that year producing a greater change than had taken place in previous years (see *Popular Science Review* for October, 1861). The identity of the principal cultivated forms of *triticum*

with *Æ. ovata* may now be regarded as fully established. These forms have generally been included by botanists under the name *T. vulgare.*

Wheat has been cultivated from the earliest ages, and was a chief crop in ancient Egypt and Palestine, as it still is in all the temperate parts of Europe, Asia, and Africa. It is cultivated to a considerable extent in the n. of India. In North America it is very extensively cultivated, and many parts of the United States and British provinces are admirably adapted to it. Wide regions of South America are equally suitable, and wheat of the finest quality is produced in Australia. In the torrid zone, wheat does not succeed, except in elevated situations; but it nowhere succeeds better than in sub-tropical regions, although it is a hardy plant, and when covered by snow, endures even very severe winters in the n. of Europe. For its successful cultivation, however, it requires a mean temperature of at least 55° Fahr. for 3 or 4 months of the year. It is an annual plant, and its capacity of enduring the cold of winter is of importance only in connection with the advantage to be derived from sowing in autumn, so as to have it more forward in spring. Its cultivation does not extend so far n. as that of barley or oats, or even of rye. In Europe, its northern limit is about lat. 60°. The quality of the grain varies much in different soils and climates, and particular varieties are also distinguished by difference of quality as well as by external characters. The wheat of the eastern parts of Britain, where the climate is comparatively dry, is superior to that of the western parts, where the sky is more cloudy and the climate more humid, although the crops in the west are not less luxuriant; and the wheat produced in Britain is not found suitable for the manufacture of macaroni, to which that of the countries near the Mediterranean is particularly adapted. Although hardy in winter and early spring, wheat becomes more delicate and susceptible of climatic influences as it advances in growth; a prevalence of dry weather, with bright sunshine from the time when it comes into ear until it is ripe, is of the greatest importance.

Common Wheat, *T. vulgare, æstivum,* or *sativum,* grows to a height generally of 3 or 4 ft., and has ears or spikes generally 3 or 4 in. long; the spike 4-cornered, the spikelets about 4-flowered; the paleæ ventricose, ovate, truncate, mucronate or awned, compressed under the point, rounded at the back, the grain free. In consequence of long cultivation, in a great variety of climates, the cultivated varieties of wheat are very numerous, more so than in any other kind of grain. New varieties are continually coming into notice; and many are in high estimation in particular districts, although little known beyond them. Some botanists have attempted to distinguish species among them, appropriating the name *T. æstivum* to the awnless kinds, and *T. hybernum* to the awned; but intermediate forms are very numerous, and the length or shortness of the awn seems to depend upon accidental circumstances. Nor do the awnless or beardless kinds perfectly correspond with the summer wheat of farmers, preferred for sowing in spring with a view to a crop in the same season, and the awned or bearded kinds to the winter wheat, sown in autumn, as some of the hardy varieties of winter wheat are awnless, and some of those usually sown in spring are bearded. Besides being classified as bearded and beardless, the varieties in cultivation are also distinguished according to the color of the grain, as *white* and *red* wheats. Some having the ears covered with a short soft down are known as *woolly* wheats. There are also differences in the length and compactness of the spike, and in the size and form of the grain, which is more rounded in some, and more elongated in others. A number of varieties, having the spike very compact or square, have been sometimes classed together under the name of *T. compactum,* and the distinction is very obvious and permanent, although there is no reason for regarding it as characterizing a distinct species. Akin to this is the Mummy Wheat (*T. compositum*), in which the spike is branched, and which is said, but on insufficient evidence, to have been produced from seeds found in mummy-cases in Egypt. Mummy wheat has been grown in England, of which the ears have had 10 or 11 branches, and 150 grains have been found in one ear; while 60 ears have been produced by a single seed. Notwithstanding these apparent advantages, however, this variety does not serve the purposes of the farmer so well as some others. In another group of varieties with compact ears (*T. turgidum* of some botanists), the glumes are remarkably tumid, and always awned. These are known by the names of gray wheat, Pollard wheat, duckbill wheat, etc., and in Germany are commonly called English wheat. Polonian wheat (*T. Polonicum*) is the common name of a number of kinds of a very peculiar appearance, with a long, loose, and somewhat nodding spike; the glumes awned, and remarkably long—twice the length of the florets. The stems are also very tall, sometimes more than 6 ft. high. These kinds, sometimes called *Grecian* or Mogadore Wheat, are cultivated in some parts of the s. of Europe, in the s. of Siberia, and in Africa. Hard Wheat, or Horny Wheat (*T. durum*), has rather small, elongated, and very hard grains, the paleæ have remarkably long awns, and the leaves are very broad. It is much cultivated in the countries near the Mediterranean, and Dr. Royle suggests that it would be a valuable acquisition to India, as it yields a good crop on comparatively sterile soils.

The red varieties of wheat are generally more hardy than the white; the grain is inferior in quality, and yields less flour, but these disadvantages are more than counterbalanced in many soils and situations by the greater productiveness of the crop. Red wheats are therefore preferred for comparatively poor soils, but the white kinds are gen

erally cultivated wherever the soil and climate are suitable. The varieties with long straw yield the best crops in dry seasons, but the short-strawed kinds are best when the season is wet. Wheat is particularly suited to clay soils, and rich heavy loams; but with good farming, excellent crops are produced even on light sandy or gravelly, and on chalky soils. Where the climate is moist, a light dry soil is most suitable; soft deep soils being productive chiefly of straw. The land intended for wheat must, at least in Britain, be in a high state of cultivation. Wheat is commonly sown after green crops, beans, or bare fallow; in the s. of England, often after grass or clover. It may be sown, at least in autumn or the beginning of winter, when the ground is so saturated with moisture, that any other kind of grain would be almost sure to perish. It is either sown broadcast or in drills, and the practice of drilling becomes more and more prevalent, both on account of the saving of seed and the superiority of the crops produced. The land prepared for wheat is very often manured with farm-yard manure; artificial manures —as guano—are also used. In Scotland, it is a common practice, when wheat is to be grown after turnips, to plow down the turnip-leaves in autumn before the wheat is sown, and to apply guano in spring. Nitrate of soda is another favorite top-dressing for wheat, but sometimes causes the plants to grow too rapidly, so that they become tender, and suffer from climatic influences. Many farmers use both guano and nitrate of soda for top-dressing wheat, and the nitrate of soda is often mixed with common salt, which is thought to be useful in giving strength and vigor to the wheat plants, preventing *lodging* and mildew. Wheat ought to be reaped before it is *dead ripe*, unless when it is intended for seed, and it ought to be stacked as soon as it is sufficiently dry to be free from danger of heating. On very rich land wheat sometimes becomes too luxuriant in spring, and its growth needs to be repressed by cutting the leaves with a scythe—a practice essentially agreeing with that mentioned by Virgil in his *Georgics* (i. 111), of allowing cattle to feed upon the young blades:

> Quid, qui, ne gravidis procumbat culmus aristis,
> Luxuriem segetum tenerâ depascit in herbâ,
> Quum primùm sulcos æquant sata?

The relative proportions of straw and grain differ very much in different varieties of wheat, and according to differences of soil, climate, and season. The proportion of the weight of grain to that of the whole plant when dried so as to be ready for stacking, varies from 20 to 47 per cent. The composition of the grain itself varies considerably, as to the proportions of starch, gluten, etc., which it contains. One hundred parts of the grain of wheat, dried in the ordinary manner, contain on an average—water, 14.83; gluten, 19.64; albumen, 0.95; starch, 45.99; gum, 1.52; sugar, 1.50; oil, 0.87; vegetable fiber, 12.34; ash, 2.36; total, 100.00.

The ash is rich in phosphoric acid, magnesia, and potash. Its composition is as follows: Potash, 29.97; soda, 3.90; magnesia, 12.30; lime, 3.40; phosphoric acid, 46.00; sulphuric acid, 0.33; silica, 3.35; peroxide of iron, 0.79; chloride of sodium, 0.09; total, 100.00. For the processes by which starch and gluten are obtained from wheat, see these articles.

The value of wheat depends mainly on the quantity of fine flour which it yields; the best wheat yielding 76 to 80 per cent, sometimes even 86 per cent, of fine flour, whereas inferior kinds seldom yield more than 68 per cent, and sometimes only 54 to 56 per cent. In general, the smoother and thinner the grain is in skin, the greater is the produce of fine flour. The greater part of the husk of wheat is separated from the flour by the miller, and is known as *bran*. That portion of the bran which is more finely divided than the rest receives the name of *sharps* or *pollard*. See the articles Bran and Flour.

Wheat-straw contains, on an average, in its ordinary state of dryness—nitrogenous substances, 1.85; non-nitrogenous substances, 67.56; mineral substances, 4.59; water, 26.00; total, 100.00; and the composition of the ash is as follows: Potash, 12.14; soda, 0.60; magnesia, 2.74; lime, 6.23; phosphoric acid, 5.43; sulphuric acid, 3.88; silica, 67.88; peroxide of iron, 0.74; chloride of sodium, 0.22; total, 100.00.

The principal diseases to which wheat is subject, some of which are often productive of great loss to the farmer, are either owing to or connected with the presence of parasitic fungi. See Bunt, Mildew, Rust, and Smut. An animalcule causes the disease known as ear-cockles (q.v.). Wheat suffers also from the ravages of numerous species of insects.—See Hessian Fly, Wheat-fly, Corn-moth, and Wireworm. The larva of a ground beetle (*zabrus gibbus*) is often very destructive to young wheat in winter and spring.

Spelt (*triticum spelta*) is regarded as a distinct species from common wheat, and is supposed to be a cultivated form of *ægilops caudata*, a native of the countries near the Mediterranean. The spikelets are smaller than in common wheat, and each spikelet has two or three, rarely four, perfect florets, besides a barren terminal one; the outer glumes and the paleæ are very broadly truncate at the top, and notched; the awns very slender; the ripened grain adheres closely to the paleæ or chaff. Spelt is supposed to be the grain called *zea* by the Greeks and *far* by the Romans. It is of little value in comparison with wheat, but can be grown on inferior soils, and is cultivated in Switzerland, at an elevation where wheat would not succeed. The bread made of it is coarse, and is used chiefly by the poorer classes.—Another species sometimes called Lesser Spelt, or One-Grained Wheat (*triticum monococcum*), is also occasionally cultivated on poor soils, and in elevated situations in the center and s. of Europe. It is sometimes called

St. Peter's corn." The ear is small and compressed, the spikelets contain only one perfect flóret and a rudimentary one; the awns are long; the grain is small, and adheres closely to the chaff.—*Triticum Bengalense* may be regarded as a kind of spelt. It has remote spikelets, long awns, and long irregularly triangular grains. It is cultivated to some extent in India.

Wheat being the most esteemed of all the cereals, particularly for the making of bread, the increase of its cultivation and use has marked the progress of agriculture and of wealth in many countries, and particularly in Britain. It is only of late that bread made of wheat has become a common article of food among the laboring classes in Britain. In some parts of the country, it is still, indeed, far from being a principal article of food among the peasantry, who use barley and oats in various forms. In the 8th c., the monks of the abbey of St. Edmund, in England, ate barley-bread, because the income of the abbey would not admit of their using wheaten bread regularly. At a later period, wheat was largely used, at least in the southern parts of England, for a short time after harvest, but the supply was soon exhausted, and recourse was again had to inferior kinds of food. There was then no trade in corn to equalize the price over the year. In 1317, when an abundant harvest had been gathered in, the price of wheat fell at once from 80s. to 6s. 8d. per quarter. The rejoicings of harvest-home were, therefore, in these times connected with a transition from poor to good fare, and from comparative want to abundance, such as happily does not attend the same occasion in our day. Down to the end of the 17th c., wheaten bread was a principal article of food only among the more wealthy; and the servants in their houses were still furnished with oats, barley, and rye. In the northern parts of England, as well as in Scotland, the use of wheaten bread was comparatively rare even at the middle of last century. "So small was the quantity of wheat used in the county of Cumberland," says Eden, in his *History of the Poor* (1797), "that it was only a rich family that used a peck of wheat in the course of the year, and that was used at Christmas. The usual treat for a stranger was a thick oat-cake (called *haver-bannock*) and butter. An old laborer of 85 remarks that when he was a boy he was at Carlisle market with his father, and wishing to indulge himself with a penny loaf made of wheat-flour, he searched for it for some time, but could not procure a piece of wheaten bread at any shop in the town." At the period of the revolution, 1689, the quantity of wheat grown in England was estimated at about 14,000,000 bushels, or about three bushels to each of the population, which was then under five millions. In 1828 about 100,000,000 bushels were produced, or about seven bushels to each of the population, then under fifteen millions (see *Library of Entertaining Knowledge; Vegetable Substances used for the food of Man*, Lond. (1832). In 1890 there were 2,386,336 acres under wheat in England, Wales, Ireland, and in Scotland, the total produce of which may be estimated about 100,000,000 bushels; besides which, a very large quantity of wheat is imported from other countries. The cultivation of wheat now extends to the most northern parts of Scotland, 2,409 acres having been under this crop in 1878 in the county of Elgin, and 3,312 in Ross and Cromarty, and even in Sutherland 52, and in Caithness 10 acres. The population of England and Scotland being now about 30,000,000, it appears that the quantity of home-grown wheat consumed amounts to about 3⅓ bushels for each of the population; but the wheat imported in 1880 amounted to about 76,000,000 bushels, raising the amount consumed to nearly 6 bushels per head of the population. Ireland is left out of account, as not being to a great extent either a wheat-growing or a wheat-consuming country. The produce per acre is greater in Britain than in any other wheat-growing country, owing to superior farming, notwithstanding disadvantages of climate and often of soil. The extent of land now under wheat has, however, of late years diminished, owing to the foreign supply, and the high price of butcher-meat making pasturage now profitable. The quantity of wheat produced in the United States in 1890 was officially given at 399,262,000 bushels. The chief wheat-growing states and their production in 1879 were—Iowa, 32,786,880 bushels; Illinois, 44,896,830 bushels; Minnesota, 3,886,520 bushels; Indiana, 43,709,960 bushels. The progress of wheat-cultivation in the western states has been extremely rapid. The crop of 1885 in the United States fell short of these figures. In 1821 the total exports of wheat from the United States were valued at $178,314, and of wheat-flour at $4,298,043. The total exports of wheat in 1880 were valued at $190,546,305, and of wheat-flour at $35,333,197. This rapid progress is due to the increase of wheat-culture in previously unsettled regions. The greater part of the wheat exported from North America is to Great Britain. Of the wheat imported into the United Kingdom in the year 1890, the United States shipped 3,440,212 quarter, Russia, 3,877,805 quarter, India, 1,822,316 quarter, Australasia, 611,538 quarter, and Canada, 225,749 quarter.

WHEATEAR, or FALLOW-CHAT, *Saxicola œnanthe*, a bird of the genus popularly known by the name chat (q.v.), of the family *sylviadæ*, a common summer visitant of Britain, abounding on downs and fallow fields. Its geographic range is wide. Its winter retreat is in the countries near the Mediterranean, and chiefly in Africa; its summer migrations extend to the furthest n. of Europe, and to Iceland and Greenland. A few wheatears spend the winter on the southern coasts of England. The entire length of the wheatear is about 6½ in.; the tail is almost square; the wings are long and pointed; and the legs are long, enabling the bird to hop about actively in quest of food. Its food consists of worms and insects, and it may often be seen perched on the top of a clod or stone, look-

ing out for them, and at the same time on the watch against enemies. The male is of an ash-brown color on the upper parts; the forehead, a band above the eyes, and the throat, white; a black mark extending from the base of the bill to each eye, and expanding behind it, so as to cover the orifice of the ear; the wings, black; the rump, and two-thirds of the tail, except the two middle feathers, white; the tip of the tail, black; the two middle feathers of the tail, entirely black; the breast, buff-color; the belly and flanks, pale buffy white. The female is less gayly colored, brown and gray prevailing. The wheatear makes its nest in an old wall, or in a crevice of a quarry or gravel-pit, often in a deserted rabbit-burrow, and generally lays six pale-blue eggs. The male has a pleasant, but not loud song, and sings well in confinement, in winter as well as in summer. This little bird is much esteemed for the table, and great numbers are therefore annually caught, not only on the continent of Europe, but in England, where comparatively few small birds are sought after for such use. It is chiefly on the downs of the s. of England, where vast flocks congregate before their autumn migration, that wheatears are caught for the market. The shepherds catch them by means of nooses placed in little excavations made in the ground, advantage being thus taken of the habits of the bird, which upon the least alarm, or even the shadow of a passing cloud, runs to hide itself.

WHEATFIELD, a town in Niagara co., N. Y., including the village of North Tonawanda. Pop. '90, 8808.

WHEAT-FLY, the popular name of certain species of dipterous insects, which are often very injurious to wheat-crops. One of them, *cecidomyia tritici* (see CECIDOMYIA), sometimes called the WHEAT MIDGE, and belonging to the same genus with the destructive Hessian fly of America, is too common both on the continent of Europe and in Britain, but fortunately is not very abundant except in particular years. It is supposed to be the same fly which appeared in the n. of New England in 1828, probably imported from the old world, and thence spread into New York and Canada, destroying a tenth part of the wheat-crop for several years, and only disappearing on being starved out by a change of crop, or by late spring-sowing of wheat. The eggs are deposited in the wheat when it is coming into flower, and the larvæ abstracting the juices, cause the grain to shrivel. The perfect insect appears in June, when great numbers may sometimes be seen on wing in the evening, their chief time of activity. It is about one-tenth of an inch in length, pale ocherous or orange, downy, with large black eyes, and long slender legs; the male with very long antennæ. The antennæ of the male differ much in structure from those of the female, and are of twenty-five joints, while those of the female have only thirteen. The larvæ are small and lemon-colored. A little black ichneumon lays its eggs in the larva of the wheat-fly, and is thus useful to the farmer by destroying it.—The name wheat-fly is also given to species of the genus *chlorops* (see CORN-FLY), destructive to wheat.

WHEATLEY, PHILLIS, 1753–84; a native of Africa; was brought to this country in 1761; purchased by Mrs. Wheatley of Boston, and by her well educated. When yet a girl she wrote many verses, and in 1774, when she was on a visit to England, was published her *Poems on Various Subjects, Religious and Moral, by Phillis Wheatley, Negro Servant to Mr. John Wheatley of Boston, in New England.* The book was reprinted in Boston.

WHEATLEY, WILLIAM, 1816–76; b. and d. New York, a well-known actor. He appeared at the Park Theatre, New York, 1826, playing at first juvenile parts; was for a time one of the managers of the Arch-st. theatre, Philadelphia, and subsequently lessee of Niblo's Garden, New York, where he produced *Black Crook.* Among his best representations were "Claude Melnotte," "Henri de Legardere," and "Captain Absolute."

WHEATON, FRANK, b. R. I., 1833; became a civil engineer, and from 1850 to 1855 was engaged in the boundary surveys of Mexico and California. In 1855 he became a lieut. in the cavalry and took part in the fort Kearney fight with the Cheyennes. In 1861 he was made lieut.col. of volunteers, and was present at the battles of Bull Run, Antietam, Fredericksburg, Gettysburg, Harper's Ferry, the Wilderness, Spottsylvania, and others. He commanded a division at Cedar Creek and elsewhere. At the end of the war he was lieut.-col. in the regular army, and in 1892 rose to the rank of brig.-gen.

WHEATON, HENRY, American jurist and diplomatist, was b. at Providence, R. I., Nov. 27, 1785, educated at Brown university; admitted to the bar in 1802; after which he spent several years in France, and six months in London, engaged in legal and literary studies. On his return to America, he resided in New York, where he contributed papers on international law to the *National Advocate,* a daily newspaper, and was appointed a justice of the marine court. In 1815 he published a *Digest of the Law of Maritime Captures or Prizes,* which has been commended as one of the best works in English on the subject. About the same time he published an *Essay on the Means of maintaining the Commercial and Naval Interests of the United States.* In 1816 he was appointed reporter of the proceedings of the supreme court of the United States, a post he filled until 1827. His reports, filling twelve volumes, a distinguished German has called "the golden book of American law;" and it is considered by the legal profession as a work of extraordinary ability and value. He also made frequent contributions to the *North American* and *American Quarterly Reviews,* and delivered addresses before literary societies. In 1825 he was engaged in revising the statute laws of New York; in

1826 he wrote his *Life of William Pinckney*, of which he furnished an abridgment for Sparks's *American Biographies*. In 1827 he was appointed *chargé d'affaires* to Denmark, and resided at Copenhagen till 1835, when he was appointed resident minister at Berlin, and in 1837, minister plenipotentiary, which post he occupied with distinguished credit until 1846. In 1831 his *History of the Northmen* appeared at Philadelphia, London, and Paris; in 1836, his *Elements of International Law;* in 1841 his *Essay*, for which he received the prize of the French institute, entitled *L'Histoire du Droit des Gens en Europe, depuis la Paix de Westphalie jusqu'au Congrès de Vienne*, which, in 1846, was published, greatly enlarged, in Leipsic and Paris, and an English translation in New York. This work is a standard authority, and its author received the highest honors from the learned societies of Europe, and his own countrymen. Having retired from political life, he died at his residence at Dorchester, Mass., Mar. 11, 1848.

WHEATSTONE, Sir CHARLES, physicist and electrician, was b. at Gloucester in 1802. From school he went to the making of musical instruments, and afterward entered into business on his own account in London. But he was no ordinary manufacturer; the scientific principles involved in the construction of instruments occupied his thought; he made many improvements, and in 1823 published a paper entitled *New Experiments on Sound*. Endowed with remarkable ingenuity, he produced numerous models and apparatus to illustrate the phenomena of acoustics and of light, his attention having been drawn to the latter by the analogies between the two subjects. Few men have done so much toward enabling the student to apprehend the principles on which scientific theories are based, particularly those of the undulatory theory of light.

In 1833 Mr. Wheatstone communicated his first paper, *On Acoustic Figures*, to the Royal society; followed in 1834, by *Experiments to Measure the Velocity of Electricity*, in which, with a mirror revolving 800 times in a second, he demonstrated the velocity at 288,000 m. in a second—greater than that of light. In the same year he was appointed professor of natural philosophy in King's college, London. In 1836 he was elected a fellow of the royal society; and in a course of lectures at the college on the velocity above referred to, he anticipated the electric telegraph by experimenting through 4 m. of copper wire. In May, 1837, a patent was taken out in the joint names of Cooke and Wheatstone, "for improvements in giving signals and sounding alarms in distant places by means of electric currents transmitted through metallic circuits." From this instrument, which had five needles, has grown that system of electric telegraphs which now ramifies over the length and breadth of the United Kingdom. The first working-telegraph—insulated copper wires inclosed in an iron tube—was constructed on the Blackwall railway in 1838.

To enumerate the titles only of Professor Wheatstone's papers on scientific subjects, and describe his various inventions, would fill many pages: a few only can be indicated here. In a paper on binocular vision laid before the royal society in 1838, he explained the principle of the stereoscope, an instrument of his invention: in 1840 he showed that, by means of electro-magnetism, a number of clocks far apart might be kept going with absolute exactitude from one central clock; and in 1843 he brought out his new instruments and processes for determining the constants of a voltaic series. In 1840, and again in 1843, the royal society awarded him their royal medal—a high acknowledgment of the merit of his researches. For a long time after that date, scarcely a year passed without a paper on some recondite scientific subject, or some new invention, or improvement on former inventions, from the hand of Professor Wheatstone, which heightened his reputation, and procured him substantial pecuniary reward. Among his inventions are his cryptograph; his automatic telegraph in two forms; his telegraph thermometer and barometer, by which an observer at the foot of a mountain could read the indications as shown by the instruments on the summit; a machine for the conversion of dynamical into electrical force without the use of permanent magnets, by which large quantities of electricity can be produced at a cheap rate; and an apparatus for conveying instructions to engineers and steersmen on board large steam-vessels.

Professor Wheatstone sat many times on the council, and was a vice-president of the royal society. He was also a corresponding member of the leading foreign scientific academies, and in 1873 he was elected foreign associate of the science department of the institute of France. In 1868 he received from her majesty the honor of knighthood, and in the same year the royal society bestowed on him its Copley medal. He was made LL.D. in 1869 by the university of Edinburgh. He died in 1875.

WHEATSTONE'S BRIDGE. An important electrical instrument for measuring the resistance of wires, etc. The greatest degree of accuracy of measurement is obtained by the so-called Bridge method, in consequence of its employment of an artificial balancing or duplicate resistance with which the other is compared electrically. This second resistance is so constructed as to afford a second path for the testing current, and it is only necessary to determine by means of suitable galvanometers the relative ease with which the current passes through the two resistances to determine the amount of the unknown resistance compared with that of the artificial one, which is, of course, known.

WHEEL AND AXLE, the second of the mechanical powers (q.v.), is a modification of the lever (q.v.). Its most primitive form is a cylindrical axle, on which a wheel concentric with the axle is firmly fastened. When employed for raising heavy weights, the weight is attached to a rope which is wound round the axle, and the power is applied

either to a rope wound round the grooved rim of the wheel, or to a handle fixed at right angles to the wheel's rim (in the latter case, the wheel may be dispensed with, unless it is useful as a conservator of momentum [see FLY-WHEEL], and an ordinary winch substituted). The wheel and axle is neither more nor less than a lever, whose extremities are not points as in the normal form, but the circumferences of circles. Accordingly the power and weight are not attached to particular points in these circumferences, but to cords wound round them, and thus the imaginary simple lever (formed by joining the points where the cords become tangents to the circles), is preserved unaltered in position and magnitude. The conditions of equilibrium are, that P (the power) × the radius of the wheel = W (the weight) × the radius of the axle, or, since the circumferences of circles are proportional to their radii, that P: W:: circumference of axle: circumference of wheel. When there is no wheel, but only a winch, the circumference described by the power in one revolution is substituted for the circumference of the wheel. The *capstan* and *windlass* are simple and common examples of this mechanical power, and combinations of toothed-wheels, or of wheels from one to another of which motion is communicated by an endless band, are compound illustrations of the same. See WINDLASS.

WHEEL-ANIMALCULE. See ROTATORIA.

WHEEL, BREAKING ON THE, a very barbarous mode of inflicting the punishment of death, formerly in use in France and Germany, where the criminal was placed on a carriage-wheel, with his arms and legs extended along the spokes, and the wheel being turned round, the executioner fractured his limbs by successive blows with an iron bar, which were repeated till death ensued. There was considerable variety in the mode in which this punishment was inflicted, at different times and in different places. By way of terminating sooner the sufferings of the victim, the executioner was sometimes permitted to deal two or three severe blows on the chest or stomach, known as *coups de grâce;* and occasionally, in France at least, the sentence contained a provision that the criminal was to be strangled after the first or second blow. Mercy of this kind was, however, not always allowed to be shown to the victims of the wheel; when Patkul, the envoy of Peter the Great, was put to death on the wheel by order of Charles XII. of Sweden, it is said that the officer in command of the guard was cashiered by the Swedish king in consequence of having allowed the head to be struck off before life was extinct in the mangled limbs. The punishment of the wheel was abolished in France at the Revolution; in Germany, it has been occasionally inflicted during the present century, on persons convicted of treason and parricide.

WHEEL-WORK. The arrangement for conveying motion from one axis to another by means of toothed-wheels, is familiar to every one; it has been in use since the days of Archimedes, and was in use, probably, for many centuries before; but it is only in modern times that the action of such wheels has been critically examined and understood. To a superficial observer, the action appears to be extremely simple; a tooth of the driver pushes against a tooth of the driven wheel, thereby causing that wheel to turn round; and, since by this turning the teeth must become disengaged, it is requisite that, before one tooth let go, a second tooth of the driver be ready to take hold of another tooth of the driven wheel. For this purpose, it is enough that the distances between the teeth on the two wheels be alike; in other words, that the diameters be proportioned to the number of the teeth.

When two unequal wheels act upon each other, the smaller one turns faster than the larger. Thus, if a wheel with 60 teeth work into one of 20, the latter will turn 3 times as quickly as the former; and it is on this principle that the trains of clock-work are arranged. For example, the *great-wheel* of a common house-clock may have 180 teeth, and may drive a smaller wheel, or *pinion* as it is called, of 15 leaves, and in this case, if the great-wheel turn once in 12 hours, the pinon must turn once in every hour; the axis of this pinon carries the minute-hand. On the same axis the *hour-wheel* is fixed which may have, say, 96 teeth, and may drive a pinion of 12 leaves. This pinion, then, must turn 8 times per hour, or once in 7½ minutes. On the same axis with this last-mentioned pinion there is fixed the *third wheel,* having, perhaps, 75 teeth, and this drives a pinion of 10 leaves, which, turning 7½ times as fast, must make one turn per minute. On the axis of this last pinion the *escape-wheel* is fixed. This escape-wheel has 30 teeth, each tooth acting twice upon the pendulum, thus making 60 beats per minute. In such a case as this, there is no difficulty in arranging the numbers of the teeth, and these may be varied in many ways, provided the proper proportions be kept. But in other cases, a considerable amount of skill, and often a great deal of labor, is required for the discovery of the proper numbers. Thus, if it be wished to indicate the moon's age on the dial of a clock, we must have an index turning once in the time between new moon and new moon. This time, which astronomers call a *lunation,* averages 29 days, 12 hours, 44 minutes, and nearly 3 seconds (2.853), and it is by no means an easy matter to find out what number of teeth will produce this motion. The mouth-wheel would need to turn rather more than 59 times as slowly as the great-wheel of the clock; and if the mean lunation had been 29½ days, without the odd 44 minutes, the thing could have been managed by making a pinion of 8 teeth lead a wheel of 59 teeth, on the axis of which another pinion, say of 10 teeth is fixed, and made to work a wheel of 50 teeth.

But then such an arrangement would go wrong nearly three-quarters of an hour every month, and in three years would indicate new moon a day too early. In order to obtain a better train, we may compute the number of days in 2, 3, 4, 5 lunations until we get nearly a number of half-days. Now, 16 lunations consist of 472 days, 11 hours, 45 minutes, or almost exactly 945 turns of the great-wheel. This proportion can be obtained by causing a pinion of 12 teeth to lead a wheel of 81 teeth, and another pinion also of 12 teeth to lead a wheel of 105 teeth. This arrangement gives an error of one quarter of an hour in 16 months, or hardly an hour in 5 years. If still greater precision be required, we must carry the multiples further: 33 lunations make 974 days, 12 hours, 13½ minutes, or 1949 turns of the great-wheel of the clock; but then this number 1949 has no divisor, and it is quite impracticable to make a wheel of 1949 teeth; so that we must continue our multiples in search of a better train. In this way, when great exactitude is desired, we often encounter an unexpected amount of labor. For reducing this labor, the method of continued fractions is employed, and the toil is further lessened by the use of tables of divisors.

Such calculations have to be made for the construction of orreries, by which the times of the revolutions of the planets are shown; and engineers have to make them, as when a screw of a particular pitch has to be cut. If, for instance, we have to cut a screw of 200 turns to the French meter on a lathe having a leading screw of 4 turns to the English inch, the axis of the lathe must make 50 turns while the screw makes 39 and a fraction, since the meter is 39.37079 inches. By applying the method of continued fractions, we discover that, for 2,225 turns of the lathe-spindle there must be 1752 turns of the screw; and as these numbers can be reduced into products—viz., 2,225 into 5x5x89, and 1752 into 2x2x2x3x73, we can easily get trains to produce the required effect. From these illustrations, it is apparent that the computation of the trains of wheel work is intimately connected with the doctrine of prime and composite numbers.

The general sizes of the wheels and the number of the teeth having been fixed on, the next business is to consider the shape which those teeth ought to have. Now, for the smooth and proper action of machinery, it is essential that the uniform motion of one of the wheels be accompanied by a motion also equable of the other wheel. Two curves have been known to give this quality of equable motion—viz. the epicycloid, formed by rolling one circle upon another, and the involute of the circle traced by the end of a thread, which is being wound upon a cylinder, or unwound from it. But the general character of all curves which possess this property has been only lately examined. If it were proposed to construct two wheels which shall have their centers at the points A and B (fig. 1), and the one of which may make 5 turns while the other makes 3, we should divide the distance AB into 8 parts, and assign 5 of these for AC, the radius of the one wheel, the remaining 3 parts for the radius BC of the other wheel. Wheels made of these sizes, and rolling upon each other, would turn equably, and if the circumferences be divided into 5 and 3 parts respectively, the points of division would come opposite to each other as the wheels turned. The circumferences of these circles are called the *pitch-lines*, and the portions of them included between two teeth is called the *distance of the teeth;* the distance, or arc CD, on the one wheel must be equal to the distance CE on the other wheel, in order that the motion may bring the two points D and E together. For a reason that will appear in the sequel, we cannot use wheels with so few as 3 or 5 teeth, and therefore we subdivide the distances CD and CE into some number of parts, say 4, and thus obtain wheels of 20 and 12 teeth instead. Since the tooth of the one wheel must necessarily come between 2 teeth on the other, the distance between the teeth must be halved, the one half being given for tooth, and the other half for space.

Having then divided off the pitch-line of the wheel B, as in fig. 1, CD being the distance of the teeth, CG the half distance, let us sketch any contour, CFGHD, for the shape of a tooth, and let us examine what should be the characters of this outline. In the first place, the form of this outline must be repeated for each tooth; and in the second place, the line should be symmetric from the top, F, of the one, to the top, I, of the next tooth, in order that the wheel may be reversible face for face. These obvious conditions having been attended to, let us cut, in thin sheet brass or other convenient material, a disk having this outline, and let us pin its center at the point B. Having prepared a blank disk on which the outline of A is to be traced, let us slip it under the edge of the previous one, and pin its center at the point A. If, now, B and A being held fast, we trace the outline of B upon A, we move each of them slightly but in the proper proportion forward, and make a new trace upon A, and so continue as far as needed, we shall obtain a multitude of curve lines marked upon A. The line which envelops and touches all these curves is, obviously, the proper outline for the wheel A; and thus it appears, that whatever outline, within reasonable limits, may have been assumed for the teeth of B, it is always possible by a geometrical operation, to discover the

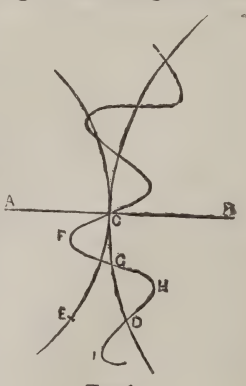

Fig. 1.

proper corresponding form for the teeth of A. These forms may be called *conjugate* to each other, inasmuch as, that if the disk A were now cut out and used as B has been, the identic form of B would be reproduced.

We may obtain a whole series of wheels, A′,A″,A‴, etc., from the same original B; and from A as an original, we may obtain another series, B′,B″,B‴, etc., having various numbers of teeth. And it has been shown that any wheel of the series A will work accurately along with any one of the series B. So far well; but then the wheel A of 20 teeth may not be like the wheel B of the same number of teeth. It becomes, therefore, a desideratum to choose the form of the teeth of B in such a manner that its conjugate of the same number of teeth may have the same form; by such an arrangement, we shall obtain a series of wheels, any one of which will work with any other.

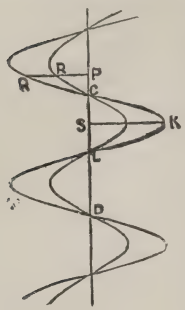

Fig. 2.

If the number of the teeth of B be augmented indefinitely, the outline of the pitch-line will become nearly straight; and so drawing through C (fig. 2) a straight line to touch the pitch-line of A, we shall have the pitch-line of the straight rack, as it is called, which could be worked by any wheel of the series A. The reverse of this rack would work with any one of the series B, and therefore, if the series A and B be identic with each other, the rack must be its own reverse. Thus we obtain a very important general result—viz., that if we mark off along a straight line distances, CD equal to the desired interval between the teeth, and then draw any line CKLMD, consisting of 4 equal parts, CK, KL, LM, MD, symmetrically arranged, all the wheels obtained from this as the original, will work into each other; and moreover the forms thus obtained answer for internal as well as external teeth.

Being then at liberty to choose any line whatever, subject to the above condition of symmetry, for the figure of the straight rack, we may inquire whether it may not be arranged so as to bring about other desiderata. This line, it may be noted, is not necessarily curved; it may be composed of straight lines, or partly of straight and partly of curved lines.

The general appearance of this wavy line recalls that curve known as the curve of sines, which, indeed, is the simplest known curve, consisting of equal and symmetric undulations, and unlimited in extent. By changing the ordinates in any ratio, say in the ratio of PQ to PR, the waves of the curve may be made shallower or deeper; and on studying the effects of such a change, we discover some new and very important laws concerning the contacts of the teeth of wheels.

Beginning with the curve of sines *proper*, in which the greatest ordinate, SK, is equal to the radius of a circle of which CD is the length of the circumference, it is found that wheels traced from it can only touch each other at *one* point: of course such wheels cannot work, because the solitary contact is now on the back and now on the front of the tooth. In this case the contour of the tooth crosses the pitch-line at an angle of 45°. On deepening the teeth, still keeping to the same kind of curve, it is found that the wheels begin to touch at more points than one; and when they are made so deep as that the contour crosses the pitch-line at an angle of 65°, there are always three contacts, neither more nor less. If the teeth be still further deepened, the contacts become more numerous; they appear and disappear in pairs, so that with an inclination of, say, 68°, there would be sometimes three, and sometimes five contacts. When it becomes 70° 17′, there are always five; and with an inclination or 73° 11′, there are always seven points in contact at once.

Of these points of contact, some are on the sides of the teeth, and others are near the top and bottom; the latter, on account of the obliquity of their action, are of no use in driving; they may be called supplementary, and their number is always one less than the number of useful or working contacts. In the system of seven contacts, four are useful, two of them being forward, and two backward, so that two teeth are always in action at once; an arrangement by which a gradual improvement in the equality of the teeth is secured by their wearing.

When two properly formed wheels are put in motion, the points of contact move also, and describe a peculiarly shaped line, the nature of which depends on the character of the primary form adopted for the tooth of the straight rack. Conversely, if this path of the points of contact be first assumed, and the law of motion in it be observed, the form of the tooth of any wheel may thence be obtained; and this leads us to the most convenient way of making the delineation.

In fig. 3, the form of the straight rack and the corresponding shape of the teeth of a wheel of 20 are shown in contact, the depth of the tooth being such as to give five contacts, which in the drawing are at the five points marked 0. If we suppose the rack to be slid upward, carrying the wheel along with it, the points of contact will change; and when the motion has been one-eighth part of the interval between two teeth, these points will occupy the positions marked 1. When a motion of another eighth is made, the two upper contacts on the left hand merge into one, and are about to disappear; at the same instant, two new contacts begin at the lower point, marked 2; and thus the motion

continues in the order of the numbers marked along the peculiarly shaped path of the points of contact. Those contacts which occur along the crossing lines of the curve are working contacts; those which happen along the two external arcs, are supplementary. When the form of this path, and the positions of the successive points in it have been obtained by calculation, the outline of any wheel is easily traced geometrically.

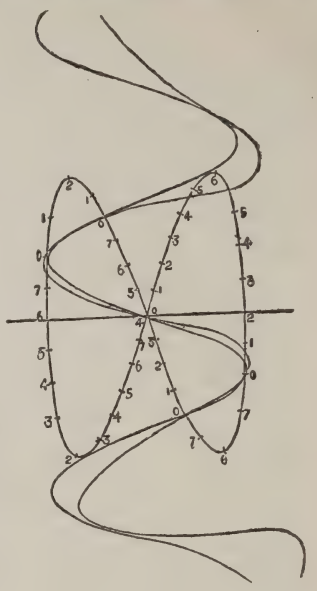

Fig. 3.

In well-constructed machinery there should never be fewer than seven contacts in the system, since of these only four are working; and therefore only two teeth are fully engaged; and it is necessary that two teeth be engaged at once, in order that the wearing may tend to remove any unavoidable inequalities of workmanship.

When we attempt to delineate the forms of wheels with few teeth by help of any of these orbits, we find that the contours overlap each other; in such cases the following tooth of the conjugate wheel effaces, as it were, the trace belonging to the preceding tooth; and the contacts, though still holding good of the geometrical curves, become mechanically impossible. Thus it is that there are limits below which we cannot go in the numbers of the teeth. If the overlapping occur at the shoulder of the tooth some of the useful contacts are wanting; but when the replication is only at the point of the tooth, the want of the supplementary contact occasions no inconvenience. An examination of the different cases shows that, with seven contacts, the smallest numbers which can be used on the three systems just mentioned are 19, 17, and 11, so that the system of epicycloidal teeth has, in this respect, the advantage over the others. Clock pinions, then, should not have fewer than eleven leaves. This method of considering the subject was first published by the writer of this article in *A New General Theory of the Teeth of Wheels* (Edinburgh, 1852).

It remains to cut the actual wheels to the shapes thus formed. The essentials of the operation are these: The blank wheel is attached to the axis of a large divided circle, which can be turned round and held in any desired position. A cutter, generally a revolving cutter, is brought down upon the blank, so as to notch out the space between two teeth; this done, the circle is turned round by the proper number of divisions, and another space is cut, and in this way the whole circumference of the wheel is gone over. In order that the work be well done, it is essential that the cutter be truly shaped; and when the edges get blunted by use, it is no easy matter to avoid spoiling the shape in the resharpening. Whatever system be followed, the form of the tooth varies from one number to another, so that the cutter which answers for a wheel of 20 cannot do for one of 30 teeth; and hence, when accurate results are wanted, there must be a cutter for each wheel. In order to avoid the expense of so many cutters, each requiring to be carefully made, the slovenly practice is too often followed of having, perhaps, two cutters, one to be used for pinions, the other for wheels; and the result is the intolerable noise which is so common in mills, and which, if properly understood, should be taken as an indication of unnecessary expenditure of power.

When, as in the wholesale manufacture of clocks and watches, multitudes of wheels are to be cut of one size, careful attention can be given to the shape of the cutter. The labor is economized by binding a considerable number of blanks together on the dividing engine, and plowing out the teeth of the whole of them at once. For the small wheels, technically called pinions, which cannot conveniently be fixed on the dividing-engine, *pinion-wires* are used; these are wires of brass or steel drawn through holes of the proper shape, and having the leaves running all along them. The watchmaker removes the leaves from those parts where they are not wanted, and thus obtains the pinion and its axle in one piece; in this way he gains the advantages of solidity and economy of workmanship.

Among the many purposes to which wheel-work is applied, it sometimes happens that an unequable motion is wanted. Thus, in the construction of an orrery, it is desirable that while one index turns uniformly to show the time, another may turn so as to show the unequal motion of the sun in the ecliptic. In that case the variations of the velocity are small, and it is enough to divide the teeth unequally, as the slight inequality can hardly affect the working of the apparatus. But when the changes of velocity are considerable, the matter must be more carefully looked into. If we suppose the pitch-lines of two wheels to be uneven, and to roll upon each other without regard to the positions of their centers, the forms of teeth to be arranged upon those pitch-lines may be traced out almost in the manner already explained for round wheels. The pitch-line must be divided into equal distances, and the disk must receive a half-sliding, half-

turning motion, so that the pitch-line may pass through the point C (fig. 4) always perpendicularly to the line AB, which is the line of centers for round wheels. The combination of this motion with the proper motion of the points of contact gives true forms for the teeth.

Thus, the form of the tooth can be obtained when that of the pitch-line is known. Now, when two disks, turning on fixed centers, touch each other at any point out of the straight line joining these centers, there is a slipping of the one surface over the other; and therefore, in order that the pitch-lines may roll together, they must be so shaped as that the point of contact may be in the line of centers. It can be shown that, for any assumed contour of the wheel A, another contour having its center at B, and rolling upon A, is possible. But, except in one or two special cases, the working out of the problem has not been accomplished. It will be enough here to mention the single case of elliptic wheels. The action of these is founded on the well-known property of the ellipse, that the sum of the distances of any point in it from the two foci is constant, and that the curve makes equal angles with these two lines. Hence two equal ellipses turning on their foci, when their centers are at a distance equal to the major axis of the ellipse, will roll upon each other; and teeth formed upon these as pitch-lines will work perfectly. When the ellipses have their major and minor axes in the proportion of 5 to 4, the focus is at one-fifth part of the major axis from one end; and therefore one focus, at one part of the revolution, moves four times as fast—at another part, four times as slowly—as the other focus.

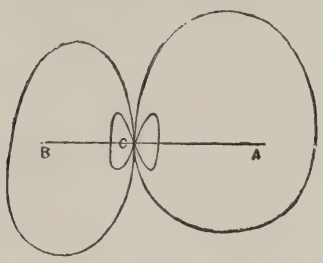

FIG. 4.

Sometimes one of the wheels has to be quite at rest during part of the motion of the other wheel. This is accomplished by causing some part of the wheel that is to be stationary, to bear upon a part of the circumference of the moving-wheel which is concentric with its axis. This is exemplified in the arrangement for counting wheels shown in fig. 5. The object of this apparatus is to count and record the revolutions of the wheel B. As this wheel turns round, a pin E attached to it enters into the slit GH, and thus carries the wheel A round as long as the pin remains in the slit, that is, until the slit GH be brought into the position IK. As soon as E leaves the slit at I, there would be no further connection between the two wheels, and A could be moved anyhow, altogether independently of B. In order to prevent this, the disk B is made nearly five-sixths entire, and parts of A are scooped out between the slits so as to receive and to fit B. By this means A is prevented from being turned either backward or forward until the pin E again comes into one of the slits. When this happens, the projecting part at G finds room in the recess F. If there be seven slits, GH, round the wheel A, and if B turn once in twenty-four hours, an index attached to A would show the days of the week; and the index might be made to be stationary all day, the change being effected during the night. Another example of this kind of interrupted motion is seen in the ordinary dead-beat clock escapement, in which the detaining surface of the pallet is concentric with the axis of the crutch.

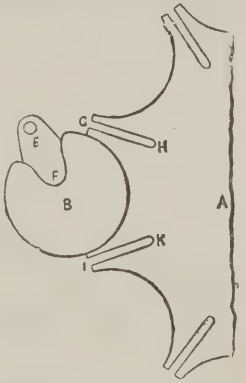

FIG. 5.

When the axes are inclined to each other, *beveled* wheels are used. Just as common wheels may be regarded as fluted cylinders, beveled wheels may be described as fluted cones having a common apex. The principles which regulate the formation of the teeth of these are the same as for plane wheels, but the application of these principles is considerably more intricate. Since both the teeth and the spaces between them are tapered, it is impossible to notch out the intervals by a single cut of a revolving cutter. Milling machines are now used for planing the teeth by means of a cutter moving in a line toward the apex of the cone. The subject is treated in great detail in *Kinematics, or Mechanical Movements*, by C. W. MacCord.

WHEELER, a co. in n. Nebraska; formed 1877; traversed by Cedar creek; surface rolling; soil fertile; 576 sq. m. Pop. '90, 1683. Co. seat, Bartlett.

WHEELER, a co. in n. Texas; formed 1876; organized, 1879; 900 sq. m. Pop. '90, 778. Co. seat, Mobeetie.

WHEELER, BENJAMIN IDE, was born at Randolph, Mass., July 15, 1854. He studied at the Colby academy, New London, and graduated at Brown university in 1875. From 1875 to 1879 he taught in the Providence high school, and was tutor in classics at Brown university, 1879–81. For the next four years he pursued courses at Leipzig, Heidelberg, Jena, and Berlin, receiving his degree of Ph.D. from Heidelberg in 1885. Returning to the United States, he became instructor at Harvard university in 1885, and professor of

comparative philology at Cornell university in 1886. He is the author of *The Greek Noun-accent* (Strassburg, 1885); *Analogy, and the Scope of its Application in Language* (Ithaca, 1887); *Principles of Language Growth* (London, 1891); joint editor with H. A. Strong and W. S. Lageman; and has contributed to the *Classical Review*, *American Journal of Philology*, etc. In 1895–96 he was director of the American school at Athens.

WHEELER, David Hilton, D.D., b. Ithaca, N. Y., 1829; moved west; was educated at the Rock River sem., and was ordained in the ministry of the Meth. Epis. church. He was a tutor in his alma mater, and was prof. of Greek at the Iowa Conference sem., Mt. Vernon. He was appointed by Pres. Lincoln U. S. consul to Geneva, and became the correspondent from that city of the New York *Tribune* and the Chicago *Tribune*. Upon his return to the U. S. he was appointed prof. of English literature and history in the Northwestern univ. While in Chicago he edited the *Lakeside Monthly;* was editor of the *Methodist*, 1875. He has pub. *Brigandage in South Italy*, and has translated Celesias' *Conspiracy of Giov. Luigi Fieschi.*

WHEELER, Joseph, M. C., born in 1836, was graduated from West Point in 1859, and received a commission in the U. S. army, which he resigned in 1861 to join the Confederate army. He served with distinction in nearly all of the military operations of the southwest. After the war he was lawyer and cotton planter until 1880, when he was elected to congress from Alabama. His election was contested and he was deprived of his seat, but was re-elected in 1884, 1886, 1888, and 1890.

WHEELER, Nathaniel, b. Watertown, Conn., 1820; received an ordinary education, and engaged in manufacturing. In 1850 Allen B. Wilson brought to his notice certain inventions and improvements in the manufacture of sewing-machines. Mr. Wheeler and others furnished the necessary capital, and in 1852 a patent was obtained, and the "Wheeler and Wilson Manufacturing company" was founded. The immense works of this establishment are now at Bridgeport, Conn. See Sewing-Machines.

WHEELER, William Almon, born Malone, N. Y., 1819; entered the university of Vermont, but did not graduate. He then studied law, was admitted to the bar, and was for some time district attorney of Franklin co., N. Y., which he represented in the assembly in 1850–51. He served in the New York senate in 1858–58, was president of the New York constitutional convention, 1867–68, a member of the 37th, 41st, 42d, 43d, and 44th congresses; and during the 43d chairman of the special committee which went to Louisiana and brought about the "Wheeler compromise." He was vice-president of the United States, 1877–81. He showed high legal attainments and a balanced judgment. He d. at Malone, June 4, 1887.

WHEELER, William Adolphus, 1833–74; b. Mass.; graduated at Bowdoin college, 1853, and for some years taught school. In 1859 he became the assistant of Worcester in the compilation of his dictionary, and afterward did important work in the revision of Webster's dictionary and in editing Hole's *Biographical Dictionary* and the *Dickens Dictionary*. From 1867 until the time of his death he was assistant librarian of the Boston public library.

WHEELING, city, port of entry, and co. seat of Ohio co., W. Va.; on the Ohio river, and the Baltimore and Ohio, the Cleveland, Lorain, and Wheeling, the Pittsburg, Cincinnati, Chicago, and St. Louis, the Wheeling and Lake Erie, the Ohio River, and other railroads; 65 m. s.w. of Pittsburg. It was settled by Ebenezer Zane in 1769, was laid out as a town in 1793, incorporated as a town in 1806, and as a city in 1836, and was the state capital in 1863–70 and 1875–85. It contains a U. S. government building, Wheeling and city hospitals, public library under the direction of the board of education, Masonic and Odd Fellows halls, national, state, and savings banks, over 30 churches, including the Roman Catholic cathedral of St. Joseph, electric light and street railroad plants, and waterworks on the Holly system. The U. S. census of 1890 reported for Wheeling, 418 manufacturing establishments, employing $8,494,630 capital and 6850 persons, paying $3,037,727 for wages and $7,381,940 for materials, and having a combined output valued at $13,022,589. The principal manufactures are iron and steel nails and spikes, iron and steel, malt liquors, glass, cigars, tanned leather, planing-mill products, and foundry and machine-shop products. There are suspension and steel bridges, the former over 1000 feet long and connecting the mainland with Zane's island, which constitutes one of the city wards, and Wheeling and Mozart parks. The city has a large river trade, and exports a great quantity of bituminous coal, in which the vicinity is rich, annually. Pop. '90, 34,522.

WHEELOCK, Eleazar, D.D., 1711–79; b. Conn.; graduated Yale college, 1733; ordained pastor of the Congregational church, Lebanon, Conn., 1735; established a school at Lebanon for the education of Indian youth, from which afterward grew Dartmouth college. He removed to Hanover, N. H., 1770, and was the president of the new college for 9 years. He published a *Narrative of the Indian School.*

WHEELOCK, John, D.D., LL.D., 1754–1817; b. Conn.; studied 3 years at Yale college; went with his father to Hanover, 1770, and graduated at Dartmouth college, 1771; was tutor, 1772–74; represented Hanover in the legislature, 1775; served for a time in the continental army; became lieut.col. and maj.; was on Gates's staff; elected president of the college on the death of his father, 1779; visited England, 1783, to obtain funds; was removed, 1815, on account of an ecclesiastical controversy, but restored in 2 years. He published *Sketches of Dartmouth College.*

WHEELWRIGHT, John, 1592–1679; b. England; graduated Cambridge, 1614; vicar of Bilsby, 1623–31; suspended by Laud for nonconformity; came to America, 1636; pastor at Braintree, Mass. His adoption of the religious views of his relative, Ann Hutchinson, alienated Mr. Wilson pastor of the Boston church; this and a sermon considered seditious caused his banishment from the colony by the general court, 1637. He went to New Hampshire, founded the town of Exeter; organized a church; removed with a part of the church to Wells, Me.; returned to Massachusetts, 1646; was minister at Hampton, 1646–54; went to England and was well received by Oliver Cromwell, who had been his classmate; returned, 1660; pastor of Salisbury, N. H., 1662. He published a reply to Thomas Welde's *Mercurius Americanus* (1645), and a *Vindication* (1654).

WHEELWRIGHT, William; 1798–1873; b. Mass.; became a sailor, and engaged in trading on the coast of South America. In 1835 he undertook to establish a line of steamers on the w. coast, and the result was the great Pacific Mail steamship company. From 1842 until the time of his death he was engaged in the construction of South American railroads, the most important being that from Caldera across the Andes to Rosario on the Parana, 934 m., opened in 1872. Wheelwright was the first to introduce the telegraph system and lighting by gas into South America.

WHELK, *Buccinum* a genus of gasteropodous mollusks, of the family *buccinidæ*. The shell is ovate, turreted, and more or less ventricose; its mouth ovate, emarginate, or produced into a very short canal below, the outer lip expanded, the inner lip usually thin and smooth within. The operculum is horny. The animal has a broad head, with two tentacula, with the base of which the stalks bearing the eyes are united, the proboscis is large, and the tongue armed with teeth, which are used for the purpose of rasping substances used for food—almost any animal substance being welcome for this use—or for perforating the shells of other mollusks in order to prey upon them. There are about 20 known species, chiefly found on the coasts of the colder parts of the world. The British coasts produce several species, of which the most abundant is the Common Whelk (*B. undatum*). It occurs from low-water mark to a depth of 100 fathoms, is some times 3 in. in length, grayish or brownish white, with numerous raised ridges and spiral striæ. It is very widely distributed in the northern parts of the northern hemisphere, and is one of the most common mollusks of the arctic regions. It is much used as an article of food, is cooked simply by boiling, and is generally eaten with vinegar and pepper.

WHEWELL, William, D.D., was b. in 1794 at Lancaster. His father intended him for his own trade—that of a joiner; but the boy having excelled at school in mathematics was persuaded to go to Cambridge. He entered at Trinity college, and graduated (second wrangler, and second Smith's prize-man) B.A. in 1816. He became a fellow, and afterward a tutor of Trinity, where also, for many years, he acted as a successful "coach," or private tutor. In 1820 he became a fellow of the royal society. Between 1828 and 1832 he was professor of mineralogy in Cambridge; and between 1838 and 1855, professor of moral theology, or casuistry. In 1841 he was appointed master of Trinity; and in the same year, he was president of the British association at its meeting at Plymouth. He was also, for a time, president of the geological society. In 1855 he became vice-chancellor of the university of Cambridge. He died at Trinity (1866), in consequence of injuries sustained through a fall when riding.

Whewell, when he acted as a private tutor, produced several text-books on mathematical subjects (one of which, his *Dynamics* [1823], is deservedly admired), which were for a time popular, but may now be said to have been superseded. He also contributed a variety of papers to the transactions of learned and scientific societies, and to scientific journals, and to the reviews. In some of these, he treated of such subjects as the tides, electricity, magnetism, and heat; in others, of abstruse and recondite subjects, literary, historical, and metaphysical. Later in life, while he continued to write papers of this class, he concentrated his powers mainly on the production of large works. Among the most important of his books are—*Astronomy and General Physics considered in Reference to Natural Theology*, being the third Bridgewater treatise (Lond., 1833); *History of the Inductive Sciences, from the Earliest to the Present Times* (3 vols., Lond., 1837); *The Philosophy of the Inductive Sciences, founded upon their History* (2 vols., Lond., 1840); *The Elements of Morality, including Polity* (Lond., 1855). Among his other works are—*The Plurality of Worlds*, which had considerable popularity from its subject; *The History of Scientific Ideas, Novum Organum Renovatum; Notes on the Architecture of German Churches; Lectures on the History of Moral Philosophy in England; Indications of the Creator;* translation of Goethe's *Herman and Dorothea;* translation of Auerbach's *Professor's Wife;* translation of Grotius's *Rights of Peace and War;* a translation of Plato's works; and *The Platonic Dialogues for English Readers.* Besides these books, he published many essays, as yet uncollected. His last composition, so far as is known, is an attack on Comte and Positivism, which appeared in *Macmillan's Magazine* after his death.

Whewell's acquisitions were most various; it would have been sufficient occupation for the lives of most book-worms to have made them. His writings, again, were so various and voluminous, it might be thought sufficient employment of the life of a mere clever book-maker to have produced them. Whewell was neither book-worm nor book-maker. A clear-headed student, he was always increasing his stock of knowledge; a vigorous and independent thinker and writer, he was always giving forth the results of his studies to the public; and having thus proceeded during a long life of almost unin-

terrupted good health, he may be taken as illustrating what at the best may be achieved by a man of ambition, ability, and unflagging industry, without genius. He was nowise superficial, like many pretenders to encyclopædic knowledge; he was really master of all that could be learned on a great many subjects. It has been said of him, "knowledge was his forte, omniscience his foible;" but it is absurd to suggest that a man can have and strain after too much knowledge, if it be, as his was, thorough knowledge. His chief ambition was to grasp, survey, and co-ordinate the sciences; and he did excellent service both to science and history in the effort to gratify it. The task suited one of his extraordinary acquisitions, good sense, and philosophic comprehension. Had he been a man of more imagination and ingenuity, he might, of course, have been better employed in endeavoring to advance some single science. As he was, this was beyond him: he made some original investigations; but the results must be pronounced unimportant.

Whewell was a large, strong, erect man, with a red face and a loud voice. He was an effective preacher and lecturer, though in both characters wanting in that "something" which wins and rivets the hearer. He was accused of being arrogant; and his general bearing gave color to the charge. A story, long current, may be told as illustrating at once his varied knowledge and his personal relations to his brother fellows. He used so to overwhelm with his learning the company at the fellows' table and in the combination room, that a conspiracy was formed to put him down. Some fellows got up a knowledge of Chinese music from scattered articles in old reviews, with which they presumed he would be unacquainted. They then made Chinese music the subject of, as it were, a casual conversation at table. For a time, contrary to his usual habit, he took no part in the conversation. When they had about exhausted themselves, however, he remarked: "I was imperfectly, and to some extent incorrectly, informed regarding Chinese music when I wrote the articles from which you have drawn your information." They were caught in their own trap, and had, as on other occasions, to submit to be instructed. See Todhunter's *W.*, and *Life* by Mrs. Douglas.

WHEY. When any substance, possessing the property of coagulating casein, is added to milk, the coagulated casein separates in flakes and clots, and sinks to the bottom, constituting what is termed the *curds;* while the supernatant, straw-colored fluid is known as the *whey*. Cheese-making affords the principal source of whey, which, thus obtained, forms, like butter-milk, a very valuable kind of drink. The whey of goat's milk is regarded as specially beneficial, and in Switzerland and elsewhere, large establishments have been set up for carrying out the *whey-cure*, either alone or in association with the grape-cure. There can be no doubt that, were the cases judiciously selected, much good, in the way of eliminating morbid matter, might be effected in a few weeks by confining the patients to a diet of brown bread, grapes, and whey; while, on the other hand, many diseases might be much aggravated by that treatment. In ordinary medicine, we recognize several useful varieties of whey, as: White-wine whey, prepared by the addition of sufficient sherry to a tumbler of heated milk to coagulate the casein. On decanting off the whey from the curds, and sweetening, we obtain a favorite sudorific draught, which may be taken with advantage as a sudorific at bedtime, whenever there is a threatening of incipient cold in the head. *Cream of tartar whey* and *niter whey*—the former prepared by boiling 100 grains of cream of tartar in a pint of milk, and the latter by the similar use of niter—act in the same way as wine whey, but more powerfully. *Tamarind whey* has been already described in the article on that fruit.

WHIG, the name given to the adherents of the colonial cause during the controversy between Great Britain and her American colonies, and during the revolutionary war. The adherents of the crown were called tories or loyalists. The term whig lost its political signification in this country till 1832, when it was revived, and assumed by the opponents of Jackson, who then dropped the name of national republicans, by which they had been known and took that of whigs, imitating the English whigs, whose opposition to the power of the throne they compared to their own opposition to Jackson's extensive use of the veto-power. For its history, see UNITED STATES.

WHIG AND TORY, the names which for the last two centuries have been popularly applied to two opposite political parties in Great Britain. Both were at first names of reproach. *Whig* was originally a nickname of the peasantry of the western lowlands of Scotland, said by some to be derived from a word or sound used by them in driving their horses; by others, from *whig*, "an acetous liquor subsiding from sour cream."—*Jamieson*. Its next application was to the bands of Covenanters, chiefly from the west of Scotland, who, subsequently to the murder of archbishop Sharpe, took up arms against the government, and after gaining some successes in encounters with the king's troops, were defeated at Bothwell bridge. Thence the name whig (or whigamore) came to be fastened, first on the whole Presbyterian zealots of Scotland, and afterward on those English politicians who showed a disposition to oppose the court, and treat Protestant nonconformists with leniency. The word *tory*—said to be derived from *tora, tora*, in Irish, "give, give," or "stand and deliver"—was first given to certain bands of outlaws, half-robber, half-insurgent, professing the Roman Catholic faitn, who harassed the English in Ireland; and was thence applied reproachfully to all who were supposed to be abettors of the imaginary popish plot; and then generally to persons who refused

to concur in the exclusion of a Roman Catholic prince from the throne. These two nicknames, which came into use about 1680, immediately became familiar words, and have since been retained as designations of two opposite political sides—the tories being, generally speaking, the adherents of the ancient constitution of England without change, and the supporters of regal, ecclesiastical, and aristocratic authority; while the whigs have been the advocates of such changes in the constitution as tend in the direction of democracy. The most sweeping constitutional change of the present century which the whigs have carried is the reform bill of 1832. Each party, while preserving within certain limits a general consistency of purpose, has undergone many changes in its principles, professions, and modes of action with the altering circumstances of the country; and among persons who have been considered adherents of each side at any given time, there have seldom been wanting a variety of more or less distinctive shades of opinion. A division in the ranks of either party has often led the more moderate section of that party to coalesce with the opposite side; and at other times, the extreme party of innovation, dropping their connection with the whigs, have adopted another name, as when those politicians whose desire was to have the whole institutions of the country remodeled on a democratic basis, assumed the designation of *radical reformers* or *radicals*. See also CHARTISM. For a considerable time after the reform bill, the governing section of the whig party were more disposed to maintain the principles of the changes already made, than to insist on further constitutional changes; and the principles maintained by whigs and tories sometimes approximated so closely that the difference seemed more one of men than of measures. Sometimes one party, sometimes the other, has appeared as the advocate of measures which have proved beneficial. In the agitation for the repeal of the corn-laws, which lasted from 1841 to 1846, the tories were ranked on the side of protection, and the whigs of free trade; but the relations of the two parties had been the reverse at a former period, when Mr. Pitt's advocacy of free trade between England and Ireland was opposed by the manufacturers of Lancashire, who succeeded in getting his measure postponed. During the last thirty years, the names *liberal* and *conservative* have to a great extent superseded the former party designations of whig and tory. See LIBERALS; LIBERAL UNIONISTS.

WHIMBREL, *Numenius phœopus*, a bird of the same genus with the curlew (q.v.), and much resembling it in form, plumage, and habits, but of smaller size, and with a bill considerably shorter in proportion. The female, which is larger than the male, is about eighteen inches in length, the bill being about three inches and a half. The plumage of the whimbrel is of a bright ash color, with streaks of brown on the neck and breast. The whimbrel is a very widely distributed bird, being found from the north of Africa and of India to the arctic regions of Europe and Asia. It occurs also in Japan. It is a bird of passage, and visits Britain chiefly in the course of its spring and autumn migrations. A few whimbrels breed in Shetland; but the number is diminishing, the eggs being in great request as a delicacy. The flesh is also highly esteemed.

WHIN. See FURZE.

WHIN-CHAT, *Saxicola rubetra* (see CHAT), a bird very similar to the stone-chat (q.v.), a summer visitant of Britain and of the northern parts of Europe. It is widely diffused over the British islands in summer, but nowhere very abundant. The head, sides of the neck, and upper parts of the body are blackish brown, each feather bordered with rusty yellow; an elongated streak of white above each eye; the throat and a streak on each side of the neck white; the breast, rust-color; a large white spot on each wing; the tail white, except the two middle quills and the tip, which are blackish brown. The colors of the female are less distinct than those of the male. The whin-chat frequents furze (or whin) bushes. Its song is pleasant.

WHIP (Parliamentary slang). A name applied to that member of the English Parliament whose duty it is to compel the attendance of his party, especially when a party vote is taken at divisions. The minor patronage of the Treasury is put into the hands of the ministerial whip in order to increase his influence.

WHIPPING. Corporal punishment by whipping, public as well as private, was formerly often awarded by the criminal law of England for minor offenses, such as petty larceny, and was not unfrequently superadded to some other punishment, such as imprisonment or the pillory. In early times, and by the usage of the star-chamber, whipping could not be competently inflicted on a gentleman.—In Scotland sentence of whipping was also frequent, the terms of the sentence sometimes requiring it to be repeated at intervals and in different parts of the kingdom. In the last century the Scottish burgh magistrates were in the habit of awarding sentence of whipping on summary convictions for police offenses, such as broils, street outrages, and the keeping of disorderly houses; but in modern practice the competency of inflicting this sentence at common law without the intervention of a jury has been made matter of doubt. Whipping used not long since to be an occasional addition to the sentence of the justiciary court on persons convicted of aggravated assaults.

The infliction of corporal punishment by whipping on women was prohibited by act 1 Geo. IV. c. 57. In act 5 and 6 Vict. c. 51, directed against attempts to injure or

alarm the queen by discharging fire-arms in her majesty's neighborhood, or otherwise, the infliction of public or private whipping not exceeding three times is made part of the punishment. Act 26 and 27 Vict. c. 44 (not applicable to Scotland) authorizes whipping in addition to penal servitude in convictions for robbery, assaults with intent to rob, and attempts to strangle or render insensible with a view of committing a crime, the number of strokes not exceeding 50 in the case of an adult, or 25 in the case of a boy under 16. Recent legislation, both in England and Scotland, has made various provisions for the infliction of this description of corporal punishment on juvenile culprits. Whipping of boys under 16 for various offenses is authorized by the English criminal consolidation act (1861); it being provided that the whipping is to be private, and not repeated more than once, and the instrument of punishment to be specified in the sentence. Similar provisions, with some additional ones, occur in 25 Vict. c. 18, as to the mode in which the same punishment is to be administered on summary convictions by justices. In Scotland, the prisons amendment act, 14 and 15 Vict. c. 27, and the act 23 and 24 Vict. c. 105, which superceded it, authorize the whipping of boys under regulations made by the lord advocate and approved by the secretary of state. By act 25 Vict. c. 18, no person above the age of 16 can now be whipped in Scotland for theft, or any crime against person or property. It is a very general impression among magistrates that whipping to the moderate extent allowed by 26 and 27 Vict. has had a most salutary effect in repressing certain kinds of outrage, the apprehension of mere imprisonment, or even of penal servitude, having little efficacy in the way of prevention. Thus, personal chastisement, the oldest form of punishment for crime, has to a certain extent been resumed in the administration of the criminal law.

As regards corporal punishment in the army and navy, see FLOGGING.

WHIPPLE, ABRAHAM, 1733–1819; b. Providence, R. I.; capt. of a privateer during the French and Indian wars. In 1772 he was commander of the expedition from Providence which burned the British schooner *Gaspee* in Narragansett bay, and 3 years later, with 2 armed vessels and 2 row galleys, he captured one of the tenders to the British frigate *Rose*. He commanded the schooner *Providence*, which did great damage to British shipping; and on her capture took command of the frigate *Providence*. In 1779 he fell in with a fleet of nearly 150 sail, under the protection of a 74-gun ship and some smaller vessels. Putting his guns out of sight, he ran up the British flag, joined the merchantmen, captured one every night, and sent her home with a crew taken from his own. He thus captured 10 vessels, 8 of which reached America in safety. In 1780 he lost his vessels, and was captured, while trying to rescue Charleston with a squadron; and he remained a prisoner till the close of the war.

WHIPPLE, AMIEL W., 1818–63; b. Mass.; graduated at West Point in 1841, and was appointed to the engineers. He was assistant astronomer to the commission on the n.e. boundary between the United States and Canada, 1844–49, and to the commission to determine the Mexican boundary, 1849–53. He was afterward engaged in surveys for a Pacific railroad, as a light-house engineer, and in other topographical work. In the war of the secession he was chief-engineer on McDowell's staff till 1862, when he was made brig.gen. and put in command of a brigade to protect Washington. He was in command of a division of the 3d corps of the army of the Potomac at Fredericksburg and Chancellorsville, and was mortally wounded at the latter battle.

WHIPPLE, EDWIN PERCY, b. Mass., 1819; clerk in banking houses at Salem and Boston, and afterward, till 1860, superintendent of the reading-room in the merchants' exchange in the latter city. He delivered poems and orations before various societies, and was a frequent contributor to the *North American Review*, to the *Atlantic Monthly*, the *Christian Examiner*, and other periodicals. Among his works are, *Literature and Life; Essays and Reviews; Character and Characteristic Men;* and *Success and its Conditions*. He d. 1886.

WHIPPLE, HENRY BENJAMIN, D.D., b. N. Y., 1822; was a merchant; studied theology with the Rev. Dr. Wilson; ordained deacon in the Protestant Episcopal church at Geneva by bishop Delancey; ordained priest at Sackett's Harbor, 1850; minister of Zion church, Rome, N. Y., 1850; rector of the church of the Holy Communion, Chicago, 1857; elected and consecrated bishop of Minnesota, 1859. He has been a warm friend and defender of the Indians, among whom he has established missions, which have been probably the most successful of such efforts. He advocates free churches, and nearly all churches in his diocese are free. He is held in very high regard as a sagacious, efficient, and devoted Christian laborer.

WHIPPLE, WILLIAM, 1730–85; b. Me.; became a sailor and engaged in the West India trade, in which he gained a fortune. He was a member of the provincial congress and committee of safety of 1775, and of the continental congress of 1776, being one of the signers of the declaration of independence. He led the New Hampshire troops at the battle of Saratoga; in 1778 was again in congress; and at the close of the war became a judge of the state superior court.

WHIP-POOR-WILL, *Caprimulgus* or *Antrostomus vociferus*, a species of goatsucker (q.v.), a native of North America, common in the eastern parts of the United States. It receives is popular name from the fancied resemblance of its notes to the words *Whip*

poor Will. It is about ten inches long, the plumage very like that of the European goat-sucker, much mottled and indistinctly marked with small transverse bands, the top of the head streaked with black, a narrow white collar on the throat. The bristles at the base of the bill are very stiff, and more than an inch long. This bird is seldom seen during the day, but seeks its food by night, catching moths, beetles, and other insects on the wing. Its flight is near the ground, zigzag, and noiseless. Its notes are heard only during the night, and are clear and loud, so that when a few of these birds are close at hand, the noise is such that those unaccustomed to it cannot sleep. In the more southern parts of the United States, the whip-poor-will is replaced by a larger species, the chuck-will's-widow (q.v.), and on the upper Missouri and to the west by a smaller one (*C.* or *A. Nuttalli*). See illus., BIRDS, vol. II.

WHIRLPOOL, a circular current in a river or sea, produced by opposing tides, winds, or currents. It is a phenomenon of rare occurrence on a large scale, but illustrations in miniature may be noticed in the eddies formed in a river by means of obstacles or deflections. The two celebrated sea-whirlpools, Charybdis (see SCYLLA) and Malström (q.v.), are now known to be merely "chopping seas," caused by the wind acting obliquely on a rapid current setting steadily in one direction while the tide is flowing, and in the opposite direction when it is ebbing. During calm weather, neither of these so-called whirlpools is dangerous for large ships, but when the current and the wind are strongly in opposition, the broken swell is so violent and extensive in the Malström as to founder large ships, or drive them against the rocks. Though in neither of these two cases, formerly so much dreaded, is there any vortical action, instances of such action do actually occur in various localities, as in the whirlpool of Corrievrekin (q.v.), and in some eddies produced by opposing winds and currents among the Orkney Islands.

WHIRLWINDS AND WATERSPOUTS. Whirlwinds differ in many respects from the storms described in the articles STORMS and TYPHOONS. They seldom continue longer than a minute at any place, and sometimes only a few seconds; their breadth varies from a few yards to nearly a quarter of a mile during their short continuance, the changes of the wind are sudden and violent; and the barometer is not observed to fall. The direction of the eddy of the whirlwinds, especially when the diameter is very small, differs from the rotation of winds in a storm, in that it may take place either way—right to left, or left to right—according to the direction of the stronger of the two winds which give rise to the whirlwind. Thus, suppose it to arise from a n. wind blowing side by side with a s. wind, and to the w. of it, then, if the n. wind be stronger, the whirl will be n. w., s., and e.; but it will be in a contrary direction if the s. wind be the stronger. Whirlwinds often originate within the tropics during the hot season, especially in flat sandy deserts; these becoming unequally heated by the sun, give rise to ascending columns of heated air. In their contact with each other, the ascending currents result in eddies, which draw up with them large clouds of dust, and the whole is borne forward by the wind that may happen to be blowing at the time. This is the origin of the *dust whirlwinds* of India, which have been admirably described and illustrated by P. F. H. Baddeley. These dust-storms are frequent in dry warm regions; and in the case of the *simoom* (q.v.), which may be regarded as a succession of such whirlwinds, they appear on a scale of the most appalling grandeur.

Extensive fires, such as the burning of the prairie in America, and volcanic eruptions, also cause whirlwinds, by the conflicting currents of heated air they occasion; and these, as well as the whirlwinds already mentioned, are generally accompanied with heavy rains, hail, and electrical displays. Whirlwinds are also of frequent occurrence in France, doing great damage to the vineyards and other crops; but in Great Britain they seldom occur.

Waterspouts are whirlwinds occurring on the sea or on lakes. When fully formed they appear as tall pillars of cloud stretching from the sea to the sky, whirling round their axes, and exhibiting the progressive movement of the whole mass precisely as in the case of the dust-whirlwind. The sea at the base of the whirling vortices is thrown into the most violent commotion, resembling the surface of water in rapid ebullition. It is a popular fallacy that the water of the sea is sucked up in a solid mass by waterspouts, it being only the spray from the broken waves which is carried up. Observations of the rain-gauge conclusively prove this.

What are sometimes called *waterspouts on land* are quite distinct from these phenomena. They are merely heavy falls of rain of a very local character, and may or may not be accompanied with whirling winds. They generally occur during thunderstorms, being quite analogous to severe hail-storms, from which they differ only in point of temperature. Also all the moisture that falls is the result of condensation; whereas, in the true waterspout the rain is mixed with spray which has been caught up from the broken waves, and carried aloft by the ascending currents of the whirlwind.

WHIS'KY (Gaelic, *uisge*, water; *uisge-beatha*, commonly written *usquebaugh*, water of life), a spirit made by distillation from grain, roots, and other materials, the best being produced from barley after it has been malted, though what is termed raw grain whisky (made from wheat, oats, rice, rye, Indian corn, buckwheat, millet, etc.), after being kept for two or three years, is scarcely inferior in quality. Whisky is also made from beet-root, potatoes, beans, molasses, sugar, etc. In these cases malt is used to a small

extent. The mode of manufacture is described under DISTILLATION. Whisky was formerly almost exclusively manufactured in Scotland, Ireland, and the United States; but distilleries are now at work largely in England, Prussia, Sweden, France, Holland, and Belgium, the foreign spirit being, however, coarser, and only suited for fortifying wines and for methylated spirit for manufacturing purposes. According to the statistics for 1871 there was distilled in Scotland 13,813,062; in Ireland, 9,302,253; and in England 7,739,720 gallons. In 1881–82 duty was paid in England on 13,868,006 gallons; in Scotland on 8,620,255; and in Ireland on 7,192,329. The largest quantity is always made in Scotland; but owing to a large quantity of the spirit being removed to England duty free, to be converted by English rectifiers into British gin, duty is paid on it in England. Scotland sends to England, in excess of the quantity returned from that country, about 3½ millions, and Ireland sends upward of a million gallons annually.

In 1858, the duty on spirits was equalized in the three kingdoms, thus putting a stop to the systematic and (as was found) irrepressible practice of smuggling spirits from Scotland and Ireland into England, which had prevailed for a long time previously. The duty was in 1860 raised to 10s. per imperial gallon, at which rate it still remains. This rate was increased to its present value by Mr. Gladstone with the avowed intention of diminishing the consumption of ardent spirits; and though it does not seem to have produced this effect, neither has it, as was always the case formerly, increased the practice of illicit distillation, owing to the improved moral tone of the population, the more thorough execution of the law, and the great capital embarked in the distilling trade acting as a deterrent against fraudulent distillation on any extensive scale. Illicit distillation is now very much on the decrease, and is almost confined to Ireland. The high price of whisky, besides limiting its consumption, has had a deleterious effect in increasing the temptation to produce a cheaper drink for the poorer classes by introducing noxious materials resembling it in effect and flavor. In years when the vine crop in France is a failure, large quantities of whisky are sent to that country, and returned as French brandy. In the United States the process of manufacture is the same as in this country, and is largely carried on in New York, Pennsylvania, Ohio, Illinois, Indiana, Kentucky, and, in a less degree, in Tennessee, Missouri, and California. A large quantity is also rectified, and reduced to alcohol, and much is exported and in part returned in the form of "French brandy," "Hollands," etc. The "Monongahela" whisky of Pennsylvania, and that from Bourbon county, Kentucky, are considered the best in the United States.

The quantity of grain consumed in the U. S. in 1884, in the production of spirits, amounted to 18,927,982 bush., being about 3,000,000 more than the number used in 1883. The average consumption for the last five years has been 24,065,879 bush., and the average yield per bush. has been a little more than 3.8 gals. The number of grain distilleries in operation during the year ending 1884, June 30, was 1078, being a small decrease from the number operated in 1883. The tax on spirits distilled from grain, etc., was $67,951,906 in 1883, and $70,631,860 in 1884. There was produced and bonded in 1884, of Bourbon whisky, 8,896,832 galls.; of rye, 5,089,958. 1884, June 30, the bonded warehouses contained 41,177,059 galls of bourbon, and 15,005,057 of rye whisky. There was exported in 1884, 3,401,410 galls. of bourbon and 710,858 galls. of rye. The internal revenue tax on whisky is 90 cents per proof gallon.

WHISKY INSURRECTION. A series of revolts in Western Pennsylvania against the execution of excise laws, culminating in an extensive uprising in 1794. The main causes of revolt were, first, the inherent dislike of a free people to excise laws with their necessary adjunct of power to inspect private property; second, the comparative freedom from legal restraint which their remoteness had hitherto secured to the western counties; third, the difficulty of shipping grain from these counties except in the portable form of Whisky, which made the excise seem an unjust discrimination against them; fourth, political opposition to the exercise by the United States of a power clearly conferred upon it, but not previously exerted.

The first excise law was passed March 3rd, 1791, and arose from political necessity. The advocates of states' rights were fast gathering power and Secretary of the Treasury Hamilton urged upon President Washington the importance of demonstrating the Federal Government's authority. The excise seemed so plainly within the Constitution that a valuable precedent might be established through it without dangerous opposition.

Considerable political excitement followed the law, and in September a customs collector was tarred and feathered. The agitation smoldered throughout the winter. In May, 1792, Congress empowered the President to call out the militia, and fresh acts of violence in August forced him to issue a warning proclamation, but it was not until 1794 that further measures became necessary. One source of complaint was the sole jurisdiction of Federal Courts in excise cases, obliging prisoners to go for trial to Philadelphia. Finally in June, 1794, jurisdiction was granted to state courts, but in July, fifty writs, issued under the old law, were served around Pittsburgh. A mob followed the marshal, crying that he was "carrying off men to Philadelphia;" great excitement prevailed, mails were robbed, the inspector's house was burned, and on August 1st over 7700 people assembled at a mass meeting at Parkinson's Ferry. Under these circumstances, upon Gov. Mifflin, of Pennsylvania, declining to take the initiative, Washington issued a proclamation ordering the insurgents to dis-

perse, and sent a requisition to the Governors of Pennsylvania, New Jersey, Virginia, and Maryland, for 15,000 militia. Meanwhile a commission, offering amnesty on full submission, returned without having accomplished anything. The troops started Sept. 1st, Washington accompanying them to Carlisle, where he placed Gov. Lee, of Virginia, in command. Meanwhile the news of their advance had its effect upon the insurgents, and another convention was held, Oct. 2nd, to pass resolutions of submission.

Commissioners were dispatched and courteously received by Washington at Carlisle, who, nevertheless, did not stop the troops.

On arrival in the disturbed districts Gov. Lee issued a proclamation of amnesty, requiring an oath of allegiance from the inhabitants, and a few days later made a general seizure of suspected persons. Many were dismissed on trial for want of evidence, and many others pardoned. The leaders had either fled or taken advantage of the amnesty. The insurrection was virtually crushed, but as a precaution 2500 men were left encamped in the neighborhood all winter. Not only had an extensive rebellion dwindled into insignificance, but by the President's promptness, another of those foundation stones was laid upon which the structure of our national government has been erected.

WHIST, a game at cards, believed to be of English origin; probably a development of the game of *trump* (or, more properly, *triumph*), which was played in England at least as early as the time of Henry VIII. Trump (or triumph) is mentioned in a sermon delivered by Latimer on the Sunday before Christmas, 1529. The game of trump is also mentioned by Shakespeare punning on the word triumph (see Douce's *Illustrations*, and *Antony and Cleopatra*, act iv. scene 12). The game of whist is not mentioned by Shakespeare, nor by any writer of the Elizabethan era.

The earliest mention of *whist* (or, more properly, *whisk*) is in the poems of Taylor the water-poet (1621). In the first edition of Cotton's *Compleat Gamester* (1674), whist has no place; but it is added in the second edition (1680) as a game "commonly known in England." Cotton says that "the game of whist is so called from the silence that is to be observed in the play;" and this derivation of the word has been generally accepted, and was adopted by Dr. Johnson, to the extent of explaining whist to be a game requiring silence. But if the original name of the game was whisk, Cotton's derivation fails. The derivation from an interjection signifying silence seems to have been taken for granted somewhat hastily.

The game was formerly played nine-up. The change to ten-up seems to have taken place in the first quarter of the 18th century. Whist played ten-up is called *long whist*. About 1785 the experiment of dividing the game into half was tried, and *short whist* was the result. The short game soon came into favor; and in 1864 the supremacy of short whist was acknowledged by nearly all the London and by many country clubs, the clubs adopting as their standard the laws of short whist as framed by committees of the Arlington and Portland.

Edmond Hoyle, the first writer of any celebrity on whist (commonly called the father of the game), was born in 1672—it is said in the neighborhood of Halifax, Yorkshire, but on insufficient grounds. He was educated as a barrister. He first published his *Short Treatise* about 1742. He used to give lessons in whist at a guinea a lesson. His *Short Treatise* ran through many editions (16 or more) during his lifetime; and since his death his works have been reproduced in numberless ways. Hoyle died in Welbeck street, Cavendish square, on Aug. 29, 1769, aged 97.

The game of whist is played by four person, two being partners against the other two. The partners sit opposite to each other. The partnership is determined by cutting. The two lowest are partners against the two highest, and the lowest has the deal and the choice of seats and cards. In cutting, the ace is reckoned lowest. Each player has a right to shuffle the pack once before each deal, the dealer having the privilege of a final shuffle. The shuffling being concluded, the player to the dealer's right cuts the pack. The dealer, having reunited the packets, is bound to deal the cards one at a time, to the players in rotation, beginning with the player to his left. He turns up the bottom card (called the trump card). The deal being completed, the players sort their cards, and the player to the dealer's left (or leader) plays a card face upward on the table. The other players follow in rotation, being bound to follow suit if they can. When all have played, the trick is complete. It is then gathered and turned over by the winning side. The highest card wins the trick. The ace is highest in playing; and the other cards reckon in the order, king, queen, knave, ten, etc., down to the deuce, or two, which is lowest. If any player cannot follow suit (i.e., has none of the suit led), he may play any card he pleases. If he plays a card of the suit turned up (called trumps), he wins the trick, unless another player also, having none of the suit led, plays a higher trump. The player who wins the trick becomes the leader for the next trick, and so on till the whole hand (consisting of 13 tricks) is played out.

After scoring, the mode of which will be presently described, the player to the last dealer's left deals in his turn; and in subsequent deals, each player deals in turn, the rotation going to the left.

After the hand is played out, the scoring is thus performed: The side who win more than six tricks reckon one for each trick above six; and the side who either separately or conjointly hold more than two of the following cards, ace, king, queen, and knave of trumps (called honors), reckon as follows: If they hold any three honors, they score two (that being the excess of their honors over their opponents); and similarly if they hold four honors, they score four. At short whist, players who are at four, cannot score

honors. The same at long whist with players who are at nine. The side who thus in one hand or in a succession of hands first reach five at short whist, or ten at long, score the game.

A game at short whist is called a single if the adversaries have already scored three or four; a double if they have scored one or two, a treble if they have scored nothing. A game at long whist is a single if the opponents have scored five or more; a double if they have scored less. There is no treble at long whist.

A rubber consists of the best two games out of three. If the same players win two consecutive games, the third is not played. The winners of the rubber win in points the value of the games they have won, and where the rubber has consisted of three games, the value of the loser's game is deducted. And whether two or three games are played, two points are added for the rubber at short whist; one point for the rubber at long. Thus, if at short whist A B (partners) win a single and a double, they win three points on the games, and they add two for the rubber, making five points. Had A B won the same, but C D (their opponents) won a treble, they would have to deduct three points, the value of the opponents' game, and would only win two points. Long whist is now seldom played.

Whist is a mixed game of chance and skill. The chance resides in the holding honors, and the fortune of having high cards dealt in the hand. The skill consists in the application of such knowledge as shall, in the long run, turn the chances of the cards in the player's favor. At the commencement of the hand, the first lead presents a problem of almost pure chance; but as the hand proceeds, observation of the fall of the cards, inference therefrom, memory and judgment, come in, so that toward the end of the hand we are often presented with a problem of almost pure skill. It is these ever varying gradations of skill and chance that give the game its chief interest as a scientific pastime.

In order to become a skillful player, it is necessary to bear in mind that the game is not one of any given player's hand against the other three, but a combination of two against two. In order that two partners shall play their hands to the best advantage, they must strive, as much as possible, to play the two hands as though they were one. To this end, it is advisable that they should pursue some uniform system of play, in order that each partner shall understand the plans of the other, and so be placed in the most favorable position to assist him in carrying them out. The experience of the last hundred years has developed a system of play tending to this result. Of this we proceed to give an epitome.

The first, or, as it is commonly called, the *original* lead should be from the player's strongest suit. A strong suit is one that contains either a large number of cards (four or more) or several high cards. The suit containing the largest number of cards (numerical strength) is the one to be mostly preferred. The object aimed at in opening with the strongest suit is to exhaust the cards of that suit from the other hands. When this object is accomplished, the cards of the suit which remain in the leader's hand (called long cards) obtain a value which does not intrinsically belong to them. They often become of great service, for when led, they either compel the adversary to trump, or they make tricks. And when trumps are all out, the player who has the lead makes as many tricks as he has long cards.

On the other side, by opening weak suits, there is considerable risk of sacrificing partner's strength, and of leaving long cards with the opponents.

Some players are prone to lead single cards, but experience shows that weak leads, as a rule, do more harm than good. Sometimes a trick or two is made by playing a trumping game; but the chances are that such tactics sacrifice partner's hand, and clear the suit for the adversaries.

The proper card of the strong suit to lead is, as a rule, the lowest. The intention is for the third player to play his highest, and so to assist in clearing his partner's strong suit. Moreover, if the leader keeps the best cards of his suit in his own hand, he has a fair chance of getting the lead again when his suit is nearly or quite established. But with ace and four or more small ones, it is considered best to begin with the ace, lest the ace be trumped, second round. Also, with a strong sequence in the strong suit, it is best to lead one of the sequence first, lest the adversaries win with a very small card. The following are the principal leads from sequences:

From ace, king, queen—lead king, then queen.
From ace, king, and small—lead king, then ace.
From ace, queen, knave—lead ace, then queen.
From king, queen, knave, and more than one small—lead knave.
From king, queen, knave, and one small—lead king.
From king, queen, and small—lead king.
From king, knave, ten, nine, etc.—lead nine.
From king, knave, ten, and small—lead ten.
From queen, knave, ten, and small—lead queen.
From knave, ten, nine, and small—lead knave.

After the first trick, the lead may remain with the first leader. His best play, as a rule, is to continue his suit. If the lead falls to another player, his play, as a rule, will be to open his best suit; and so on. If the lead falls to the first player's partner, he has

choice of two modes of play. If he has a good strong suit of his own, as, for instance, one of those in the list above, and containing four or more cards, he would, as a rule, open it; if not, he would, as a rule, do well to continue the suit his partner first led; or, as it is commonly called, to return his partner's suit. The object is to strengthen partner by assisting to clear his strong suit.

In returning a suit, if the player has only two cards of it remaining in his hand, he should return the highest; if more than two, the lowest. The exception is, if he has the winning card, he should return that irrespective of the number of other cards in the suit. The reason of this rule is that, with but two cards of the suit remaining, the player is weak in the suit, and he is therefore bound to sacrifice his good card to support his partner. But with three or more remaining after the first round, he is strong, and is therefore justified in calling on partner to support him.

This rule of play is most important. It should be carefully observed with even the smallest cards, as it enables partner to count the situation of the remaining cards. For example: A leads a suit in which C (his partner) holds ace, three, and two. In returning A's suit, after winning with the ace, C is bound to return the three and not the two. When C's two falls in the third round, A will know that his partner has no more of the suit. But suppose C's cards to be ace, four, three, and two. In returning the suit, C is bound to choose the two. Then after the third round, A will conclude with certainty that C has at least one more card in the suit.

Late in a hand, the considerations with regard to the lead vary. If there is no indication to the contrary, it is best for each side to continue the suits originally opened by them. But the fall of the cards may show that it is disadvantageous to persevere in the suits first led. In such cases, the player must have recourse to other and weaker suits. The general rules to be observed here are—to choose a suit in which there is reason to infer that the right-hand adversary is weak; or—but this is less favorable—one in which the left-hand adversary is strong. In either case, if the suit chosen contains but three cards, none higher than knave, or only two cards, it is generally right to lead the highest.

The second player, as a rule, should play his lowest card, in order to preserve his strength in the leader's suit. The first trick in the suit is left to partner, who has an even chance of holding a better card than the third player. But if the second hand has a strong sequence, he should play the lowest of the sequence, by which partner's hand may be saved, and a high card still remain over the original leader.

The following are the principal sequences:

With ace, king, queen—play queen.
With ace, king, etc.—play king.
With king, queen, knave—play knave.
With king, queen, etc.—play queen,
With queen, knave, ten—play ten.
With queen, knave, and one small—play knave.

When a high card is led, it is sometimes advisable for the second player to cover it with a higher one. The shortest rule is to put an honor on an honor, if with but two or three cards of the suit. With king or queen, and four of the suit, it is better to pass an honor led.

When the second hand has none of the suit led, he should, as a rule, trump, if he has but two or three trumps; but he should not trump a losing card if he has more than three trumps.

The third hand, as a rule, plays his highest card in order to support partner in his suit. The exceptions are, with ace, queen, etc., the queen is to be played; and if partner has begun with a high card, it is often right to pass it.

The management of trumps varies according to whether the player is strong or weak in them. If strong (i.e., with four or more), they should not be used for trumping, if it can be avoided, but should be kept together, in hopes of establishing a suit, and of remaining with the long trump, with which to get the lead after the other trumps are out, and so to bring it in. Thus, if the opponents lead a losing or doubtful card, it is better, as a rule, not to trump it when holding four trumps. But if the opponents lead a winning card, it is, as a rule, better to trump it, though holding four trumps, than to pass it in hopes of bringing in a suit.

With five trumps, the chance of succeeding in exhausting the opponents' hands, and of remaining with the long trump, is so considerable, that a player having five or more trumps, should lead them; and as number is the principal element of strength, he should not be deterred from leading trumps merely because the fourth hand has turned up an honor.

With four trumps only, it is better first to lead the strong suit. When the adversaries' hands are cleared of that suit, or so far cleared that the holder of the long cards in that suit commands it, it is, as a rule, safe to lead from four trumps.

As a rule, less than four trumps should not be led from. But a player is justified in leading from weak trumps, if he holds winning cards in every suit; if the adversaries are both trumping a suit; or if the game is lost, unless partner has strength.

It is most important to return partner's trump lead at once, unless he has led from

weakness; for partner, by leading trumps, declares a strong game, and it is then the best policy to abandon one's own plans, and to support his.

It follows that a player should not, as a rule, lead a card for his partner to trump, unless he has four or more trumps; for with less than four trumps, the player is weak, and if he forces his partner to trump, partner is weakened also; and the chances are that by weakening partner under such circumstances, the command of trumps will remain with the adversaries.

But a player may force his partner, although weak himself, if partner has already been forced, and has not afterward led trumps; if partner has already declared weakness in trumps, as by trumping a doubtful card second hand; if two partners can each trump a different suit; and when one trick from partner's hand wins or saves the game.

The same considerations which make it inexpedient to force partner when weak one's-self show the advantage of forcing a strong trump hand of the opponents.

There are yet some general rules of play which have not been explained.

The second, third, and fourth players should always play the lowest of a sequence. The rule here given is in conformity with the play that would naturally be adopted in playing cards that are not in sequence; and by keeping to a uniform plan, players are enabled to infer what cards their partner does or does not hold. It is true that the adversaries often gain the same information; but it is found by experience that it is of more advantage to inform partner than to deceive the opponents.

As a rule, it is advisable to lead out the winning cards of partner's suit. The presumption is that he has led from his strong suit; and by leading out the winning cards, the suit is cleared for him, and his long cards are not obstructed. The reverse applies to suits led by the adversaries. It is mostly right to retain the winning cards of such suits as long as possible, in order to stop the establishment of them.

When a player has none of the suit led, he should, as a rule, throw away from his weakest suit; for by discarding from a strong suit, its numerical power is damaged. But when the adversaries have shown great strength in trumps, it is not advisable to keep small cards of a long suit, as it is not likely that it can ever be brought in. Under such circumstances, the player should throw away from his best protected suit, and keep guards to his weaker ones.

Players should watch the cards as they are played, and endeavor to infer from them where the others lie. Thus, if a player wins a queen with an ace, it may be inferred that he has not the king, the rule being to win with the lowest; if a player leads trumps at starting, it may be inferred, as a rule, that he is strong in trumps, or has a very fine hand. By recording in this way, and by counting the number of cards played in each suit, skilled players will often, toward the close of a hand, know the position of all the important cards remaining in; and by means of this knowledge, they will be able to play the end of the hand to the same advantage as though they had seen all the cards.

And lastly, and most important of all, players should play to the score. Thus, wanting but one trick to save or win the game, a winning card should be played at once. The example is stated as for one trick; but it should always be kept in mind how many tricks are requisite to win or save the game, or even a point, and the play should be varied accordingly.

In America the most popular style of this game is one of seven points, in which honors are not counted. A great many players no longer give the dealer an advantage by cutting for a trump, but it is named, before the cards are dealt, by the player on the dealer's left. The trump signal, popular in England for so many years, is now coming into universal use. In consists in discarding an unnecessarily high card on the first lead and afterwards a lower one. This signifies that the person so playing desires trumps to be led, to which his partner must respond at the earliest opportunity by leading out the best trump in his hand, and if that takes, the next best, and continue. A new method of leading has come into vogue into the U. S. of late, which consists of ignoring small cards when leading from a long suit, and leading as would be done with the four higher cards in hand. The result is that upon the close of the second round all the players are informed of the whereabouts of the small cards. But it is disputed whether this general knowledge is an advantage to the dealer or not. The methods of play laid down in the main article are still in vogue; but judgment must be exercised in attempting to establish a strong suit; it must not be attempted at all hazards, and with a weak hand it is often better to play a defensive game. See *American Whist* (revised ed., 1886).

WHISTLER, James Abbott M'Neill, b. Lowell, Mass., 1834; was educated at West Point; went to England abt. 1855, where he studied art, and then studied in Paris under Gleyre. He settled in London, 1863, and has exhibited paintings and etchings at the Royal acad., etc., and the Hague, and at the Paris salons. He removed to Paris in 1892. His etchings are universally praised, but his paintings are both abused and admired. Among his pictures that have been exhibited are "Wapping," "Old Battersea Bridge," "The White Girl," "Sea and Rain," and a number of paintings which he styles nocturnes, arrangements, symphonies, and harmonies in different colors. His paintings evince talent and originality, though some critics declare them to be incomprehensible. He has painted portraits of Carlyle, Sarasate, etc. He has published *Ten O'Clock* (1888); *The Gentle Art of Making Enemies* (1890).

WHISTON, William, was b. Dec. 9, 1667, at Norton, in Leicestershire, of which place his father was rector. His earlier education he received at home; subsequently, he be-

came the pupil of a Mr. Antrobus at Tamworth, and finally he went to Cambridge, where he greatly distinguished himself, chiefly as a student of mathematics. In 1690 he took his degree, and obtained a fellowship in 1693. The year after he became chaplain to Dr. More, bishop of Norwich; and in 1698, having been presented to the living of Lowestoft, in Suffolk, he was married to Miss Antrobus, the daughter of his old preceptor, his fellowship being thus forfeited. Meantime, in 1696, had appeared his *Theory of the Earth*, a work which, despite, or perhaps in virtue of, the oddity of certain of its speculations, procured him a considerable reputation. That his genuine claims as a man of science were considerable, is made clear by the fact that in 1703, by the express influence of sir Isaac Newton, whose acquaintance he had made some years previously, he was appointed to succeed him in the Lucasian professorship at Cambridge. On receiving this appointment, he gave up his living, and again settled himself at the university. In addition to the duties of his chair, he engaged in clerical work; and such was his success as a preacher, that he would probably have attained high position in the church, had not the development of his theological opinions led him into Arian heresy —his frank and fearless avowal of which at once in his preaching and his writings led, in 1710, to his expulsion from his professorship and the university. In the same year appeared the most noted of his original writings, *An Historical Preface to Primitive Christianity Revived*. His subsequent prosecution in the church courts forms a curiously complicated chapter in the history of such matters. The result was, that after five years of vexatious suspense, during which the proceedings swayed hither and thither in the strangest way, they proved in the end abortive, and Whiston was permitted to remain formally a member of the church of England. By many of the clergy, however, much dissatisfaction was expressed; the famous Dr. Sacheverel in particular thundered from the pulpit against the delinquent, and refused to admit him to communion—an example which was followed by others. It seems significant of the social stigma attached to him in the minds of the orthodox, that when Halley, in 1720, proposed him as a member of the royal society, his old friend Newton successfully opposed his admission. Whiston himself, the most amusingly vain of men, remained indeed deeply convinced that Newton's conduct was dictated by jealousy of his superior scientific genius—a notion in which he probably found not many to agree with him. Having no ostensible means of livelihood, Whiston was frequently reduced to great straits; but he had kind friends, who were ready to assist him at need. In the dissemination of his religious opinions he continued unwearied; his publications on the subject were numerous; also, he occasionally delivered lectures; and he instituted a religious society, which had meetings at his own house. He also busied himself much with scientific crotchets, chief among which was a scheme for calculating the longitude, of the success of which he was assured. He died on Aug. 22, 1752, at the great age of 85. Of all his numerous works, a translation of Josephus was the only one which continued for a time to perpetuate the name of its author; and of this there have been several reprints. His memoir of his own life (published in his lifetime in 3 vols. 1749–50) is a curious specimen of self-portraiture.

WHITAKER, Daniel K., ll. d., b. Mass., 1801; graduated at Harvard, 1820; studied law, and settled in South Carolina and became the law partner of ex-governor Wilson of that state. He is best known as the founder and editor of the *Southern Literary Journal*, *Whitaker's Magazine*, and the *Southern Quarterly Review*. The last was started in 1841, and for twenty years had a high reputation. In 1866 Mr. Whitaker became editor of the *Monthly Review*, published at New Orleans. D. 1881.

WHITAKER, Nathaniel, d. d., 1732–95; b. N. Y.; graduated Princeton college under president Burr; was ordained and settled over the Congregational church at Norwich, Conn. In 1765 he visited Great Britain with the Rev. Samson Occum to procure funds for the support and enlargement of the school at Lebanon, Conn., under the care of the Rev. Eleazar Wheelock. They were cordially received in England and Scotland, and obtained £12,000. This school, established for the education of the Indians, was in 1770 removed to Hanover, N. H., was chartered by Governor Wentworth under the name of a college, and called Dartmouth in honor of lord Dartmouth, who had generously contributed to the American agents for the Indian school. Dr. Whitaker on his return was settled at Salem, Mass., and Norridgewock, Me.

WHITAKER, Ozi William, d.d., b. Mass., 1830; graduated Middlebury college, 1856; principal of the North Brookfield high school for several years; studied theology at the Protestant Episcopal seminary, New York; rector of St. John's church, Gold Hill, Nev., 1863–65; of St. Paul's, Englewood, N. J., 1865–67; of St. Paul's, Virginia, Nev., 1867; missionary bishop of Nevada and Arizona, 1868; assistant bishop, diocese of Pennsylvania, 1886; bishop, 1887.

WHITBY, a parliamentary borough, market t., and thriving seaport in the north riding of Yorkshire, on both sides of the mouth of the Esk, 56 m. n.n.e. of the city of York by railway. A stone bridge with a swivel, by which vessels are admitted into the inner harbor, connects the two parts of the town. Two piers, of which the w. one is about 1000 ft. long, run out into the German ocean, and protect the outer harbor, and it is further protected by two inner piers, which break the force of the waves during storms. Pop. '81, 14,554; '91, 13,274.

WHITE, a co. in central Arkansas, having the White river for its e. boundary, drained by Little Red river and Bayou des Arc; 1137 sq.m.; pop. '90, 22,946. Co. seat, Searcy.

WHITE, a co. in extreme n.e. Georgia; 170 sq.m.; pop. '90, 6151. Gold is found in considerable quantities. Co. seat, Cleveland.

WHITE, a co. in s.e. Illinois, drained by the Wabash river, separating it from Indiana, and also by the Little Wabash; 500 sq.m.; pop. '90, 25,005. Co. seat, Carmi.

WHITE, a co. in n.w. Indiana, drained by the Tippecanoe river; 500 sq.m.; pop. '90, 15,671. Co. seat, Monticello.

WHITE, a co. in central Tennessee, having the Caney fork of Cumberland river for its s. and s.w. boundary; 390 sq.m.; pop. '90, 12,348. Co. seat, Sparta.

WHITE, Andrew Dickson, ll.d., b. N. Y., 1832; educated at Yale college, and the university of Berlin. He was professor of history and English literature at the university of Michigan, 1857–62, and was president of Cornell university from 1866–85. He was a member of the N. Y. state senate in 1863–66, one of the commissioners to San Domingo in 1871, and minister to Germany, 1879–81, and again in 1897. Among his works are *Lectures on Mediæval and Modern History* (1861), *Studies in General History* (1865), and *The Warfare of Science* (1876).

WHITE, Gilbert, author of the *Natural History and Antiquities of Selborne*, was b. at Selborne, in Hampshire, on July 18, 1720. Educated at Oriel college, Oxford, he received his m.a. degree in 1746, and in 1752 he was made a senior proctor of the university. At an early period of his life he retired to his native village, to indulge his taste for literature and natural history; and there he died on June 20, 1793. His charming *Natural History and Antiquities of Selborne*, which has made White an indisputable English classic, was published in 1789. Probably no book on natural history has been more frequently reprinted. Among the various editions may be mentioned that of Professor Bell (1877), and the one by Frank Buckland, with a chapter on antiquities by lord Selborne (1875). After White's death, Dr. Aikin published a selection from his natural history journal, under the title *A Naturalist's Calendar*.

WHITE, Henry Kirke, was b. on Mar. 21, 1785, at Nottingham, in which place his father was a butcher. At the age of 15 he was apprenticed to an attorney; and, while in his business he showed exemplary diligence, his leisure hours were passionately devoted to intellectual pursuits, and especially to the cultivation of poetry. He also became a member of a literary society in Nottingham, and began to attract notice by his fluency and ability as a speaker. To the *Monthly Mirror* he was wont to send contributions, and the merit of his verses drew to him the attention of Mr. Hill, its proprietor. Acting on the advice of this gentleman and Mr. Capel Lofft, who also took a generous interest in him, he published in 1803 a small volume of poems, which was cruelly treated by the critics, and found little acceptance with the public. It was the means, however, of securing him influential friends, notably Southey, and the rev. Mr. Simeon, through whose influence a sizarship in St. John's college, Cambridge, was procured for him. In his studies he highly distinguished himself; but the ardor with which they were pursued speedily proved the ruin of a constitution at all times delicate; consumption rapidly developed itself, and he died Oct. 19, 1806. The year after two volumes of his *Remains* were published by his friend Southey, to whom his MSS. had been intrusted, prefaced by a pleasing memoir of the deceased poet. White's poetry, however, is now almost forgotten.

WHITE, Horace, editor, was born at Colebrook, N. H., in 1834; removed with his family to the west; graduated at Beloit College, Wis.; was editor of the *Chicago Tribune* 1864–74; and since 1883 has been assistant editor of the *New York Evening Post*. He edited Bastiat's *Sophismes Économique* (1869), and *Cossa's Scienza delle Finanze* (1888). His style is trenchant and convincing.

WHITE, Hugh Lawson, 1773–1840, lawyer and statesman, was born in North Carolina, and removed with his parents when very young to Tennessee, where his educational facilities were very meagre. He was in the Indian war in 1792, probably deciding the events of the battle at Etowah, by killing the leading chief, Kingfisher, which caused the Indians to flee in dismay. After the war he studied in Philadelphia, read law in Lancaster, Pa., and began practice in Knoxville, Tenn., in 1796. From this time until 1825 he occupied many and important positions under the state government. In the latter year he was elected U. S. Senator to fill the vacancy caused by the resignation of Gen. Andrew Jackson. He favored Jackson in many of his measures, but in 1835 made a stirring speech in favor of limiting executive patronage. (Jackson removed 690 public officials during his administration, while the entire number removed from 1790–1829 had been 74). This speech was regarded as an attack on the administration, and the breach was further widened by his opposition to Benton, who offered a proposition to erase from the records certain resolutions of censure that had been passed against the President. Judge White had voted against the resolutions when offered, but he considered the effacement from the records as unconstitutional, and desired, instead, that they be simply "rescinded and declared null and void." This caused a complete rupture between White and the President, and in 1836 White received the electoral votes of Tennessee and Georgia for President. In 1839 he resigned his seat in the senate because

he received instructions from the legislature to vote against his better judgment. See a *Memoir, with Selections from His Speeches and Correspondence* (1856).

WHITE, Rev. Joseph Blanco, was b. at Seville, in Spain, on July 11, 1775. His father was a merchant there of Irish parentage, who had married a Spanish lady of old Andalusian family. Finding his father's counting-house on trial not at all to his mind, he quitted it to prepare himself for holy orders, and in 1799 he was ordained a priest. But, born with a mind curiously restless and inquisitive, he ceased in no long time to find himself at home in the Romish communion; and in 1810 he came to England, which he never afterward quitted. Joining himself to the English church, he seems to have meditated becoming one of its clergymen; an intention which it was quite as well he did not carry out, inasmuch as his speculations rapidly led him to results not recognized by English orthodoxy. On coming to England he settled himself in London, where for some years he conducted a monthly Spanish paper called *El Español.* On the cessation of the peninsular war, in 1814, this publication ceased also, as having no longer a *raison d'être;* but meantime its services to the government of the day had been such as to secure for its editor a pension for life of £250 per annum. Subsequently Mr. White lived chiefly in London, employed as a man of letters. Though in literary circles recognized as a man of fine talent, and known as a contributor to the *Quarterly* and *Westminster Reviews,* and other high-class periodicals, he scarcely succeeded in making a permanent impression on the public by any of his more formal publications. Of these the most important were: *Letters from Spain* (1822), contributed some years before to the *New Monthly Magazine; Practical and Internal Evidence against Catholicism* (1825); *Poor Man's Preservation against Popery* (1825); and *Second Travels of an Irish Gentleman in Search of a Religion* (2 vols. 1833). He died on May 20, 1841, in Liverpool, whither he had removed some years before. In 1845 there was given to the world, as his legacy to it, by much his most striking and valuable work, *The Life of the Rev. Joseph Blanco White, written by himself, with portions of his Correspondence;* edited by John Hamilton Thom (London, 3 vols. 8vo).

WHITE, John Blake, 1781–1859; b. S. Car.; studied art in London under Benj. West. He practised law in Charleston, painting as an amateur. His pictures are much prized, especially those on historical subjects, such as "Gen. Marion inviting the British Officer to Dinner in the Pedee Swamp," "Mrs. Motte urging Gen. Marion in order to dislodge the British," "The Battle of Ft. Moultrie," "Rescue of American Prisoners by Sergeant Jasper and John Newton," "Massacre of American Prisoners by the English and Indians at Frenchtown," "The Battle of Eutaw Springs," "The Martyrdom of Hayne," "Gen. Marion and his men fording the Pedee," "Battle of New Orleans," "Capture of André," "Unveiling of the U. S. flag in the City of Mexico," etc.

WHITE, Peregrine, 1620–1704; the first English child born within the limits of New England. His birth was on the *Mayflower,* in Cape Cod harbor, Nov. 20, 1620. After his father's death his mother married Gov. Edward Winslow, this being the first marriage in New England. It is recorded that Peregrine was "vigorous and of a comely aspect." He held several military and civil offices, and died at the good old age of 84 years.

WHITE, Richard Grant, 1821–85; b. New York: educated at the univ. of New York, and began in the law, but soon devoted himself entirely to newspaper and literary work, and especially to the study of the English language. His most important work is his *variorum* edition of Shakespeare, containing also a memoir and a critical essay (1857–65). Among his works are: *Shakespeare's Scholar* (1854); *Essay upon the Authorship of the Three Parts of Henry VII.* (1859); *Memoirs of the Life of William Shakespeare* (1865); *Words and Their Uses* (1870); and *Every-Day English* (1880). Mr. W. was a frequent contributor to the *Galaxy,* the *Atlantic Monthly,* and other periodicals.

WHITE, William, D.D., 1748–1836; b. Philadelphia; graduated college of Philadelphia, 1765; studied theology; went to England and was ordained deacon by the bishop of London, 1770, and priest by the bishop of Norwich, 1772; returning, became rector of Christ church and St. Peter's church, Philadelphia; chaplain to congress, 1777; presided over the first Episcopal convention in America, 1789, and wrote the constitution of the church, which was then adopted; elected bishop of the diocese of Pennsylvania, 1786; consecrated at Lambeth Palace by archbishop of Canterbury, 1787. He, with bishop Seabury, revised the Book of Common Prayer for the American Episcopal church. He published *Memoirs of the Protestant Episcopal Church; Comparative Views of the Controversy between the Calvinists and the Arminians; Lectures on the Catechism.* He had a happy combination of intellectual and spiritual qualities for the office of bishop at the organization of the Episcopal church in America.

WHITECHAPEL is a district situated in the eastern suburbs of London, which was originally named from a certain chapel within its limits. In early times all distances east of London were measured from this chapel. It is now the locality of numerous sugar bakeries, generally carried on by Germans, and is inhabited mostly by artisans. London Hospital and the Tower of London are within its limits.

WHITE COLORS. The principal white pigments used by painters are: (1) *White lead* (see Lead), which is not only used as a color, but forms the body of most oil-paints; (2) *Derbyshire white,* which is sulphate of baryta; (3) *pearl white,* or trisnitrate of bismuth; and (4) *zinc white,* or hydrated oxide of zinc.

WHITE EAGLE, ORDER OF THE. This degree in Freemasonry of Knights was instituted by Vladislas V. in 1325. Its decoration is a star-shaped piece of metal, with seven points, beautifully engraved, with a shield displaying a lion rampant, and a sceptre before him, indicating the house of Judah, a well under a tree, an arrow by its side, and a bull underneath; a man in a kind of frock-coat, with both hands uplifted. At the base is a spread eagle and two harpies, evidently representing cherubim. Beneath the shield is a star with the letter J in the centre, for Jehovah, and over all the eye of Providence. The motto is, *Kodes la Adonia.*

WHITE FEATHER. A game-cock with a white feather in his tail was looked upon as not being of the true game breed, hence the expression, "to show the white feather," signifies a lack of courage.

WHITE FLUX. See FLUX.

WHITE GUNPOWDER is a mixture that was at one time employed in blasting, but is now seldom used in consequence of the danger attending its preparation, and the facility with which it explodes by friction. Its ingredients are chlorate of potash, dried ferrocyanide of potassium, and sugar.

WHITE HOUSE, THE, known also as the executive mansion, is the president's abode at Washington, D. C. It is two stories high; 176 ft. long by 86 ft. wide; built of freestone painted white, whence its name. It stands on Pennsylvania ave., about a mile from the capitol, and is surrounded by handsomely laid out grounds, about 20 acres in extent. Upon the lower floor are the reception rooms; the upper floor contains the offices of the president and his secretaries, and apartments for the family. The first president's house was built 1792–1800, and was burned by British troops, 1814. The present edifice was built 1818–29: and the cost of its erection and maintenance is computed at about $2,000,000. It is not now regarded as fitted for its purposes.

WHITE LADY, a being who, according to popular legend, appears in many of the castles of German princes and nobles, by night as well as by day, when any important event, whether joyful or sad, but particularly when the death of any member of the family is imminent. She is regarded as the ancestress of the race, shows herself always in snow-white garments, carries a bunch of keys at her side, and sometimes rocks and watches over the children at night when their nurses sleep. The earliest instance of this apparition spoken of was in the 16th c., and is famous under the name of Bertha of Rosenberg (in Bohemia). The white lady of other princely castles was indentified with Bertha, and the identity was accounted for by the intermarriages of other princely houses with members of the house of Rosenberg, in whose train the white lady passed into their castles. In the castle of Berlin she is said to have been seen in 1628, and again in 1840 and 1850. The most celebrated in Britain is the white lady of Avenel, the creation of sir Walter Scott. It was long a common belief in the Highlands that many of the chiefs had some kind spirit to watch over the fortunes of their house. Popular tradition has many well-known legends about white ladies, who generally dwell in forts and mountains as enchanted maidens waiting for deliverence. They delight to appear in warm sunshine to poor shepherds or herd-boys. They are either combing their long hair, or washing themselves, drying wheat, beating flax, or spinning; they also point out treasures and beg for deliverance, offering as reward flowers, corn, or chaff, which gifts turn in the instant into silver and gold. They wear snow-white, or half white, half black garments, yellow or green shoes, and a bunch of keys at their side. All these and many other traits that appear in individual legends may be traced back to a goddess of German mythology who influences birth and death, and presides over the ordering of the household. Still more distinctly the appellation white lady and the name Bertha point back to the great goddess of nature, who appears under various names, and who, as *Berhta* (i.e. the brilliant, shining, white), held her circuit on Twelfth-night and revealed her power. When the legend goes on to say that the Bohemian Bertha of the 15th c. promised the workmen of Neuhaus a sweet soup on the completion of building the castle, and that this soup, along with carp, is still given in remembrance of it to the poor on Maundy Thursday, we recognize again the festival dishes consecrated to Berhta, such as fish, oatmeal gruel, or dumplings, etc., which it is still customary to eat about the time of Twelfth-night and Christmas in most districts of Germany.

WHITE LEAD. See LEAD.

WHITE MOUNTAINS, a mountain-chain of New England, regarded as an outlier of the Appalachian range, commences at the headwaters of the Aroostook river, in Maine, where its first summit is mount Katahdin, and extends in a broad plateau, from 1600 to 1800 ft. high, w. by s. nearly across New Hampshire, where it has twenty bold peaks, with deep, narrow gorges, wild valleys, beautiful lakes, lofty cascades and torrents, forming the "Switzerland of America," and a favorite resort of summer tourists. Mount Washington, the highest summit in New England, 6,286 ft., has a practicable carriage-road and a hotel on its summit; Mount Adams, the second of the group, is 5,819 ft.; the lesser are named Franklin, Monroe, Jefferson, Pleasant, Madison. In the Franconia group are Lafayette, 5,269 ft., and Moosehillock, 4,790. These mountains furnish the chief sources of the Connecticut, Merrimac, and Androscoggin rivers. The rocks are ancient metamorphic, with naked granite and gneiss. The Ammonnoosuck river falls 5000 ft. in 30 m. The discovery of the White Mountains is accredited to

Derby Field, 1642. He found many crystals upon them which he mistook for diamonds, and for a long time the chain was called "the Chrystal Hills." The Indians had a great reverence for the Mts., believing them to be the abode of the Great Spirit, and rarely ascended the higher peaks, for it was reported among them that no one who scaled the sacred heights returned alive. There was a legend that the Great Spirit once bore a good chief and his spouse to the summit of the Mts., and that all the people below were destroyed by a flood. The first settlement among the Mts. was made in 1792 by a hunter and guide; in 1803 a small inn was built near the Giant's Grave, a tall mound near the Ammonoosuc river, but it was not until 1852 that hotels began to be erected. The first bridle-path to the summit of Mt. Washington was cut, 1819; in 1820 a small party of gentlemen slept upon the summit of Mt. W. and named the different peaks. The railroad by which the top of Mt. Washington is now reached has a grade of 3,625 ft. in three miles. For several years the summit has been occupied during the winter as a station of the meteorological dept. of the U. S. army. The winds have been known to attain a velocity of 100 m. an hour, and the thermometer has sunk to 59° below zero. The Mts. are becoming more and more popular as a summer resort on account of their delightful temperature, and wild and beautiful scenery. There are five notches or passages through them: the White Mt. Notch, through which the Saco river passes, is 1914 ft. high, 2 m. long, and only 22 ft. wide at its narrowest point; the Franconia Notch, famous for its narrow water-ways, is 2014 ft. high; and the Pinkham Notch is 2018 ft. high; the other notches are the Grafton and Dixville. There are many water-falls, some of them of great beauty; among the most famous are, the falls of the Ammonoosuc, descending more than 5,000 ft, in a course of 30 m.; the Berlin falls on the Androscoggin; the Crystal Cascade and Glen Ellis on a tributary; Ripley's falls on a tributary of the Saco; the Silver Cascade on the side of Mt. Webster, and the Artist's falls in North Conway. The area of the entire White Mts. range is over 1200 sq.m. For descriptions, etc., see Drake's *Heart of the White Mountains*, 1882; Osgood's *New England*, a handbook for travelers; and various books of travel in New England. See Washington, Mount.

WHITE PINE (*P. Strobus*), called in England and sometimes in New England, Weymouth Pine, the tallest tree in the eastern United States, often attaining in primitive forests a height of 160 feet. See Pine.

WHITE PINE, a co. in e. Nevada, a part of the Great Basin, crossed by mountain ridges, bordering on Utah; 9892 sq. m.; pop. '90, 1721, chiefly of American birth, with colored. Silver from quartz rock is largely exported. Co. seat, Hamilton.

WHITE PLAINS, town and co. seat of Westchester co., N. Y.; on the New York Central and Hudson River railroad; 22 miles n.e. of the Grand Central depot, New York. It contains the new Bloomingdale asylum for the insane, new hall of records, Alexander institute (Pres.), Lyceum, institute, and co. law libraries, state and savings banks, hospital, and several weekly newspapers. Here in Oct., 1776, the battle of White Plains was fought. Oct. 12, Gen. Howe having occupied Throgg's Neck in Westchester co., Washington sent on a corps to White Plains, and began to evacuate Manhattan island. On the 23d, Washington took up his quarters at White Plains. On the 28th, Washington, with a large force, had a strong position, and Howe, not caring to attack him, dispatched some 4000 men to seize on Chatterton hill, w. of the Bronx river. The 1400 Americans, under McDougall, who occupied the hill, were forced to retreat to Washington's camp. While Howe was waiting for reinforcements, Washington, on the evening of the 31st, occupied the high ground above White Plains. Five days later Howe withdrew to Dobbs ferry. On Nov. 9 Washington began the removal of his troops to New Jersey. Pop. '90, 4508.

WHITE PRECIPITATE. See Mercury.

WHITE RIVER, a river of Arkansas and Missouri, rises in the Ozark mountains, flows n.e. into Missouri, then turning e. and s.e. into Arkansas, drains the northeastern portion of the state, and, flowing southerly, empties itself into the Mississippi near the mouth of the Arkansas. It is 800 m. long, and navigable 380 miles.

WHITE RIVER, formed by the junction of two forks in Knox co., Ind., flows in a generally s.w. direction, entering the Wabash about 25 m. below Vincennes, only 30 m. from the junction. The w. fork is nearly 300 m. long, and on it are situated Anderson, Muncie, and Indianapolis. The e. fork, sometimes called the Blue river, has a length of 250 miles.

WHITE RIVER, a tributary of the Missouri, rises in the extreme northwestern part of Nebraska, and after a northeasterly, and then easterly course through South Dakota, empties into the Missouri in Lyman county, in that state. It flows through the Bad Lands and has a total length of about 300 miles. Its largest affluent is the South Fork.

WHITE'S is a famous club (see Club), located on St. James St., London. It is an aristocratic club whose members are chosen without reference to politics, and its membership is limited to five hundred. When first established, in 1698, it was known as White's Chocolate House, but it was changed to a club about 1736. Frequent references may be found to this club in the writings of Swift, Pope, Macaulay, and many others. See Clubs.

WHITE SEA (Russ. *Bjeloje-nore*), an arm or great bay or inlet of the Arctic ocean, which, between cape Kanin on the Kaninskaia peninsula, and cape Sviatoi on the Kola

peninsula, penetrates the Russian government of Archangel southward to lat. 64° north. At its entrance between capes Kanin and Sviatoi it is 100 m. broad; after penetrating the land 150 m. in a south-easterly direction, it narrows to a width of 35 m.; but after sweeping s. for 200 m., it again considerably widens, forming in the n.w. the gulf of Kandalak, and in the s. and s.e. the great gulfs of Onega and Archangel or Dwina. The White sea covers an area estimated at 47,000 sq.m., and the length of its coast-line is over 1000 miles. The coasts in the n. and e. are mountainous, in other places they are mostly low, and abound in lakes, which communicate with the sea by rivers. The greatest depth of the White sea is 1133 feet. From the middle of August ice forms on the coasts sometimes to the width of 30 m., and is not melted till the following July.

WHITE SULPHUR SPRINGS, a watering-place in Greenbrier co., W. Virginia, 227 m. w. of Richmond. It has hotel accommodation for 1500 guests. The spring is in the lowest part of a beautiful valley, and is covered by a dome supported by 12 Ionic columns, and surmounted by a statue of Hygeia; it is 1925 ft. above tide-water; yields 30 gallons per minute of water at 62° Fahr., impregnated with sulphates of lime, soda, magnesia, carbonate of lime, chlorides of calcium and sodium, iron, iodine, sulphur, carbonic acid, sulphureted hydrogen, oxygen, nitrogen. It is considered efficacious in dyspepsia, liver diseases, gout, rheumatism, and diseases of the skin and kidneys. The various mineral springs, at a distance of 22 to 24 m. from the above, are also much resorted to.

WHITE SWELLING. See JOINTS.

WHITE VITRIOL. See ZINC.

WHITE-WASH, slaked quicklime, reduced to the consistency of milk by means of water. It is used for coloring walls, and as a disinfectant. If merely for coloring, a little size is added, but not when used for sanitary purposes.

WHITE-WOOD BARK. See CANELLA.

WHITEBAIT, a small fish, called by Valenciennes *rogenia alba*, and for which he constituted the genus *rogenia* as a distinct genus of the herring family (*clupeidæ*), but which is now generally regarded by naturalists as merely the fry of the herring. The whitebait fishery is actively prosecuted on some parts of the British coast, particularly in the estuary of the Thames, where the whitebait is very abundant in spring and summer, beginning to appear in the end of March or early in April. Adult whitebait are caught on the coasts of Kent and Essex during winter, and in this condition are about 6 in. in length. Whitebait is also found in the Forth. It is much in request as a delicacy for the table, forming a favorite dish of epicures. At the time when ordinarily captured, whitebait are only from an inch and a half to 4 in. in length. They are caught by means of bag nets sunk 4 or 5 ft. below the surface of the water. For several months they continue to ascend the river in shoals with the flood-tide, and descend with the ebb-tide, not being able to live in fresh water. They are fried with flour or crumbs; they are often laid on a napkin and sprinkled with fine flour and a little salt, rolled about till well covered with flour, and then thrown into a pot of boiling lard, where they remain till they are of a pale straw color. Londoners resort to Greenwich and Blackwall to enjoy whitebait dinners. It has become the practice for her majesty's ministers to repair to Greenwich for a whitebait dinner every year before the prorogation of parliament in autumn. Some of the corporations of London indulge in a similar annual festivity. The whitebait has the body more compressed than the mature herring; the belly is serrated; the lower jaw is longer than the upper; the scales are very soft, small, and thin, and very easily rubbed off; the color is silvery white, greenish on the back. The food of the whitebait seems to consist of minute crustaceans. It seems probable that the fry of all the British *clupeidæ*—the pilchard, the sprat, and the shad—are indiscriminately taken and used like the fry of the herring, under the name of whitebait.

WHITEBOY, the name of an illegal association of the peasantry in Ireland, which for a long series of years was the fruitful source of agrarian outrage, sometimes of a very revolting and sanguinary character. The association had its origin in the early years of the reign of George III.; and first took an organized form in the county of Tipperary, where it appeared in the shape of a united resistance to an attempt on the part of certain proprietors to inclose and appropriate lands up to that time common. The movement at the beginning was confined to throwing down the newly erected fences, and destroying the inclosure, from which circumstance the rioters were in the first instance called "levelers;" but their views soon extended further, and they addressed themselves to the redress, first, of the oppressive exactions of tithes, and afterward of various other grievances, especially those connected with the tenure of land. The name of whiteboys was given to them in consequence of their wearing white shirts in their nightly expeditions. Many acts of cruelty and outrage having been committed, a special commission was issued in 1762 for the trial of the offenders; but the repression was only partial and temporary, and whiteboyism re-appeared more than once in the southern province. In 1787 a new association, whose members called themselves the "Right-boys," appeared in the same district, and was made the subject of discussion in the Irish parliament. The conflicts of the northern orangemen (q.v.) and ribbonmen (see RIBBONISM) for a time drew attention away from the minor discontents of the south; but the same spirit of secret

combination has continued among the peasantry down to the present day. The shana vests, caravats, Rockites, terry alts, and other more obscure or more local denominations, must be regarded as embodiments of the very same discontent, which has long held its ground among the poorer classes in Ireland, and which, although undoubtedly exaggerated and imbittered by the recollections of hereditary wrong inseparable from the condition of a conquered people, are held, even by politicians of moderate views, to have much justification in the social condition of the people, and in certain striking anomalies of the legislature in reference to Ireland. The ground of discontent furnished by the endowment and establishment of the church of a small minority of the population, has now ceased to exist. See FENIAN SOCIETY.

WHITEFIELD, GEORGE, one of the founders of Methodism, was b. in the Bull inn, at Gloucester, on Dec. 16, 1714. He was educated at the grammar-school of his native town, at which he appears to have distinguished himself, especially by elocutionary displays at the annual visitations. On leaving school, he was for a time engaged assisting in the business of his mother, the hostess of the Bull inn; but he obtained admission as a servitor at Pembroke college, Oxford, when in his 18th year. About three years earlier, John and Charles Wesley had laid, in the university of Oxford, the foundations of Methodism—a system which at first resembled the rule of a religious order more than the bond of a religious sect; requiring from its professors ascetic observances and devotion to works of piety and charity. It was not till he had been upward of a year at the university that Whitefield became associated with the Methodists. He at once made himself remarkable among them for zeal, for the austerity of his ascetism, for labor too great for his strength among the sick and the prisoners in the jail. His health gave way, and he had to go home, when his native air soon restored him; after which he carried on at Gloucester the same pious and self-denying practices which he had begun at the university. His conduct drew upon him the attention of the bishop of the diocese, who offered, though Whitefield was only twenty-one, to admit him immediately into orders. The offer was accepted, and Whitefield was ordained a deacon in 1736, before he had taken his degree. He preached his first sermon in Gloucester cathedral, and the effect of it was remarkable. The vehemence and earnestness of his oratory deeply moved the audience; and five persons are said to have been driven mad with fear and excitement. Complaints were made to the bishop; but this good man gave no heed to them—simply saying that he hoped the madness would last to the following Sunday. During the next two years, Whitefield preached with similar results in various churches in England.

Meanwhile, Wesley had been in America establishing missions among the colonists; and in 1738 he desired Whitefield to join him, a request that was immediately complied with. Whitefield had to go to London to make arrangements for his journey; and this visit, though not his first, seems first to have made him known to the inhabitants of the metropolis, upon all classes of whom—fine gentlemen like Chesterfield, and cool skeptics like Bolingbroke, as well as the more mobile crowd—he afterward made an impression such as, probably, no other preacher ever produced. His success in London was immediate, and much exceeded all that had befallen him previously. The doors of the church in which he was to preach were besieged before the dawn; the unlighted streets in the early morning were filled with persons carrying lanterns, making their way to the place of worship many hours before the time of service. This lasted until his departure for America. He was hereafter to be almost as closely connected with evangelical labors in America as in England itself; but on this first occasion, his stay was short—only a few months. He returned to be admitted to priest's orders, and to collect funds for the establishment of an orphanage in Georgia. He soon went back to America, but not before a beginning had been made of his split with the English church, whose clergy he offended by preaching in the open air, whether he got permission from the parish clergyman or not, and by deviating, whenever he thought fit, from the liturgy of the church. But the remarkable and beneficial effects of his preaching on the rude miners and others who flocked to hear him, consoled him for clerical censures; and after this, he seems to have preached almost by preference in the open air. His second visit to America occupied nearly two years. He came back in 1741.

It was about this time that doctrinal differences led to his separation from John Wesley—both of them being by this time disowned by the established church. Wesley believed and preached the doctrine of universal redemption; Whitefield was a rigid Calvinist. Each thought his belief of the utmost importance, and, in the end, each excommunicated the other. Whitefield's supporters now built him a large shed at Moorfields, near Wesley's chapel—which, being temporary, was known as the tabernacle; and his preaching gathered immense audiences around him. But he had no talent for organization; and as soon as he went away on his frequent and protracted journeys, his supporters began to disperse. But that the countess of Huntingdon, a lady of wealth and of abilities, became a convert to his views, Whitefield, in all probability, would not have founded a sect. But this lady appointed him her chaplain; she built and endowed chapels to maintain his Calvinistic doctrines; and thus a slight memorial of Whitefield's preaching, though it more directly commemorated the zeal and energy of lady Huntingdon, remains in what is known as the Huntingdon connection.

One of his most famous missionary journeys was that which he made to Scotland in 1741. He went to Scotland on the invitation of Ralph and Ebenezer Erskine, well known as leaders of a secession from the church of Scotland; but his notions were too catholic for his friends; he was as ready to preach in a parish church as to a seceding congregation, and more ready still to preach in the open air; and the Erskines soon differed from and separated from him. That the impression he made upon the people of Scotland was very strong and very general, may be inferred from the fact that the leading corporations of Scotland—Edinburgh, Glasgow, Aberdeen, Stirling—admitted him to their citizenship. At Cambuslang, in Lanarkshire—a mining district, mainly inhabited by rude colliers, then *adscripti glebæ*—his preaching produced one of the most remarkable "revivals" of modern times; many thousands were stricken with concern about their souls, and violent physical manifestations followed upon their excitement—foaming at the mouth, bleeding at the nose, convulsions—which, by many who read of them, were attributed to divine influence, by others to the devil. It was on his return from this visit to Scotland, that Whitefield, making a stay in Wales, met and married a widow, a Mrs. James. His marriage, like that of Wesley, was not a happy one.

To America, Whitefield paid seven visits, several of which lasted for two or three years. He set out for America for the last time in 1769. He was ailing at the beginning of the voyage; he was ill at the end of it; and he died somewhat suddenly not long after his arrival in America, at Newburyport, Mass., on Sept. 30, 1770. A collection of his sermons, letters, and controversial writings was published in the following year (*The Works of the Rev. George Whitefield*, 6 vols. Lond., 1771); and in 1772 were published his memoirs, by Dr. Gillies. His writings do not sustain the impression which would be derived from the accounts of his preaching. They show him as a man of somewhat slender talent and common-place quality of mind; quite unlearned; entirely free from the casuistical turn, as well as deficient in the worldly knowledge and prudence, for which Wesley, like many other enthusiasts, was pre-eminent. His success as a preacher seems to have been in no small degree due to a sonorous but expressive voice; no doubt it was mainly due to the earnestness of his faith, to the fluency and rude strength of his homely language, and to that vehemence and impetuosity of nature which, perhaps, is the thing most distinctive of the orator. Of the *Memoirs of the Life and Character of George Whitefield*, by J. Gillies, D.D., of the College church, Glasgow, originally published at London in 1772, subsequent editions, containing additional matter, appeared in 1798, in 1811, 1812, 1813, and in 1827. An anonymous *Life of George Whitefield*, founded upon his journals and letters, and borrowing largely from the work of Dr. Gillies, appeared at Edinburgh in 1826. *Whitefield's Life and Times*, by Robert Philip, D.D., was published at London in 1837; and there has since appeared *George Whitefield: a Light rising in Obscurity*, by Andrews (Lond. 1864); and, in 1876, another full memoir by Tyerman.

WHITEFISH, *Coregonus albus*, a fish of the family *salmonidæ* (q.v.), of the same genus with the gwyniad, vendace, powan, pollan, etc. It is found in the lakes and large rivers of North America, from the St. Lawrence and its tributaries to the Arctic regions, and is one of the most valuable of American fresh-water fishes, abounding over a great extent of country, and being excellent for the table. It is the *attihawmeg* of the north-western Indians. The body is elongated but thick, the head small and the muzzle pointed, the tail forked, the scales large. The mouth is destitute of teeth. It sometimes attains a length of two feet and a half, and weighs ten pounds. It is bluish-gray on the back, lighter on the sides, and white below. It spawns in October, proceeding from the lakes up the rivers for this purpose. It usually swims in shoals, like its small British congeners. It feeds chiefly on insects and entomostraca. It is caught by nets, which are often spread under the ice, and the fishery is attended with much labor and exposure. The Indians sometimes spear it through holes in the ice. The whitefish forms the principal food of many Indian tribes and of the fur-traders during great part of the year. It is often salted by them. The flesh is bluish-white, changing to a pure white when boiled, whence the name. The most southern lake in which the whitefish is found is lake Champlain. An allied species, the Otsego Whitefish (*C. Otsego*), found in lake Otsego, is also of exquisite flavor; but it is now rare.

WHITEHALL, a town and city in Greene co., Ill.; on the Burlington route and the Chicago and Alton railroads; 34 m. s.w. of Jacksonville. They are in an agricultural, coal mining, and potter's clay region, and the city has manufactories of pottery, drain-tile, and sewer-pipe. Pop. '90, town, 3244; city, 1961.

WHITEHALL, a town and village in Washington co., N. Y.; at the head of lake Champlain, and on Poultney river, the Champlain canal, and the Delaware and Hudson railroad; 24 m. w. by s. of Rutland, Vt. The village was settled by Philip Skene in 1761, was long known as Skenesborough, and was an important military depot in 1812. There are national banks, electric lights, high school, union school library, weekly newspapers, shipyards, railroad shops, and silk, hosiery, grist, and saw mills. Pop. '90, town, 5402; village, 4434.

WHITEHA'VEN, a parliamentary borough and seaport of Cumberland, near the point where the estuary of the Solway firth joins the Irish sea, 40 m. s.w. of Carlisle by railway, 36 in a straight line, and 34 m. e.n.e. of Ayre point, the northern promontory of

the isle of Man. The harbor is commodious. The sources of the prosperity of the town are its vicinity to extensive collieries, and there are iron and brass foundries and blast furnaces, iron smelting works, and manufactures of cordage, sail-cloth, etc. Coal is exported in large quantities. Pop. '81, 19,295; '91, 18,044.

WHITEHEAD, Cortland, D.D., b. New York, 1842 ; graduated at Yale coll., 1867 ; was ordained priest in the Prot. Epis. church, 1868 ; was a missionary in Col. for three years ; and rector of the Church of the Nativity, South Bethlehem, Penn. He was consecrated bp. of Pittsburgh, 1882.

WHITEHOUSE, Frederick Cope, Egyptologist. He graduated at Columbia College, 1861, and at Gen. Theol. Sem., 1865, but was not ordained. He has made special explorations and surveys in Egypt, and pub. several papers and pamphlets of value, *Lake Moeris : from recent explorations*, 1882 ; *Researches in the Moeris Basin*, 1883 ; *Moeris the wonder of the world*, 1885 ; *The Pyramid-Hill of Gizelo*, 1885 ; also, *Is Fingal's cave artificial ?* 1882 ; and *The Science-Myth of Fingal's cave*, 1884.

WHITEHOUSE, Henry John, D.D., D.C.L. ; 1803–74 ; b. New York ; graduated, Columbia college, 1821, and at the General Episcopal Seminary, New York, 1824 ; rector of St. Luke's, Rochester, 1830–44 ; St. Thomas's, New York, 1844–51 ; consecrated assistant bishop of Illinois, 1851, and bishop, 1852.

WHITELOCKE, Bulstrode, 1605–75 ; b. London ; educated at Oxford, but took no degree; read law in the Temple, and in 1626 was among the junior counsel at the impeachment of Buckingham. In 1640 he was elected to the "long" parliament, and, as chairman of the impeachment committee, drew up the charges against the earl of Stafford. He was also one of the Oxford commissioners appointed to treat with Charles I.; a member of the Westminster assembly, 1643; governor of Windsor, 1644; commissioner of the great seal, 1649. He disapproved of the trial of the king, and refused to take part in it. In 1656 he was speaker of the house of commons; was one of Cromwell's lords, and commissioner of the great seal to Richard. He left the MSS. of an autobiography and other works, the most noteworthy of which was a historical account of the important events in which he participated.

WHITESIDE, a co. in n.w. Illinois, having the Mississippi river for its n.w. boundary ; drained by Rock river, Elkhorn, and Little Rock creeks ; 700 sq.m. ; pop. '90, 30,854. Co. seat, Morrison.

WHITETHROAT, *Curruca cinerea*, a bird of the family *sylviadæ*, a summer visitant of Britain: plentiful during summer in the greater part of England and in Ireland, but comparatively rare in Scotland. It is also common during summer in the s. and middle of Europe, and is found even in the north. It places its nest in a low bush, or among a tangled mass of brambles and weeds. Its food consists both of insects and berries Its song is not very sweet, but is delivered with great energy, and it seems to vie with other birds in singing, refusing to be outdone. It is very lively and amusing as a cage-bird, and very easily tamed. The whole length of the whitethroat is 5½ inches. Its plumage is brown, of various shades; the breast and belly brownish-white, tinged with rose-color in the male.

WHITEWATER, a city in Walworth co., Wis.; on the Chicago, Milwaukee and St. Paul railroad; 45 m. s.e. of Madison. It is the seat of a state normal school, and has a public library, normal school library, national bank, weekly newspapers, and manufactories of cheese, flour, beer, and lumber. Pop. '90, 4359.

WHITEFIELD, a co. in n. Georgia, having the Connasauga river for its e. boundary; 285 sq.m. ; pop. '90, 12,916. Co. seat, Dalton.

WHITFIELD, Henry, 1597–about 1651 ; b. England ; called to the bar, but afterward took orders in the church of England. He protected some of the Puritan divines during Laud's persecution, to which he was himself finally exposed. He emigrated to New Haven in 1637, and was one of the founders of Guilford. He afterward returned to England, and was minister at Winchester. He wrote on the progress of religion among the Indians, and other subjects.

WHITGIFT, John, the third Protestant archbishop of Canterbury, was b. at Great Grimsby, in Lincolnshire, according to one account in 1530, according to another in 1533. His father was a merchant, and is said to have belonged to a family long established in Yorkshire. His early years were passed within the abbey of Wellow, near Grimsby, of which his uncle was the abbot; and from that he went to St. Antony's school in London, a religious house then in great reputation. About 1548 he was entered at Queen's college, Cambridge. After a short time he removed to Pembroke hall, of which he continued a member till 1555, when he was elected a fellow of Peterhouse. He took orders in 1560, and as he showed a remarkable talent for preaching, the bishop of Ely appointed him his chaplain, and gave him the living of Feversham. In 1563 he was appointed lady Margaret's professor of divinity. In 1567 he became master of Pembroke hall; and in the course of the same year queen Elizabeth, who admired his preaching, and had made him one of her chaplains, appointed him to the mastership of Trinity college. About this time he also obtained the regius professorship of divinity, and took his doctor's degree. He was appointed dean of Lincoln in 1571, bishop of Worcester in 1577, and archbishop of Canterbury in 1583. He at one time held together

—under a dispensation from the archbishop—the deanery of Lincoln, the mastership of Trinity, the regius professorship of divinity, and the living of Feversham: and the dispensation enabled him to hold, along with these, any other benefice whatever. This cannot have been often paralleled, even in the history of pluralities. Of course the man so favored had rendered and was rendering considerable services to the church and to the crown.

His first work, on becoming master of Trinity, was upon a revisal of the statutes of the university. He obtained such powers for the heads of houses as enabled them to eject from the lady Margaret's professorship the able and energetic Puritan, Cartwright, on the score of his Calvinistic creed. He afterward, at the request of Archbishop Parker, published an answer to an "Admonition of Parliament" (drawn up by a clergyman named Field), presented to the house of commons on behalf of the Puritans, in which it was maintained that, in matters of doctrine and discipline, the church should admit nothing as authoritative but what was contained in the word of God. This work was published in 1572. It has always been held that in it Whitgift vindicated the position of the Anglican church against the Puritans with no less ability than bishop Jewell showed in defending it against the Romanists. He was answered by Cartwright on behalf of the Puritans; he replied, and Cartwright rejoined; and as the works on either side were revised by the most learned and eminent men of the two parties, they give an excellent view of the state of opinions in the Anglican church at this time. After becoming primate, Whitgift labored assiduously to secure uniformity of discipline in the church. He had the full confidence of queen Elizabeth, who placed all the church patronage of the crown, including the bishoprics, in his disposal, and he was armed with full powers for carrying out his design. He required the clergy not only to subscribe to the royal supremacy, the liturgy, and the thirty-nine articles of the church, but also to a set of additional articles framed mainly with the view of purging the church of Puritanism. The bishops were required to administer those tests; and the clergymen who refused to accept them were deprived of their livings. This measure was harshly conceived; but Whitgift is said to have been a kindly man, and to have used his authority over the clergy gently, especially in his later years. He was made a privy councilor in 1586, and in that capacity drew up a set of statutes for cathedral churches, to make their services conform to the principles of the reformation. He was offered the chancellorship by queen Elizabeth, but he declined the office. On the accession of king James, he seems to have been much alarmed for the stability of the system which he had spent his life in rearing; and though the monarch treated him with the utmost observance, anxiety upon this account is said to have hastened his end. He died of paralysis Feb. 29, 1604. He is undoubtedly entitled to rank with the ablest and most distinguished prelates that have adorned the English church. He founded a magnificent hospital and a grammar-school at Croydon.

WHITING, *Merlangus*, a genus of fishes of the family *gadidæ*, differing from the cod, haddock, and their congeners (*gadus* or *morrhua*), in having no barbule on the lower jaw, and also in their more slender form, which adapts them for pursuing their prey more actively and further from the bottom of the sea. The Common Whiting (*M. vulgaris*) is abundant on many parts of the British coast, particularly on the western coasts of Britain, and on the coasts of Ireland; on the northern coasts of Scotland it is comparatively rare. It not unfrequently attains a weight of 3 or 4 lbs.—although the whitings brought to market are seldom of this size; but a whiting has been taken of 7 lbs. weight. The head and body are compressed; the deepest part is at the vent, which is opposite the middle of the first dorsal fin; the upper jaw extends a little beyond the lower; both jaws have long sharp teeth, and there is a triangular patch of teeth on the palate. The scales are small. There are three dorsal fins, and two anal fins; the tail-fin is even. The color is dusky yellow on the back, the sides paler, the belly silver white; there is a black spot on the upper part of the root of the pectoral fin. The whiting is a voracious fish, preying on mollusks, worms, crustaceans, and small fishes. It is caught chiefly by hand lines and long lines; mussels and pieces of cuttle-fish are very generally used for bait. It is in high esteem for the table, and is regarded as particularly delicate and easy of digestion. The flesh is of a pearly whiteness, whence the English name.

WHITING is an impure carbonate of lime, prepared by grinding and then washing chalk, so as to separate the coarser particles from the finer ones, which are collected in masses, and dried. It is extensively used for size-painting, and as an article of household economy, for cleaning plate; and on emergency, may be employed as an antidote (in suspension in milk) in cases of poisoning with oxalic, or one of the mineral acids.

WHITING, a town in Lake co., Ind., on lake Michigan, and the Pennsylvania Co.'s railroads; 17 m. s.e. of Chicago. It has a good harbor and steamer communication with the ports of the great lakes, and is principally engaged in the manufacture of paint and in refining and shipping petroleum oil. Pop. '90, 1408.

WHITING, William, 1813–73; b. Mass.; graduated at Harvard college and the Harvard law school; began the practice of his profession at Boston, and gained a high rank. He was solicitor of the U. S. war department, 1862–65, and had considerable influence on some of Lincoln's measures. He was a member of congress at the time of his death. His most important publication is his work on *The War Powers of the President, and the Legislative Powers of Congress in Relation to Rebellion, Treason, and Slavery*

WHITLEY, a co. in n.e. Indiana; drained by the Eel river; 330 sq.m.; pop. '90, 17,768. Co. seat, Columbia City.

WHITLEY, a co. in s.e. Kentucky, drained by the Cumberland and Laurel rivers; containing the cataract of the Cumberland river, with a perpendicular fall of 60 ft.; 580 sq.m.; pop. '90, 17,590, chiefly of American birth, with colored. Co. seat, Williamsburg.

WHITLOW, or PARONYCHIA, is a painful inflammatory affection of the phalanges of the fingers, almost always proceeding to suppuration. There are several varieties of this affection, according to the texture primarily attacked; thus, it may be situated in the skin, the cellular (or connective) tissue beneath the skin or under the nail, the tendons or tendinous sheaths running along the fingers, or the periosteum. If the skin be the seat of inflammation, vesicles appear, which soon discharge pus, after which relief is rapidly afforded. Such cases require little care or attention, and give rise to hardly any constitutional disturbance. If the cellular tissue is the primary seat of inflammation, there is a painful sensation of tenseness and throbbing of the part, and often considerable febrile disturbance, until the pus can be evacuated. Although this form is painful, no serious mischief is to be apprehended. When, however, the tendons and their sheaths, or the periosteum, are affected, a much more serious form of whitlow is developed, which has been already discussed in the article TENDON. In this form, the suppuration may extend up the arm, and occasion destruction of the joints, and even death.

Whitlow may originate either spontaneously, or after an external injury, such as a prick from a needle, thorn, etc. In the treatment of the milder forms, the finger or thumb should be held for half an hour or longer in water as hot as can be borne, after which lunar caustic should be rubbed freely over the painful surface; and if there are any febrile symptoms, the patient may take a powder, consisting of 4 grains of calomel, 3 of James's powder, and 3 of Dover's powder, at bed-time, to be followed in the morning by an ordinary black draught. The hot local baths should be carried on till matter shows itself; and, as soon as its presence and seat are determined with certainty, an incision should be made to admit of its escape. Even if suppuration has not taken place, a free incision into the inflamed part often gives great relief. There is a pernicious popular idea that the application of cobblers' wax, or some other stimulating substance, will draw the inflammation to the surface, and bring the whitlow "to a head." There is reason to fear that a considerable number of fingers are annually sacrificed to this delusion. As it is not always easy to state in an early stage how a whitlow may turn out, it is advisable that surgical aid should always be at once obtained.

WHITMAN, a co. situated in s.e. Washington, having the Snake river for its s. boundary; about 2,124 sq.m.; pop., '90, 19,109, chiefly of American birth, with colored. Co. seat, Colfax.

WHITMAN, MARCUS, D.D., American missionary and patriot, born in N. Y. in 1802; went in 1835 as missionary to Oregon Territory, commissioned by the A. B. C. F. M.; discovered a plot to annex that region to the British possessions, and in the winter of 1842–43 made a horseback journey across the continent to warn and advise the U. S. government; returned in 1843 with a large emigrant train; was highly successful in missionary work among the Indians, but was treacherously murdered, with his wife, in 1847. Whitman county and Whitman college, both in Washington, were named for him. See Barrows, *Oregon*, and article OREGON.

WHITMAN, SARAH HELEN (POWER), 1803–78; b. R. I. In 1828 she married John W. Whitman of Boston. She was a literary critic and poet of some merit. *Hours of Life and Other Poems*, a collection of minor pieces, was published in 1853, and *Edgar Poe and his Critics* in 1860.

WHITMAN, WALT, b. West Hills, L. I., 1819; educated in the Brooklyn and New York public schools. He worked at the printer's trade in summer, and was a schoolteacher in winter. He traveled extensively in this country and Canada, 1847–48; was an editor for a short period in New Orleans and Long Island, and finally returning to Brooklyn, learned the carpenter's trade. He was a nurse in the federal military hospitals, 1862–65; and a government clerk at Washington, 1865–74. He long resided in Camden, N. J. He published *Leaves of Grass*, a book of poems without rhyme. His other works include *Democratic Vistas; The Two Rivulets; Drum Taps; Specimen Days and Collect* (1883); *Good-By, My Fancy* (1891). His *Complete Works*, including letters to his family during the war, and *Letters to Peter Doyle*, were published in 1887. There is much debate regarding his rank as a poet—some critics placing him among the most eminent poets; others denying him even the name of poet. He has many admirers in England. His style is so undeniably his own that he can be classed with no other writers. He died in 1892.

WHITNEY, ADELINE D. (TRAIN), b. Boston, 1824; married Seth D. Whitney of Milton, Mass. Her first published writing was a poem, *Footsteps on the Seas* (1857). She has contributed to several magazines, and is the author of the very popular stories, *Faith Gartney's Girlhood* (1863); *A Summer in Leslie Goldthwaite's Life* (1866); *Patience Strong's Outings* (1868); *Real Folks; Bonnyborough* (1885); *A Golden Gossip* (1892); and others.

WHITNEY, ASA, 1791–1874; b. Mass.; in his youth learned the blacksmith's trade, and became a machinist. He was engaged in the manufacture of machinery in several

states; in 1830 was made master-machinist, and in 1833 superintendent of the Mohawk and Hudson railroad. From 1839 to 1841 he was a canal commissioner of New York, and in 1842 went into partnership with Matthew Baldwin in the manufacture of locomotives at Philadelphia, where he remained until his death. In 1848 he began the manufacture of patent iron annealed car-wheels, by which he acquired large wealth. He left $50,000 to the university of Pennsylvania for the founding of a chair of dynamical engineering.

WHITNEY, Eli, American inventor, was b. at Westborough, Mass., Dec. 8, 1765, and was educated at Yale college, where he paid his expenses partly by school teaching, partly by mechanical labor. Having graduated in 1792, he went to Georgia as a teacher; but finding a generous patron in the widow of Gen. Greene, of the revolutionary army, he resided on her estate, and studied law. The cotton culture at this period, especially that of the best kind, the "green seed," was limited by the slow and difficult work of separating the cotton from the seed by hand; but Mrs. Greene told her complaining neighbors that she was sure Whitney could help them out of their trouble, for he could make anything. At their desire, he set to work under great disadvantages, for he had to make his own tools, and even draw his own wire; but the reports of his success prompted some lawless people to break into his workshop, and steal his machine, and get others made before he could secure a patent. He, however, formed a partnership with one Miller in 1793, and went to Connecticut to manufacture cotton gins; but the lawsuits in defense of his rights took all his profits, and $50,000 voted him by the state of South Carolina. Finally in 1798 he got a government contract for the manufacture of fire-arms, and was the first to effect the division of labor, by which each part was made separately. He made a fortune by this manufacture, carried out with ingenious machinery at Whitneyville, Conn.; while he had but barren honor from the gin, one of the most important of the whole series of inventions connected with the cotton manufacture. He died at New Haven, Jan. 8, 1825. See Cotton.

WHITNEY, Josiah Dwight, b. Mass., 1819; graduated at Yale college in 1839. The next year he was employed on the New Hampshire geological survey. He spent the years 1842–46 in European study, and soon after his return engaged on a survey of the lake Superior mineral region. From 1855 to 1860 he made a geological survey of Iowa, and the lead district in Wisconsin; and in 1860 he became state geologist of California. In 1865 he became Sturgis-Hooper professor of geology at Harvard university. He has published valuable reports of his surveys and other works. D. 1896.

WHITNEY, William Collins, b. Conway, Mass., 1841; graduated at Yale coll., 1863; afterward at the Harvard law school. He began the practice of law in New York, in the office of Judge Lawrence, and entered political life in the campaign against the Tweed ring, 1870–71. In 1875 he was appointed corporation counsel by Mayor Wickham. He aided in organizing the county democracy in New York, and was a strong opponent of Tammany. In 1885 Pres. Cleveland appointed him sec. of the Navy.

WHITNEY, William Dwight, ll.d., b. Mass., 1827; graduated in 1845 at Williams college. He afterward studied in Berlin and Tübingen, and is now the foremost of American philologists and grammarians. In 1853 he returned to this country, and in 1854 was made professor of Sanskrit in Yale college. In 1856 he published, with Prof. Roth of Berlin, the *Atharva Veda Sanhitâ;* in 1862 a phonetic grammar on the *Atharva Veda,* with text, notes, and translation; in 1868 twelve lectures on the principles of linguistic science; and in 1869 a German grammar and reader, in common use in the schools and colleges of the country. He also contributed many articles to the *Bibliotheca Sacra, New Englander, Journal of the Oriental Society,* and other periodicals; and furnished articles on oriental philology and kindred topics to Appleton's American Cyclopædia. In 1879 Prof. Whitney published a Sanskrit grammar of both the classical language and the older dialects. He is the author of *Language and the Study of Language,* etc. He died in 1894.

WHITON, James Morris, ph.d., b. Boston, 1833; graduated Yale college, 1853; teacher in high school, Worcester, Mass., 1853–54; rector Hopkins grammar school, New Haven, Conn., 1854–64; pastor First Congregational church, Lynn, Mass., 1865–69; pastor of North Congregational church, Lynn, 1869–75; principal of Williston seminary, Easthampton, Mass., 1876–78; pastor of First Congregational church, Newark, N. J., 1879–85; and (1886) of Trinity Congregational church, New York. He has published: *Latin and Greek Lessons and Primers,* 5 vols.; *Select Orations of Lysias; Is Eternal Punishment Endless?; Essay on the Gospel according to Matthew; The Gospel of the Resurrection; The Law of Love; Old Points to New Texts.*

WHITSUNTIDE ("White-Sunday-tide"), the English name of the season of Pentecost (q.v.), is so called from the white garments anciently worn by the newly baptized catechumens, to whom that sacrament was usually administered on the vigil of Pentecost. The name "Whitsuntide" comprehends the entire octave or the week which follows Pentecost Sunday; but the word is more strictly applied to the Sunday, Monday, and Tuesday of that week. The two latter days, down to a very recent date, were observed in the Roman Catholic church as holidays of strict obligation. Many festive observances were anciently practiced in connection with the Whitsuntide holidays, which in England and other Protestant countries still subsist, having outlived the religious association.

WHITTEMORE, Amos, 1759–1828; b. Mass.; at first a gunsmith in Cambridge; afterward engaged in the manufacture of wool and cotton cards. In 1797 he secured a

patent for a card-making machine to puncture the leather and set the wires, which was sold for $150,000, but eventually bought back by his brother Samuel. Whittemore was never able to secure an English patent for his invention.

WHITTEMORE, THOMAS, D.D., 1800–61; b. Boston; studied theology with the rev. Hosea Ballou; minister of a Universalist church at Milford, Mass., 1821, and at Cambridgeport, 1822–31; was associate editor of the *Universalist Magazine;* editor and proprieter of *The Trumpet,* a Universalist paper, for 30 years. He was president of the Massachusetts and Vermont railroad, president of the Cambridge bank, and member of the legislature. He published: *Modern History of Universalism; Songs of Zion; Life of Hosea Ballou; A Plain Guide to Universalism.*

WHITTIER, JOHN GREENLEAF, American author and poet, was born near Haverhill, Mass., Dec. 17, 1807, and was descended from an emigrant to New England in 1638, whose children became members of the society of Friends. His life before his majority was attained was that of the average country lad in New England, and was spent mainly in work on his father's farm. Among the few books that found their way into the simply furnished farm-house was a copy of Burns, and this incited young Whittier, who had already begun to put his thoughts into rhyme, to imitate the Scottish poet, and some lines contributed in his nineteenth year to the *Newburyport Herald,* at that time edited by William Lloyd Garrison, possessed sufficient merit to draw from the latter encouraging words, and to lead to a personal acquaintance. Owing largely, no doubt, to Garrison's counsel, young Whittier determined to obtain a better education, and having learned shoemaking, a common industry in that section of the country, he earned enough to warrant his entering Haverhill Academy, where he studied for a year or more, 1827–28, and gained additional experience by teaching school one winter at Amesbury. His advance was so rapid that in 1829 he became editor of the *American Manufacturer,* published in Boston, and in 1830 was called to Hartford, Conn., to edit the *Haverhill Gazette,* succeeding George D. Prentice, who had gone to Kentucky to write the life of Henry Clay. Shortly after this he edited the *New England Weekly Review.* In 1831 Garrison started his anti-slavery paper, *The Liberator,* and Whittier, who came to his aid and published in that paper some of his most passionate protests against slavery, deliberately imperilled his own chances for popularity—for the sake of principle. In 1832 his health failed and he returned to Haverhill, where he carried on the ancestral farm, and represented the town in the state legislature, 1835–36. By this time his name had become a household word in anti-slavery families throughout the country, and in 1836 he was appointed Secretary of the American Anti-Slavery Society. In 1838 he took up his residence in Philadelphia, and for a year edited the *Pennsylvania Freeman,* but even in the stronghold of Quakerism, there was objection to free speech, though the editor's foes were not of his own household of faith, and the obnoxious paper was suppressed by a mob that sacked and burned the printing-office. Whittier then returned to Massachusetts, and after editing at Lowell for six months, the *Middlesex Standard,* made Amesbury his home, though from 1876 much of his time was spent at Oak Knoll, Danvers. From 1847 to 1859 he contributed editorials to the *National Era,* the anti-slavery paper published in Washington, for which Mrs. Stowe wrote *Uncle Tom's Cabin.* He was a member of the Massachusetts Electoral College in 1860 and 1864, but after that time took little if any part in public life, though continuing to guide or excite public sentiment through his writings. In 1877 his seventieth birthday was celebrated by a dinner given in Boston, and the venerable poet received appreciation and loving tributes in prose and verse from the most distinguished authors of America.

Whittier's prose writings are a *Life of John G. C. Brainard* (Hartford, 1831); *Legends of New England* (Hartford, 1831); *Justice and Expediency, or Slavery considered with a view to its Abolition* (1833); *The Stranger in Lowell* (1845); *Supernaturalism in New England* (N. Y., 1847); *Leaves from Margaret Smith's Journal* (1849); *Old Portraits and Modern Sketches* (Boston, 1850); *Literary Recreations and Miscellanies* (1854); *Prose Works* (2 vols., 1866). He aided in founding the *Atlantic Monthly* in 1857, a journal whose sympathies with the anti-slavery movement were constant and pronounced. His poetical works comprise *Moll Pitcher* (1832); *Mogg Megone* (1836), subjects already treated in *Legends of New England; Ballads* (1838); *Lays of My Home, and other Poems* (1843); *Miscellaneous Poems* (1844); *The Voices of Freedom* (Phila., 1849); *Songs of Labor, and other Poems* (Boston, 1853); *The Chapel of the Hermits, and other Poems* (1853); *A Sabbath Scene: A Sketch of Slavery in Verse* (1853); *The Panorama, and other Poems* (1856); *Complete Poetical Works* (2 vols., 1857); *Home Ballads, and other Poems* (1860); *Snow-Bound* (1862); *In War Time, and other Poems* (1863); *National Lyrics* (1865); *The Tent on the Beach, and other Poems* (1867); *Among the Hills, and other Poems* (1868); *Miriam, and other Poems* (1870); *The Pennsylvania Pilgrim, and other Poems* (1872); *Mabel Martin* (1875); *Hazel Blossoms* (1874), including poems by his sister, Elizabeth Hussey (1815–64); *Poetical Works* (new ed., 1875); *A Centennial Hymn* (1876); *The Vision of Echard, and other Poems* (1878); *The King's Missive, and other Poems* (1881); *The Bay of Seven Islands, and other Poems* (1883); *Poems of Nature* (1885); *St. Gregory's Guest, and other Poems* (1886); *Legends and Lyrics, Poems* (1888). He compiled, with the aid of Lucy Larcom, *Child Life; Child Life in Prose* and *Songs of Three Centuries,* and edited the *Journey of John Woolman,* the Quaker preacher and philanthropist (1871). Whittier's *Complete Poetical and Prose Works* (7 vols.) were published in 1888–89.

If it is true, as is usually claimed, that Longfellow is our most popular poet, Whittier must be ranked next to him, and indeed in certain characteristics he is his equal. The finish and faultless melody that distinguish everything from the pen of the author of *Evangeline*, merits largely due to Longfellow's artistic temperament and culture, are often lacking in the verses of the Quaker bard, but Whittier is fully as direct, as genuine in his sentiment, as truthful in his word paintings, and is far more sympathetic, where the masses are concerned. If his sonnets and ballads are rugged and unfinished at times, they are like the fields he ploughed and mowed in his boyhood, unattractive to one who surveyed them from afar, but yielding wholesome odors of upturned earth and clover, and affording around the boulders that strewed them graceful ferns and rare wild flowers. Pre-eminently is Whittier the poet of New England, whether he recites with trembling voice the trials of Quaker and of witch-haunted Puritan, the legends of the coast towns or of the Indian ravaged settlements; and when he sings of farm life, and of families gathered about their firesides, it is with a love that can only be born of experience. *Snow-Bound*, one of his few continued poems, perhaps the most typical one, is a charming idyl, which is largely autobiographical, and its descriptions of winter scenery are as faithful as any that Lowell or Thoreau have written. It is rightly ranked by Stedman with "The Deserted Village" and "The Cotter's Saturday Night," and Burroughs has pronounced it "the most faithful picture of our northern winter that has yet been put into poetry." Whittier's sentiment is ever healthful and almost naïve in its simplicity, and "The Friend's Burial" and "My Lost Playmate" may be mentioned as instances. The influence of his pen before and during the civil war must be seriously considered by one who seeks to account for the ardor with which the New England States entered into and endured that conflict, but his sympathies were not bounded by geographical lines, for social wrongs, and religious bigotry in all nations found in him a stern rebuker. His religious poems evince a firm faith in a pitying All-Father, a happy resignation, and a loving hope for men of every creed. Some of his religious poems are very beautiful, and one, at least, "We may not climb the Heavenly steeps," is found enriching the hymn-books of many denominations. He died Sept. 7, 1892. See the admirable criticism of Whittier as an author in Stedman's *Poets of America* (Boston, 1885); *John Greenleaf Whittier, his Life, Genius and Writings*, by William Sloane Kennedy (1882), and the biographies by Underwood (Boston, 1883), and Pickard (1894).

WHITTINGHAM, William Rollinson, D.D., 1805–79; b. New York; graduated at the General Theological Seminary, New York, 1825; ordained, 1827; rector of St. Luke's church, New York, 1831; went to Europe for health, 1834; elected professor of church history in the General theological seminary, 1835; consecrated bishop of Maryland, 1840. During the war of the secession he was a firm friend of the national government, while many of his clergy espoused the southern cause. He edited *The Family Visitor, Children's Magazine, The Churchman, Parish Library of Standard Works*, with prefaces, notes, etc., and published several sermons.

WHITTINGTON, Richard. As the existence of this remarkable man is by many supposed to be wholly mythical, it has been thought not out of place here to state briefly the few authentic facts of his life. Whittington was descended from a good Gloucestershire family, and was born probably about 1350, the younger son of sir William Whittington, who possessed the estate of Pauntley in that county. His father died not long after Whittington was born, and Richard, who had no fortune, set out for London, to endeavor to make one by means of trade. That he left London on account of ill-usage, but was induced to return by his interpretation of the friendly sound of Bow Bells, and that he afterward made his living through the instrumentality of a cat, are stories not improbable, but which cannot be well authenticated. He appears, however, to have apprenticed himself to a mercer, and to have rapidly risen in the world. It is not known at what date he set up for himself, but we find him a member of the Mercers' company in 1392, in which year he was elected an alderman of the city, and in the following year was appointed sheriff. In 1397 Whittington was elected lord mayor of London; was again chosen to fill that office in 1406; was elected member of parliament for the city in 1416; and in 1419, for the third time, filled the office of mayor. These statements accord with the popular story of Whittington's having been "thrice lord mayor of London," although some antiquaries doubt if he filled that office oftener than twice. Whittington, on account of various services rendered to Henry V., received from that sovereign the honor of knighthood. We are not informed of the date of Whittington's marriage; but from various authentic sources we learn that his wife's name was Alice, daughter of sir Hugh Fitzwarren. She appears to have died several years before her husband, and to have left no issue. Whittington died in the spring of 1423, aged about 63 years. There can be no doubt that Whittington was diligent and exceedingly prosperous in business, upright and liberal in character—"a vertuous and godly man, full of good works (and those famous)"—and in many respects considerably in advance of his time. His liberality appears to have been unbounded. At his death, he left the bulk of his property to be laid out in purposes of charity, and in completing those works which had been commenced under his own superintendence. For further details concerning the life of this remarkable man, we refer the reader to the Rev. Samuel Lysons's *Model Merchant of the Middle Ages* (Lond. 1860), an admirable and judicious biography of Whittington; also to various volumes of *Notes and Queries*.

WHITTLE, Francis McNeece, d.d., ll.d., b. Va., 1823; graduated at the theol. sem. of Virginia, 1847; was ordained priest in the Prot. Epis. church, 1848; consecrated asst. bp. of Va., 1868; and assumed the full charge of the diocese at the death of Bp. Johns, 1876.

WHITTLESEY, or Whittlesea, a decaying village and market-t. in Cambridgeshire, 5 m. e. of Peterborough. The population in and about Whittlesey are mostly employed in agricultural pursuits and in brickmaking. *Whittlesea-mere*, a shallow lake, which formerly existed in the n. of Huntingdonshire, 4 m. s.w. of Whittlesey, was 2 m. in length by 1 in breadth, and abounded in fish, water-fowl, etc., is now drained and laid out in fenlands, which are under cultivation. Whittlesey is connected by a branch with the Great Northern and Great Eastern railways. The pop. in '91 was 3556

WHITTREDGE, Worthington, b. Ohio, 1820; became a portrait and landscape painter in Cincinnati. After a residence in Europe, 1849–59, he took up his residence in New York. Among his best-known works are: "Lake George," "Ruins of Tusculum," "The Roman Campagna," and "The Coast of Rhode Island."

WHITWORTH, Sir Joseph, b. England, 1803; studied mechanics and manufacturing in Manchester, and became a large manufacturer. He made valuable inventions in planing machines, etc.; but was best known as the inventor and manufacturer of the Whitworth breech-loading cannons and rifles, which he began to make in 1854. His baronetcy was bestowed on him in 1869. He d. 1887. See Artillery.

WHOOPING-COUGH. See Hooping-Cough.

WHORTLEBERRY. See Huckleberry.

WHY'DAW, or Whidaw, a maritime province of Dahomey (q.v.), on the bight of Benin. It is populous and very fertile, and exports palm-oil, gold-dust, ivory, and many slaves.—The town of Whydaw is the principal seaport of Dahomey, a decaying place, owing to the suppression of the slave-trade. It is still, however, the principal seaport of the kingdom. Pop. formerly 50,000, now under 12,000. It is situated about a mile and a half from the sea, close to a lagoon and a swamp, between which and the sea a sandy neck intervenes. Into the lagoon flow several rivers, known to slave-traders.

WHYDAW BIRD, Whydaw Finch, or Widow Bird, *Vidua*, a genus of birds of the family of weaver-birds (q.v.), having long wings, and a boat-shaped tail, the two middle feathers of the tail of the males excessively lengthened during the breeding-season. The name is derived from the country of Whydaw in western Africa, and widow bird is a mere corruption of it, which, however, has given to the genus its name *vidua* (Lat. widow), regarded as appropriate, because the long tail of the male drops off after the breeding season, and also because of the general dark color of the plumage. The species are natives of the tropical parts of Africa and the s.e. of Asia. They are frequently brought to Europe as cage-birds, both on account of their plumage and the sweetness of their song. The best-known species (*V. paradisea*) is a small bird, about the size of a canary, with black and brownish-black plumage, with a broad collar of orange-rufous color, and breast of somewhat similar color; two feathers of the tail in the male very broadly webbed in the breeding season, and ending in a hair-like shaft, two feathers very much elongated, sometimes a foot in length, and about three-quarters of an inch in breadth.

WHYMPER, Edward, b. London, 1840; at first a draughtsman on wood. Preferring an active life, in 1861 he went up Mont-Pelvoux, then thought to be the highest mountain in France, and from its top discovered the Pointe des Ecrins, the highest of the French Alps which he ascended in 1864. The following year he succeeded in making the ascent of the Matterhorn (14,780 ft. high), though three of his companions and one of his guides were killed. He traveled in Greenland, 1867, finding magnolia cones, and thus demonstrating the former existence of luxurious vegetation in that country. His collection of fossil plants is in the British museum; for a description, see article by Prof. Heer in the *Transactions* of the Royal society for 1869. For his *Scrambles among the Alps in the years* 1860–69, he received from the king of Italy the decoration of chevalier of the order of SS. Maurice and Lazarus. He re-visited Greenland, 1872; ascended the Andes, 1879–80, and was the first known explorer of the heights of Chimborazo (20,517 ft.) and other mountains. The discovery of glaciers on the Andes was due to him. He has published also *The Great Andes of the Equator* (1892).

WHYTE, William Pinkney, ll.d., b. Baltimore, 1824; educated at Baltimore coll., and under private tutors; studied law at Harvard law school, and was admitted to the bar, Baltimore, 1846; was a member of the state legislature, in 1847; state controller, 1853–55; was appointed by the gov. of Md. to fill a vacancy in the U. S. senate, 1868–9; was elected, as a dem., gov. of Md., 1861, and resigned upon being elected to the U. S. senate, 1874, in which he served until 1881; was made attorney-general of Maryland, 1887.

WICHERN, Joh. Heinrich, superintendent of the Rauhes Haus (q.v.), near Hamburg, and known by his exertions in the affairs of the German home mission, was born at Hamburg on April 21, 1808. He attended the gymnasium of his native town, and then studied theology at Göttingen and Berlin. Shortly after passing his examinations at Hamburg, he directed himself to practical usefulness, visited the poor and the wretched in the courts and lanes of the town, and undertook the direction of a free

Sunday-school for poor children, in which he soon gathered round him from 400 to 500 scholars, instructed by 40 voluntary male and female teachers. At this time Wichern declined the offer of a charge in the neighborhood of Hamburg, as he already entertained the idea of an institution such as the Rauhes Haus, which he opened in 1833. From about 1840 Wichern was much engaged with undertakings of a similar kind in Germany, to which his mother institution gave rise. The example was soon followed by France on a great scale (Mettray, near Tours), then by England, Holland, and other countries. It was chiefly through the instigation of Wichern that at the first Protestant ecclesiastical assembly held at Wittenberg in 1848, for the purpose of concerting united action, a central home mission committee was appointed, under which title Wichern had formed the idea of comprehending all exertions on behalf of the poor, the miserable, and the morally and religiously lost. This home mission has exerted a wide and beneficial influence on the n. of Germany, and as a member of the committee, Wichern found in it an extended field for his exertions. Traveling through all parts of Germany, Wichern was the means, by his exhortations, of founding all sorts of institutions and societies for education and the care of the sick, of the poor, and of prisoners. On his return from a visit to England in 1851, the Prussian government commissioned him to inspect all the houses of correction and prisons, to the general supervision of which he was appointed in 1858. Prevented by this constant practical usefulness, he published but little. In his *Home Mission of the German Evangelical Church* (Hamburg, 1849), he explains his views of Christian charity, and its relation to the ecclesiastical and social questions of the day. After 1844 he published his *Fliegende Blätter* (Fugitive Leaves), which contain parts of his discourses at the ecclesiastical diets. In 1851 Wichern received from the university of Halle the degree of D.D. He d. 1881.

WICHI'TA, a co. in w. Kansas, drained by the branches of Smoky Hill river; 720 sq. m.; pop. '90, 1827, of American birth. Co. seat, Leoti.

WICHI'TA, a co. in n. Texas, having the Red river for its n. boundary; drained by the Wichita river; 600 sq. m.; pop. '90, 4831. Co. seat, Wichita Falls.

WICHITA, city and co. seat of Sedgwick co., Kan.; on the Arkansas river, and the Atchison, Topeka, and Santa Fé, the Chicago, Rock Island, and Pacific, the Missouri Pacific, the St. Louis and San Francisco, and the Wichita and Western railroads; 160 m. s.w. of Topeka. It contains Wichita university, Fairmount college, Lewis and All Hallows academies, business colleges, Wichita and St. Francis hospitals, public library, Linwood, Riverside, and Schuman parks, U. S. government building ($200,000), city hall ($100,000), co. court-house ($250,000), Y. M. C. A. building ($75,000), opera house, national and state banks, and about 30 churches. There are gas and electric light plants, electric street railroads, waterworks supplied from driven wells, two large packing-houses (cost $500,000), 70 wholesale houses, and 84 manufacturing firms. Pop. '90, 23,853.

WICK, a royal, parliamentary, and municipal burgh and seaport, capital of Caithnessshire, stands on both sides of Wick Water, at the mouth of that stream, and at the head of an inlet called Wick bay, 16 m. s.s.w. of Duncansby Head, and 18½ m. e.s.e. of Thurso. The parliamentary boundaries include the royal burgh, which, with the suburbs of Louisburgh and Boathaven, lies on the n. side of the river and bay, and Pulteney-town on the s. side; pop. over 5000—the total pop. of the parliamentary burgh being, in '91, 8512. Pulteney-town, a settlement of the British fisheries society, is a flourishing town managed by improvement commissioners. The bay is about a mile long by half a mile broad, exposed to frequent storms from e. and n.e. There is an excellent tidal harbor of considerable capacity, the property of the said society. The institutions within the parliamentary burgh comprise a county court-house and prison, 9 churches and chapels, a town-hall, the Pulteney-town academy, and a chamber of commerce. For the last half century Wick has been the headquarters of the herring-fishery in Scotland.

WICK, the material used for the center of candles and lamps, which, from its porous nature, draws up the oil by capillary attraction in such quantities as to burn easily. Usually, wicks are made of cotton, but formerly flax, hemp, and rushes were used. For ordinary candles the wick consists of a bundle of cotton thread, lying parallel with each other, but for wax, spermaceti, paraffine, stearine, etc., they are usually of twisted or plaited cotton. See CANDLE.

WICK-I-UP, the name used by the Indians of the Northwest to designate a temporary hut made of saplings and leaves. See TEPEE, WIGWAM.

WICKLIFFE, JOHN. See WYCLIFFE.

WICKLOW, a maritime co. of the province of Leinster, Ireland, is bounded on the n. by the co. of Dublin, e. by the Irish channel, s. by the co. of Wexford, and w. and s.w. by the counties of Carlow and Kildare. Its greatest length is 40 m., and greatest breadth 33; the total area being 781 sq. m., or 500,178 acres. The pop. in 1851 was 92,978; in 1881, 73,553, of whom 58,571 were Roman Catholics, 13,722 Protestant Episcopalians, and the rest Protestants of other denominations; and in 1891, 62,136. The coast-line stretches in a southerly direction about 39 m., is in many parts precipitous, and being, moreover, obstructed by sandbanks, is very dangerous for shipping. The surface ascends in some parts most abruptly from the sea, and a large portion is mountainous and unproductive. The Wicklow mountains, however, form rather a group than a range, and on the western and north-western side, decline less precipitously toward the central

plain. The most elevated point is Lugnaquilla, which is 3039 ft. above the level of the sea. Several other peaks approach this elevation, and the glens which lie between the several mountains or groups are exceedingly picturesque, especially Glencree, Glendalough, Glenmalure, Ismail, the glen of the Downs, Devil's glen, and Ovoca, the scene of Moore's well-known Irish melody, *The Meeting of the Waters*, whence the Ovoca river flows, to fall into the sea at Arklow. The valleys are, for the most part, of limited extent; but some plains of considerable size lie upon the eastern and southern shore. The lakes, although strikingly beautiful, are few in number, and of small size, the principal being loughs Dan, Bray, and Tay, and the loughs of Glendalough and the rivers, some of which drain the eastern, and others the western slope, are little more than mountain streams, at least so far as their course lies within the limits of this county. The Liffey and Slaney rise in Wicklow, but do not reach any considerable volume until after they have issued from it. The great central group of mountains is a mass of granite, which protrudes through mica and clay slate, to which latter formation the minor elevations both on the eastern and the western side generally belong. The granitic protrusion, which is one of the most remarkable and best defined in the kingdom, falls away on the e. side toward the sea, and on the w. toward the great central limestone. The minerals of Wicklow are numerous and varied in character. In the granite and mica-slate are found galena, green and white lead ore, and copper pyrites. From the clay-slate tract are obtained gold, silver, copper, iron, lead, zinc, tin, tungsten, manganese, arsenic, and antimony. The quantity of gold found is very small. Silver is found in combination with lead, which is raised with great success and profit at Glenmalure. The copper mines also are very productive; and of late years the utilization of the sulphur, which was formerly wasted, has added largely to the profit of the mining operations.

The climate resembles that of Wexford (q.v.). The soil is very various in character. In the mountains it is thin and poor, but generally dry, although there is a considerable proportion of bog. In the valleys and level districts, the subsoil is generally gravel, and the soil is for the most part either dry, or, even in the boggy districts, susceptible of drainage. On the whole, in the lowlands, the soil is moderately fertile; but there is little cultivation of wheat, the chief agricultural pursuits being dairy-farming and grazing; and the culture, on a limited scale, of barley, oats, turnips, and potatoes. Except in the Ovoca district, where there are important mining industries, the occupations of the people are purely agricultural. The fisheries are almost wholly neglected; and the manufacture of flannels, once extensive, is now nearly extinct. There is a large number of villas, with extensive and highly cultivated parks, especially in the picturesque district which lies between Bray and Wicklow. The county is divided into eight baronies. The chief towns are Wicklow, Bray, Arklow, and Baltinglass. Wicklow returns two members to parliament, one for the eastern and one for the western division.

WICKLOW, a seaport, capital of the above co., is situated at the mouth of the river Vartrey, n. lat. 52° 58′, w. long. 6° 3′, 32 m.s.s.e. from Dublin, with which city it is connected by the Wicklow, Wexford, and Waterford railway. The pop. in 1881 was 3391, of whom 2000 were Catholics, 600 Protestant Episcopalians, and the rest of other denominations. Pop. '91, 13,273. It is an assize town. Although it is a seaport the export trade is extremely small; nor are the fisheries of much value. The principal exports are the products of the mining operations and the agricultural produce of the district. The streets are narrow and ill built, nor is there any public building deserving of notice.

WICOMICO, a co. in s.e. Maryland, having the Pocomoke river for its e. boundary, the Nanticoke on the n.w., Chesapeake bay on the s.w.; drained by the Wicomico; 369 sq. m.; pop. '90, 19,930. Co. seat, Salisbury.

WICOPY. See LEATHERWOOD.

WIDDIN, or VIDIN (anct. *Bononia*), formerly an important Turkish fortress, is now a t. in Bulgaria, on the right bank of the Danube, 16 m. from the Servian frontier, and is surrounded on the land side by morasses. Its streets and bazars are pestiferously dirty. For centuries Widdin has been a strong post in all the contests between the Turks and their northern neighbors, and it was called by the Turks the Virgin fort, from its never having been taken. Widdin has thriving industries and trade, leather work and gold and silver filigree numbering among its specialties. The Berlin congress of 1878, which erected Bulgaria into a principality, determined that the extensive fortifications of Widdin and other Bulgarian fortresses should be demolished. Pop. '88, 14,772.

WIDGEON, or WIGEON, *Mareca*, a genus of ducks of the non-oceanic section, with the hind-toe not webbed, having the bill shorter than the head, and of equal width throughout, much rounded at the tip, with a broad strong nail; the lamellæ of the upper mandible prominent; the wings long and pointed; the tail wedge-shaped. The species are pretty numerous, migratory birds, appearing in great flocks in the warmer countries which they visit during the winter. The COMMON WIDGEON (*anas* or *mareca penelope*) is plentiful in Britain during winter. A few breed in the most northern parts of Scotland, but the ordinary breeding-place is in more northern regions. This species is

found at some season of the year in almost all parts of Europe, and in Asia as far s. as the n. of India. It is found also in North America, along the Atlantic coast. It is known as one of the birds of Japan. Its whole length is about 18 inches. The forehead and top of the head in the male are white, the cheeks and hind-part of the neck reddish chestnut; the upper parts grayish white, crossed with irregular zigzag lines of black; the tail nearly black; the wing coverts white, tipped with black; the primaries dark brown; a green speculum edged with black; the throat, pale rufous; the breast and belly, white. The female is very different, the head and neck rufous brown, speckled with dark brown; the back varied with two shades of brown, darker in the center, and paler in the edges of the feathers. The widgeon is the most common of all the duck tribe in Lapland, frequenting grassy swamps, lakes, and rivers. Flocks of widgeon appear in Scotland and England, on lakes and rivers, in winter, and most abundantly in severe winters. They feed during the day time, and chiefly on grass. The note of the Widgeon is a shrill whistle, whence its French name *siffleur*, and the English names, *whew duck* and *whewer*. Its flesh is good for the table.—The AMERICAN WIDGEON (*anas* or *mareca Americana*) is a larger bird than the European widgeon, being about 23 in. long. The upper parts are finely waved transversely with black and reddish-brown, the under parts are mostly white; the top of the head is almost white; the wing-coverts white, the greater tipped with black; the speculum green, encircled by black. It breeds chiefly in the northern parts of America, and is common in winter on the coasts of the United States, and in the rice-grounds. Its flesh is highly esteemed. It rarely visits Great Britain. See illus., LARKS, ETC., vol. VIII.

WIDOR, CHARLES MARIE, composer, b. in Lyons, France, Feb. 22, 1845. He studied the pianoforte and organ under Lemmens in Brussels, and composition under Fétis. In 1860 he became organist of the church of Saint-François, Lyons, and in 1869 of Saint-Sulpice, Paris. He is one of the most celebrated of all organists and a distinguished composer of the modern French school. His works are: *Maitre Ambros*, opera, Paris, 1886; *La Nuit de Walpurgis*, symphonic poem; Psalm CXII. for two choruses, two organs and two orchestras; *Marche Nuptiale* for orchestra; Concerto for pianoforte with orchestra; six symphonies for organ; chamber music; pianoforte music, and songs.

WIDOW, see JUS RELICTÆ, SUCCESSION, MARRIAGE, DOWER.

WIDOW-BIRD. See WHYDAW BIRD.

WIELAND, CHRISTOPH MARTIN, one of the greatest of German poets, was born, Sept. 5, 1733, at Oberholzheim, near Biberach, his father being pastor of that place and afterward in Biberach itself. The precocity of his powers early excited attention, and when only 12 years of age, he had essayed his poetical talent both in Latin and in German verses. In 1750 Wieland went to the university of Tübingen to study law, but occupied himself more with the classics, and with recent literature both native and foreign. From Tübingen, he returned to Biberach in 1752. At this time, Klopstock's example had an extraordinary influence on him, so that he gave himself up to a mystical piety, foreign to his nature, which he gives utterance to in the *Empfindungen des Christen* (The Christian's Experiences). While in this mood, an invitation from Bodmer led him to give up the intention of graduating at Göttingen, and go to Zürich. The number and nature of his productions at this time show the effect which the example of Bodmer's desultory way of working was beginning to have upon him. He soon, however, returned to the more congenial field of the literature and life of the Greeks. The lively interest which he took in Frederick the Great prompted Wieland to work out the ideal of a hero in a great poem, for which purpose he fixed on Cyrus. The first five cantos appeared, 1757, and a new edition, 1759; but the reception it met with was not very cordial, and consequently it remained unfinished. The beautiful episode from the *Cyropaideia* of Xenophon, *Araspes und Panthea*, appeared about this time, and revealed Wieland as the poet of love. In 1760 he received an appointment in his native town in connection with the law-courts. At this period he engaged in the arduous task of translating Shakespeare (8 vols. Zür. 1762–66). However little Wieland, whose mind had been formed after Greek, Roman, and French models, and who was constitutionally inclined to pleasant and easy trifling, was calculated to enter fully into the spirit of Shakespeare, he nevertheless was, for his time, tolerably successful, and opened up the path for his successors.

Wieland now spent much of his time at Warthausen, near Biberach, the estate of the count von Stadion, an accomplished and highly intellectual man, but thoroughly a man of the world, and averse to all religious enthusiasm. From the tone of the society he met here, as well as by the course of his reading, Wieland became imbued with that modern French philosophy which runs through the most of his later writings. In some of these, there is an unmistakable tendency to licentiousness, from which his personal life always remained free; in most of them, however, he has blended the Greek sensibility to outward impressions with the French love of pleasure into a peculiar graceful philosophy of life. The first production which bears the impress of this French-Greek sensuousness, was the poetical tale *Nadine*, which he himself calls a creation in Prior's manner. In 1766 and 1767, *Agathon*, a romance in 3 vols., made its appearance, which greatly contributed to establish Wieland's fame. His views on the subject of love are most fully and worthily expounded in the didactic poem *Musarion* (1768), a work of

singular grace and harmony of treatment, which he himself called a philosophy of the Graces. Wieland had, in the meanwhile (1765), married a lady of Augsburg, and accepted a call to Erfurt (1769), as professor of philosophy in the university. He terminated what may be called the erotic period of his literary career with the *Verklagter Amor* (The Impeachment of Love), wherein he, in a manner, vindicated the kind of poetry to which he had till then devoted himself.

A period of delightful leisure and undisturbed work began for Wieland when the widowed duchess Anna Amalie invited him to Weimar (1772), as tutor to her two sons, with the status of hofrath, and a salary of 1000 thalers, which was continued to him after his duties as tutor ceased. Wieland was entirely in his own place in the society of the distinguished men (such as Musäus and Von Einsiedel) already gathered round this court; and his genius began to soar more courageously. He wrote his vaudeville *Die Wahl des Hercules* (The Choice of Hercules), and the lyrical drama, *Alceste* (1773), which were received with great approbation. Of greater importance for German literature was the publication of the *German Mercury*, a monthly periodical, to which Wieland, till toward the close of his life, devoted himself with the greatest earnestness, and which he made the vehicle for disseminating his æsthetical views. On the whole, however, his criticism was neither genuine nor very deep, and suffered from that conventional narrowness which was then dominant in France. His letters on his *Alceste* in the *Mercury* (Sept., 1773) contains sufficient traces of this tendency, at which Goethe and Herder were so much offended. The former wrote in relation to it the satire *Götter, Helden, und Wieland* (Gods, Heroes, and Wieland). Wieland answered the attack with pleasantry and with his characteristic good nature. Shortly afterward, Goethe himself joined the circle at Weimar, the soul of which was the duchess-mother, Anna Amalie. Wieland's literary powers developed themselves here more and more; and for more than 20 years, almost nothing of any importance occurred, either in the political or literary world, in which he did not take a more or less active part. His literary productiveness showed itself chiefly in the *Geschichte der Abderiten* (History of the Abderites, 1774), a charming work, depicting the follies of small communities, in which the muse of Wisdom is disguised under the garb of the Satyr. This was followed by a series of tales and stories, partly imitations of foreign originals, and partly of his own invention. *Oberon*, a romantic heroic poem, the most perfect and enduring of his greater works, appeared 1780 (last ed. Leip. 1853). It was followed by the translation of Horace (*Letters*, 1782; *Satires*, 1786) and of Lucian (1788). Wieland pronounced the *Epistles* of Horace with the commentaries to be those of his works on which he put the greatest value. He has given us a complete sketch of his conception of the Greek world in the *Aristipp* (1800). A collected edition of Wieland's works up to 1802, in 36 vols., with 6 supplementary vols. in large quarto, and large and small octavo (new edition with the poet's life, 53 vols., 1828; 36 vols., 1839), was got up by the bookseller Göschen in Leipsic. From the proceeds, Wieland was enabled to buy the estate of Osmannstädt, near Weimar. From 1798 to 1803, he lived here in the circle of his numerous family (his wife, in the course of 20 years, had brought him 14 children), and devoted the geatest part of his time to literary labors, among which his *Attic Museum* (1796–1804) and the *Neue Attic Museum* (1805–9) were not the least. In these publications, he strove to make his countrymen familiar with Greek poetry, philosophy, and rhetoric. In 1803 he sold his estate, and returned to Weimar, where he very soon became intimate with Schiller. Here he lived to see the day of the battle of Jena, the death of the duchess Amalie, and also of Herder and Schiller. The marks of honor which he received from Alexander and Napoleon, and his admission to the French "Institut," helped to alleviate his many griefs, among which one of the greatest was the death of his wife, 1801, with whom he had lived for so many years in great happiness. His own death took place Jan. 20, 1813.

Wieland had neither the spirit of a reformer like Klopstock and Lessing, nor did he attain the poetical greatness of Goethe or Schiller; nevertheless, he did great service to German literature, which has not always been sufficiently recognized. He gave to German poetry, as it was rising into true national importance, the still wanting grace and harmony of expression and versification, in which respect Goethe learned much from him. The poetic handling of mediæval chivalry was an entirely new creation of his, and thus the school of romantic poetry is indebted to him for its origin. He also introduced poetical materials from England, France, Spain, and Italy, which were not without influence. In all his appropriations Wieland exercised that fine discernment which seizes upon what is universally human, so that he nowhere appears as a blind imitator. His criticism, too, with all its shallowness, contributed much to the diffusion of general culture.—Compare, besides Gruber's *Biographie Wieland's* (4 vols., Leip. 1827; vols. 50–53 of the *Works*), *Wieland's ausgewählte Briefe* (4 vols., Zür. 1815), *Auswahl denkwürdiger Briefe* (2 vols., Wien, 1815), and *Briefe an Sophie Laroche* (Berl. 1820); also Löbell's *C. F. Wieland* (1858).

WIELICZ'KA, small t. of Austrian Galicia, 8½ m. directly e.s.e. of Cracow by railway. It is remarkable for its salt mines, in which the majority of its inhabitants are employed. Pop. '90, 6037.

town itself is entirely undermined by the excavations, which extend upward of 9,590 ft. from e. to w., 3,600 ft. from n. to s., and are 1780 ft. in depth. The mines extend to four stories or "fields," one below the other. In the second story, the visitor is rowed across a salt lake, and when he has reached and is exploring the third story, he is informed that the lake he lately crossed is now right above his head. The stories are simply large chambers excavated in one enormous mass of rock-salt, of great purity, and apparently of inexhaustible extent. In one of the chambers, the miners have scooped out a Gothic chapel, and skillfully carved a number of statues and obelisks from the solid rock-salt. The mines produce 61,500 tons English per annum.

WIENAWS'KI, HENRI, 1835–80; b. Poland; educated at the Paris conservatory, where he was a pupil of Clavel and Massart on the violin; and afterward studied harmony with Colet. He began to give concerts in 1852, and soon won a high reputation as a violinist. He visited the United States with Rubinstein in 1872. He subsequently became a professor in the Brussels conservatory. He has written many compositions for the violin.

WIERTZ, ANTOINE JOSEPH, 1806–65; b. Belgium; studied art in Antwerp and at Rome, returning to Brussels in 1865. In the earlier part of his career Wiertz produced several pictures biblical or mythological in subject, and of colossal size, such as "Contending for the Body of Patroclus" and "The Triumph of Christ." He was a man of undoubted genius, though eccentric and with a strong taste for the grotesque. On one occasion he sent a genuine Rubens to a Paris exhibition marked with his own initials. It was promptly rejected, and he did not fail to turn the rejection into ridicule. His studio, built for him in 1847 by the Belgium government, is still open to the public, and contains all his paintings, many being specimens of the *peinture mate*, a combination of fresco and oil painting by which many startling effects are produced.

WIES'ELBURG (Magyar, *Moson*), a co. in w. Hungary, drained by the Danube, Rabnitz, and Leitha rivers; 786 sq. m.; pop. '90, 85,050. Capital, Ungarisch-Altenburg.

WIES'BADEN, chief t. in the Prussian district of the same name, in the province of Hesse-Nassau (formerly the independent duchy of Nassau), one of the oldest and most famous of the German watering-places, delightfully situated on the s. slopes of Mt. Taunus, 26 m. w. of Frankfort, and 5 m. n.w. of Mainz by railway. The town has been called "a city of lodging-houses," and this may be understood from the fact that during the "season" the number of the visitors is greater than that of the resident inhabitants. But though almost every house is appropriated to the reception or entertainment of guests, the town is well and regularly built. The *kursaal* comprises an extensive dining-hall, in which frequently 300 people sit down to dinner, and which also serves as a ball-room, together with good reading-rooms, etc. In the large gardens behind the *kursaal*, it is the habit of the visitors to sit in the evenings at their numerous small tables, regaling themselves with coffee or ices—the men smoking, the women knitting—and all either chatting or listening to the music played by a band on such occasions. Other buildings are the *Schlösschen* (little palace), containing a library and a collection of antiquities, in which are a number of curious Roman *bassi-relievi*, statues, altars, etc., found in the vicinity; the handsome Protestant church, finished in 1862; the superb Greek chapel, built by the duke of Nassau as a mausoleum, in which repose the remains of his first wife. There are 14 hot springs, all of a high temperature, and numerous bathing-houses throughout the town; but the principal is the *kochbrunnen* (boiling-spring), the temperature of which is 156° Fahr. The spring has all the appearance of a boiling caldron, and so copiously does it pour forth its waters, that, though they are used both for drinking and to supply the principal baths in the town, a vast quantity escapes, and runs away through gutters and drains, sending up clouds of vapor in its passage along the streets, and adding to the warmth of the temperature of Weisbaden in summer. Next in heat and volume to the *kochbrunnen* is the spring that rises in the garden of the *Adler* (Eagle) hotel, the temperature of which is 134° Fahr. The use of the Wiesbaden hot-springs is considered highly efficacious in cases of gout, rheumatism, scrofula, and other skin diseases and nervous affections. The waters of these springs are saline, and contain silica and iron. The prosperity of Weisbaden is entirely due to its springs; and the beauty of its situation and environment, the agreeable walks and rides, and the never-failing gayety that prevails during the season, render it one of the most popular of the spas. The season lasts from June to September, and, though the public gaming-tables were abolished in 1872, the number of visitors annually is near 40,000. Pop. '90, 64,670.

Wiesbaden is very ancient; its springs are the the *Fontes Mattiaci* mentioned by Pliny. The Romans built a station here, and erected a fort on a hill on the n.w. side of the town, still known as the Römerberg, and which was garrisoned by the 22d Roman legion. The *Mattiaci*, a subdivision of the German tribe called the *Catti*, allied themselves with the Romans; but in the 3d c. the barbarian Germans rose against the Romans, and destroyed their forts, including Wiesbaden. Urns, tiles, coins, etc. are found abundantly whenever the foundation of a house is dug; and that the Romans appreciated the virtues of the waters is proved by the remains of ancient baths that have been found, and by the votive tablets recording the thanks of Romans who had been restored to health by the waters, still preserved in the museum.

WIG (Lat. *pilus*, the hair; *pilare*, to pluck off the hair; from which was formed *pilucare*, and hence *pilucca*, a head of hair: this was transformed in Ital. into *perruca*, Fr. *perruque*, whence Eng. *periwig*, shortened into *wig*). The use of false hair for concealing baldness, or for the supposed adornment of the head, appears to belong to all ages and countries. There is an Egyptian wig in the British museum, supposed to be about 4,000 years old; and some of the South sea islanders are said to be skillful wig-makers. Xenophon mentions that Astyages wore an immense wig. Several of the Roman emperors wore wigs, and Lampridius relates that the wig of the emperor Commodus was highly perfumed, and sprinkled with gold dust. After this there are no historical traces of the wig till about the end of the 14th c., when wigs made their appearance in France, and hence spread gradually over other European countries. The fashion of wearing wigs set in strong in the reign of Louis XIII. (1610–43), and for more than a century no gentleman of fashion could appear without one. Such was the extravagance in this article of dress that as much as three guineas an ounce was paid in England for fine qualities of hair, and wigs were made at a cost of £140. In was only toward the end of the 18th c. that the unnaturalness of this ornament appears to have been thought of, and it began to be superseded by the queue with hair-powder (q.v.). Except by judges and barristers, wigs are now used only in cases of baldness, and then they are made in imitation of nature, which was by no means the case with the wigs of old times.

WIG'AN, a prosperous market and manufacturing t., and municipal and parliamentary borough, in Lancashire, on the Douglas, 15½ m. s.s.e. of Preston, and about the same distance from Liverpool on the s.w., and Manchester on the s.e. Originally rather irregularly built, Wigan has for some years progressed rapidly in the improvement of its streets and buildings. It is well sewered and liberally supplied with water. The parish church of All Saints is an ancient stately edifice, and has recently been almost entirely rebuilt. There are 21 churches and chapels belonging to the establishment; 9 Roman Catholic, and 21 other dissenting places of worship. Pop. '81, 48,194.

WIGGER, Winand Michael, d.d., b. New York, 1841; graduated, St. Francis coll., N. Y., and studied Rom. Cath. theology at Seton Hall sem., N. J., and at Genoa, Italy. He was assistant in St. Patrick's cathedral, Newark, N. J., 1865–69; was appointed rector of St. Vincent's church, Madison, N. J., 1869; of St. John's, Orange, N. J., 1873; of St. Theresa's, Summit, N. J., 1874; and again of St. Vincent's, 1876. He was consecrated bp. of Newark, 1881.

WIGGLESWORTH, Edward, 1742–1826; b. Mass.; grandson of Michael, and graduate of Harvard in 1761. He received a colonel's commission from the provincial Congress of Massachusetts in 1776; and the same year held an important command in Arnold's lake Champlain squadron. He was col. of the 13th Massachusetts regiment, 1776–79. Washington appointed him collector of Newburyport.

WIGGLESWORTH, Michael, 1631–1705; b. England; came with his father to America, 1638; graduated, Harvard college, 1651; tutor and fellow; studied divinity; minister at Malden, Mass., 1656; remaining till his death. He declined the presidency of Harvard college, 1684. He published a poem—*The day of Doom, or a Poetical Description of the Great and Last Judgment, with a Short Discourse about Eternity*—very popular, passing through several editions; *Meat out of the Eater*, another popular poem. He left in MS. a poem on *God's Controversy with New England*, now printed in the *Proceedings* of Massachusetts historical society.

WIGHT, Moses, b. Boston, 1827; studied painting in Italy, after his return from which he practiced his profession in Boston. He afterward studied *genre* painting at Paris with Couture. Among his portraits are "Agassiz" and "Everett," among his *genre* pictures are "Lisette" and "The Old Cuirassier."

WIGHT, ISLE of, an island in the English channel, remarkable for the variety and beauty of its scenery, and the mildness and salubrity of its climate, lies almost centrally, close off the southern coast of England, in which it is partially embayed, and is divided from it by a channel varying from less than 1 m. to more than 6 m. in breadth, known as the Solent (q.v.), which spreads out to the e. into the broad and safe anchorage of Spithead (q.v.) and St. Helen's roads. Its form is remarkably regular, its longer and shorter diameters (22 m. 5 furlongs, and 13¾ m. in length respectively) running almost due e. and w., and n. and south. Its shape is rhomboidal, and has been compared to a bird with expanded wings or to a turbot. It is 56 m. in circuit, and embraces an area, including its inlets, of 98,320 acres. Pop. '91, 78,718. Newport (which returned one member to parliament until 1885, when it was disfranchised) is the capital; the other chief towns are Ryde, Cowes, and Ventor (all described under their separate headings), of which the first and last have sprung up from small villages within the present century. Yarmouth is a small decayed t. near the western extremity of the island, formerly returning two members, a privilege once also possessed by Newtown on the n. w. coast, a once important town, now sunk to an insignificant hamlet. On the s.e. coast, the delightful health-resorts of Sandown and Shanklin have lately acquired the size and importance of towns. Railway communication has been opened between Ryde and Ventnor, and between Cowes and Newport. Throughout the island there are good though generally narrow roads, for the most part picturesque and bounded by hedgerows. The chief physical feature of the island, to which it owes its shape and much of its beauty, is a

long undulating range of chalk downs, extending, as a kind of backbone, from the Culver cliffs on the e. to the Needles on the w., rising to its greatest elevation in Mottiston down, 661 ft. (Ashey down is 424 ft., and Bembridge down 355 ft.) above the sea. The river Medina, rising near the southern extremity of the island, flows n. through a gap in this range, expands into a tidal estuary below Newport, and flows into the Solent at Cowes, and divides the island into the hundreds of the e. and w. Medine. In addition to the central ridge, a second range of chalk downs, of greater elevation—St. Boniface down, 783 ft., Dunnose (Shanklin down), 771 ft., St. Catherine's, 769 ft.—rises at the southern point of the island, and expands into a broad promontory, the s. face of which forms the picturesque district known as the Undercliff, or "back of the island," of which Ventnor is the capital. This district owes its remarkable beauty to a series of land-slips on a gigantic scale, of prehistoric date, which have laid bare a long wall of rugged cliff, below which a succession of sunny terraces, due to the gradual subsidence of the strata, slope gently down to the sea. The whole of this part of the island is completely sheltered from the colder winds, and enjoys a well-merited reputation as a residence for invalids suffering from consumption or any disease of the respiratory organs. Its remarkable healthiness is attested by the returns of the registrar-general, which prove that the death-rate of the district is absolutely the lowest in the kingdom; while the mildness of its climate is evidenced by the luxuriance of the myrtles, fuchsias, sweet-scented verbenas, and other exotics, which live through the winter without protection.

In a geological point of view, the Isle of Wight is most interesting. The great variety of strata displayed within so small an area, under circumstances so favorable for examination, renders it one of the best available localities for the young observer. The n. side of the island presents a succession of tertiary or eocene strata, including beds of fresh-water limestone, which have been extensively worked for building-stone for many centuries, and based on beds of London and plastic clay. In Alum bay, at the w. extremity of the island, the rapid succession of vertical layers of sand and clays of bright and varied hues, produce a singular and beautiful effect. The central ridge or backbone consists of strata of chalk imbedding layers of flints, and the underlying formation in an almost vertical position. Isolated masses of chalk that, in consequence of their superior hardness, have survived the marine and atmospheric waste, form the well-known Needles, at the w. opening of the Solent, and the picturesque rocks of Freshwater bay. The downs at the s. of the island belong to the same formation, but here the strata have been undisturbed, and are nearly horizontal. The cliffs of the Undercliff are of the upper green-sand or firestone, underlying the chalk. Below this comes the gault or blue marl. To the action of the land-springs upon this unctuous formation, the land-slips to which the back of the island owes its beauty are due. The lower green-sand succeeds the gault, occupying the greater part of the area between the n. and s. chalk downs. This forms excellent corn-land, and presents a wall of cliff to the sea, diversified with many narrow picturesque gorges, locally known as chines, where a small rivulet has eaten away the friable strata. The chief of these are those of Shanklin, Luccombe, Blackgang, and Whale chine. The fresh-water wealden formation is the lowest visible in the island, and is seen in the cliffs of Brook to the w., and of Redcliff bay to the east. Bones of the colossal iguanodon and other saurians are found in this formation.

The soil of the island is very varied, both in nature and fertility. That of the northern half is, to a considerable extent, a cold, stiff clay, more suited for the growth of wood, especially oak, than corn. Of late years, however, much of the woodland has been cleared, and judicious draining operations, in which the late prince consort led the way on the royal domain of Osborne (near East Cowes), have produced very beneficial results. Farming is still on the whole somewhat primitive; even on large farms the flail may still be seen in use. The soil of the s. half is chiefly a red loam, which is exceedingly productive, especially in crops of barley, and, in the more rich and sheltered lands, of *white* wheat. *Red* wheat is grown in abundance in other parts of the island; while the stiffer clays of the n. grow capital crops of oats. The chalk downs afford admirable pasturage for sheep, which are celebrated for the pureness of their wool, chiefly exported to Yorkshire, and which furnish the London market with early lamb. The chief exports are wool, corn, flour, cement stones (septaria), and white glass-house sand. The principal communication between the mainland and the island is by steamboats plying daily between Portsmouth and Ryde, at both of which places there are good landing-piers.

The *history* of the Isle of Wight presents but comparatively few points of interest. It is supposed, with much probability, to have been the tin mart of the Greek traders mentioned under the name of *Ictis* by Diodorus Siculus. The Romans knew it as *Vecta* or *Vectis*, which is merely the Latinized form of the native name. It was conquered for the Romans by Vespasian in the reign of Claudius (43 A.D.). Cerdic, the founder of the kingdom of Wessex, took the island 530 A.D., and handed it over to his nephews, Stuf and Wihtgar. In 661 A.D. it was reduced by Wulphere of Mercia, and given to Ethelwold, king of Sussex, from whom it was wrested (686 A.D.) by Ceadwalla of Wessex, to whom, under the benign influence of Wilfrid, archbishop of York, the island owes the introduction of Christianity. During the three centuries preceding the Norman con

quest, it was repeatedly devastated by the Danish pirates, who made it their stronghold, to which they retired with their plunder. William the Conqueror gave it to his kinsman, Fitz-Osborne; Henry I. transferred it to the family of De Redvers, in whose hands it remained till the reign of Edward I., when it passed by sale to the crown During the French wars of Edward III. and his successors, the island was repeatedly invaded and pillaged by the French. At the close of the reign of Henry VIII., the armada dispatched by Francis I., under the command of D'Annebault, made several landings on the coast, and inflicted some damage, but were ultimately driven back by the prowess of the islanders. The most interesting event in the history of the island is the imprisonment of Charles I. in the castle of Carisbrooke, after his flight from Hampton court, from Nov. 23, 1647, to Sept. 15, 1648. Carisbrooke was also the place of the imprisonment of his children, prince Henry and the princess Elizabeth, the latter of whom died there, and was buried in Newport church, where a beautiful monument by baron Marochetti has been erected to her memory by queen Victoria.

Among the celebrated natives of the Isle of Wight we may notice Dr. Robert Hooke, the experimental philosopher, born at Freshwater, 1635; and Dr. Thomas Arnold of Rugby, the regenerator of public-school education, born at East Cowes, 1795.

The antiquities are not numerous. Sepulchral barrows occur on the downs, and Saxon burial-places have been discovered in several localities. There are the remains of a Roman villa, with a tesselated pavement, at Carisbrooke. The remains of Quarr abbey, near Ryde, are very scanty. Carisbrooke castle is a fine ruin, occupying a commanding position. The churches are picturesque, but not remarkable for beauty of architecture. There are but few monumental brasses or other sepulchral memorials of interest.

WIGHTMAN, William May, d.d., ll.d.: 1808–82; b. S. C.: graduated at Charleston college, 1827; admitted to South Carolina Methodist Episcopal conference, 1828; supplied several churches; was agent for Randolph Macon college, Virginia; professor of English literature there, 1837; presiding elder, 1839; editor of the Charleston *Southern Christian Advocate*, 1840–54; member of the Louisville convention which organized the Methodist Episcopal church, South, 1845; president of Wofford college, Spartanburg, 1854; chancellor of the Southern university, Greensboro, Ala.; elected bishop of Methodist Episcopal church, South, 1866. He published the life of bishop Capers.

WIGTON, a market and small manufacturing t. of Cumberland, in the midst of a specially agricultural district, 11½ m. by railway s.w. of Carlisle. It carries on manufactures of ginghams and checks. The harbor, which belongs to the port of Ayr, can accommodate vessels of 300 tons burden. It was a constituent of parliamentary boroughs until 1885, when it was merged in the county. Pop. '81, 3948; '91, 3836; parliamentary district of the county, about 36,000.

WIGTOWN, a co. forming the s.w. corner of Scotland, is bounded on the w. by the Irish channel, n. by Ayrshire, e. by the stewartry of Kirdcudbright and the Solway firth, and s. by the Irish sea. Its extent from e. to w. is computed at from 32 to 34 m., and from n. to s. 24 to 28 miles. This county, which constitutes West Galloway, was formed about the year 1341, and is between 54° 38′—55° 4′ n. lat., and 4° 16′—5° 6′ w. longitude. Wigtown is somewhat irregular in form, being deeply intersected by two arms of the sea, one of which, loch Ryan, a long, narrow inlet, stretches southward from the n.w. corner for fully 9 m. into the county, while Luce bay on the s. makes a wide indentation 15 m. long with an average of 12 wide, the heads of the inlet and bay being only 6 m. apart. The coast-line is about 120 miles long, and the inlets are rocky and unsafe for vessels, but loch Ryan is a good harbor. The western part of Wigtown, known as the *Rhins of Galloway*, thus forms a peninsula whose length (from n. to s.) is 28 m., and breadth 1½–6 m.; its northern extremity is Corsewall point, and its southern the Mull of Galloway, each promontory being provided with a light-house. The south-eastern half of Wigtown is separated from the stewartry by Wigtown bay, 15 m. long and 14 m. wide at its mouth, and between this latter and Luce bay, Wigtown extends southward in a blunt triangular form, terminating in Burrow Head. The inhabitants of Wigtown were originally of Celtic origin, and up to the middle of the 16th c., a Celtic dialect was universally spoken; and for a century afterward it was in use in the remote districts. Wigtown is irregular in its surface, but its eminences are inferior in height to those of any other county of Scotland—none of them exceeding 500 feet. The soil is varied, and—with the exception of a portion lying along the sea-shore, especially in the s.e., which consists of a rich loam—the quality is mostly inferior. There is a large extent of moss and moor, mostly of a very poor and unproductive nature, judging from the appearance and produce of much of what has been reclaimed. There has, however, been a considerable improvement made of late years in farm-buildings. The climate is rather mild, but moist, the rainfall being comparatively great. There are many dairy establishments in this county, almost exclusively for making cheese similar to the Somersetshire cheddar. The Galloway cattle, a hornless breed and among the finest in Scotland, are raised in the county; and although cattle-raising is the most important occupation, agriculture is carried on extensively. Beets and potatoes are raised in large quantities, and among the cereals oats and barley are the most important. Mining and manufactures are unimportant. The chief towns are Stranraer and Wigtown, the capital.

Besides numerous small streams, Wigtown contains three rivers of considerable size, the Cree, which forms the eastern boundary, and the Bladnoch—both of which fall into Wigtown bay—and the Luce, which empties itself into Luce bay; the former two are navigable for a few miles, and yield salmon and trout. The county also possesses several small fresh-water lochs. In the Rhins of Galloway, on the s.w., is situated the parish of Kirkmaiden, the most southerly point in Scotland—hence "from Maidenkirk to John o' Groat's." There were at an early period a considerable number of religious houses in the county; and the church, believed to be the oldest in Scotland, founded by St. Ninian, was built near the site of what is now the village of Whithorn. Pop. '81, 38,602; parliamentary constituency (1881–82), 1700.

WIGTOWN, a royal, municipal, and parliamentary burgh, market-town, and seaport in the s.w. of Scotland, capital of the county of Wigtown or West Galloway, is situated on Wigtown bay, near the mouth of the Bladnoch water. It is 40 m. w.s.w. of Dumfries, and nearly 150 m. distant by railway from Edinburgh. The parish church was erected in 1852. It is of Gothic architecture, and much superior to the ordinary run of country churches. In the church-yard there are three tombstones in memory of martyrs who suffered in the time of episcopal persecution. Two of them are old. On the summit of the Windyhill, the highest ground in the neighborhood of the town, an obelisk of freestone was placed some years ago, in memory of these same martyrs—two of whom, women, are said to have been drowned here. The authenticity of this event, though lately questioned by some, is doubted by very few in the locality where it is said to have happened. Pop. '91, 1445.

WIGWAM. This term is derived from the Algonquin or Massachusetts, *wēk*, "his house" or "dwelling place," with affixes denoting possession or location; *wēkon-om-ut*, English contraction making it *weekwam*, or *wigwam*. An Indian cabin or hut. As built by the Indians, it was composed of bark or mats laid over a frame-work of branches of trees, fastened into the ground in a circular shape, so arranged as to converge at the top, leaving an aperture for the escape of smoke. Two low openings were left on opposite sides, for entrance and egress, which were closed, at will, with bark or mats, according to the direction of the wind. When the Columbian order, a political society which was organized in 1789, was incorporated in 1805 under the title of the Tammany Society, thus adopting the name of an obscure Indian chief, their place of meeting was also christened, to meet the exigencies of the period, which delighted in ceremonies, parades, and trappings in Indian style, and the "great wigwam" of the "Tammany sachems" passed into history. In 1812 the Society built its first hall on the site of "The Sun" building, and it was rebuilt in 1860. In 1867 it removed to the "wigwam," now in use in East Fourteenth St. See TAMMANY SOCIETY.

WIKANA, the *Wacaka des Indes* of the French, a dietetic preparation of cacao much used in France for invalids. It consists of roasted cacao nibs and sugar, in the proportion of three parts of the latter to one of the former, well mixed together, and flavored with cinnamon, vanilla, ambergris, and musk.

WILBARGER, a co. in n. Texas, on Red river; 940 sq. m.; pop. '90, 7092. Co. seat, Vernon.

WILBERFORCE, SAMUEL, D.D., 1805–73; b. England; educated at Oxford; ordained 1828, and appointed curate of Chickendon; rector of Brightstone, isle of Wight, 1830; select preacher before the university of Oxford, 1837; archdeacon of Surrey, rector of Alverstoke, and chaplain to prince Albert, 1839; canon of Winchester cathedral, 1840; Bampton lecturer, 1841; sub-almoner to the queen, 1844; dean of Westminster, 1845; bishop of Oxford the same year, and chancellor of the order of the garter; lord high almoner of the queen, 1847. He was a high churchman, but opposed ritualism. He was one of the ablest debaters in the house of lords. He published *Sermons at Oxford; Eucharistica; Note-Book of a Country Clergyman; Rocky Island and other Parables; Agathos and other Stories; History of the American Episcopal Church.*

WILBERFORCE, WILLIAM, was b. at Hull, Aug. 24, 1759. His father was a wealthy merchant, descended from an old family, proprietors of Wilberfoss, in the e. riding of York. Wilberforce, at the age of 9, on his father's death, was sent to school at Wimbledon, where, under the care of a pious aunt, he ran the risk of becoming a Methodist. But his mother did not approve of a serious education, and removed him to a Yorkshire school, where the religious impressions he had received were soon dissipated by a life of gayety. His constitution was delicate, but he was quick and spirited, and fond of society, in which his lively conversation and musical talent made him a great favorite. While at school, he addressed a letter to a York paper "in condemnation of the odious traffic in human flesh," a subject he seems never afterward to have lost sight of. At 17 he entered St. John's college, Cambridge, and in due time he passed his examinations with credit. He came, on attaining his majority, into possession of a large fortune, and determined to enter parliament. In 1780 he was returned for Hull. He had known Mr. Pitt when at Cambridge, and in London they became inseparable friends. Wilberforce, in parliament, however, remained independent of party. The elevation of Mr. Pitt to the premiership gave him an opportunity of taking office, but he declined to do so. He rendered, however, efficient service to his friend. In Mar., 1784, on the eve of a dissolution, he spoke at a county meeting in York, called to vote an address against the coalition ministry; and such was the effect of his eloquence, that when he had concluded, a

resolution had been come to by the freeholders that he should be asked to stand for the county. He did so; and in spite of opposition from the great whig families, he was returned without a contest. Wilberforce's success in the leading county set an example to other constituencies, which was of very great advantage to the Pitt ministry. In the same year, Wilberforce made a tour on the continent with some ladies of his family and Isaac Milner, the dean of Carlisle, during which the serious impressions of his youth seem to have been revived. In 1787 he in a great measure eschewed gayety, and founded an association for the discouragement of vice; and in the following year, while in very bad health, he entered on his great struggle for the abolition of the slave-trade, to which he thenceforward dedicated his whole time. He was powerfully supported by the Quakers, and by Mr. Thomas Clarkson, who kept alive interest in the subject beyond the walls of the house of commons. In 1789 he first proposed the abolition of the slave-trade in the house of commons, and met, as he expected, with powerful opposition. In 1804 his bill was first carried through the commons; it was thrown out in the lords; and in the following year it was again lost in the commons. In 1806, however, a resolution was moved by Mr. Fox, pledging the commons to a total abolition of the slave-trade in the following session. It was adopted by the lords. Just before the discussion began in Jan., 1804, a work had been published by Wilberforce against the slave-trade, which had a marked influence on public opinion and the subsequent debates. The bill was passed by the lords. In the commons it was carried by an enthusiastic majority. Sir Samuel Romilly, who supported the measure, compared the feelings of Napoleon, then at the height of his glory, with those of the English philanthropist, "who would that day lay his head upon his pillow, and remember that the slave-trade was no more;" and the whole house burst into applause, and greeted Wilberforce with enthusiastic cheers. Wilberforce now sought to secure the abolition of the slave-trade abroad. He at the same time entered on an agitation for the total abolition of slavery itself. Declining health, however, compelled him in 1825 to retire from parliament, in which, since 1812, he had sat for the borough of Bramber. The movement against slavery was then intrusted to sir T. Fowell Buxton. Three days before Wilberforce's death, news was brought him that the abolition bill had passed a second reading, and he thanked God he had lived to see his countrymen spend 20 millions sterling in such a cause. He died July 29, 1833, and was buried as a national benefactor in Westminster abbey. In 1797 Wilberforce married the daughter of Mr. J. Spooner, the banker of Birmingham, by whom he had a large family. Wilberforce is the author of a *Practical View of Christianity*, which, on its publication in 1797, met with great success. — See the *Life of Wilberforce*, by his sons, and *The Private Papers of William Wilberforce* (1897). His third son, Samuel (born 1805, died 1873), became Bishop of Oxford in 1845, and bishop of Winchester in 1869. He distinguished himself in parliament by his eloquence, and was author of a *History of the Episcopal Church in America*, *Agathos*, and *The Rocky Island*, allegories, sermons, etc. See *Life of Samuel W.* (3 vols., 1879–83).

WILBUR, Hervey Backus, b. Mass., 1820; graduated at Amherst college, 1838; studied medicine and engineering, and became a practicing physician at Barre, Mass. In 1848 he received several idiot pupils into his house, treating them after Seguin's method. In 1815 the N. Y. legislature established an experimental school for idiots at Albany, which in 1854 became fully organized as the state idiot asylum at Syracuse, and of which Dr. Wilbur long had charge. He d. 1883.

WILCOX, a co. in s.w. Alabama on the Alabama river; 940 sq. m.; pop. '90, 30,816. Co. seat, Camden.

WILCOX, a co. in central Georgia; 563 sq. m.; pop. '90, 7980, chiefly of American birth. Co. seat, Abbeville.

WILDBAD, a small t. of Würtemberg, in the Black Forest, romantically situated in a valley watered by the Enz, about 29 m. w. of Stuttgart. It is noted for its thermal springs and baths, the water of which ranges from 90° to 100° Fahr. in temperature. The baths consist of numerous basins formed round the springs as they gush from the rocks, and floored with sand for the comfort of the bathers. From the circumstance that these baths are natural, or *wild*, and not artificial, the town derives its name. The waters are nearly pure, the principal ingredient they contain being common salt. They are peculiarly beneficial for rheumatism, gout, stiffness of limbs, paralysis, etc., and for some skin diseases. The season lasts from May till September, and the number of visitors has steadily increased from 470 in 1830 to 9074 in 1895. Pop. '90, 3446.

WILD CAT. See Lynx; Cat; Felidæ.

WILD CHERRY, two trees and one shrub, belonging to the rose family (order *rosaceæ*), sub-order *amygdaleæ*, genus *prunus*, indigenous to North America. 1. *P. Pennsylvanica*, or wild red cherry, is a tree from 20 to 30 ft. high, common in rocky woods, particularly in the northern states, flowering in May. Leaves oblong-lanceolate, pointed, finely and sharply serrate, green and smooth on both sides; flowers in a cluster on long pedicels; fruit round, light-red, very small, with thin pulp; stone globular. 2. *P. serotina*, the wild black cherry, whose timber is so much prized for cabinet and other work, is a fine tree with gray, sometimes rather shaggy bark on the trunk, and reddish

limbs, often growing in the western states to 80 ft. in height and 2 ft. or more in diameter, but smaller in the Atlantic states; leaves lanceolate-oblong, taper-pointed, serrate, with incurved, short, and callous teeth, thick, shining above; flowers, which appear in June, and fruit, in long racemes; fruit purplish-black, about the size of a common pea, but often larger on rich alluvial soils; when very ripe and large, they are agreeable to the taste. In some of the older sections of New York it was many years ago planted in the fields and along the fences, where some of the trees are still growing, but few are now planted. *P. Virginiana* is the common choke-cherry, but the name has been erroneously applied in the dispensatories to the wild black cherry just described. It is a tall, rather slender shrub (sometimes it may be called a tree), from 8 to 15 ft. high, with grayish bark, leaves oval, oblong, or obovate, blunt-pointed, sharply serrate; racemes short and close; petals roundish; fruit red, turning to dark crimson, and very astringent until perfectly ripe, when it is not unpleasant, if large, and growing on good soil; flowers in May; grows along fences and river banks, especially northward.

WILD-FOWL, a popular term, synonymous with *water-fowl*, and generally applied to web-footed birds, but sometimes employed also to include herons, plovers, and other birds which frequent rivers, lakes, and sea-shores. The different kinds are noticed under their proper heads.— *Wild-fowling* is one of the most difficult, and yet one of the most interesting pursuits of the British sportsman. *Rock-fowling* (see FOWLING) is not included under this term. Wild-fowling is prosecuted in a great variety of ways. The wild-fowler seeks his game with a gun and dog, generally a retriever; or he uses a small boat, called a *punt*, adapted to the shallow waters in estuaries which wild-fowl frequent; or he proceeds a little further to sea, in a boat with sails; sometimes he employs a yacht, or he endeavors to approach his game on land by the aid of a *stalking-horse;* or he has recourse to decoys, and other contrivances, by which great numbers of wild-fowl are captured. It is chiefly on the eastern and south-eastern coasts of England that wild-fowl abound in Britain, and they are most abundant in severe winters, coming as migratory birds from the north; but the draining of the fen-lands has greatly reduced their numbers. The ancient Greeks and Romans captured wild-fowl by various kinds of nets, one of which, called the *argumentum*, was not unlike the modern decoy-pipe, the birds, however, being generally driven, and not enticed into it. The *panthera* was a large purse or drag-net, placed along the banks of rivers. The ancient wild-fowlers sometimes practiced a system of decoying, apparently less perfect than the modern system, but essentially of the same nature, enticing the birds to their snares by movements intended to excite their curiosity, and for this purpose the fowlers clothed themselves in feathered jerkens, and danced with peculiar motions and gestures. Nooses and bird-lime were also much employed in ancient times. The Egyptians made much use of the *throw-stick*, a missile similar to the boomerang of the Australians, and which was dexterously thrown so as to hit the neck of the bird. In more recent times, falconry was much practiced for the capture of wild-fowl. The gun, decoys, and flight-ponds are now chiefly in use. Although many wild-fowl are killed with the ordinary fowling-piece, it is not thus that the greatest numbers are obtained. Much larger guns are used in punts and yachts, by which many are killed at one shot. The *stalking-horse* is still used in some parts of England, in order to enable the wild-fowler, armed with an ordinary fowling-piece, to get within reach of the birds, whilst they are feeding on the level swampy ground which they chiefly frequent. A horse well trained for the purpose, advances toward them, the fowler concealing himself on the side of it furthest from them. An ox is sometimes trained for this use, and indeed the kind of animal with which the birds are most familiar in the locality is most suitable. Artificial stalking-horses are sometimes employed, made of canvas, and stuffed with straw, the head being down, as if grazing. This practice is common in some parts of France. The use of the stalking horse is very ancient. Wild-fowl shooting is not unattended with danger. In pursuit of wounded birds on the ooze, the sportsman or fowler must use *splashers*, thin boards about 18 in. square, attached to the feet, to prevent him from sinking; and if he fall, it is very difficult for him to regain his feet. He cannot raise himself by resting his hands on the mud, which only makes him sink deeper and deeper, nor can he do it by getting upon his knees. The only method is to roll over on the back, drawing the arms out of the mud, and placing one foot with his splasher firmly on the ooze, to press both hands on the knee of the leg so raised, and give a vigorous spring. The punter is also in great danger of losing himself in foggy weather when pursuing wounded birds, and being unable to get back to his punt, when a fearful death awaits him on the return of the tide.

The curly-coated retriever is the best dog for the wild-fowl shooter, but good training is necessary to fit the dog for his use. The punter ought not to carry a dog with him, because the dog, having no opportunity of exercise after his return from the water, soon suffers from the cold of the winter weather in which the sport is pursued.

Sledging for wild-fowl is practiced by professional wild-fowl shooters on some parts of the English coast, particularly that of Hampshire. The sledger traverses the oozes by means of a small light sledge called a *launching-punt*, with a gun in the fore-part. He pushes it ahead, crawling on his knees, and often at full length on the mud, till he gets within range His most severe work is on sands and dry ground.

The *gunning-punt* is a small generally flat-bottomed boat, about 17 ft. in length, with a gun placed in the front of it, generally carrying about half a pound of shot at a charge. The punt must be nicely trimmed, so that the gun is nearly on a level with the surface of the water; and the fowler, having approached the birds where they are congregated, often kills great numbers by its discharge. The sport is pursued both by day and by night. The punt is generally constructed to carry only one person, and although he rows it in the ordinary manner till he discovers the birds, he is obliged then to lie down in the punt, and force it forward by a pole or by the oars with no little exertion, till he gets within range. The danger is not inconsiderable of his mistaking another punt in the darkness of night for an assemblage of wild-fowl, and firing at his fellow-sportsman. In a clear moonlight night, he proceeds if possible, against the light, so that he may see, and not be seen. By a successful shot, great numbers of water-fowl are often killed. The punt-gun is capable of being *tipped*, that is, elevated so as to shoot water-fowl on the wing; and the most successful shots are often made by waiting till they rise, and tipping the gun. The punter cannot expect to recover all his wounded birds, and there are men on some parts of the coast who make their living during winter mostly by seeking for them in the morning.—The *sailing-punt* is a mere modification of the ordinary gunning-punt; the sail saving much hard work to the fowler, but its use is attended with great danger, and it is utterly unsuitable for rough water. A *shooting-boat* is therefore sometimes used; but in it the gun cannot be fixed level with the surface of the water, as in the punt, and still more is this the case with the *shooting-yacht*. The practice of the sportsman is therefore considerably different, and the best shots are generally made after the birds are on the wing. The helmsman of the shooting-yacht must be quick and skillful in luffing up, in such a manner as to cross the flight of the birds, that they may be well exposed to the gun, which is generally larger than the punt-gun. Great numbers of wild-geese, swans, etc., are often killed from the shooting-yacht. In approaching the birds, the greatest caution is necessary, and the men in the yacht must be carefully concealed behind the bulwarks.

Notwithstanding the draining of fen-lands, many of the decoys of the eastern coast of England are still very valuable, and in some instances they afford a considerable part of the living of the parochial clergy. A good decoy-pond attached to a rectory adds not a little to its value. It is in severe winters that the decoy-pond is most productive. It must be in a secluded situation, and the proprietor takes care to keep it as secluded as possible, permitting no use of the gun or rifle in its neighborhood. An extent of three or four acres is about the best for a decoy-pond. Very large ones are found to be comparatively much less productive. The decoy-pond ought to be surrounded with trees and copse, reeds and sedges being permitted to flourish near the water. Several *pipes* are led off from the pond, in different directions, ditches of 6 or 8 in. in depth, of a curved form, and becoming narrower toward the extremity. It is in these pipes that the wild-fowl are caught, particularly mallards, teal, and widgeons, and often in very great numbers. The length of the pipe is generally from 60 to 80 yds., its breadth at the mouth from 20 to 30 ft., diminishing to 2 ft at the extremity, where it terminates in a tunnel-net, generally carried out on the dry land. The whole pipe is spanned with a light netting, spread upon semicircular bars of iron rod, in an arch of about 12 ft. above the water at the entrance, but becoming lower as the pipe becomes more narrow. To attract wild-fowl to the pond, and to induce them to enter the pipe, *decoy-ducks* are kept, constant inhabitants of the pond, and regularly fed. Wild-fowl come more readily to the pond because of their presence, and follow them also to the mouth of the pipe, and into it, when they come at the well-known whistle of the decoy-man, to feed on the grain which he scatters for them on the water. It is only thus that the decoy-ducks are of use. They are not trained in any way, nor do they display any intelligence beyond response to the whistle which invites them to their food. Very different is the case with the decoyer's dog, the *piper*, so called not from any vocal powers, but from his use in enticing birds into the pipe. The dogs best adapted for this purpose are of a peculiar breed, small, fox-like, and very lively and frolicsome. They are very carefully trained, and their peculiar qualities seem to be in some measure hereditary. On the convex side of the curve of the pipe, for about 30 or 40 yds., instead of netting coming down to the ground, screens made of reeds are placed of height sufficient to conceal the decoyer; but they are placed obliquely, with narrow outlets between them, through which his dog may pass, and with bars in the intervals about 18 in. high, for the dog to leap over. When the wild-fowl have been attracted to the mouth of the decoy, and the decoyer, peeping through the screens, perceives that they are in the proper situation, he sends out the dog, which makes sportive gambols in their sight, and they are attracted by the strange object, as sheep are when a small dog plays about in the field where they graze. They enter the pipe in pursuit, as if for gratification of their curiosity, and the dog leaps over the first leaping-bar, and disappears behind the screens, where his master immediately rewards him with a piece of cheese or other delicacy. When the wild-fowl have advanced a little further, the dog is sent out again, repeats his gambols, leaps over the second leaping-bar, and gets a second piece of cheese. The curiosity of the birds seems to increase, and when they have proceeded far enough the man shows himself, whereupon a rush is made by the birds toward the far end, where they are captured. The dog is trained to keep perfect silence. A single bark would disperse the birds. The success of the decoyer depends very much on the

state of the weather, and he must consider the direction of the wind in order to the choice of the pipe he is to use. Into such details, however, we cannot enter. It is in the daytime, and not by night, that wild-fowl are captured in the decoy. They generally leave the decoy-pond at night for neighboring feeding-grounds. The decoyer often finds it profitable not to attempt the capture of birds when they first appear on the pond, but to wait for a few days, when they congregate in greater numbers.

Decoys are of so great value that many acts of parliament have been passed for their regulation and protection. A decoy which has been established for twenty years enjoys certain privileges secured by law, particularly as to the quietude of its vicinity, which must not be disturbed by the firing of guns at wild-fowl apparently going to the pond, even by the proprietors of land over which they pass.

Flight-ponds alone remain to be noticed. These are used chiefly for the capture of pochards or dunbirds, which very seldom enter the pipes of the decoyer. The same pond is sometimes used both as a decoy-pond and a flight-pond. The pochard, having its legs placed far back, cannot rise from the water so suddenly as the wild-duck or widgeon, and skims the surface for many yards, proceeding by a very gradual ascent. To capture flights of pochards, nets are used, which are fixed to a cumbrous apparatus of poles at the side of the pond. The pond may be about 70 or 80 yds. square.

Folkard, in his excellent work upon wild-fowling, remarks that writers upon sporting literature generally apply correct terms to game and birds of the land, while water-fowl are invariably classed by them as "flocks." The modern terms, as applied to water-fowl, are, according to Folkard, as follows: "A herd of swans. A gaggle of geese (when on the water). A skein of geese (when on wing). A paddling of ducks (when on the water). A team of wild-ducks (when flying in the air). A sord or suit of mallards. A company of widgeon. A flight or rush of dunbirds. A spring of teal. A dopping of sheldrakes. A covert of coots. A herd of curlews. A sedge of herons. A wing or congregation of plovers. A desert of lapwings. A walk of snipes. A fling of oxbirds. A hill of ruffs. A small number of wild-fowl, as ducks and geese (about 30 or 40), is termed a 'trip.' The same of widgeon, dunbirds, or teal, is termed a 'bunch;' and a smaller number (from 10 to 20) is called a 'little knob.' Of swans, it would be said, a 'small herd;' and sometimes of geese, a 'little gaggle,' or a 'small skein;' and so of ducks, a 'short' or 'long team.'"

WILD HUNT (Ger. *wilde* or *wüthende jagd;* also *wildes* or *wüthendes heer*, wild or maddening host; *nachtjäger*, night huntsman, etc.), the name given by the German people to a fancied noise sometimes heard in the air at night, as of a host of spirits rushing along over woods, fields, and villages, accompanied by the shouting of huntsmen and the baying of dogs. The stories of the wild huntsman are numerous and widespread: although varying in detail, they are uniform in the essential traits, and betray numerous connections with the myths of the ancient gods and heroes. The root of the whole notion is most easily discernible in the expression still used by the peasants of lower Germany when they hear a howling in the air, "wode hunts" (*Wode jaget*), that is, Wodan or Odin marches, as of old, at the head of his battle-maidens, the Walkyries, and of the heroes of Walhalla; perhaps, too, accompanied by his wolves, which, according to the myth, along with his ravens, followed him, taking delight in strife, and pouncing upon the bodies of the fallen. The heathen gods were not entirely dislodged from the imagination of the people by Christianity, but they were banished from all friendly communication with men, and were degraded to ghosts and devils. Yet some of the divine features are still distinctly recognizable. As the celestial god Wodan, the lord of all atmospheric and weather phenomena, and consequently of storms, was conceived as mounted on horseback, clad with a broad-rimmed hat shading the face, and a wide dark cloak; the wild huntsman also appears on horseback, in hat and cloak, and is accompanied by a train of spirits, though of a different stamp—by the ghosts of drunkards, suicides, and other malefactors, who are often without heads, or otherwise shockingly mutilated. One constant trait of the stories shows how effectually the church had succeeded in giving a hellish character to this ghost of Wodan—when he comes to a *cross* road, he falls, and gets up on the other side. On very rare occasions, the wild huntsman shows kindness to the wanderer whom he meets; but generally he brings hurt or destruction, especially to any one rash enough to address him, or join in the hunting-cry, which there are many narratives of persons in their cups having done. Whoever remains standing in the middle of the highway, or steps aside into a tilled field, or throws himself in silence on the earth, escapes the danger. In many districts, heroes of the older or of the more modern legends take the place of Odin; thus, in Lusatia and Orlagau, Berndietrich, that is, Dietrich of Bern; in lower Hesse, Charles the Great; in England, King Arthur; in Denmark, King Waldemar. The legend has also in recent times attached itself to individual sportsmen, who, as a punishment for their immoderate addiction to sport, or for the cruelty they were guilty of in pursuing it, or for hunting on Sunday, were believed to have been condemned henceforth to follow the chase by night. In lower Germany, there are many such stories current of one Hakkelberend, whose tomb even is shown in several places. Still, the very name leads back to the myth of Wodan, for Hakkelberend means literally the mantle-bearer (from O. H. Ger. *hakkul;* O. Norse, *hökull* or *hekla;* Ang.-Sax. *haccle*, drapery, mantle, armor; and *bern*, to bear).

The appearing of the wild hunter is not fixed to any particular season, but it occurs frequently and most regularly in the twelve days between Christmas and Epiphany.

Another version of the wild hunt is to be found in the legend prevalent in Thuringia and the district of Mansfeld. There the procession, formed partly of children who had died unbaptized, and headed by Frau Holle or Holda (see BERCHTA), passed yearly through the country on holy Thursday, and the assembled people waited its arrival, as if a mighty king were approaching. An old man, with white hair, the faithful Eckhart (see TANNHÄUSER and VENUSBERG), preceded the spirit-host, to warn the people out of the way, and even ordered some to go home, so that they might not come to hurt. This is the benign goddess, the wife of Wodan, who, appearing under various names, travels about through the country during the sacred time of the year. This host of Holda or Berchta also prefers the season about Epiphany. In one form or other, the legend of the wild hunt is spread over all German countries, and is found even in France and Spain.

WILDE, OSCAR FINGALL O'FLAHERTIE WILLS, b. Ireland, 1856; son of Sir William, a well-known oculist, and Lady Wilde. He graduated at Magdalen coll., Oxford, 1878, winning the Newdigate prize for English verse. He devoted himself to poetry and to æsthetic culture, upon which topic he has delivered many lectures, and has been styled the apostle of æstheticism. He has been satirized under the guise of Postlethwaite by Du Maurier, and is the original of Gilbert's "Bunthorne" in the comic opera of *Patience*. A vol. of his poems was published, 1880. A tragedy, *Guido Ferranti* in 1890, and *Intentions* (essays) in 1891. He delivered a series of lectures in the U. S., 1882–83. In 1893–95 he won considerable success as a writer of epigrammatic comedies,—*Salome*, *Lady Windermere's Fan*, and *The Importance of Being Earnest;* but in the latter year, being convicted of unnatural practices, he was sentenced to prison at hard labor. He remained in prison till 1897.

WILDE, RICHARD HENRY, 1789–1847; b. Dublin, Ireland; came to this country in 1797; studied law; was admitted to the bar, 1809, and rapidly rose in his profession; became attorney-general of Georgia, and was a member of congress, 1815–17, 1824–25, and 1827–35. He was a poet of some merit, and in his stay in Europe, 1835–40, made interesting documentary discoveries in regard to Dante, and found an original painting of the poet. He wrote *The Love, Madness, and Imprisonment of Tasso* (1842) and *Hesperia*. His poem, *My Life is like a Summer Rose*, was praised by Byron. From 1843 to his death he was professor of law in the Louisiana university.

WILDER, BURT GREEN, M.D.; b. Boston, 1841; graduated in the scientific dept. of Harvard univ., 1862, and in the med. dept., 1866; elected prof. of physiology at Bowdoin coll., 1874, having been previously appointed prof. of physiology, comparative anatomy, and zoology at Cornell. His works include *Researches and Experiments on Spider's Silk*, 1866; *What Young People should Know; Anatomy, Physiology, and Hygiene of the Human Reproductive Organs*, 1875; *Emergencies; how to avoid them and how to meet them*, 1879; *Health Notes for Students, new ed.*, 1883; *Introduction: Guide to Practical Works in Elementary Anatomy, based upon the Cat, Frog, and Menobranchus*, 1881. He wrote, in conjunction with Prof. Gage, *Anatomical Technology as applied to the Cat, etc.*, 1882. He was, 1885, pres. of the American Neurological assoc.

WILDER, MARSHALL PINCKNEY, b. N. H., 1798; became a merchant in Boston in 1825. He was a member of both houses of the Massachusetts legislature, became president of the senate in 1850, and was also a member of the executive council. He did much for the progress of agriculture and of horticulture; was active in establishing the state agricultural college, and the state board of agriculture. D. 1886.

WILDERNESS, BATTLES OF THE. The name given to a series of engagements which took place in Virginia, between the federal and the confederate forces, in 1864. The "Wilderness" is an extensive tract of table-land stretching southward from the s. bank of the Rapidan, seamed with ravines, and, excepting a few small clearings, covered with a dense growth of dwarf timber and underbrush. At the period of the opening of the campaign of 1864, of the army of the Potomac, the confederate army, under Gen. Lee, occupied the bluff ridges which skirt the s. bank of the Rapidan. This was a position made strong by nature; and which had been so strengthened by works, that a direct attack upon it would have proved fruitless; and he could only be drawn from it by a turning movement. It would have been more easy to have flanked Lee's left; but that movement would have separated Grant too far from his base of supplies, and Grant concluded to cross the Rapidan by its lower ford, and turn Lee's right. The plan of Gen. Grant was, in fact, to gain the rear of the confederate army, and he had given the instructions necessary to the fulfillment of this purpose to his corps commanders. But instead of retreating out of the region which bears that name, Lee fought the battles of the Wilderness.—The army of the Potomac, under the immediate command of Gen. Meade, broke camp on May 3d, 1864, and crossed the Rapidan by the various fords, the second corps under Gen. Hancock having the left, and bivouacking at Chancellorsville. One hundred thousand men, with the enormous train of 4,000 wagons, were per-

mitted by Lee to cross the river unmolested; doubtless with the design that this vast mass of men and impediments should become entangled in the wilderness, and be destroyed or captured. On the morning of the 5th the confederates attacked the right of the union advance, and later in the day the left became heavily engaged behind breastworks hastily thrown up, and such natural defenses as the character of the country offered. This day's fight was marked by the loss of Brig.Gen. Alexander Hays, a chivalrous and intrepid union soldier and leader. The fight on the 5th was mainly with A. P. Hill's corps, and on the 6th Longstreet came into action with a heavy force, against which were brought the 2nd and a part of the 9th corps, supported by Sheridan's cavalry, which sharply attacked the enemy. While the right of the union line was being severely pressed by the confederates, Longstreet attacked the left in force, and drove it back with heavy loss, being finally supported by re-enforcements commanded by Lee in person, when the union breastworks were captured, though they were afterward retaken. After the fight at Chancellorsville; which resulted in its defeat with very heavy loss, the federal army retreated along what was known as the Brock road. In this, the last battle of the wilderness, ten thousand men were killed and wounded, on both sides; the union loss being the greater, particularly in officers. It had been Gen. Grant's design, in crossing the Rapidan, to turn Lee's flank, and get between him and Richmond. This intention was temporarily defeated by the stern resistance offered in the wilderness; but with the dogged tenacity which characterized him, Grant returned to it immediately after the fight, ordering his columns forward toward Spottsylvania court-house, in which movement Lee immediately followed him, marching his army by roads nearly parallel with that followed by the union forces. There was no fighting on the 7th, and the union army pushed forward on that date with the 5th corps in the advance, with orders to seize Spottsylvania court-house. In this, however, the confederates anticipated them, and when the 5th corps (Gen. Warren) reached the open plain near the court-house, it was met by a murderous fire on the part of Longstreet's corps, which had already reached this point. This was on the 8th, late in the afternoon, and the union army formed under fire, the 5th corps being supported by the 2d (Hancock's), with a brigade of heavy artillery massed in rear of the line of battle, but which was afterward withdrawn by orders from headquarters. On the 9th there was constant firing by confederate sharpshooters, and now fell Gen. Sedgwick, the brave commander of the 6th corps, who was shot in the face, while rallying his men. There was no heavy fighting on the 9th, but on the 10th there was a general attack all along the line, and the union army suffered greatly and was forced to retire. On the 12th the series of disasters was in a measure retrieved; the celebrated "Stonewall" confederate brigade being captured almost in its entirety, including 4,000 prisoners, 20 pieces of artillery, with horses, caissons, and material complete, several thousand stand of small arms, and more than 30 battle-flags: among the prisoners were Maj.Gen. Edward Johnson and Brig.Gen. George Stuart. It was in this day's fight that Maj.Gen. Lee, seeing the battle going against him, attempted to lead a charge of Early's men in person, and was only restrained from periling his own safety through the earnest remonstrances of his officers, and loud cries from the men of "Gen. Lee to the rear!" The battle was not renewed until the 18th, and on the 19th a movement was made to the North Anna, and thence to Cold Harbor and the Chickahominy. A running fight was kept up until June 12th, when Grant made his change of base to the James river, making a march of 55 m. across the peninsula, to a point just below Harrison's landing; Lee's army not interfering with the withdrawal of the union forces from their ill-starred campaign in the wilderness. The two armies during this campaign of 43 days, numbering each about 100,000 men, lost about equally. The design of Gen. Grant, however, was foiled by the shrewd maneuvering of Lee, and the fierce fighting of the confederate solders. Gen. Hancock, after the wilderness, when asked where the second corps was, answered that "it lay buried between the Rapidan and the James." This was hardly an exaggeration, as that corps alone lost 9,762 men between May 4 and 27. This corps suffered more in proportion than the others, but the entire campaign was a period of frightful slaughter on both sides; and this, though the union advance reached a point within 15 m. of Richmond, without any strategic or other military success to balance it.

WILDEY, Thomas, 1783–1861, b. England; emigrated to America in 1817, settled in Baltimore, and engaged in the trade of coach-spring making. He was the founder of the American order of odd fellows. The members of the organization in Baltimore erected a monument to him.

WILEY, Isaac William, d.d., 1825–84; b. Penn.: studied medicine and afterward theology, joining the Methodist Episcopal conference in 1849; missionary to China, 1850–54. After his return was a pastor, 1854–58; principal of the seminary at Pennington, N. J., 1858–64; editor of the *Ladies' Repository,* published at Cincinnati, by the Methodist church, 1864–72; elected bishop 1872, and resided at Cincinnati, Ohio. He published *Fallen Heroes in Foo-Chow,* and *Religion in the Family.*

WILEY, John, b. Long Island, N. Y., 1808; was a clerk in his father's book-store in New York from the age of thirteen for three years; then a clerk in a wholesale dry goods store; was associated in the book-business at one period with A. T. Goodrich, subsequently with George Long; was a partner with George P. Putnam, 1838–48, the firm being engaged chiefly in importing foreign publications, and subsequently conducted the business in connection with his sons. He died in 1891.

WILFRID, Saint, an Anglo-Saxon bishop, was born, of noble parents, in the kingdom of Bernicia in 634. He was remarkable when a boy for his good looks, graceful manners, and ability. He became at 14 the attendant on a Saxon nobleman, who had retired to spend the last years of his life in the monastery of Lindisfarne. There his attention was directed to the controversy as to the time of celebrating easter (q.v.) existing between the two sections into which the Anglo-Saxon Christians were divided; the one advocating the Roman practice, which was that of the continental churches generally, the other adhering to the Scoto-British. Wilfrid resolved to visit Rome to ascertain which was in the right, and thither he went at the age of 19, with recommendations from the courts of Kent and Bernicia. He returned to England a warm partisan of the Roman party. From Alfrid, king of Northumbria, he received a grant of land and a monastery at Ripon, and there, in 664, he was ordained a priest. The synod of Whitby, which met in 664 to discuss the disputed questions between the two parties in the church, was attended by the most distinguished members of both, and among others, by Colman, bishop of Lindisfarne, and Wilfrid. We have a curious acccount of this conference. The king presided, and seems at first to have been puzzled by the arguments, but he noticed that Colman always referred to St. Columba, Wilfrid to St. Peter—and it struck him that the relative power of these saints had a close connection with the points at issue. "St. Peter," says Wilfrid, "is the rock on which the Lord founded his church, and to him he intrusted the keys of heaven." "Did St. Columba not receive the same power?" asked the king. Colman could not say he had. "Then you both admit that God has given the keys to St. Peter?" Both said they did. "Well," continued the king, "if it is so, I shall not oppose him. Were I to do otherwise, I might find no one to open the gate when I came there; St. Peter might turn his back on me. We must not offend him." The council and audience were carried away by this argument, and the king decided in favor of the Roman party. Wilfrid was afterward named bishop of York, but he did not enter into possession of his see until 669. He then surrounded himself with great pomp, built churches, one of which, at Hexham, was said to be the finest north of the Alps, and strove to oppose the ecclesiastical to the royal power. A quarrel followed with the new king of Northumbria, named Egfrid, and Wilfrid was deposed. He started on a journey to Rome, to make a personal appeal to the pope; but he was driven by a storm to the Coast of Friesland, the inhabitants of which were still pagan. There, however, he was hospitably received by the king. To his arrival the people attributed an excellent fishing season and abundant harvest. He was asked to preach, and he did so in his own Anglo-Saxon tongue, which was perfectly intelligible to the Frisians. Such was the effect, that he baptized many thousands of the people, and all the princes. The event is one of the most memorable in the history of northern Germany and Scandinavia, for with it began the conversion of these countries to Christianity by Anglo-Saxon missionaries, and the introduction into them of the arts and knowledge inherited from ancient civilization (see Boniface; Willibrod). Wilfrid reached Rome, and the pope decided in his favor; but on his return to England, the king gave no heed to the decree, and committed him to prison. He escaped, however, to the Weald of Sussex, where he converted the pagan inhabitants. He was afterward recalled to his see; and a proposal was made to elevate him to the primacy, but he was still opposed, as the leader of the Roman party, and ultimately he was deposed and excommunicated. He again went to Rome, remained there some years, returned to England in 705, and died at Oundle, in Northampton, in 709.

WILHELMJ, August, b. Usingen, Germany, 1845; son of August, formerly atty. gen. of Prussia. He studied music under Conrad Fischer, and made his first appearance as a violinist at Limburgh, 1854. He went to Weimar, 1861, and there met Liszt, who procured his admission to the Leipsic conservatory, where he studied for three years. He has since traveled throughout Europe, Asia, and America. In 1894 he became professor in the Guildhall academy in London.

WILHELMSHAVEN, the chief naval port of Germany, is on the w. side of the entrance of the bay or gulf of Jade, about 45 m. n.w. of Bremen. The town, first projected in 1856, has been regularly laid out on a strip of ground bought by Prussia from Oldenburg in 1864. It is now a fortress of the first rank, defended by outlying forts and an elaborate system of torpedoes; and with its moles, extensive basins, dry docks, vast stores for the navy, and workshops for all the requirements of a fleet, has been a very costly creation. A harbor for commercial purposes has been made to the s. of and connected with the naval one; but the mercantile importance of Wilhelmshaven is yet in the future. The population, '90, was 15,471. See Jade.

WILHELMSHÖHE. See Cassel.

WILKES, a co. in n.e. Georgia, having the Broad river for its n. boundary, the Little river on the s.; 464 sq. m.; pop. '90, 18,081. Co. seat, Washington.

WILKES, a co. in n.w. North Carolina, having the Blue ridge on the n. border, drained by the Yadkin; 680 sq. m.; pop. '90, 22,675. Co. seat, Wilkesboro.

WILKES, Charles, American naval officer and explorer, was b. in New York in 1798, and entered the navy in 1818, becoming lieut. in 1826. In 1838 he was made commander of an exploring expedition, by which the Samoan and Fiji islands were carefully surveyed, and many other regions of the southern seas examined. In 1842 he

published a *Narrative* of the expedition (5 vols. 1845), for which he received the gold medal of the Royal geographical society. In 1849 he published a volume on *Western America;* and in 1856, on the *Theory of the Winds.* As commander of the U. S. steamer *San Jacinto,* he in 1861 forcibly removed from the British mail-steamer *Trent,* Messrs. Mason and Slidell, commissioners of the confederate states to England and France, and conveyed them to Boston, receiving the thanks of congress, and the acclamations of the people; but, at the demand of the British government, his act was disapproved, and the commissioners restored. In 1862 he was promoted to the rank of commodore, and in 1863 commanded a squadron in the West Indies. In 1866 he was commissioned as rear admiral on the retired list. He died Feb. 8, 1877.

WILKES, GEORGE, b. 1820; d. 1891; in 1858 became co-editor with William T. Porter of the *Spirit of the Times,* a sporting and dramatic paper published in New York, of which he is now proprietor. He published a *History of California* (1845); *Europe in a Hurry* (1852); and a series of Shakespearean papers which appeared in his journal have been republished in book form. In 1870 he received the grand cross of Stanislas from the emperor of Russia for suggesting a railroad to China and India, *via* Russia. D. 1885.

WILKES, JOHN, a celebrated public character, was b. in London, Oct. 17, 1727. His father, a brewer or distiller at Clerkenwell, sent him when a lad to the university of Leyden, where he received an excellent education. On his return to England in 1749 he married a Miss Mead, an heiress, ten years his senior. His good manners, learning, ready wit, and open table secured him many friends, but extravagance and dissipation soon involved him in difficulties. He and his wife separated, and in a lawsuit which followed, facts came out most damaging to his character. He was nevertheless named high sheriff of Buckinghamshire, and in 1757 returned to parliament as member for Aylesbury. In the house he joined in the popular clamor against lord Bute; and in June, 1762, founded a paper entitled the *North Briton,* in which he denounced him with such vigor and success as to drive him from the ministry. He attacked with equal bitterness the next ministry, insinuating that although Mr. Greville was nominally at the head of affairs, lord Bute still had the ear of the king. In the 45th number of the *North Briton,* he charged the king with having uttered a falsehood from the throne, and in consequence, his house was entered, and his papers were seized. He was himself committed to the Tower, on a general warrant. But he was released by Chief-Justice Pratt, on account of his privilege as a member of parliament. His paper was burned by order of the house of commons; but a riot ensued, showing that public sympathy went with Wilkes. A prosecution was next instituted against the under-secretary of state by Wilkes for the illegal seizure of his papers; and he obtained £1000 damages—a declaration being at the same time made by the chief-justice that general warrants are illegal. Wilkes then went to France, on the plea of bad health, and was expelled from the house of commons. In his absence he was convicted of having printed privately an obscene poem, of which he was one of the authors. It was hoped that evidence of his immoral character would disgust the public with him. But the copy of the book on which the prosecution had been founded had been obtained surreptitiously from a printer employed; and this fact becoming known, the steps taken by the government, instead of injuring Wilkes, only added to the outcry against ministers. On the formation of a new ministry under the duke of Grafton, Wilkes returned to England, and becoming a candidate for Middlesex, harangued great crowds in London. After his election he was arrested, in consequence of his outlawry; and on the way to prison he was rescued by a mob. He, however, after it had dispersed, voluntarily gave himself up to justice. When parliament met, a crowd assembled to convoy him to the house of commons. A riot took place, and the military were ordered to fire on the mob in St. George's Fields. Many persons were wounded, and one was killed. The coroner's jury who sat on the body returned a verdict of murder against the magistrate who had given the order to fire; and he was tried for that crime, but acquitted. Wilkes secured a copy of a letter from lord Weymouth to the chairman of the Lambeth quarter sessions in which it was recommended that the military should be employed to suppress disturbances in London. It was published with a preface by Wilkes, in which he charged the secretary of state with having planned "the massacre in St. George's Fields." The house declared the preface to contain a seditious libel, and Wilkes was again expelled. He was after this re-elected several times as member for Middlesex; but the elections were declared void. Col. Luttrell, who vacated his seat and opposed him, obtained only 300 votes; but he was declared to be duly elected, in defiance of a protest from the whole country. Wilkes, still in prison, was now recognized as the champion of public liberty, and became the most popular man in England. In 1769 he obtained a verdict against lord Halifax in the court of common pleas, with £4,000 damages. He was shorly after discharged from prison on giving a bond for good behavior during seven years. In 1774 he was chosen lord mayor of London, and again returned for Middlesex, which he continued to represent for many years. In 1782 the resolution by which he had been declared incapable of re-election was expunged from the minutes of the house of commons, as subversive of constitutional rights. The other resolutions relating to Wilkes were at the same time expunged. Two years later he withdrew from the house of commons. He died Dec. 27, 1797.

WILKES-BARRE, city and co. seat of Luzerne co., Pa.; on the Susquehanna river, and the Central of New Jersey, the Delaware and Hudson, the Delaware, Lackawanna, and Western, the Lehigh valley, the New York, Susquehanna, and Western, and the Pennsylvania railroads; 18 miles s.w. of Scranton. It is near the center of the famous Wyoming valley, and the beautiful scenery around it attracts many tourists and summer visitors. It contains a high school, Hillman academy, female institute, Mollinckrodt convent school, city hospital, Osterhaut free library, Y. M. C. A. building, public park along the river bank, electric, gas, and naphtha light plants, electric street railroad system, water-works supplied from Spring brook, about 20 public school buildings, nearly 50 churches, and national and state banks. The city was settled in 1769, incorporated as a borough in 1806, and chartered as a city in 1871. The U. S. census of 1890 reported for Wilkes-Barre, 270 manufacturing establishments, employing $5,598,139 capital and 4405 persons, paying $2,058,978 for wages and $4,026,579 for materials, and having a combined output valued at $7,746,371. The principal manufactories are foundries and machine shops, locomotive and car works, silk and lace mills, wire rope and axle works, flour and grist mills, and breweries. The distinctive industry of the city is coal-mining. Anthracite coal has been mined here since before the Revolutionary war, and the various mines yield an average annual output of 12,000,000 tons, and employ about 36,000 men and boys. The mammoth vein underlying the city and almost all of the Wyoming valley has an estimated average thickness of 56 feet. The city has a property valuation of over $40,000,000, assessed at about one-seventh of actual value; owns property valued at $250,000; and has a net debt of less than $400,000. Pop. '90, 37,718.

WILKIN, a co. in w. Minnesota, bounded by the Red and Bois de Sioux rivers, which separate it from N. Dakota; 725 sq.m.; pop. '90, 4346, chiefly of American birth. Co. seat, Breckenridge.

WILKIE, Sir DAVID, a distinguished Scottish painter, was b. in Fifeshire, at Cults, of which parish his father was minister, Nov. 18, 1785. His boyish passion for art was too strong to be resisted by his father, who, with much reluctance, sent him in 1799 to study in the academy of Edinburgh. Here he greatly distinguished himself; and returning home, in 1804, he painted his "Pitlessie Fair," a piece in which already his peculiar genius is pronounced, and which brought him the sum of £25. The price seems paltry; but for the work of an unknown country stripling in an original walk of art, it was perhaps to be considered handsome. Shortly after, Wilkie proceeded to London, intending to return to Scotland after a year or two of study; but the great success of his picture, "The Village Politicians," determined him to settle in the metropolis. Not that pecuniarily, he was very greatly benefited, £30 being all that the earl of Mansfield could with difficulty be got to pay for the picture, though aware that, on a point of honorable scruple, the artist had refused repeated offers of £100; but the originality and humor of the work greatly captivated the public, and at once established the reputation of the painter, who had soon commissions in plently, at greatly advanced prices. In 1809 his brethren of the Royal academy ratified the favorable verdict of the public by electing him an associate; and two years afterward he was advanced to the rank of academician. In 1814 in company with his friend Haydon, he visited Paris, and inspected with great delight the art-treasures at the Louvre. Though his father had died some years before, and his mother and sister were now living with him at Kensington, in 1817 he made a run into Scotland, and, while the guest of Scott at Abbotsford, painted his well-known picture of the great poet and his family. During these years, Wilkie had been engaged on the series of pictures on which mainly his fame rests; pictures familiar by engraving to every one (the "Blind Fiddler," "Card Players," "Rent Day," "Jew's Harp," "Village Festival," "Blind Man's Buff," "Distraining for Rent," "The Penny Wedding," "Reading of the Will," etc.), in which the homely humors of humble life are expressed by a vehicle appropriately simple, and—though scarce in the higher sense to be called color—of charming purity and transparency. In this style, distinctively his own, his genius is commonly held to have culminated in "The Chelsea Pensioners listening to the News of Waterloo," which was painted during the years 1820–21. This work was a commission from the duke of Wellington, who paid the artist 1200 guineas for it. Subsequently, he changed his style, sought to emulate the depth and richness of coloring of the old masters, and deserting the homely life, which he could treat so exquisitely, chose elevated, and even heroic subjects, to the height of which he could never rightly raise himself. The florid picture, painted in 1830, of "George IV. entering Holyrood," which, though not without its fine points, can delight no one but a flunkey, gave the first hint of the change; and no doubt a tour over nearly the whole continent, which he made for his health, in 1824, everywhere, of course, intent upon the grand old masterpieces, did something to stimulate the new and unwise ambition. By common consent it has been adjudged unwise; and Wilkie remains, and will remain, memorable, not for the quasi-high art of his later years, but for the simpler, truer, and, in every right sense, higher art of his earlier time. He never, however, ceased to be popular, and honors continued to be showered upon him. On the death of sir Henry Raeburn, he succeeded him as limner to his majesty; in 1830 he was made painter in ordinary to his majesty, in room of sir Thomas Lawrence deceased; and in 1836 the honor of knighthood was conferred upon him. Wilkie had never been robust; and his health now began to give way seriously. In 1840, seeking to re-establish it, he

once more left England; but he did not find what he sought. Having visited Syria, Palestine, and Egypt, he died on his voyage home, off Gibraltar.

WILKINS, a township in Allegheny co., Penn. Pop. 2304.

WILKINS, Sir CHARLES, D.C.L. 1749–1836; b. England; went to Calcutta in the service of the East India company, 1770; remained several years and acquired a thorough knowledge of Bengali, Arabic, Persian, and Sanskrit. He made type for printing Halhed's Bengali grammar, and matrices for the font of Persian type. He translated the *Bhagavat Gita* and *Hitopadesa*. Returning to England, 1786, he was appointed librarian of the East India company, 1801; was knighted 1823. He published a *Grammar of the Sanskrit Language; The Roots of the Sanskrit Language;* edited Richardson's *Arabic and Persian Dictionary*, 2 vols.

WILKINS, JOHN, D.D., 1614–72; b. England; graduated at Oxford, 1632; took orders 1635; was chaplain to lord Say and Charles, count palatine of the Rhine; during the civil war, adhered to the parliament; was made warden of Wadham college, 1648; married the sister of Oliver Cromwell; appointed by Richard Cromwell master of Trinity college, 1659, and ejected at the restoration, 1660; having obtained favor with Charles II., was made prebendary of York, 1660; rector of St. Lawrence, London, 1662; and bishop of Chester, 1668. Among his published writings were treatises on *The Moon a Habitable World; The Earth probably one of the Planets; The Gift of Preaching*, and *The Beauty of Providence*.

WILKINS, MARY E., American author, was born at Randolph, Mass., and still resides there. After writing verses and stories for children's magazines, she contributed to *Harper's Bazar*, a sketch entitled "Two Old Lovers," and by similar studies of character published in that journal and in *Harper's Magazine*, became known as a most graphic depictor of certain phases of New England country life. Her collected stories have appeared under the leading titles *A Humble Romance* (1887) and *A New England Nun* (1891), besides the novels, *Jane Field; Pembroke; Jerome, a Poor Man* (1897), and a tragedy, *Giles Corey, Yeoman*, founded upon incidents connected with the witchcraft trials at Salem.

WILKINSBURG, borough in Allegheny co., Pa; on the Susquehanna river and canal, and the Pennsylvania railroad; 7 m. e. of Pittsburg, the co. seat. It has a national bank, high school, railroad car works, steel works, flour mill, iron foundry, many interests controlled by Pittsburg capitalists, and a weekly newspaper. Pop. '90, 4662.

WILKINSON, a co. in central Georgia bounded n.e. by the Oconee river; 417 sq.m.; pop. '90, 10,781. Sulphur springs are found. Co. seat, Irwinton.

WILKINSON, a co. in extreme s.w. Mississippi, bordering on Louisiana; 592 sq.m.; pop. '90, 17,592, chiefly of American birth, with colored. Co. seat, Woodville.

WILKINSON, JAMES, 1757–1825; b. Md.; served under Arnold in the n., was at Trenton and Princeton, and was appointed by Gates adj.gen. in 1777. In 1778 he became secretary of the board of war presided over by Gates. He resigned in 1779 in consequence of a quarrel with Gates, but was soon appointed clothier-gen. of the army. After the war he removed to Kentucky. In 1791 he was appointed to the U. S. infantry, and led an expedition against the Wabash Indians. He commanded Wayne's right at Maumee Rapids, and was appointed gen.-in-chief in 1796. He was governor of Louisiana, 1805–6; given command along the Mississippi in 1808; three years later he was court-martialed, but acquitted of complicity with Aaron Burr, and of being in the pay of Spain. In 1813 he was made maj.gen., and sent north. His campaign was unsuccessful, mainly on account of Hampton's disagreement with him, and he was superseded. A court of inquiry exonerated him in 1815. The same year he was discharged from the army then being reorganized. The rest of his life was spent in Mexico. He wrote *Memoirs of My Own Times* (1816).

WILKINSON, JEMIMA, 1753–1819; b. R. I.; educated in the society of Friends; when 20 years old after an apparent suspension of life, from the effect of severe fever, she recovered, and asserted that she had been raised from the dead to instruct the living; professed to work miracles; and had a few followers who with her built in Yates co., N. Y., a village named Jerusalem. At her death the sect was broken up.

WILKINSON, Sir JOHN GARDNER, a distinguished traveler and archæologist, was the son of the late Rev. John Wilkinson, of Hardendale, in Westmoreland, and was born on the 5th of October, 1797. Having lost both his parents at an early age he was left under the guardianship of the Rev. Dr. Yates, by whom he was sent to Harrow school in 1813, and to Exeter college, Oxford, three years later. While a boy, young Wilkinson had a strong desire to enter the navy, principally with a view to seeing foreign countries. He also in early life showed a great fondness for architecture and sculpture. While at Harrow he made sketches of all the churches within a radius of some miles from the school; and, while at Oxford, often employed himself in drawing from the objects contained in the Arundel collection. He still further cultivated his taste for architectural antiquities by trips on the continent, made during his college vacations. In the latter part of 1821 he took up his abode at Cairo, where he learned both to read and speak Arabic; he also studied Coptic. Making Cairo his head-quarters he now traveled through and investigated almost every part of Egypt and Lower Nubia. Twice he ascended the Nile as far as the second cataract, and several times as far as Thebes. At the latter famous site he

spent more than twelve months in making explorations; he also visited the deserts on either side of the river, and the Egyptian oases. During subsequent visits he completed the exploration of those deserts, and, in fact, made a complete survey of Egypt, on a scale of about 10 in. to a degree, which unfortunately, for the interests of science, has not yet been published. The same might have been the case with his *Survey of Thebes*, had not the author engraved and published it at his own expense. As a result of his first visit to Egypt, Wilkinson transmitted to the British museum more than 300 antiquarian objects, besides numerous specimens of natural history. Wilkinson's first residence in Egypt extended over a period of twelve years, during which time he composed and published his first two works on Egyptian subjects—viz., *Materia Hieroglyphica; containing the Egyptian Pantheon and the Succession of the Pharaohs, from the Earliest Times to the Conquest by Alexander, and other Hieroglyphical Subjects: with Plates and Notes explanatory of the same.* The preface to this work is dated "Pyramids of Geezeh, July, 1828;" but it was printed and revised for the author at Malta in the same year. This work was followed by *Extracts from several Hieroglyphical Subjects, found at Thebes and other parts of Egypt, with Remarks on the same*—also printed at Malta in 1830, but with a dedication to sir W. Gell, dated "Thebes, 1827." In the same year (1830), he published his *Topographical Survey of Thebes, Tapé, Thaba, or Diospolis Magna*, in six sheets. In 1833, Wilkinson, in consequence of ill health, was obliged to return to England. In 1835 he published *Topography of Thebes, and General View of Egypt* (Lond. John Murray). This was followed in 1837 by *Manners and Customs of the Ancient Egyptians, including their Private Life, Government, Laws, Arts, Manufactures, Religion, and Early History; derived from a Comparison of the Paintings, Sculptures, and Monuments still existing with the Accounts of Ancient Authors: illustrated by drawings of those Subjects* (3 vols. Lond. John Murray). This work at once obtained great popularity, both from the extent and soundness of its information, and the agreeable style in which it was written. It was highly spoken of by the critics; and obtained for him also the honor of knighthood, with which he was invested in 1839. Many things of importance were, however, omitted in it, which he afterward published in *A Second Series of the Manners and Customs of the Ancient Egyptians, including their Religion, Agriculture, etc.* (2 vols. and a volume of plates, Lond. Murray, 1841). Wilkinson again visited Egypt in 1841 and in 1843. He also visited Syria, Constantinople, Tunis, and Sicily, returning to England after an absence of two years, by the Illyrian coast of the Adriatic. During his two years' absence he also visited Dalmatia and Montenegro, which gave occasion to the publication of his *Dalmatia and Montenegro, with a Journey to Mostar, in Herzegovina, and Remarks on the Slavonic Nations; the History of Dalmatia and Ragusa; the Uscoes, etc.* (2 vols., Lond. Murray). Wilkinson's other works are—*Modern Egypt and Thebes; being a Description of Egypt, including the Information required for Travelers in that Country; with Wood-cuts and a Map* (2 vols., Lond. Murray, 1843); *Hand-book for Travelers in Egypt; new edition condensed of Modern Egypt and Thebes* (Lond. 1847, and again in 1858); *The Architecture of Ancient Egypt, with a Large Volume of Plates Illustrative of the Subject* (Lond. 1850); *The Fragments of the Hieratic Papyrus at Turin, containing the Names of Egyptian Kings, with the Hieratic Inscription at the back* (Lond. 1851); *A Popular Account of the Ancient Egyptians, revised and abridged from his larger Work* (Lond. 1854); *The Egyptians in the Time of the Pharaohs;* to which is added an *Introduction to the Study of Egyptian Hieroglyphs*, by S. Birch (Lond. 1857), published as a companion to the Crystal palace guides; *On Color, and on the Necessity for a General Diffusion of Taste among all Classes; with Remarks on laying out Geometrical Gardens, illustrated by Colored Plates* (Lond., 1858). His death took place in 1875.

WILKINSON, William Cleaver, D.D.; b. Westford, Vt., 1833; graduated at Rochester univ., 1857, and at the theol. sem., 1859. He was pastor of the Wooster-place Bapt. church, New Haven, Conn.; prof. modern languages at Rochester univ., 1863–64; pastor of Mount Auburn church, Cincinnati, 1865–66; prof. of homiletics and pastoral theology at Rochester theol. sem., 1872–81. He is counselor of the Chautauqua lit. and scientific circle, and dean of the depart. of lit. and art in Chautauqua univ. Among his works are, *The Dance of Modern Society*, first ed., 1869; *A Free Lance in the Field of Life and Letters*, 1874; *The Baptist Principle; Poems; Edwin Arnold as Poetizer and Paganizer; College Greek Course in English.* He became prof. at the Chicago Univ. 1892.

WILL. The mind is divided into three distinct functions—feeling (see Emotion), intellect or thought (see Intellect), and will or volition. Under will, is included the putting forth of active energy to move our own organs, or change something about us, but all energy is not voluntary energy. The peculiarity of action from will, in contrast to other activities, as the powers of nature—wind, gravity, etc., is its being preceded or inspired by *feelings*, or by the pleasures and pains of an individual mind. Hence, will is defined, *action prompted by feeling.* The feelings that prompt the will, called motives, are our pleasures and our pains; pleasure felt or imagined moves us to continue and increase the pleasurable state; pain urges us to work for the abatement of the pained condition.

In the maturity of the powers, a human being, or animal, can perform a great variety of specific actions at the bidding of the various wants or desires. The sensation of thirst induces at once a series of complicated movements, ending in the relief of the painful feeling. But no man or animal is born with the ability to make a journey to a well, whenever thirst is felt; the human infant cannot even perform the voluntary act of lift-

ing anything to its mouth. Our most ordinary voluntary movements are the result of an education; and the explanation of the volitional energies consists in ascertaining what are their beginnings or germs in the mental constitution, and how they are brought to the finished state.

Three different facts of our nature appear to concur in forming the collective aptitudes of the will:

I. The fact termed spontaneous activity, or the self-acting energy of the system, whereby movements arise without waiting the stimulus of the senses. Any actively disposed animal, after rest and nourishment, begins to move merely through a surplus of nervous power, and not because it is wakened out of dormancy by the solicitations of sensible objects. Without this tendency to commence movements in the first instance, there would be no apparent basis for the voluntary acquirements. See SPONTANEITY. In imitation with the voice, for example, we must begin by uttering sounds, and then discover by the ear their agreement or disagreement with the sounds heard.

II. The second fact is the tendency to abide by a movement giving pleasure, and to relax a movement coincident with pain. From the first moments of sentient life, every animal appears to possess this property. If a movement happens to coincide with an access of pleasurable warmth, the animal maintains, and possibly increases, the movement: if the warmth passes into pain, the movement ceases. The infant sucks so long as the feeling is pleasurable, and ceases when satiety comes on. This power may be an offshoot of the general law connecting pleasure with an increase, and pain with a diminution of vital energy. See EMOTION. However arising, the fact is unquestionable, and is exemplified all through life. Without our going through any process of deliberation or resolution, we sustain an activity that brings us agreeable sensation, and remit an activity ending in pain. We keep our eyes fixed on a cheerful flame, and withdraw them when the glare is overpowering; the process is self-acting and intuitive.

III. The third fact is the operation of the retentive power of the mind, in joining together, by a permanent association, movements and feelings that have existed together for some time. This is a branch of the great law of contiguous association. See ASSOCIATION OF IDEAS. The will is an educated function, and education supposes the plastic or fixing operation expressed by the above-named law.

But the chief nicety in explaining the growth of the will consists in showing how the proper movements and feelings originally came together. This is the problem of the development of voluntary power, which would demand an extended illustration. A brief indication of the process must suffice.

One of the easiest examples is the moving of the head to follow a light or other object pleasing to the gaze. This power is not possessed at the commencement of life, and the process of arriving at it is supposed to be as follows: The child has its eyes fixed on the light, and enjoys the luminous excitement. The light is moved to one side, and is therefore lost to the direct gaze, and there is no power to recover it. An accidental movement of the head, occurring by mere spontaneity, carries the eyes round to encounter the light again, or to follow it as it moves; the consequence is, that the recovered pleasure of the spectacle sustains the movement that brings it. Now, every such coincidence tends to become fixed, by the law of plastic association; and after a few repetitions of the accidental concurrence, there is a connection formed between the optical impression and the movement that is found to go along with and sustain it. Thus it is, that a movement of the object to the right hand, which leaves a characteristic trace on the visual organ, becomes associated with a movement of the eyes and the head to the right hand; and whenever the optical fact arises, the movement is apt to follow. This makes one distinct item in our volitional acquisitions; one instance of the power of definitely acting to a definite feeling.

Another example might be taken from the feelings of warmth and chillness—both very powerful sensations in all animals. One of the most obvious means of attaining comfortable warmth is to crouch and bring all the limbs close to the body. A very early experience would connect this posture, accidentally hit upon, with the comfortable sensation; and, by virtue of the primary law of the mind, connecting pleasure with exalted energy, the movement, once coinciding with the pleasure, would be sustained and adhered to, so long as it brought the pleasure; and in course of a few repetitions, a definite association would be formed between the state of chillness and this mode of relieving it. By a more lengthened and round-about process, more complicated associations would be formed, such as coming close to the warm body of a companion, running into shelter, approaching a fire, going into the sunshine, etc.; but, in all cases, the only mode of attainment that can be pointed out, is (1) the concurrence of spontaneous movements with feelings of pleasure, or relief from pain; (2) the maintenance of those movements by the first law of self-conservation; and (3) the forming of a link between the two by the force of plastic association.

The illustration may be varied by viewing the case from the side of pain. The immediate and direct result of pain, from the dawn of sentient life, is to lower active energy for the time, and therefore to arrest whatever movements are in progress; this is the general rule, although there is an important exception in the case of acute or pungent pains, which, in the first stage, stimulate and excite the active members. Hence, when a movement happens to coincide with a pain, it is liable to be arrested; a bitter morsel in the mouth makes one cease chewing, by reducing the active power for the moment. The primitive endowment of the system would lead to nothing further, until some chance

movement of the mouth tended to get rid of it, which movement would be promoted and sustained by the pleasurable feeling of relief, which is the operation of the principle from the other side.

The growth of the will is conspicuously shown in imitation, which is an acquired aptitude, and a department of our voluntary power. In imitation there must be (1) a spontaneous tendency to move the active organs concerned—the voice, the mouth, the hands, etc.; (2) a sense of the effect, with a certain pleasure in attaining it; and (3) a cementing process, as already described. In learning to speak, the infant must first articulate something of its own accord; the resulting sound affects its own ear, and is discovered to coincide with a sound heard from others. The frequent repetition of the articulate effort leads to its being coupled in the mind with the sound that it gives; and when this association is mature, the sound heard will induce the articulating movement; and this is the power of imitation. But previous to the opportunity of associating the exertion of the mouth, throat, and lungs with the sound emitted, there does not appear to be any capability to imitate articulate sounds. The same would apply to imitation by the hands.

The will in its full development includes not merely a series of associations of movements with the ordinary pleasures and pains, but also the power of performing actions to the word of command, the imitative faculty just discussed, and the power of acting from a mere wish to perform a certain action, or to produce a certain effect upon things about us—as to open a window or stir the fire. It might be shown that all these various aptitudes grow, by successive stages, out of the three fundamental facts above described. The process involves many struggles and failures, from there being so much in it depending on accidental commencements; hence one reason of the slowness of the early education of human beings.—See also FREE-WILL.

WILL is, in English law, a writing by which a person entitled to property declares what is to done with such property after his death. Though, by the Wills act, 1 Vict. c. 26, a writing is indispensable to a will, yet there is an exception in the case of soldiers or sailors who, from their occupation, and while in actual service, are allowed to make a verbal or nuncupative will; and this exception only extends to their personal estate, for they must make a written will, like other persons, in order to deal with their real estate. An infant or person under 21 years of age, cannot, since 1838, make a will. A married woman can only make a will if she has separate property, or her husband assents to her will, or she makes the will by virtue of some power of appointment vested in her. As a general rule, it is absolutely necessary that the party making a will should have a free and disposing mind at the time; and hence, if he or she is a lunatic, or drunk, or acting under compulsion, fear, or undue influence, the will is invalid. There is no limit as to the time preceding death when a will may be made; it is enough that the testator was at the time capable and sensible, though he died immediately after. A will must be executed in presence of two witnesses, who see the testator sign the will, or at least hear him acknowledge it. But there is no particular form of words in which a will must be made for the purpose of disposing either of realty or personalty. The will must be in writing, but it need not be in ink or written continuously. The testator may sign by his mark or by an assumed name. Though a seal is not equivalent to signature, yet a person may have a stamp to sign papers with, and that will be sufficient for a will also. The testator need not sign the will if he authorize some one to do so for him in his presence. The signature must be at the foot or end of the will; but if it is placed so as to lead a court to the conclusion that it was intended to give effect to the will, that will be enough. Though the witnesses need not know it is a will, they must be present together when the testator signs it or acknowledges his signature. The witnesses must sign their names or make their marks. A legatee, or the wife or husband of a legatee, may be an attesting witness, but by being so, he or she will forfeit any legacy left to him or her by the will. But one may be an executor though he attests the will. A will is revoked by the marriage of the testator or testatrix. The mere fact of making a subsequent will does not of itself operate to revoke a prior will, unless there is some inconsistency in whole or in part; and, as a general rule, no will will be revoked by any presumption of an intention on the ground of an alteration in circumstances. The usual way of revoking a will is to burn, tear, or destroy it with the intention of revoking the same; or by executing another will which expressly revokes the prior will. When a testator tears or cuts away that portion of his will containing the signature and attestations, the presumption is that he intended to revoke the whole. But merely cutting out a part of the will, or striking it through with a pen, does not amount to a revocation. It is to be borne in mind that, in order to revoke by tearing, etc., there must be an intention to revoke, so that a mere accidental tearing will prevent the act from having the force of revocation. When there are interlineations or alterations in a will, it is presumed these are made after signature, unless there is evidence to prove the contrary. A will which is in any manner revoked can only be revived by re-execution, or by a codicil showing an intention to revive it; but many nice questions have arisen as to what causes a will to revive.—In Scotland a will is used only to denote a testament affecting personal or movable property; while a will affecting real or heritable property can only be made by way of a deed having a present operation. A will

or testament may be written in the hand-writing of the testator, and if signed by him, will not require witnesses, being then called a holograph will. In other respects, wills are subject to nearly the same rules which prevail in England with respect to revocation, etc. Wills of real property are called dispositions or deeds, and have a present operation, and the mode in which they are drawn up is that of conveying the property to the disponee, but reserving the testator's life-rent. The effect of this is that the testator retains the property in his own hands while he lives; but the moment he dies, the disposition *mortis causa* comes into play, and the disponee then takes the property, subject to the deed. In the United States the law in regard to the making, attesting, and probating wills is governed by the statutes of the different states, which, though they disagree in many particulars, are in most points governed by the common law principles above enunciated. Nuncupative wills are regarded with distrust, and the making of them closely restricted by statute. The English statute making the will of any person under 21 invalid has been adopted in many states. The rights of married women in regard to wills have been greatly extended in most states; though the harsh common law doctrine that a *femme coverte* can make no will without the husband's consent is retained in a few. Monomania may or may not be a disability, according as the nature of the delusion does or does not affect the testator's capacity to judge sanely in regard to the disposition of his property. The law is far less stringent as to the wording than as to the execution and attestation of a will. The language may be both informal and ungrammatical; it is enough that it expresses the intention clearly. But the attestation must be precise. Two usually, sometimes three, witnesses are necessary. In a few states a *holograph* of personalty need not be attested. The provisions of the statute of frauds in regard to wills are in force in all the states. Implied revocation is, therefore, in most cases barred, nor can courts of equity reform a will upon proof of *mistake* as in the case of contracts. The common law rule that marriage and the birth of a child after the execution of a will was a revocation is sustained in most states, but with some limitations. It is not necessary that there should be witnesses to the voluntary canceling, burning, or destroying of a will by the testator. The republication of a will occurs where a will has been formally revoked but not destroyed, and has again been made valid by a second attestation. Though the will dates from the death of the testator, the language must often be construed in reference to the time of execution. The method of proving wills is described under PROBATE COURT. See DEED, LEGACY.

WILL, a co in n.e. Illinois, adjoining Indiana; about 850 sq.m.; pop. '90, 62,007, chiefly of American birth. Bituminous coal is found. Co. seat, Joliet.

WILLAMETTE RIVER, a river in Oregon, rising in the Cascade mountains, and flowing n.w. and n. until it empties into the Columbia river. On its banks are Portland and Oregon City. It is always navigable as far as Portland, and by means of locks and a canal at Willamette Falls, 25 m. from its mouth, small steamboats can for the greater part of the year reach Eugene City, 130 m. from the mouth of the river.

WILLARD, EMMA C. (HART), 1787–1870; b. Conn.; taught a district school at the age of 16; was a teacher at Middlebury, Vt.; married there Dr. John Willard, 1809, and opened a boarding school for girls; submitted plans for a higher seminary to Gov. Clinton of New York, and with his approval opened one at Waterford, 1819, removing it to Troy, 1821, and conducting it with great success till 1838, when she resigned it to her son and settled at Hartford, Conn., devoting herself to the improvement of her numerous school books and to public labors for the promotion of education.

WILLARD, ERASTUS, 1800–71; b. Mass.; graduated Waterville college, Me., 1824, studied theology at Newton theological seminary; was pastor of a Baptist church, Grafton, Vt., 1833; went to France, 1835, and instructed candidates for the ministry; returned 1856, and was a missionary among the Ottawa Indians, 1856–59; settled at Salem, N. Y., 1859–65, and afterward at Newport, R. I.

WILLARD, FRANCES ELIZABETH, b. N. Y., 1839; graduated at North-western college, 1858; taught in various western towns; was principal of the Genesee Wesleyan seminary, Lima, N. Y., 1867; elected president of the Evanston college for women; connected with the North-western university, Chicago, 1871–74; 1874–79, correspond. sec. Woman's christian temperance union, becoming pres. in 1879; in 1882 became member of executive committee prohibition party; in 1883 founded the World's christian temperance union; 1888, became pres. American branch International council of women. Has pub. *Nineteen Beautiful Years; Woman and Temperance,* etc.

WILLARD, JOSEPH, D.D., LL.D., 1738–1804; a great-grandson of President Samuel; b. Me.; went to sea in early youth; graduated at Harvard college, 1765; tutor there, 1766–72; became colleague pastor of the Congregational church at Beverly, Mass., 1772; and president of Harvard college, 1781–1804. Among his published writings are several sermons; a Latin address on the death of Washington; and scientific papers in the *Memoirs of the American Academy* and the *Philosophical Transactions.* He was also a noted Greek scholar, and left an unpublished grammar of the language.

WILLARD, SAMUEL, 1640–1707; b. Mass.; graduated Harvard college, 1659; minister of Groton, 1663–76, whence he was driven during king Philip's war; colleague with the Rev. Thomas Thacher of old South church, Boston, 1678, and afterwards his suc-

cessor; vice-president and acting president of Harvard college, 1701, until his death. He opposed the proceedings of the court during the witchcraft prosecutions. He published *Brief Animadversions*; *The Fountain Opened.* A posthumous folio volume was published entitled, *A Complete Body of Divinity*, consisting of lectures given for 19 years.

WILLARD, Simon, 1605–76; b. England; came to America in 1634; and was the founder of Concord, Mass., and a resident of Groton, Salem, and Charlestown, where he was a magistrate. In king Philip's war he served as major of the militia.

WILLCOX, Orlando Bolivar, b. Mich., 1823; graduated at West Point, 1847, and was commissioned in the artillery. He served in Texas and Florida; resigned, 1857, and practiced law until 1861, when he became col. of the 1st Michigan volunteers, the first western regiment at the front. He joined with Ellsworth in taking possession of Alexandria; took part in Bull Run, Antietam, Fredericksburg, the Tennessee and Richmond campaigns, and distinguished himself at Spottsylvania and Petersburg. He left the volunteer service with the brevet rank of maj. gen. Under the pseudonym of "Major March" he wrote *Shoepack Recollections*, and other books. He became col. of 12th regiment, U. S. A., and in 1886, brig.-general; retired in 1887, and from 1889 to 1892 was governor of the Soldiers' Home, Washington, D. C.

WILLEMS, Florent, b. Belgium, 1823; studied art at Mechlin and at Paris, where he settled in 1839. He ranks high among the *genre* painters of that city. Among his best pictures are: "Une Partie du Music," "Visite de Marie de Médicis à Rubens," "Au Roi!" "La Sortie," "Sealing the Love-letter," and "The Music Lesson."

WILLEMS, Jan Franz, a distinguished Flemish philologist and writer, and noted as one of the originators of the great Flemish national movement, was b. in 1793, at the little village of Boechout, near Antwerp. Willems, at the age of twelve, was sent to the town of Lierre, to learn singing and music, for which he had early evinced considerable aptitude. At Lierre, which continued to be the seat of some of those ancient Belgian literary associations known as "Rêderyk-Kamers," or chambers of rhetoric, mysteries and other scenic representations were given from time to time in connection with these institutions; and during Willems's residence in the town he was frequently called upon to take part in these singular entertainments, a circumstance to which he ascribed his first impulse toward the study and cultivation of the old Flemish language and literature. The talents which he exhibited in his acting, and in the composition of satirical verses, attracted the notice of several influential persons at Lierre, through whose agency he was sent to Antwerp, to study in the office of a notary; and in 1812 he contended successfully for the prize awarded for the best poem on the battle of Friedland and the peace of Tilsit. From this period his poetical and dramatic compositions followed each other in rapid succession. His ode *Aen de Belgen* (To the Belgians), which appeared in 1818, in which he exhorted his countrymen to resume the use of their native Flemish, and his clever treatise on *De Nederduytsche Tael en Letterkunde* (1819–24), in which he traced the history of the Flemish and Dutch tongues from their common origin to their gradual but slight divergencies, marks an epoch in the literary history of Belgium. The Dutch government showed their sense of his anti-French tendencies by giving him the post of keeper of the archives at Antwerp, while the royal institute at Amsterdam elected him a member of its learned corporation; but the Catholic party in Belgium, resenting the attempt made by Willems to refer the decline of Belgian national renown to the abandonment of the Flemish vernacular, looked upon his writings with mistrust; and in 1830, when Belgium was definitely separated from Holland, the dominant Belgian party deprived Willems of his office, and left him for a time in obscurity and neglect. In 1835, chiefly through the influence of his old opponent, S. Van de Weyer, he was, however, promoted to the place of keeper of the archives at Ghent, where he continued to reside in the enjoyment of numerous literary successes and national honors till the period of his death, which took place in 1846. Willems had the satisfaction, during the latter years of his life, of seeing the gradual growth of the Flemish movement, which, since his death, has continued to advance with steady progress, and has resulted in the formation of many literary societies, the publication of numerous literary and historical remains of the old Flemish, and a more general cultivation of the vernacular. Among the numerous Flemish works published by Willems, special notice is due to his version of the mediæval poem of *Reineke Vos* or *Reynard the Fox*, for which he claims a Flemish origin; while, among the more important of his strictly national works, we may instance his editions of the rhymed chronicles of Jan de Klerk and Jan van Heelu, and his *Mengelingen van Vaderlandschen Inhond.* See Flemish School.

WILLEMSTAD, a fortified t. in North Brabant, on the Hollandsdiep, 19 m. n.w. of Breda, erected by William I., prince of Orange, to protect the traffic between Holland and Zeeland. There are bastions, forts, inundation sluices, and a good haven. Population about 2000. In 1793, baron van Boetzelaar successfully defended Willemstad against the French, under Dumouriez, who, after a heavy bombardment, were obliged to break up the siege. It was the birthplace of the naval hero, Callenberg, who, when De Ruyter fell in action with the French, succeeded to the command.

WILLEMSTAD, chief t. of the island of Curaçao (q. v.).

WILLET, *Symphemia semipalmata*, a bird of the family of *scolopacidæ*, a native both of North and South America. It is about 15 in. long; dark ash-color above; the

rump, upper tail coverts, and under parts white, the tail grayish, the tail-feathers, all except the two middle feathers, spotted with dark-grayish brown; the secondaries of the wings white, with dark-brown spots. The bill is two inches and a half in length, very thick, compressed; the wings long; the legs long and strong, the tail short and nearly square; the toes partially webbed. This bird is found in summer as far north as the coasts of New England; in winter, it retreats to the gulf states. The flesh is highly esteemed, and the eggs are reckoned a delicacy. Willets are usually seen in flocks, and generally near the sea. The name is derived from the note.

WILLETT, MARINUS, 1740–1830; b. N. Y.; a lieut. in Delancy's regiment in the French wars. He was at the attack upon Ticonderoga, and went with Bradstreet's expedition against fort Frontenac. He accompanied Montgomery in his Canada campaign, and in 1777 defended fort Stanwix against a mixed force under St. Leger, and held out till Arnold came to his assistance. After the war he settled in New York, of which he was sheriff, 1784–92, and mayor in 1807.

WILLETT, THOMAS, 1611–74; b. England; a merchant in the Plymouth colony, who removed to New York when it passed into the hands of the English. He was the first mayor of that city. He afterwards removed to Barrington, R. I., where he died.

WILLEY, HENRY, b. N. Y., 1824, educated at the Bridgewater, Mass., normal school, practiced law in New York state, but went to Massachusetts in 1858, and afterwards became editor of the New Bedford *Evening Standard*. He has given considerable attention to botany, and especially to the study of the North American lichens. Among his works are *List of North American Lichens* (1873), *Enumeration of the Lichens found in New Bedford, Mass.* (1892), and numerous papers on lichens, contributed to scientific journals or transactions.

WILLIAM I., King of England, commonly called *William the Conqueror*, was the illegitimate son of Robert, surnamed *Le Diable*, duke of Normandy. He was born in 1027, and succeeded to the dukedom on the death of his father, in 1035. Previous to his father's death, he had been intrusted to the care of Henry I. of France; but it was owing rather to the quarrels and jealousies of his own subjects than to the protection of Henry, that he was able to preserve his dominion intact, until his arrival at manhood. In 1047 he gained a victory at Val de Dunes over a powerful competitor, Guido of Macon; and in 1054 he defeated another rival, Guillaume, count of Arques, being aided in both contests by the French. His ambition now began to extend to England, where Edward the confessor reigned at this time. On visiting England, William found his hopes of succeeding Edward much strengthened by the dominance of Norman influence in the councils of that monarch. On Edward's death, however, the Witenagemôte (q.v.) chose Harold (q.v.) to fill the English throne; ignoring, according to the monkish chroniclers of Norman bias, in so doing, an alleged bequest of Edward in favor of William. The Norman asserted his pretended rights by a powerful invasion, and the result was his acquisition of the crown by the famous battle of Hastings, Oct. 14, 1066. Harold having been killed in the fight, the Saxons chose Edgar Atheling as his successor. Edgar, however, was soon obliged to yield, and William was crowned king of England, Dec. 25, 1066; from which day his reign is dated. Edgar remained for some time at his court, and his treatment of the conquered people was at first mild and conciliatory; but his savage suppression of a rebellion, which broke out in the n. in 1070, laid the foundation of an irreconcilable antipathy between Saxon and Norman, which rendered a continuance of this policy impossible. Before long, William began to rule like a true conqueror. Everywhere, the Saxons were reduced almost to a state of slavery. The higher classes were deprived of every office of church and state, while the people were ground down by new and oppressive taxes. Fortresses were erected over the country, and garrisoned to overawe the Saxon inhabitants. In 1072 the Saxons were so far reduced to submission that William found time to lead an army across the border into Scotland, in order to punish the king of that country Malcolm Canmore, for having received and protected Edgar Atheling. The conqueror marched as far n. as the Tay, and received a nominal submission from Malcolm. In 1085 an attempt was made to overturn the power of the English king by Canute, king of Denmark. A great naval armament was got together for the purpose of invasion, but the enterprise was abandoned, its abandonment being caused partly by bad luck, and partly, it is supposed, by a skillful application of William's treasure. The tax called the *Danegelt* (q.v.) was reimposed to meet the expense caused by the threatened war. Disputes having arisen between William and his son Robert respecting the duchy of Maine, which had come to William through his marriage, Nov. 2, 1053, with Matilda, daughter of Baldwin, 5th earl of Flanders, father and son took up arms against one another. The dispute was ultimately adjusted through the intercession of queen Matilda. Most of the latter part of William's life was spent in Normandy, the government of England being intrusted mainly to his half-brother, Odo, bishop of Bayeux. William was of a corpulent habit of body, at which fact it seems that his brother monarch, Philip I. of France, had pointed some sarcasm. William, in a fit of wrath, raised an army and invaded France. He took the city of Mantes, and set it on fire; but while in full enjoyment of the blaze, his horse, stumbling on some hot embers, threw him, and the injury he received proved fatal. He died Sept. 9, 1087. Stern and ruthless as William undoubtedly was, he yet knew how to govern a nation and protect it from foreign aggressions. For more than two centuries England had been harassed by the frequent descents of piratical hordes. He put an

end to these. Never after William's time did a Norse rover venture to show face on the English coast. In the common administration of justice he was royally impartial, many of his severities are even referrible in part to his thorough hatred of anarchy; while his attitude toward the church is admirable. He clearly defined the limits of ecclesiastical judicature, and when the formidable Hildebrand desired that the conqueror should do homage to him for the kingdom of England, the latter boldly refused.

WILLIAM II., King of England, surnamed *Rufus*, second son of William the Conqueror, was born in Normandy in 1056. He was educated by the celebrated Lanfranc, archbishop of Canterbury. He was the favorite son of his father, who, on his deathbed, recommended him to the barons and prelates as his successor to the crown of England. William was, at the time of his father's death, along with him in Normandy. But no sooner had the event taken place than he sat out for England. Landing at Dover, he obtained possession of its castle and of several other fortresses. He then presented himself to Lanfranc, who proposed him to the nobles and prelates as their king. No opposition was offered, and William was crowned on Sept. 26, 1087. Meanwhile, his elder brother, Robert, had entered upon possession of the duchy of Normandy. The relative position of the brothers was such as, in these times, was sure to lead to war between them. Robert, at the instigation of Odo, bishop of Bayeux, endeavored to excite an insurrection in England. This attempt having failed, William, in revenge, invaded Normandy in Jan., 1090. An arrangement having been ultimately come to through the mediation of Philip I. of France, Robert and William then turned their united arms against their third brother, Henry, who had purchased from Robert the district of Cotentin, comprising nearly one-third of Normandy. The fortune of war went against Henry, who was driven into exile. Returning to England, William's next enterprise was an invasion of Scotland. The life of William seems to have been a continual scene of strife. Returning from Scotland, he felt himself called upon to renew the contest with his brother, who had, meanwhile, strengthened himself by an alliance with Philip of France. A pecuniary payment, however, by William to Philip soon dissolved the bond between him and Robert. William would now, doubtless, have taken signal vengeance on his brother, had he not been recalled to England by disturbances in Wales and in the north. In the year 1096, Robert, having resolved to go to Palestine, sold his duchy of Normandy to William, for £10,000. This transaction led to a contest between William and a chieftain named Helie de la Flêche, who had all along disputed Robert's right to the Maine district of Normandy. Helie was not, however, able to withstand the English monarch, who now took the field against him. He was obliged to disband his forces and take to flight. This was the last warlike achievement of William Rufus. He was shot (it is said, accidentally, though there appears equally good reasons to believe the act intentional) by an arrow, supposed to come from the bow of sir Walter Tyrrel, while hunting in the New forest, Aug. 2, 1100. His body was found by a poor charcoal-burner, who conveyed it in a cart to Winchester. William inherited the courage, energy, and political talent of his father, but he was ruthless and unprincipled.

WILLIAM III., King of England, was the posthumous son of William II. of Orange, and Mary, eldest daughter of Charles I. of England. He was born in 1650. The alliance of his family with the Stuarts excited the jealousy of Oliver Cromwell, and by his influence the young prince and his descendants were declared to be excluded from the stadtholdership of the United Provinces. William "found himself," says Macaulay, "when first his mind began to open, the chief of a great but depressed and disheartened party, and the heir to vast and indefinite pretensions, which excited the dread and aversion of the oligarchy, then supreme in the United Provinces." The restoration of the Stuarts, however, in England greatly improved his prospects; and on the murder of De Witt, William, then in his 22d year, was chosen stadtholder. The republic was at this time carrying on an apparently hopeless war with its powerful neighbor, Louis XIV. of France; but by the wisdom and determination of the young stadtholder, the contest, which lasted for nearly seven years, was in 1678 terminated by the treaty of Nimeguen, in a manner highly advantageous and honorable for the United Provinces. A few years before, their ruin had seemed inevitable; and the fame of William became great over Europe. Shortly before this event, he had married his cousin, the princess Mary, eldest daughter of the duke of York, afterward James II. of England. This marriage, entered into solely from political considerations, did not at first prove a happy one. William seems to have been jealous of his wife's position, and too reserved to give utterance to his feelings. According to Macaulay, a complete explanation and reconciliation were ultimately brought about by the agency of bishop Burnet.

In 1686 William became the head of a league formed among the Protestant princes of Germany, the kings of Spain, Sweden, and others, having for its object to curb the power of Louis XIV. The treaty by which the alliance was constituted was signed at Augsburg in July, 1686. In England the tyranny of James II. was now beginning to estrange from him the affections of every class of his subjects. The eyes of all were turning toward the stadtholder as their only hope. Having formed his resolution, William conducted his operations with great secrecy and skill. On Nov. 5, 1688, he landed at Torbay, with an army of 15,000, composed of English and Dutch. His success was rapid and bloodless. Men of influence of all parties gave him their

presence and support; and on Dec. 18 following, he entered London triumphantly as a national deliverer. The adherents of James held out for some time in Scotland and Ireland; but the death of Dundee ended their resistance in the former country; while in the latter it was ended in 1691, after a vigorous contest of two years, in which the Stuart party had, in most cases, the advantage. The object of William in accepting the crown of England was probably not so much to free the English nation from the tyranny of James, as to enlist its power on his side against that of France. In spite of his sterling qualities, and of the debt which they owed to him, the English nation never really liked William III. The death of his wife, in 1694, on whom the crown had been conferred jointly with himself, materially injured his position. His schemes were thwarted by parliament; continual plots for his assassination were hatched by the adherents of James; and in his warfare with France, victory was almost always on the side of Louis, William being in person repeatedly defeated by Luxembourg (q.v.); and it was not without a struggle and a pang that he agreed to the terms of the peace, eminently popular, however, which was concluded at Ryswick on Sept. 10, 1697. The death of Charles II. of Spain in 1700, and the succession of Philip of Anjou, was another blow to his policy. He carried it on, however, with unflagging vigor till his death, which was occasioned by a fall from his horse, on Mar. 8, 1702. The massacre of the Macdonalds of Glencoe (q.v.), and his conduct to the promoters of the Darien scheme are two blots on William's reputation which his most thoroughgoing apologists have been unable to efface. However, he was undoubtedly a practical genius of the highest order, and the services which he rendered both to England and to his native country can hardly be overrated. During his reign the bank of England had been founded, the modern system of finance introduced, ministerial responsibility recognized, the liberty of the press secured, and the British constitution established on a firm basis. In his domestic life he committed the error of a too stern repression of all manifestation of kindly or genial feeling. His manner was wholly Dutch, and even his countrymen thought him blunt. "In his intercourse with the world in general," says lord Macaulay, "he appeared ignorant or negligent of those arts which double the value of a favor, and take away the sting of a refusal."

WILLIAM IV., King of Great Britain and Ireland, third son of George III., was born on Aug. 21, 1765. Until 1771 he remained, along with the prince of Wales and prince Frederick, under the care of Dr. Majendie. He was then sent to Kew, where, with prince Edward, afterward duke of Kent, he was under the guardianship of col. Bude. On June 15, 1779, he entered the navy as midshipman on board the *Prince George*, then under rear-admiral Digby. The *Prince George* then joined Admiral Rodney's squadron, on its way to Gibraltar. After seeing a considerable amount of service, prince William was made a lieut. on June 17, 1785; and in the year following he received his commission as capt. In 1789 he was created duke of Clarence and St. Andrews, and earl of Munster, with an allowance from parliament of £12,000 a year. Subsequent to this, several acts of insubordination rendered an actual continuance of his professional career impossible. He was, however, formally promoted through the successive ranks until he was made admiral of the fleet in 1801. Meanwhile, however, he had been living almost entirely ashore, with Mrs. Jordan (q.v.), a celebrated actress, with whom he had become connected in 1791. By her he had a family of five sons and five daughters, who became known by the surname Fitzclarence, and were raised to titular dignities. On July 11, 1818, he married Adelaide, eldest daughter of the duke of Saxe-Meiningen. The issue of this marriage was two daughters, both of whom died in infancy. By the death of the duke of York, in 1827, the duke of Clarence became heir-presumptive to the throne, to which he succeeded, on the death of his brother, George IV., on June 26, 1830.

The great event of the reign of William IV. was the passing of the reform bill. After a fierce and protracted struggle, the bill was read a third time in the house of lords on June 4, 1832, and three days afterward it received the royal assent. The first reformed parliament met on Jan. 29, 1833. The abolition of colonial slavery, the reform of the poor-laws, and of the Irish church, were the immediate results of the great constitutional change. King William died, after a short illness, on June 20, 1837. He was succeeded by his niece, Queen Victoria.

WILLIAM THE LION, one of the early kings of Scotland, succeeded his brother, Malcolm IV., in 1165. He is commonly called William the Lion, but why he obtained that title is one of the mysteries of history. When heraldry long afterward became a science, and was supposed to have been in use earlier than it really was, it was not unnaturally supposed that he was the first king who used, as a heraldic achievement, the lion, afterward the chief feature in the arms of Scotland. His predecessors had long contested with the kings of England the sovereignty of Northumberland and other districts of what is now the north of England. Under Malcolm, these claims were virtually abandoned, and the king of Scots received, as a sort of equivalent for them, the earldom of Huntingdon and other valuable estates holding of the English crown. William had still, however, a hankering after the Northumbrian districts. He attended Henry of England in his continental wars, and is supposed, when doing so, to have pressed for a portion at least of the old disputed districts. In his disappointment, he

invaded them, after the example of his ancestors. On July 13, 1174, he fell, almost by accident, into the hands of an English party. For security, he was conveyed to Normandy, and there he consented, as the price of his liberation, to perform that homage for his kingdom which the English kings so long in vain attempted to exact from the government of Scotland. How far the Scots community would have admitted that he had a right to bind them to such a condition, may be doubted. The treaty of Falaise, however, as the transaction was termed, from the place where it was adjusted, was revoked in the year 1189 by Richard I. of England, in consideration of a payment of 10,000 marks, which he wanted for his celebrated expedition to Palestine. William had several disputes with the church, but he was one of the early benefactors of the regular ecclesiastics, and founded, in 1178, the great abbey of Arbroath, which he dedicated to Thomas à Becket, who had been slain eight years earlier. King William died in 1214.

WILLIAM, Prince of Orange, and Count of Nassau, the founder of the independence of the Netherlands, was born at Dillenburg, April 16, 1533. His father, William, was the second son of count John of Nassau-Dillenburg, and succeeded to the German possessions of the family; while his elder brother, Henry, obtained the extensive estates in Luxemburg, Brabant, Flanders, and Holland. The latter also, by his marriage with Claudie of Chalons, added the charming and valuable little principality of Orange to his already extensive domains; but his son René, dying without issue, left Orange along with the Low Countries' estates to William, in 1544. William had hitherto lived at Dillenburg under the care of his father, who was a zealous Lutheran; but on his becoming the most powerful lord of the Low Countries, he was sent to the queen regent's court at Brussels, and brought up in the Catholic faith. At the age of 15 he became page to the emperor Charles V., who took an almost paternal care of him, attentively watched the development of his character, and, satisfied with the result, took him into his inmost confidence, making him the safe repository of the most important secrets, employed him in various diplomatic offices, and, in 1555, promoted him, over the heads of all his veteran officers, to the command of the imperial army on the French frontier. In all these various situations, William acquitted himself completely to his patron's satisfaction; displaying acute intelligence, sound judgment, and a precocious knowledge of men, while bearing himself with a grace and dignity of manner that gained universal esteem. Charles, on his abdication, strongly recommended William to his son Philip as a confidential adviser; and accordingly, we find him employed to draw up the treaty of Cateau-Cambresis, and selected as one of the four hostages to be given to France for its fulfillment. During William's residence in France, he was confidentially informed by Henry II. of a secret arrangement which was being formed between France and Spain for the complete extermination of heretics in both countries; and with admirable nerve, dissembling his horror of the project, he resolved in his own mind to oppose the execution of the scheme in the Netherlands to the uttermost of his power. On returning to the Low Countries, he became the leader of the party which devoted itself to the maintenance of the chartered liberties of the country, agitated for the recall of the Spanish troops, opposed the augmentation of the number of bishoprics (a pet scheme of Philip's, for his opposition to which he first incurred the bitter dislike of his sovereign), and finally broke entirely with cardinal Granvelle, the president of the council, and the willing agent of Philip's tyranny. Expostulations to the regent Margaret of Parma, and directly to Philip himself, far from producing any good result, seemed only to hurry the bigoted monarch to more extreme measures; the cruel edicts against heretics were made still more stringent, and at the end of 1564 the inquisition was established. William, however, steadily refused to allow these oppressive enactments to take effect in his hereditary governments of Holland and Zealand; and though he did not join in the famous protest known as the "compromise" which was presented to the regent by the "beggars," he supported their proposals at court, seeing that, though maintained with somewhat too much violence, their aims were the same as his own. For the next few years he was unremitting in his exertions to impress both the rulers and the people with the desirableness of moderation, and on several occasions succeeded by his personal influence in repressing religious dissension. Hitherto he had labored conjointly with counts Hoorn and Egmont, but failing to convince his two associates of the rank duplicity of the king, of which he himself was assured by means of the spies in his pay at the Spanish court, and of his perfidious designs against them, he was compelled to leave them to their fate, and retired to his German estates. Hoorn and Egmont were seized and executed; William, cited as a rebel (Jan., 1568), and, on the ground of being a knight of the golden fleece and a sovereign prince, refusing to appear, had his estates confiscated, and the duke of Alva arrived at Brussels, to reduce the provinces to submission. William had hitherto lived in a most luxurious and extravagant manner, the splendor of his household far exceeding that of his royal master; but now he effected a thorough retrenchment, and disposed of his valuables, to equip four armies for the invasion of the Low Countries. Two of the armies failed completely; the third, under his chivalrous brother Louis, was destroyed at Jemmingen by Alva; and the fourth, 30,000 strong, under his own immediate command, lay in Brabant, unable to force Alva's army to a conflict, till want of the means of paying his soldiers forced him to retreat. His next

attempt was made in 1572, and though as unsuccessful on land as before, he succeeded in exciting Holland, Zealand, Gelders, Overyssel, and the bishopric of Utrecht to rise for their liberties; and was proclaimed by these provinces as their stadtholder for the king, whose authority he and they still acknowledged. Meantime, his coadjutors, the "beggars of the sea," had taken Brill and Flushing, and had committed heavy depredations on Spanish commerce. But ere long the fortune of the Spaniards on land was again in the ascendant; fortress after fortress fell into their hands, despite William's utmost efforts to relieve them; and though Holland and Zealand still remained faithful to the cause of liberty, he found it impossible to raise an army which could fairly cope with the enemy. He succeeded, however, by breaking the dykes, in saving Leyden, though Antwerp and Haarlem experienced all the horrors of a siege and capture. It was at this period that William openly professed himself a Calvinist, though, with his usual moderation, he utterly disclaimed the bigoted fanaticism which characterized his co-religionists, and in which they went near to equal their adversaries the Catholics. Success still attended the patriot fleet, and though the gallant Louis, with his brother Henry, was defeated and slain at Mooker-Heide (April 14, 1574), the ruinous condition of the Spanish finances, and the general detestation in which the soldiers of Philip were justly held, helped William to hold his ground. In March, 1575, conferences were opened at Breda between the belligerents, but Philip obstinately refusing to yield an iota, they were broken off; and in October of that year the provinces of Holland and Zealand pronounced Philip's deposition, and gave power to William to choose the country under whose protectorate they were to be placed. Meantime, the rapacity of the Spanish soldiery had roused the fifteen provinces which still remained loyal to Philip, and the league, known as the *Pacification of Ghent* (Oct., 1576), the object of which was to drive out the foreign troops, and establish, at least for a time, toleration in religion, was the consequence. This was a brilliant success for William; and though Don John of Austria, the new governor, tried to dissolve it by the "perpetual edict" (Feb. 12, 1577), in which he granted nearly all demands, William succeeded, by skillful policy, in foiling the attempt. War was accordingly resumed, and the patriots were defeated at Gembloux (Jan. 31, 1578), though their spirits were from time to time buoyed up by an occasional success. The next governor, Alexander Farnese, succeeded, however, in detaching the Walloon provinces from the league, though, to compensate for this, William obtained the signature of the *Union of Utrecht* (Jan. 23, 1579), the first foundation of the Dutch republic. In the following year his two faithful provinces, Holland and Zealand, after having been nominally under the sway of the archduke Matthias of Austria, and of the duke of Anjou, proclaimed William their sole ruler, the duke of Anjou being still acknowledged as sovereign of the others. William, however, after his long and desperate struggle for his country's freedom, was not destined long to enjoy the honors of sovereignty, for, on March 15, 1580, Philip had, by Granvelle's advice, put a price of 25,000 gold crowns on his head, and the incitement of this magnificent bribe produced various attempts to assassinate him, the last of which, by Balthasar Gerard, was successful, at Delft, July 10, 1584. William was four times married, and left by his first wife, Anne of Egmont, Philip-William, prince of Orange; by his second, Anne of Saxony, the famous Maurice (q.v.); and by his fourth, Louise de Coligny, Frederick-Henry, who succeeded Maurice as stadtholder of Holland

William the Silent, as he was called in his day, from his discretion and not from any moroseness of disposition, was tall in stature, and had a dark complexion, brown hair and eyes, and a broad forehead. He was generous and frank, his piety and integrity are unquestioned, and his sagacity, courage, and determined will made him a leader of men. A memorial tower in his honor was erected at Dillenburg in 1875. See *Lives* by Klose (1864), Herrmann (1873), and Motley, *The Rise of the Dutch Republic.*

WILLIAM I. (Frederick Wilhelm), first king of the Netherlands; 1772–1843; b. Brussels; grand-nephew of Frederick the Great. Under the title of Prince of Orange, he commanded the Dutch army till the conquest of his country by France, soon after which he went to Berlin. In 1802 his father, the last stadtholder, gave him the principality of Fulda, with other districts; but they were taken from him in 1806 on account of his refusal to join the Rhenish confederation. Becoming a gen. in the Prussian service, he was captured by the French at Jena. He was soon released, and entered the Austrian service. In accordance with the arrangements made at the congress of Vienna he was declared king of the Netherlands (including Belgium) in 1815; and he exchanged his territories in Germany for the grand-duchy of Luxembourg. Belgium gained its independence by the assistance of France, 1830–32. He abdicated in 1840 in favor of his son William II.

WILLIAM II. (Frederick George Lewis), King of the Netherlands, son of William I., was b. at the Hague, Dec. 6, 1792. In 1795 his father sought an asylum in England, and a few years later went to settle at Berlin. The young prince studied at Berlin and Oxford; and in 1811, joining the army in Portugal, he served on the staff of lord Wellington, to whom he became ajt. and speedily obtained the rank of col. His bravery was conspicuous at Fuentes de Onoro and Ciudad Rodrigo. At Badajoz, the storming column having been repulsed, the young prince met and rallied the retiring troops, leading them anew to the attack, and was the first to spring into the breach.

He took an active part at Salamanca, Vittoria, and the battles of the Pyrenees. On the return of the Orange family to the Netherlands, William I. made him commander of the army. The last campaign of Napoleon brought the prince again into active service, and he gained fresh laurels at Quatre Bras and Waterloo, where he was wounded. The prince of Orange married, Feb. 26, 1816, Anna Paulowna, youngest sister of the emperor Alexander I. of Russia. When the Belgian revolution began, in 1830, he was called again into public life; and, as governor of the loyal districts, tried by concessions to allay the storm, but the provisional government at Brussels was not to be satisfied, and having overstepped the limits of his commission, the prince was recalled. In July he took command of the army, and pushed to the center of Belgium; when, at Louvain his victorious course was interrupted by French intervention, and the Dutch army retired to the north. Having more liberal views than were then common, the prince took little share in state affairs, and spent his life chiefly at Tilburg, as commander of the army of observation. On the abdication of William I. (see NETHERLANDS), the prince of Orange assumed the reigns of government (1840) as William II. The political movements of 1848 were felt in the Netherlands, as in other countries; and the ministerial plans of reform not having satisfied the party of progress, the king announced his willingness to sanction whatever changes in the constitution were thought necessary, and the storm was averted. The new constitution was proclaimed Nov. 3, 1848. William died on Mar. 17, 1849, regretted by all ranks. He was marshal in the British army, and held a multitude of European orders.—See *Het Leven van Willem II.*, door J. J. Abbink; also the same by Bosscha.

WILLIAM III. (ALEXANDER PAUL FREDERICK LEWIS), tne last king of the Netherlands, was b. Feb. 19, 1817, and succeeded to the throne on the death of his father, William II., in 1849. The kingdom has since enjoyed uninterrupted peace; material prosperity has increased, and the public debt has been considerably reduced. William's reign has been chiefly distinguished for undertakings which contribute to the true greatness of a nation. In 1866, Luxemburg and Limburg withdrew from the German confederation, the latter being incorporated with the Netherlands. By his first wife, a Würtemberg princess, W. had two sons, neither of whom survived ; by his second wife, a daughter of the prince of Waldeck, a daughter, the present queen (b. 1880). He died Nov. 23, 1890.

WILLIAM I. (Ger. FRIEDRICH-LUDWIG WILHELM), King of Prussia, and the first emperor of united Germany, was the second son of Frederick William III., and was b. Mar. 22, 1797. He joined the army at an early age, and was engaged in the campaigns of 1813–14 against France. On the accession of his elder brother, Frederick William IV. (q.v.), to the throne in 1840, William became governor of Pomerania, and afterward sat in the Prussian diet, and vigorously supported the absolutist party. In consequence, he was so much disliked by the people that on the outbreak of the revolution in 1848 he had to flee to England; though he returned some months after, and was elected to the national assembly. However, from this time he interfered little in the quarrels between the constitutionalists and absolutists, though he gladly accepted the command of the troops dispatched to put down the rising in Baden; and in Oct., 1857, the king having become incapacitated for business, William was commissioned to act as regent, a commission renewed from time to time till his permanent installation in Oct., 1858. At this time he was very popular in Prussia, owing to his supposed opposition to some of the obnoxious measures of the king's ministers, and to his vigorous advocacy of conjoint action with Britain and France in the war of 1854; and his election as regent was consequently opposed by the aristocratic and pietistic parties, who were, on his elevation, dismissed from power, and a more liberal ministry formed. On Jan. 2, 1861, William ascended the throne; and the occasion of his coronation, Oct. 18, following, he himself put the crown on his head, declaring that he "ruled by the favor of God, and of no one else." The result of the elections to the chamber of deputies, which were being carried on at the same time, being much in favor of the liberal party, William, who was quite astonished at the fact of the party whom he looked upon as the opponents of the crown having a majority, attributed it to the intrigues of secret enemies; and in his address at the opening of the chambers, saying that he "never could permit the progressive development of our inner political life to question or to endanger the rights of the crown and the power of Prussia," disclosed the principle of his policy, a policy which, with all the unflagging perseverance and unconquerable obstinacy which characterize men, like him, of thorough honesty, unflinching firmness, and considerable narrow-mindedness, he afterwards unremittingly pursued. The first chamber which sat after his coronation was dissolved, despite the protest of a large majority of the members; but the succeeding elections further increased the liberal majority; and though some popular measures were brought forward, and some obnoxious taxes abolished, the new chamber proved as refractory as its predecessor, and refused its consent to the extensive changes in the Prussian military system (the king's pet scheme), and to the raising of money by loan, to be applied for that and other ministerial projects, till its constitutional powers were fully acknowledged. On Sept. 22, 1862, Herr von Bismarck-Schönhausen, formerly the ambassador at Paris, was made prime minister; and the deputies having not only rejected the ministerial budget, but resolved that the expenditure of moneys not sanctioned by them was

a breach of the constitution, the chamber was dissolved, Oct. 14, the king declaring by message that as the three estates could not agree, he should continue to do his duty to his people, without regard to "these pieces of paper called constitutions," in which he had no faith. The number of the liberals was further increased in the following year, and the contest continued; the deputies displaying the same firmness and extreme moderation as before; while the king and his ministers made it plainly understood that if the lower chamber did what the government asked it to do, all would be well; but if not, the king would "do his duty" without its aid. However, this strife between the old feudal and the modern liberal doctrines was shelved at the close of 1863, by the able strategy of Bismarck, who revived the old dispute with Denmark regarding its government of Sleswick and Holstein, and by forcing Austria to conjoint action, contrived to make the question one of "German" interest. See SLESWICK. Then came the war (see GERMANY) between Prussia and Austria. William became the head of the North German Confederation in 1867. At Ems, in July, 1870, took place the memorable interviews between William and the French ambassador, Benedetti, which ended in the war of 1870–71. William accompanied the army, and commanded at the decisive battles of Gravelotte and of Sedan. On Jan. 18, 1871, William was proclaimed emperor of Germany in the palace of the French kings at Versailles; and, as if completely to re-habilitate the old imperial title, the ancient enmity between pope and emperor was fully revived by the subsequent educational measures of the German government. In May, 1878, the emperor was twice shot at, being seriously wounded the second time. These attempts were attributed, directly or indirectly, to socialist influence, and led to legislation tending to repress socialism. William married, June 11, 1829, Maria Louisa of Saxe-Weimar, by whom he had issue Frederick William, who reigned as Frederick III. (q.v.); and Louisa, the present grand-duchess of Baden. He died at Berlin, March 9, 1888, and was buried at Charlottenburg.

WILLIAM II. (FRIEDRICH WILHELM VICTOR ALBRECHT VON HOHENZOLLERN), emperor of Germany and king of Prussia, son of Frederick III. and Victoria, princess royal of England, was b. Jan. 27, 1859. After graduation at a university he received a thorough military training, and in 1888 was promoted by his grandfather to the rank of major-general. He ascended the throne in June, 1888, on the death of his father. His public speeches exhibit him as a man of aggressive and impulsive temperament. He married, Feb. 27, 1881, princess Augusta Victoria of Schleswig-Holstein. His eldest son, Frederick William, the present crown prince of Germany, was b. May 6, 1882.

WILLIAM THE SILENT. See WILLIAM, PRINCE OF ORANGE.

WILLIAM AND MARY COLLEGE, at Williamsburg, Va., is, after Harvard, the oldest in the United States, having been chartered by William and Mary in 1693. In 1619 grants of land for a college near Richmond, Va., had been obtained, but the design was frustrated by the Indian massacre of 1622. In 1660 the grants of land were renewed; but not until 1693 was a royal charter and endowment secured. The institution was appointed surveyor-general of Virginia; and by its charter was entitled to a penny a pound on all tobacco exported from Virginia and Maryland. In 1766 these privileges were worth more than $5000 per annum, but the revolution cut them off. Until 1793, also, it shared with Harvard the interest of a fund left for educational purposes by the hon. Robert Boyle. While the institution suffered such losses by the revolution, it was a cordial advocate of it. Itself a result of the revolution of 1688, its students were enthusiastic friends of that of 1776. George Washington, having been examined by it, was made one of its surveyors. Besides the losses suffered in two wars, the college buildings were three times destroyed by fire. Under the auspices of Jefferson it was the first college in the United States to adopt modern methods of study, adding at a very early date to the college course the study of law and the constitutions of the state and the United States, the study of political economy, history, modern Languages, etc. The institution maintained its existence in the midst of obstacles, but from 1881–88 was obliged to close its doors. In 1888, it was reopened with the addition of a normal department, and had, 1890–91, 8 professors, 188 students. President, Hon. Lyon G. Tyler, LL.D.

WILLIAMS, a co. in N. Dakota; on the Missouri river; 1260 sq. m. Pop. '90, 109. Co. seat, Williston.

WILLIAMS, a co. in extreme n.w. Ohio, bordering on Indiana and Michigan; 415 sq.m.; pop. '90, 24,897. Co. seat, Bryan.

WILLIAMS, ALPHEUS STARKEY, 1810–78, b. Conn.; graduated at Yale, 1831, studied law and practiced in Detroit, where he was also for some years, judge of probate, and editor of the *Advertiser*, and, from 1849–53, postmaster. He served as lieut.col. of volunteers in the Mexican war, in 1861 was commissioned brig.gen. of volunteers, and in 1862 took command of the 1st division of Banks's corps. At Cedar Mountain his troops held the field until a third were disabled. Gen. Williams held commands also at Antietam, Fredericksburg, Chancellorsville, and Gettysburg, in the Atlanta campaign and in the march to the sea, where he led the 20th corps. He was U. S. minister at San Salvador, 1866–69.

WILLIAMS, ELEAZAR, 1787–1858, thought to be a grandson of Eunice, daughter of John Williams, the "redeemed captive;" was educated by friends of the family at Long meadow, Mass.; was a secret agent of the United States among the Canadian Indians in the war of 1812; became an Episcopal minister, 1826, and was employed among the In-

dians at Green bay. About 1842 he declared himself the "lost dauphin of France," who had been carried secretly from prison in Paris, and brought to America. This claim was ingeniously advocated by the Rev. J. H. Hanson, in *Putnam's Monthly* (1853), and afterward in a volume entitled, *The Lost Prince.* Those who believed the story thought that he had a decidedly Bourbon countenance; others regarded him as a good looking half-breed Indian.

WILLIAMS, Elisha, 1694–1755, b. Mass.; graduated at Harvard college, 1711; preached at Newington, Conn., then a parish of Wethersfield, 1720–25; was president of Yale college, 1726–39, when he resigned because of ill health; was a member of the legislature and a judge of the superior court; served as chaplain to the Connecticut regiments in the expedition against cape Breton, 1745; was appointed col. of a regiment raised for an expedition against Canada, and went to England to collect the pay due to his men.

WILLIAMS, Ephraim, 1715–55, b. Newton, Mass.; at first a sailor, then a soldier, and a capt. in the colonial forces in the French war. In 1750 he received from the government a grant of 200 acres of land within the limits of the present towns of Williamstown and Adams. Fort Massachusetts was built there, and he was put in command of that, and the other forts w. of the Connecticut river. In 1755 at the head of a regiment sent to re-enforce sir William Johnson, he was ambuscaded near lake George by a force of French and Indians, and killed. Williams college (q.v.), was eventually founded, with property bequeathed by him for a free school.

WILLIAMS, Helen Maria, 1762–1827, b. England; published several volumes of poetry; went to Paris just before the revolution; wrote in favor of the Girondins; and was imprisoned; was released after Robespierre's fall; returned to Paris, 1796; after the peace of Amiens, was again imprisoned. Among her published writings are numerous volumes relating to France and the revolution: translation of *Paul and Viginia;* and the well-known hymn, "While thee I seek, protecting power."

WILLIAMS, James, 1740–80, b. N. C.; settled in South Carolina in 1773, and was a delegate to the provincial congress of that colony in 1775. Four years later he was appointed col. in the state militia. At the battle of Stono the same year, he held a command; and he defeated a combined force of British and loyalists at Musgrove's Mills in 1780. He was killed at the head of one of the attacking columns at the battle of King's mountain.

WILLIAMS, James D. 1808–80, b. Ohio; received only a common school education and became a farmer in Indiana. He was an old school democrat, served many terms in the state legislature as representative and senator, and in 1874 was elected to congress. In 1876 he was the democratic candidate for governor of Indiana, and in a contest unusually exciting from its occurring in the year of presidential elections, defeated his opponent, Benjamin Harrison. He was popular with the working classes, and had a studied plainness in manners and dress.

WILLIAMS, Jesse, 1807—86, b. N. C.; one of the engineers who made the first survey of the Miami and Erie canal, upon whose construction and that of the Ohio canal he was engaged 1824–32. In the latter year he became chief engineer of the Wabash and Erie canal, and in 1837 was made by the state of Indiana chief engineer of all the internal improvements in that state; and he continued to hold that position, with the exception of 5 years, though almost constantly engaged in railroad construction or management. In 1853 he was appointed chief engineer of the Pittsburg and Fort Wayne railroad, of which he soon became a director. He was a government director of the Union Pacific railroad, 1864–69, and was afterward chief engineer of the Grand Rapids and Indiana, and of the Cincinnati, Richmond and Fort Wayne railroads.

WILLIAMS, John, 1582–1650, b. Wales; graduated at Cambridge, 1603, where he was distinguished in a wide range of studies; chaplain to the lord chancellor, 1609, and afterward to James I. with whom he was a favorite; prebendary of Hereford, 1612, of Lincoln, 1613; and of Petersborough, 1616; dean of Salisbury, 1619; and of Westminster, 1620; keeper of the great seal, 1621; bishop of Lincoln, 1621; preached the king's funeral sermon, 1625; offended Charles I.; was condemned after 8 years' proceedings before the star chamber, on the charge of betraying the king's secrets, suspended from his bishopric; fined £18,000; imprisoned in the Tower, 1636–40; released by the long parliament, and restored to his diocese; archbishop of Canterbury, 1641; imprisoned again and released 1643, supported the king during the rebellion.

WILLIAMS, John, 1664–1729; b. Mass.; graduated at Harvard college, 1683; was ordained pastor at Deerfield, Mass., 1688; in 1704, 340 French and Indians broke open his house, killed two of his children and started with him, his wife, 4 children and other prisoners for Canada. On the second day Mrs. Williams, unable to proceed, was killed. In Canada he was treated kindly, and in 1706 was redeemed with two of his children and other captives. He resumed his pastoral charge and published a narrative of his imprisonment the title of which, *The Redeemed Captive,* was popularly applied to himself.

WILLIAMS, John, a celebrated missionary, was born at Tottenham, London, June 29, 1796. At the age of 14, he was apprenticed to an ironmonger, and during his appren

ticeship, displayed a great taste for mechanics, and acquired a knowledge of mechanical arts, which he afterward turned to great account. Having become deeply religious, he offered himself to the London missionary society as a missionary to the South seas. He was ordained in 1816, and sent to Eimeo, one of the Society islands. Two months after his arrival, he was able to preach to the people in their native tongue. From Eimeo, he soon went to Huaheine, and afterward to Raiatea, the largest of the Society group. His labors here were attended with great success; the island became Christian, and the arts and habits of civilization were introduced along with Christianity. Wherever Williams went, he not only preached the gospel, but instructed the people in the arts, so as to elevate them from their state of barbarism. At Raiatea, he heard of Raratonga, the chief of the Hervey islands, and thither he went in 1823. The mission which he founded there was eminently successful; not only Raratonga but the whole group of the Hervey islands being Christianized. In his missionary work, Williams made great use of native teachers, trained by himself. He translated the New Testament into the Raratongan language, and prepared books for the schools which he established. After spending some time in Raratonga, he wished to return to Raiatea; but the island in which he lived lay out of the way of vessels, and he resolved to build one. He made all the necessary tools, and in about 15 weeks completed the vessel itself, a boat 60 ft. long, and 18 wide, the sails of native matting, the cordage of the bark of the *Hibiscus*, the oakum of cocoa-nut husks and banana stumps. In this vessel, during the next four years, he visited many of the South sea islands, extending his missionary labors to the Samoa islands. In 1834 he came to England, where he remained for nearly four years, during which he procured the publication of his Raratongan New Testament by the Bible society, and raised £4,000 for the purchase and outfit of a missionary-ship for Polynesia. In 1838 he returned to the chosen sphere of his labors, visited many of the islands, and finally the New Hebrides, where he hoped to plant a mission, but was killed, Nov. 20, 1839, and most of his body eaten by the savage natives of Erromanga.

WILLIAMS, John, d.d., b. Mass., 1817; graduated Trinity college, 1835; ordained a Protestant Episcopal clergyman, 1841; rector of St. George's church, Schenectady, N. Y., 1842–48; president of Trinity college, Hartford, 1848–53; assistant bishop of Connecticut, 1861; was appointed bishop on the death of Bishop Brownell, 1865. He is the author of *Ancient Hymns of the Holy Church; Thoughts on the Gospel Miracles*; *Inaugural Discourse at Trinity College; Studies in the Book of the Acts;* contributed articles to the *Church Review;* edited Browne's *Exposition of the Thirty-nine Articles.*

WILLIAMS, John J., d.d., b. Boston, 1822; was educated at the Sulpician coll., Montreal, and the sem. of St. Sulpice, Paris. After being ordained he was appointed asst. priest of the Boston Rom. Cath. cathedral, 1845, and was made rector, 1855. He took charge of St. James' parish, 1857; was appointed coadjutor bp. of Boston, 1866; and later was consecrated bp.; made abp. of Boston, 1875.

WILLIAMS, John S., b. Mt. Sterling, Ky., 1820; graduated at Oxford coll., O. 1839; practised law at Paris, Ky.; served in the Mexican and civil wars, holding a brigadier generalship in the confederate service. He was a member of the Ky. legislature, 1857 and 1875; and was elected, as a dem., to the U. S. senate, 1878.

WILLIAMS, Jonathan, 1750–1815, b. Boston; entered business life, several times made voyages to England and the West Indies, and was secretary to Franklin when the latter was ambassador to France. He resided some time in Philadelphia, studied the subject of fortification, and in 1801 became a maj. in the artillery and engineers. By the act of 1802, establishing the West Point academy, maj. Williams was made superintendent of the institute, but resigned in 1803, a question of relative rank having arisen. He was re-appointed with the rank of lieut.col., and made chief engineer. From this time until 1812 he had charge of West Point. He also had charge of the fortifications of New York harbor, and planned Castle Williams (Governor's Island), Fort Columbus and Castle Clinton (afterwards Castle Garden). He was the first to introduce here principles of scientific military engineering and fortification. On the outbreaking of the war of 1812 Col. Williams claimed command of Castle Williams, and on refusal resigned. In 1814 he was elected to congress. He published *Elements of Fortification*, 1801, and other military and scientific works.

WILLIAMS, Sir Monier, b. Bombay, 1819; studied at King's college, London; entered Oxford, 1838; soon obtained an Indian writership, and studied at the East India college, Haileybury, gaining the first prizes in all the oriental subjects; resigned his Indian appointment, returned to Oxford, and graduated, 1844; prof. of Sanskrit at Haileybury, 1844–58; at Cheltenham college, 1858–60; Boden Sanskrit professor at Oxford, 1860; visited India, 1875. He has published *A Practical Grammar of the Sanskrit Language; An English and Sanskrit Dictionary; Original Papers Illustrating the History of the Application of the Roman Alphabet to the Languages of India; Indian Epic Poetry; A Sanskrit and English Dictionary; Indian Wisdom; Hinduism; Modern India and the Indians*, etc.

WILLIAMS, Otho Holland, 1749–1800, b. Md.; lieut. of a rifle company at the beginning of the revolution. In 1776 he became maj. in a rifle regiment, which was part of the garrison of fort Washington, N. Y., upon its capture by the British. Williams resisted gallantly, but was taken prisoner. As soon as he was exchanged he was made col. of the 6th Md. regiment. He was afterward adjt.-gen. in Gate's army in the south, He distinguished himself at the battle of Camden, and in the army under Greene, gaining the day at Eutaw by his charge.

WILLIAMS, Roger, founder of the state of Rhode Island, was born in Wales (some say London) between 1599 and 1603. In his youth he came to London, and attracted the attention of sir Edward Coke by his short-hand notes of sermons and speeches in the star chamber; and was sent by him to Sutton's hospital, now the Charterhouse school, in 1621; matriculated pensioner of Pembroke coll., Cambridge, 1625; took degree bachelor arts, 1626–7. He studied Latin, Greek, Hebrew, French, and Dutch, and was beneficed at High Laver, Essex, it is believed; but he soon became an extreme Puritan, and emigrated to New England, arriving at Boston, Feb. 5, 1631, "a young minister, godly and zealous, with his wife Mary." He refused to join the congregation at Boston because the people would not make public declaration of their repentance for having been in communion with the church of England; he therefore went to Salem as assistant preacher, but was soon in trouble for denying the right of magistrates to punish Sabbath-breaking and other religious offenses, as belonging to the first table of the law. For his opposition to the Mass. bay government, he was banished, and went to Plymouth, where he assisted its minister, and studied Indian dialects. In 1633 he returned to Salem, and was settled over the church, but was opposed by the government for denying its right to take the Indians' lands without purchase, and the right to impose faith and worship. He held that it was not lawful to require a wicked person to swear or pray, which were both forms of worship; and that the power of the civil magistrate extends only to the bodies, goods, and outward state of men, and not to their souls and consciences. Banished from the colony in 1635, and threatened to be sent back to England in order to prevent the infection of his new doctrines from spreading, he escaped in midwinter to the shores of Narragansett bay, accompanied by a few adherents, where he purchased lands of the Indian chiefs, founded the city of Providence, and established a government of pure democracy. Having adopted the belief in adult baptism of believers by immersion, Williams was baptized by a layman, and then baptized him and ten others, and founded the first Baptist church in America. Later, he doubted the validity of this baptism, and withdrew from the church he had founded. In 1643 he went to England to procure a charter for his colony, and published a *Key into the Language of America*, and *The Bloudy Tenent of Persecution for Cause of Conscience Discussed*, etc., his chief work on the nature and sphere of civil government. After returning to Rhode Island, he came a second time to England on business of the colony in 1651, when he published *Experiments of Spiritual Life and Health, and their Preservations*, dedicated to his friend, lady Vane, and written, as he says, "in the thickest of the native Indians of America, in their very wild houses, and by their barbarous fires;" also, *The Hireling Ministry none of Christ's*, and *The Bloody Tenent yet more Bloody by Mr. Cotton's Endeavor to wash it White in the Blood of the Lambe*. At this period he engaged in an experiment of teaching languages by conversation, and made the acquaintance of Milton. He returned to Rhode Island in 1654, and was elected president of the colony; refused to persecute Quakers, but held a controversy with them, and published *George Fox digg'd out of his Burrowes*. By his constant friendship with the Indians, he was of great service to the other colonies; but they refused to remove their ban, or to admit Rhode Island into their league. He died in 1683.—See Memoirs, by Knowles (Boston, 1833); Gammell (Boston, 1846); Dexter's *As to Roger Williams and his so-called "Banishment"* (Boston, 1876); also W.'s biography and works published by the Narragansett club (1866).

WILLIAMS, Rowland, d.d., 1817–70, b. in Wales; graduated Cambridge, 1839; fellow and tutor, 1839–50; vice-principal and prof., Hebrew in the Welsh theological college of St. David's, Lampeter, and chaplain to the bishop of Llandaff; select preacher at Cambridge, 1854; vicar of Broad Chalk, 1859. He was one of the writers of *Essays and Reviews*, was prosecuted in the court of arches and condemned, 1862, but the judgment was reversed, 1864. He published *Rational Godliness; Christianity and Hinduism Compared; Broad Chalk Sermon-Essays on Nature, Mediation, Atonement, Absolution*, etc.; *The Hebrew Prophets; Psalms and Litanies*. See *Life* by his widow (1874).

WILLIAMS, Samuel, ll.d., 1743–1817, b. Mass.; graduated Harvard college, 1761; minister of Bradford, Mass, 1765–80; Hollis prof. of mathematics and natural philosophy, Harvard college, 1780–88; lectured on astronomy and natural philosophy in the university of Vermont; preached at Rutland, Vt., 1789–95, and subsequently two years at Burlington. He surveyed the w. boundary of Massachussetts, 1788, and the boundary line of Vermont, 1805. He published *The Natural and Civil History of Vermont;* was for some time editor and proprietor of *The Rutland Herald;* was fellow of the American academy of arts and sciences; contributed papers on astronomy, etc., to scientific journals.

WILLIAMS, Samuel Wells, ll.d., b. N. Y., 1812; educated at Rensselaer school, Troy. In 1833 he went to Canton, China, as a printer for the American board of missions, and was assistant editor of the *Chinese Repository* for several years. He soon became well versed in both Chinese and Japanese, and translated parts of the Bible into the latter tongue. He published a lesson book and vocabulary on the Chinese, 1842–44; and in 1845 returned to New York, where he published, in 1848, *The Middle Kingdom*, probably the best work extant on Chinese government, geography, education, religion, and social life. Mr. Williams returned to China and was interpreter to Perry's expedition to Japan, 1853–54; was for a short time secretary of the U. S. legation in that country; revisited the United States in 1860; in 1862 was secretary of the Pekin legation, and

in 1875 again returned to this country and accepted a position as lecturer on the Chinese language and literature in Yale coll. He published, in 1856, a *Tonic Dictionary of the Chinese Language in the Canton Dialect*, a new edition of which was published at Hong Kong in 1876, and in 1874 his *Syllabic Dictionary of the Chinese Language*, a work of great philological importance. In 1881 he was elected president of the New York Bible society. He d. 1884.

WILLIAMS, Seth, 1822–66; b. Maine; graduated at West Point, and was appointed to the artillery. He was aid-de-camp to Gen. Patterson during the Mexican war, and was brevetted capt. for his conduct at Cerro Gordo. He was adjutant at West Point, 1850–53. On the outbreak of the civil war he was appointed brig.gen. of volunteers. He was McClellan's adjutant-gen., and in 1864 became active inspector-gen. on Grant's staff. He rose to be maj.gen.

WILLIAMS, Stephen, d.d., 1693–1782; b. Mass.; was carried captive from Deerfield by the Indians to Canada with his father, the Rev. John Williams, and family; redeemed by the French governor and sent to Boston, 1705, followed by the rest of the family, 1706. He wrote soon after a narrative of the captivity; graduated Harvard college, 1713; taught at Hadley, 1713–14; ordained Congregational minister at Longmeadow, 1716; chaplain in sir William Pepperell's regiment against Louisburg, 1745, and in Col. Ephraim Williams's regiment to lake George, 1755; visited the Housatonic Indians at Stockbridge, Mass., and established a mission among them.

WILLIAMS, Thomas, 1815–62; b. New York; graduated at West Point and was appointed to the engineers. After serving in the Florida campaign and on the frontier he became Gen. Scott's aid-de-camp, and went through the Mexican war. He was made brig.gen. of volunteers in 1861, commanded fort Hatteras till the spring of 1862, and was then put at the head of a brigade in the Ship Island expedition. He led the land troops at Vicksburg, June, 1862, and was killed in August defending Baton Rouge, La., against Breckenridge.

WILLIAMS, Thomas Scott, ll.d., 1777–1861; b. Conn.; graduated at Yale, 1794; studied law, and after admission to the bar practiced at Mansfield and Hartford. He was repeatedly a member of the legislature, and was elected to Congress, 1817–19. 1829–47 he was a judge of the Conn. supreme court, and in 1834 was appointed chief-justice, which position he held until 1847. From 1831 to 1835 he was mayor of Hartford. He was president of the American tract society, and left $30,000 for benevolent objects.

WILLIAMS, Rev. William, 1665–1741; b. Mass.; was graduated at Harvard in 1683, his cousin John, "the redeemed captive," being another of the 3 members the class contained. From 1685 to his death he was minister at Hatfield, Mass. A number of his sermons were published, one of which commemorated the half-century of his settlement.

WILLIAMS, William, 1731–1811; b. Conn.; graduated at Harvard college in 1751. Attached to the staff of his relative Col. Ephraim, he fought in the battle of lake George, 1755. Settling as a merchant in Lebanon, Conn., he was for many years town clerk, and frequently represented the town in the legislature. He belonged to the Conn. committee of correspondence, was speaker of the house in 1775, and afterward a member of the council and of the committee of public safety. He was a signer of the declaration of independence in the congress of 1776–77, and was again in congress, 1783–84.

WILLIAMS, William, 1788–1870; b. Conn.; became a gen. of Conn. militia and an eminent shipping merchant; aided in establishing the Norwich free academy by liberal contributions and active service for many years as president of its board of trustees; taught a sabbath-school and maintained religious services among the Mohegan Indians for 17 years; was an active officer of the Seamen's friend society, and a liberal promoter of Bible and missionary societies.

WILLIAMS, Sir William Fenwick; b. Nova Scotia, 1800; became ensign in the royal artillery, 1825. From 1840 to 1843, then being a capt., he served in Turkey, and was brevetted maj. and col. In 1848 he was appointed a commissioner for the settlement of the Turco-Persian boundary, and in 1854 British commissioner with the Turkish army; he was with it when the great victory over the Russians under Mouravieff was won, Sept., 1855. The defense of Kars by Gen. Williams was heroic; and after he was forced to surrender his conduct was rewarded with the rank of k.c.b., a baronetcy, a pension of £200, and from Oxford the degree of d.c.l. From 1856 to 1859 he was a member of parliament, and subsequently in command at Woolwich and in Canada, and governor-general of Gibraltar; retired, 1877. He d. 1883.

WILLIAMS, William R., d.d., b. New York, 1804; graduated at Columbia college, 1822; studied law and practiced it one year; studied theology and entered the ministry in the Baptist church, 1831, becoming pastor of the Amity street church, New York, and continuing there until his death, a period of above 50 years, notwithstanding repeated calls to more conspicuous positions. Dr. W. went three times to Europe and collected there a large and excellent library. Among his published writings, besides many sermons and addresses, are: *Miscellanies; Religious Progress; Christian Character; Lectures on the Lord's Prayer;* and a *History of the Baptists.* He d. 1885.

WILLIAMS COLLEGE, at Williamstown, Berkshire co., Mass., was chartered in 1793. The town and the college were named in honor of Col. Ephraim Williams, who had command of the forts in the Hoosac valley, and was killed in a battle with the French and Indians, Sept. 8, 1755. By his will he established a free school in the township which was to bear his name. The most advanced students in this school became the first college class, numbering 4, and receiving degrees in 1795.

There are 6 buildings used as dormitories, whose names, dates of erection, and cost are as follows: West coll., 1790, $11,700; East coll., 1798 (burnt 1841, rebuilt 1842), $12,400; South coll., 1842, $4000; Kellogg hall, 1847, $5000; College hall, with large dining-rooms, 1872, $10,000; Morgan hall, 1882, $100,000. Total capacity, 242 men. There are 9 Greek-letter fraternity houses, with rooms for 75 men.

There are 7 buildings used for books, cabinets, recitations, etc.: Griffin hall, 1828, $10,000; Lawrence hall, 1846, $7000; Jackson hall, 1856, $4000; Chapel and Alumni hall, 1859, $18,000; Goodrich hall, 1864, $25,000; Clark hall, 1882, $25,000. Thompson chemical laboratory, 1892, $60,000; Thompson physical laboratory, 1893, $60,000; Thompson biological laboratory, 1893, $60,000; College infirmary, $10,000. There are 2 astronomical observatories — the Hopkins, 1838, the first one in this country, $3000, and the Field memorial, 1882, $10,000. For physical training there are the Lasell gymnasium, 1887, $50,000, and the Weston athletic field, $6000. The library has 40,000 books and an endowment of $40,000. The cabinets to illustrate natural science are ample, and the laboratories for chemical and biological work are large and well furnished. The Mark Hopkins memorial building for offices and recitations, 1889, cost nearly $100,000.

The corporate name is, "The President and Trustees of Williams coll." Of the 17 trustees, 5 are elected by the alumni, the others by the body itself. During the hundred years of its history the college has had 6 presidents, 54 professors, and 5319 students, 3075 of whom took the full course. The 22 classes under Dr. Fitch averaged 22 men, the 6 classes under Dr. Moore 15 men, the 15 classes under Dr. Griffin 21 men, the 36 classes under Dr. Hopkins 41 men, the 9 classes under Dr. Chadbourne 34 men, and the 16 classes under Dr. Carter have averaged 59 men, and the faculty now numbers 28 men. The present (1897) number of students is 385. Of the 4000 graduates, 1000 are clergymen, 1000 lawyers, 500 teachers, and 400 physicians.

The 4 years' course of study is strictly collegiate, and the studies are fixed for half that period. 12 studies are offered as electives in junior year and 16 in senior year. The degree of B.A. is given to those who complete the full course. The degrees of M.A. and PH.D. are given on examination, the latter to students in practical astronomy or geodesy.

The college has never been denominational, but its boards of government and of instruction, and the greater number of its students are connected with Congregational and Presbyterian churches. The first foreign missionary society and the first alumni association in this country were formed in this college. The present administration has enjoyed marked financial growth. The annual income is $70,000. President, Franklin Carter, PH. D., LL. D., a graduate of the college in 1862.

WILLIAMSBURG, a co. in e. South Carolina, bounded s.w. by the Santee river; 948 sq.m.; pop. '90, 27,777, chiefly of American birth, includ. colored. Co. seat, Kingstree.

WILLIAMSBURG, city and co. seat of James City co., Va.; near the James river; about 48 m. s.e. of Richmond; the site of William and Mary college, and the Eastern lunatic asylum; pop. '90, 1831. Williamsburg was settled in 1632, being the oldest incorporated town in the state. Before the revolution it was the seat of the provincial government, and, until 1779, the capital of the state. An old Episcopal church, built in 1678, is still in use. When, in 1862, the confederate forces evacuated Yorktown, they fell back on Williamsburg and threw up works about 2 m. e. of the city. The federal forces under Gen. Sumner, consisting of the divisions of Hooker, Kearny, Stoneman, Couch, Smith, and Casey, followed at once, and on May 6 attacked the enemy's position. A stubborn contest ensued, lasting from early morning until night. In this engagement Hooker's division and Hancock's brigade suffered severely. The day was saved by Hancock's feigning to retreat, and, when the enemy followed, ordering a charge which completely routed the part opposed to him. The loss was nearly equal; about 2300 on each side. During the night the confederate Gen. Johnston withdrew.

WILLIAMSBURG, N. Y. See BROOKLYN.

WILLIAMSON, a co. in s. Illinois, drained by the s. fork of Saline river and the Big Muddy in the n.w. portion; 440 sq. m.; pop. '90, 22,226, chiefly of American birth. Co. seat, Marion.

WILLIAMSON, a co. in central Tennessee, having extensive ledges of Trenton limestone, drained by the Harpeth river; 550 sq. m.; '90, 26,321, chiefly of American birth, with colored. Co. seat, Franklin.

WILLIAMSON, a co. in central Texas, drained by the San Gabriel river, and Brushy and Salado creeks; 1070 sq. m.; pop. '90, 25,909, chiefly of American birth, with colored. Co. seat, Georgetown.

WILLIAMSON, HUGH, LL.D., 1735–1819; b. Penn.; graduated in 1757 at the university of Pennsylvania, where he was professor of mathematics, 1760–64. He pursued a course

of medical studies at Edinburgh and Utrecht, and settled as a physician in Philadelphia. When in London in 1773 the privy council summoned him and consulted him in regard to American affairs. Returning to the United States in 1776 he became an army surgeon. He served several terms in congress, and was a member of the convention which drew up the constitution. He settled in New York in 1793. Among his writings is a *History of North Carolina* (1812).

WILLIAMSPORT, a town in Washington co., Md.; on the Potomac river, the Chesapeake and Ohio canal, and the Cumberland valley and the Western Maryland railroads; 6 m. w. of Hagerstown. It has public schools, national bank, electric street railroad, waterworks supplied from the river, flour and saw mills, brick yard, and glove, chair, sash and door factories. It was settled in 1787, and during the civil war became conspicuous from the fact that the confederate army under Lee crossed into Maryland at this point. Pop. '90, 1277.

WILLIAMSPORT, city and co. seat of Lycoming co., Pa.; on the Susquehanna river, and the Beech Creek, the Fall Brook, the Northern Central, the Pennsylvania, and the Philadelphia and Reading railroads; 94 m. n. of Harrisburg. It contains a U. S. government building, Y. M. C. A. building, Dickinson seminary, high school, seminary, public school, and Y. M. C. A. libraries, hospital, home for the friendless, a city park of 40 acres, electric light and street railroad plants, gravity system of waterworks, and national, state, and other banks. The U. S. census of 1890 reported for Williamsport, 302 manufacturing establishments, employing $12,335,423 capital and 6113 persons, paying $2,677,579 for wages and $5,919,284 for materials, and having a combined output valued at $11,107,037. The principal industries are those connected with lumbering, and the manufacture of sewing machines, bicycles, leather, silk, furniture, heaters, and emery wheels. The great Susquehanna lumber boom, which cost over $1,000,000 and has a capacity of 300,000,000 feet of lumber, is located here. Pop. '90, 27,132.

WILLIAMSTOWN, a town in Berkshire co., Mass.; on the Hoosac and Green rivers, and the Fitchburg railroad; 5 m. w. of North Adams. It was incorporated in 1765; contains several villages; is the seat of Williams college (q. v.), and is principally engaged in farming and the manufacture of cotton and woolen goods. Pop. '90, 4221.

WILLIBROD, or **WILBRORD**, Saint, first bishop of Utrecht, and "apostle of the Frisians," claims notice as being one of that meritorious band of British and Irish missionaries by whom Christianity was established in northern Germany. He was b. about the year 658, in the kingdom of Northumbria; and, although educated in the monastery of Ripon, where he received the tonsure, was sent, for final instruction, like most of the monks of that age, to the schools of Ireland. After a sojourn of 13 years in that country, he resolved to devote himself to the conversion of Friesland, in which some of his fellow-monks had already engaged with little success. In 690 he sailed with 12 companions, and passing up the Rhine, arrived at Ultrajectum, the present Utrecht, soon after the victory of Pepin over the Frisians. By Pepin they were warmly received; and Willibrod having established the first beginnings of his mission, went to Rome in 692, whence he returned, with the sanction of the pope, Sergius I., and continued his labor till 695, when he again visited Rome, and received episcopal consecration, together with the pallium of an archbishop. Fixing his see at Utrecht, he converted a large number of the inhabitants, and extended his missionary colonies from that center as far as the Danish provinces; and, although he received some check upon the death of Pepin in 714, yet the successes of Charles Martel enabled him soon afterward to resume, under similar favorable auspices, the work which, after many alternations, ended in the successful establishment of Christianity. Willibrod died at a very advanced age in 738, at the monastery which he had founded at Echternach, near Treves. His festival is Nov. 7. See Bede's *Ecclesiastical History*, chaps. 10 and 11.

WILLIMANTIC, a city in Windham co., Conn.; on the Willimantic and Natchaug rivers, and the Central Vermont, the New England, and the New York, New Haven, and Hartford railroads; 32 m. e. of Hartford. It contains a state normal training school, public and Dunham Hall libraries, high school, national and savings banks, waterworks supplied from the Natchaug river, and electric light plant. The Willimantic river falls 91 feet here, providing unexcelled water power, which is utilized by large manufactories of linen thread, cotton warps, hosiery, print cloth, silk, machinery, paper, carriages, etc. Pop. '90, 8648.

WILLING, Thomas, 1731–1821; b. Philadelphia; educated in England, where he read law in the temple, London, but returned to this country and became a business partner of Robert Morris. The firm were of great assistance to the revolutionary cause in supplying stores, etc., and also financially. See Morris, Robert. Mr. Willing became mayor of Philadelphia, judge of the supreme court, delegate to the continental congress of 1775, and president of the provincial congress of 1774. He was the president of the first bank in the United States.

WILLIS, Nathaniel, 1780–1870; b. Boston; father of Nathaniel P. In 1803 he founded the *Eastern Argus* at Portland, Me., and in 1816 started the first American religious paper, the *Boston Recorder* (since become the *Congregationalist*), with which he

was connected until 1843. From 1827 to 1857 he was the editor of the *Youth's Companion*, still an excellent periodical, of which he was also the founder.

WILLIS, Nathaniel Parker, American author, was b. at Portland, Me., Jan. 20, 1807. His father became the publisher of the *Boston Recorder*, said to be the first religious newspaper ever permanently established. Educated at Yale college, he obtained in 1827 a prize for *Scriptural Poems*. On the completion of his college course, he established the *American Monthly Magazine*, afterward merged in the *New York Mirror*, in which he was associated with George P. Morris. In 1831 he visited Europe, and contributed to the *Mirror* his *Pencillings by the Way*. Appointed *attaché* to the American legation at Paris, he had favorable opportunities for observing European society; and after a visit to Greece and Turkey, returned to England in 1837, and was married to a daughter of a British officer, Gen. Stace. While in England, on account of some personalities in his writings, more consonant to American than English manners, he became involved in a quarrel with Capt. Marryat, which led to a duel. He contributed to the London *New Monthly* his *Inklings of Adventure*, also published in 3 vols.; and in 1839 returned to New York, and published a literary paper, *The Corsair*, and *Letters from under a Bridge*, written at a beautiful country-seat, named, in compliment to his wife, Glenmary. He wrote also at this period *Tortesa the Usurer* and *Bianca Visconti*, dramas, and the descriptions of scenery illustrated in Bartlett's *United States and Canada*. In 1844 he engaged with Gen. Morris in editing the *Daily Mirror*. His wife died, and he revisited Europe, and published *Dashes at Life with a Free Pencil*, 1845; returned to New York in 1846, he was married to a daughter of the Hon. Joseph Grinnell, of Massachusetts, and with his former partner established the *Home Journal*, to which he contributed most of the following works, also published in a collected form: in 1850, *People I have Met*, and *Life Here and There;* 1851, *Hurrygraphs, Memoranda of a Life of Jenny Lind;* 1853, *Fun Jottings, A Health-trip to the Tropics, A Summer Cruise in the Mediterranean;* 1854, *Famous Persons and Places, Out doors at Idlewild;* 1855, *The Rag-bag;* 1856, *Paul Fane, or Parts of a Life else Untold;* 1860, *The Convalescent*. Much of this work was done during a long, brave struggle with what appeared to be consumptive disease. Mr. Willis was an observant and thoughtful writer, discursive, fragmentary, picturesque, sprightly, quaint, and graceful, full of elaborate ease, and ingenious spontaneity. He edited the *Home Journal* (Gen. Morris having died in 1864), and resided at his romantic highland retreat of Idlewild, until his death, Jan. 21, 1867.—His sister is a popular writer, under the *nom de plume* of "Fanny Fern;" and his brother, Richard Willis, is a musician and musical critic.

WILLIS, Richard Storrs, b. Boston, 1819; brother of Nathaniel P. He graduated at Yale college in 1841, and became a writer for the press. He has edited several periodicals in New York, and has written works on music, of which *Church Chorals and Choir Studies* (1854), is perhaps the best known.

WILLIS, Robert, 1800–75; b. London; graduated at Cambridge, 1826, and took orders in the church of England; but is best known as an architect, inventor, and scientist. From 1837 until his death he was professor of natural and experimental philosophy at Cambridge. Among his inventions were the lyophone and odontograph.

WILLIS, Thomas, 1621–75; b. Wiltshire, England; graduated at Oxford, 1639. He fought as a royalist in the revolution, studied medicine during the protectorate, and at the restoration was made Sedleian professor of natural philosophy at Oxford. In 1666 he became physician in ordinary to Charles II. Willis made important medical discoveries concerning the brain, and published two treatises on the subject—*Anatomy of the Brain* (1664); and *Pathology of the Brain and Nervous System* (1667).

WILLIS'S ROOMS. See Almack's.

WILLISTON, Samuel, 1795–1874; b. Mass.; commenced the study of theology, which he relinquished on account of weakness of the eyes, and engaging in business, acquired a large fortune from the manufacture of buttons. He established in Easthampton, Mass., Williston seminary, 1840, to which he gave $270,000, and bequeathed $600,000; endowed two professorships in Amherst college, 1845–47, and gave the college in addition $150,000. He three times erected a church at Easthampton, and was a liberal benefactor to Mount Holyoke female seminary. His total gifts and legacies amounted to $1,500,000.

WILLOUGHBY, Sir Hugh, about 1500–54; b. England; in 1553 made admiral of a fleet of three vessels sent out at the expense of the London merchants with license from Edward VI. "to discover strange countries." The vessels took out 136 persons, of whom 18 were merchants having a share in the expenses of the expedition. In July, 1553, a storm on the coast of Norway dispersed the fleet, which was forced to remain on the coast for some time. Two of them went into the harbor of Arzina, in Lapland, where all the crews and passengers were lost. The third was wrecked, but a few of her crew escaped to Archangel.

WILLOUGHBY LAKE, in Westmore, Orleans co., Vt., is about 7 m. in length, and has great depth. There is a peak of considerable height on each shore. Willoughby mountain, the highest of the two, has many rare plants. The place is a summer resort.

WILLOW, *Salix*, a genus of trees and shrubs of the natural order *salicaceæ*, otherwise regarded as a sub-order of *amentaceæ*. This order or sub-order, to which the poplar (q.v.) also belongs, is distinguished by having the flowers naked or with a cup-like perianth; numerous ovules; a naked, leathery, one-celled, two-valved fruit; seeds with long hairs; leaves with stipules. In the willows, the flowers are absolutely naked, the stamens from one to five in number, the leaves simple and deciduous. There are many species, but their precise number is not likely to be soon determined, as they are very difficult to distinguish botanically, and varieties are very numerous. They are mostly natives of the colder temperate regions of the northern hemisphere, although some are found in warm countries, as *salix tetrasperma* in the hottest parts of India, and another species abundantly on the banks of the Senegal. Most of them are shrubs, and some are of very humble growth, particularly those of arctic and alpine regions. Thus, *S. herbacea*, which is common on the mountains of Scotland, seldom rises more than an inch from the ground. *S. arctica* and *S. polaris* are the most northern woody plants. Other small species are also found to the very limits of perpetual snow in different countries, as *S. Lindleyana* on the Himalaya. Some of the species have already been noticed in the articles Osier and Sallow. Some of those which more generally receive the popular name willow, are trees of large size, and remarkably rapid growth. The wood of some of them, as the White Willow, or Huntingdon Willow (*S. alba*), and the Crack Willow (*S. fragilis*), is used for many purposes, being remarkably durable, especially in damp situations, although light and soft. It was anciently used for shields. Cork-cutters and others employ it for whetting sharp-edged implements. It is very tough. It is used for making paddles of steamboats, because it wears better in water than any other kind of wood. Willows are often planted as ornamental trees, especially near streams and in moist grounds. Many kinds are also planted on the banks of rivers to retain the soil in its place, and restrain the encroachments of the river. They are the better adapted for this purpose that they grow readily by cuttings; and willow-stakes driven into a moist soil strike root, and soon become luxuriant. The twigs of most of the willows are very tough and flexible, and are used by coopers for making hoops, and by gardeners for tying espalier trees, and for many similar purposes. They are much used for basket-making and other kinds of wicker-work. See Osier. Willow withes were probably amongst the first ropes used by man. But the young shoots of many of the kinds with ovate or little elongated leaves are comparatively brittle, and ill adapted for wicker-work. Willow trees are sometimes treated as pollards, and the lop used for fuel and other purposes. They are also often grown as coppice-wood, yielding a great bulk of hoops, poles, fuel, etc. The leaves and young shoots are in some countries used as food for cattle, and even dried and stacked for that use. A fragrant water is distilled in the n. of India, from the catkins of the Egyptian or Caliph Willow (*S. Egyptiaca*). A principle called *salicine* exists in the bark of willows, which has been found efficacious in intermittent fevers, and is sometimes used as a substitute for quinine. It is crystalline and intensely bitter. The flowers of the willow, which in many species appear before the leaves, are much sought after by bees. The male catkins of many species are very beautiful, the prominent anthers being of a fine yellow color, or as in *S. purpurea*, of a rich purple. The Weeping Willow (*S. Babylonica*), (see Weeping Trees), is a very ornamental species, a native of the east, now much planted in America, and on the continent of Europe, on account of its beautiful pendent twigs. What is called Napoleon's Willow is a variety of it.—The white willow or Huntingdon willow is by far the largest species known in America. It attains a height of 80 ft., and grows so rapidly that a cutting has been known to become a tree of 30 ft. in ten years. Its head is much branched and spreading, its leaves narrow elliptical-lanceolate, silky beneath, and sometimes also above. See illus., Hazel, etc., vol. VII.

WILLOW-MOTH, *Caradrina cubicularis*, a species of moth, of which the caterpillars feed upon the grain of wheat, often doing very much mischief. The perfect insect is of a mouse color, and its wings are closed flat upon its back when it is at rest. On the upper wings are three transverse wavy lines and some black dots. The under wings are pearly white, with a slight tinge of brown near the fringe, and brownish nervures. The body is slender, the antennæ thread-like. The whole length, without the antennæ, is rather more than half an inch. The caterpillar varies in color from dull ocherous red to dirty green, with a blackish head, two brown spots on the first segment, a wavy line on each side edged with black. The chrysalis is bright brown. This moth is often abundant in summer in hayfields, gardens, and barn-yards. The caterpillar feeds on grain through the winter, and draws the corn together with a thin silken web in February or March, when about to assume the chrysalis state.

WILLS, William Gorman, 1830–91, playwright, b. in Ireland, studied at Trinity college, Dublin, and became a portrait painter, but soon gave his attention chiefly to literature, writing a number of successful plays, among which may be mentioned *Charles I.* (1872); *Eugene Aram* (1873); *Marie Stuart* (1874); *Nell Gwynne* (1878); *Blackeyed Susan* (1880); *Claudian* (1885); and *A Royal Divorce* (1891).

WILLS, William Henry, 1810–80; b. England; one of the founders of *Punch*. He belonged to the original editorial staff of the London *Daily News*. In 1850, in association with Charles Dickens, he founded *Household Words*, and he afterwards helped to establish *All the Year Round*, from which he retired soon after Dickens's death.

He published collected articles under the title *Old Leaves Gathered from Household Words.*

WILMER, J. P., D.D., 1812–78; b. Alexandria, Va.; d. New Orleans. He graduated at the univ. of Virginia, and at the Prot. Epis. Alexandria seminary. He had charge of two parishes in Va., and later became rector of St. Mark's church, Philadelphia. In 1861 he returned to Va., and became chaplain in the confederate army. He was sent to England to procure bibles for the southern soldiers; but was captured upon his return while attempting to run the blockade; upon his release, re-entered the army; appointed bp. of Louisiana, 1866.

WILMER, RICHARD HOOKER, D.D., b. Alexandria, Va., 1816; graduated at Yale coll., 1836, and at the theol. sem. of Virginia, 1839; was ordained priest in the Prot. Epis. church, 1840; rector of several parishes in Va., and of St. James' church, Wilmington, N. C.; was consecrated bp. of Ala., 1862.

WILMINGTON, city, port of entry, and co. seat of Newcastle co., Delaware; at the junction of the Brandywine and Christiana rivers, and on the Baltimore and Ohio, the Philadelphia, Wilmington, and Baltimore, and the Wilmington and Northern railroads; 27 miles s.w. of Philadelphia. It was settled by Swedes in 1638, incorporated as a borough in 1739, and chartered as a city in 1832. The city contains a U. S. government building, the Delaware, Homœopathic and co. hospitals, the State asylum for the insane, State industrial school for girls, the Ferris reform school, the quarters of the State historical society, high school, free library, Friends' school, the Hebb school, the Old Swedes' church, built in 1698 and still used, and public parks aggregating over 250 acres. There are national, state, and savings banks, safe deposit companies, gas and electric lights, electric street railroads, over 80 churches, waterworks supplied from the Brandywine river, and daily, weekly, and monthly periodicals. The U. S. census of 1890 reported for Wilmington 590 manufacturing establishments, employing $20,585,646 capital and 14,377 persons, paying $7,664,148 for wages and $13,050,152 for materials, and having a combined output valued at $24,568,125. The principal manufactories are morocco leather factories, railroad car and locomotive works, foundries and machine shops, iron and wood shipbuilding yards, iron and steel works, carriage and wagon shops, slaughtering and meat-packing plants, paper and other machinery works, cotton and paper mills, and malt liquors. The foreign commerce of the port in the fiscal year 1896–97 was, imports of merchandise, $113,536; exports, $4,724,644. The coastwise and interstate trade is very large. Pop. '90, 61,431.

WILMINGTON, city, port of entry, and co. seat of New Hanover co., N. C.; on Cape Fear river, and the Atlantic Coast line, the Cape Fear and Yadkin Valley, the Seaboard Air line, the Wilmington, Newbern, and Norfolk, and the Wilmington Sea Coast railroads; 26 miles from the Atlantic ocean, 210 miles n. of Charleston, S. C. It was settled in 1730, incorporated in 1739, and chartered as a city in 1866. The city has a U. S. government building, U. S. marine hospital, an armory, Y. M. C. A. building, the Gregory normal institute, high and grammar schools, gas and electric lights, electric street railroads, waterworks, about 20 churches, national and state banks, public library, and daily, weekly, and monthly periodicals. There are cotton mills and compresses, extensive guano works, car shops, and foundries. Pop. '90, 20,056.

WILMOT, DAVID, 1844–68; b. Penn.; educated at the Bethany academy, and called to the bar. In 1834 he began to practice at Wilkes-Barre, but soon afterward settled in Towanda. He was a prominent democratic politician, and a member of congress, 1845–51. A bill appropriating $2,000,000 to buy Mexican territory having been introduced into congress, Wilmot, Aug. 8, 1846, offered an amendment providing "that as an express and fundamental condition to the acquisition of any territory from the republic of Mexico by the United States, neither slavery nor involuntary servitude shall exist in any part of said territory." This proviso, the "Wilmot proviso," as it was afterward called, passed the house, but not the senate. It was the basis of the free-soil campaign of 1848. Wilmot became a republican; was U. S. senator, 1861–63, and was made a judge of the U. S. court of claims in 1863.

WILNA. See VILNO.

WILSON, a co. in s.e. Kansas, drained by the Verdigris and the Fall rivers; 576 sq. m.; pop. '90, 15,286. Co. seat, Fredonia.

WILSON, a co. in central North Carolina, drained by Moccasin and Contentnea creeks; 355 sq. m.; pop. '90, 18,644. Co. seat, Wilson.

WILSON, a co. in Tennessee, having the Cumberland river for its n. boundary, containing extensive ledges of limestone; 536 sq. m.; pop. '90, 27,148. Co. seat, Lebanon.

WILSON, a co. in central Texas, drained by the San Antonio river; abt. 940 sq. m.; pop. '90, 10,655. Co. seat, Floresville.

WILSON, ALEXANDER, American ornithologist, was b. at Paisley, Scotland, July 6, 1766. He was the son of a weaver, and was apprenticed to the weaving-trade, at which he worked seven years, amusing himself at the same time by writing verses. As soon as he was free he gratified a roving disposition by mounting a peddler's pack, and went to

Edinburgh to take part in a discussion, in which he maintained the poetic claims of Fergusson against Allan Ramsay, and, in the same cause, wrote *The Laurel Disputed, a Poem.* The piece by which he is best remembered, is a droll poem in the Scottish dialect, styled *Watty and Meg.* He also contributed to *The Bee,* and made the acquaintance of Burns. He was prosecuted for a lampoon upon a resident of Paisley, and condemned to a short imprisonment, and to burn the libel with his own hand at the Paisley cross. Determined to leave a country where his genius was unappreciated, he sailed from Belfast for America, and landed at Newcastle, Del., July 14, 1794, with a few borrowed shillings in his pocket, and no acquaintances. He got work with a copper-plate printer in Philadelphia, then with a weaver; traveled as a peddler in New Jersey, where the brilliant plumage of the birds attracted his attention; then engaged as a school-teacher in Pennsylvania, and then walked 800 miles to visit a nephew in New York. Teaching a school once more in New Jersey, he lived near the botanic garden of William Bertram, who was well acquainted with birds, and, stimulated and encouraged in his studies of nature, Wilson resolved to make a collection of all the birds that were to be found in America. In Oct., 1804, he set out on his first excursion, in which he traveled to Niagara Falls, and wrote *The Foresters, a Poem.* In 1805, he learned etching of a Mr. Lawson, from whom he had already learned to draw; and was employed on the American edition of *Rees's Cyclopædia.* He soon prevailed upon the publisher, Bradford, to undertake an American ornithology. In Sept., 1808, he brought out the first volume, but in a style too costly for the tastes and fortunes of the period, so that he obtained only 41 subscribers in the eastern states, and had no better success in the southern. The second volume was, notwithstanding, brought out in 1810. In 1811 he made a canoe voyage down the Ohio, and traveled overland through the lower Mississippi valley, from Nashville to New Orleans, collecting specimens for his third volume. In his eager pursuit of a rare species of bird of which he long wanted a specimen, he swam across a river, and caught cold, which ended in his death, at Philadelphia, Aug. 23, 1813, when he had nearly completed his work—the 8th and 9th volumes being published after his death. It was continued by Charles Lucien Bonaparte, in 4 vols. (1825–33). A monument was erected to his memory in Paisley abbey churchyard in 1874.

WILSON, Allen B., b. N. Y., 1824, and learned the cabinet maker's trade. In 1849, having at that time never seen a sewing machine, he invented one in which the material was carried forward by a feeding-plate. By this means an endless seam could be formed at any curve. This feeding device he greatly improved in 1850 by giving the roughened feeding-plate four motions. He also introduced the rotary hook and stationary bobbin, the special feature of the "Wheeler and Wilson." In the same year he met Nathaniel Wheeler, and with him and other investors, started the Wheeler & Wilson manufacturing co., the works of which are now at Bridgeport, Conn. D. 1888.

WILSON, Alpheus Waters, d.d., b. Baltimore, 1834; educated at Columbian coll., Washington, D. C.; entered the ministry of the Meth. Epis. church, 1853. He was sec. of the board of missions of the Meth. Epis. church, South; and was elected bp., 1882. He is the author of *Missions.*

WILSON, Augusta (Evans), b. Geo., 1835; married L. M. Wilson, of Mobile, Ala., in 1868. She has written several novels, of which *Beulah* (1859), *St. Elmo* (1866), *Infelice* (1875), and *At the Mercy of Tiberius* (1887) may be mentioned.

WILSON, Sir Daniel, ll.d., a distinguished writer on archæological subjects, was b. at Edinburgh in 1816. He was educated at the university of his native city, and was early attracted by antiquarian studies. He had been for some time secretary to the Scottish society of antiquaries, when he was appointed professor of history and English literature in the university of Toronto—an institution of which he has done much to increase the prosperity and usefulness. Among his works are *Memorials of Edinburgh in the Olden Time* (1848; new ed. 1878); *Oliver Cromwell* (1843); *Archæology and Pre-historic Annals of Scotland* (1851; 2d ed. 1863); *Pre-historic Man: Researches into the Origin of Civilization in the Old World and the New* (2 vols. 1862; enlarged and re-written, 3d ed. 1876); *Chatterton* (1869); *Caliban: the Missing Link* (1873); a volume of poems called *Spring Flowers* (1875). He edited the journal of the Canadian institute, of which in 1859 and 1860 he was president. He succeeded Dr. McCaull in the presidency of Toronto univ., 1881. He was knighted in 1888 and died 1892.

WILSON, George, m.d., f.r.s.e., chemist, brother of Daniel, was b. at Edinburgh in 1818. In 1840, after studying in various laboratories, and graduating in medicine at Edinburgh, he received a license as lecturer on chemistry from the royal college of surgeons in that metropolis. He subsequently became lecturer on chemistry in the school of arts, and in the veterinary college; and in 1855 he was appointed professor of technology in Edinburgh university. In conjunction with this office he held the curatorship of the Industrial museum, an institution which owes much of its completeness and order to his knowledge and skill. Professor Wilson, who had long struggled with ill-health, died in 1859. Among his scientific works mention may be made of his *Text-book on Chemistry* in Chambers's *Educational Course, Researches in Color-blindness,* and *The Five Gateways of Knowledge.* Other works are the *Life of Cavendish* (1851); the

Life of Dr. John Reid (1852); and, along with Mr. Geikie, the *Memoir of Edward Forbes* (1861). There are also several poems from his pen. A memoir of Wilson, illustrating his singularly attractive character, was published by his sister (Mrs. Sime) in 1860

WILSON, HENRY (legally assumed name of Jeremiah Jones Colbaith), vice-president of the United States; b. Farmington, N. H., 1812; d. Washington, 1875. A shoemaker by trade, he represented Natick, Mass., in the state legislature and senate; aided in forming the Free Soil and Republican parties; elected to United States senate, 1853; raised the 22d Mass. regiment, 1861, and was for a time its colonel; re-elected to senate, 1865; became vice-president on ticket with Grant, 1872; author of *History of the Rise and Progress of the Slave Power in America* (1874–77), etc.

WILSON, HORACE HAYMAN, a distinguished Sanskrit scholar, was b. in London, in the year 1786, and was educated for the medical profession. In 1808 he went to India as assistant-surgeon on the Bengal establishment, and in a short time afterward, on account of his proficiency in chemistry, obtained an appointment in the Calcutta mint as assistant to Dr. Leyden. He now applied himself diligently to the study of Sanskrit, and in a few years obtained so high a reputation for his scholarship, that, upon the decease of Dr. Hunter in 1811, Wilson was appointed to succeed him as secretary of the Asiatic society of Bengal, on the recommendation of Mr. H. T. Colebrook. In 1813, Wilson published his first work, viz., *The Mégha Dúta, or Cloud Messenger, a Poem in the Sanskrit Language, by Kálidása; translated into English Verse, with Notes and Illustrations, by H. H. Wilson.* This work, originally published at Calcutta in 1813, was reprinted in London in the following year. His next publication was *A Dictionary, Sanskrit and English, translated, amended, and enlarged from an original compilation prepared by Learned Natives* (Calcutta, 1819–40). This work proved to be of great advantage to students of Sanskrit, and added considerably to Wilson's reputation. His works have been published in a collective edition of 12 vols. (1864–70). Among them as written, edited, or translated by him are: *Select Specimens of the Theatre of the Hindus, translated from the Original Sanskrit,* 3 vols. (Calcutta, 1827); *The Raghu Vansa, or race of Raghu, a Historical Poem, by Kálidása, with a Prose Interpretation of the Text, by Pundits of the Sanskrit College of Calcutta* (1832), edited by Wilson; *The Vishn'u-Purán'a, a system of Hindu Mythology, translated from the Original Sanksrit, and illustrated by Notes* (Lond. 1840); *An Introduction to the Grammar of the Sanskrit Language* (Lond. 1841); *Ariana Antiqua, a Descriptive Account of the Antiquities and Coins of Afghanistan* (Lond. 1841); *History of British India from* 1805 *to* 1835 (1848); *Rig-Veda-Sanhita* (1850); *A Glossary of Judicial and Revenue Terms, from the Arabic, Persian, Hindustani, etc.* (1855). Many of these works were produced while Wilson held the office of assay-master and secretary of the mint at Calcutta. In his official capacity, he often received the thanks of the government of India for reforms in the coinage and other services. He became professor of Sanskrit in Oxford in 1832, and died in 1860.

WILSON, JAMES, LL.D., 1742–98; b. Scotland; educated at Glasgow, St. Andrew's, and Edinburgh universities; emigrated to America; studied law and practiced in Reading, Penn., and Annapolis, Md. In 1778 he settled in Philadelphia. He was prominent in the discussions preceding the revolution, was a member of the congress of 1775 and strongly advocated independence. He was also a delegate in 1783 and 1786, and a member of the constitutional convention of 1787. In 1789 he was made a judge of the U. S. supreme court, and in 1790 became law professor in the university of Pennsylvania. He published with Thos. McKean, *Commentaries on the U. S. Constitution.*

WILSON, JAMES, 1795–1856; b. Scotland; the brother of John ("Christopher North"). He studied law, traveled several years on the continent, and settled near Edinburgh, where he spent the rest of his life. He had an extensive knowledge of natural history, and published several books on various branches of the subject. He also contributed many articles to *Blackwood's Magazine* and the quarterlies, and wrote the articles on natural history and zoology in the *Encyclopædia Britannica.* In 1859 Dr. James Hamilton published his *Memoirs.*

WILSON, JAMES F., b. Newark, O., 1828; studied law and commenced practice in Iowa; was a member of the state constitutional convention, 1856, and of the state legislature, 1857–61, serving the last year as pres. of the senate; was elected, as a repub., to congress; was elected to the U. S. senate, 1883. He died in 1895.

WILSON, JAMES GRANT, b. Edinburgh, 1832; emigrated in 1833 to the United States, and was associated with his father in the publishing business at Chicago. He served in the war of the secession, being made brig.-gen., and has since lived in New York. Among his works are *Illinois Officers in the Rebellion; Life and Letters of Fitz-Greene Halleck; Poets and Poetry of Scotland; Sketches of Illustrious Soldiers;* and a *Biography of Bryant,* prefixed to the memorial edition (1880) of the latter's *Family Library of Poetry and Song; Personal Recollections of the Rebellion;* and *The World's Largest Libraries* (1894).

WILSON, JAMES HARRISON, b. Ill., 1837; graduated at West Point, 1860, and was commissioned in the topographical engineers. He served at fort Pulaski and Port Royal; with McClellan at South Mountain and Antietam; at Vicksburg; through the Wilderness and Shenandoah campaigns, and elsewhere. In 1865 he commanded several cavalry expeditions into Georgia and Alabama, and captured Selma, Montgomery, Columbus, and Macon. Jefferson Davis was captured by troops under his command.

He was rapidly promoted, and left the army in 1870 with the brevet rank of maj.-gen. He has since engaged in railroad management, having been president of the New York and New England railroad, 1880–83. He has written a life of Gen. Grant and a work on China.

WILSON, JOHN, 1588–1667; b. England; studied at Eton, 1598–1602; graduated, Cambridge, 1606; obtained a fellowship; studied law three years; was ordained in the church of England; chaplain to lady Scudamore; preached at Mortlake, Henley, Bumsted, Stoke, and Candish; minister of Sudbury, Essex, but was repeatedly suspended by the bishop's court; embarked for America, 1630, at the Isle of Wight, with Winthrop and others of the Massachusetts colony, and landed at Salem, Mass. At Charlestown he organized a church consisting of himself, Governor Winthrop, Isaac Johnson, and Deputy-Governor Thomas Dudley, which afterwards became the First church of Boston; was ordained teacher in this church by the imposition of the hands of the members; ordained as its pastor, 1632. In 1634 he visited England, returning with his wife, and the renowned Hugh Peters who was compelled to leave for non-conformity. With Governor Winthrop, Wilson opposed the antinomian sentiments of John Wheelwright and Ann Hutchinson. He was chaplain to the troops sent against the Pequot Indians of Connecticut, 1636; was associated with John Eliot in his missionary labors among the Indians. He was distinguished for his benevolence and zeal. He published in England *Some Helps to Faith.* In America, *A Latin Poem to the Memory of John Harvard; The Day Breaking, if not the Sun Rising, of the Gospel,* relative to the Indians in New England.

WILSON, JOHN, famous as Prof. Wilson, and the Christopher North of *Blackwood's Magazine,* was b. on May 18, 1785, at Paisley, where his father was a wealthy manufacturer. His earlier education he received in the house of Dr. M'Letchie, minister of the parish of Mearns, a wild moorland district in Renfrewshire, his boyish residence, which he long afterward commemorated in some of his most charming essays. After having been transferred for a time to the care of the Rev. Joseph Macintyre of Glenorchy, in the Highlands, the love of which became for him a lifelong passion, he was sent to the university of Glasgow, where he remained for 4 years, distinguished as on the whole a diligent and successful, though somewhat fitful and irregular, student. In 1803 he went to Magdalen college, Oxford, where he became notable at once for the splendor of his intellectual gifts, and for his supremacy in the various athletic sports—boxing, rowing, running, etc.—which have always formed a not inconsiderable part of the education bestowed at the English universities. In 1806 he signalized himself by his Newdigate prize poem, *On the Study of Greek and Roman Architecture;* and the year after he took his degree of B.A., that of M.A. following in 1810. Meantime, he had left Oxford and settled himself in Cumberland, attracted partly by the beauty of the lake country and partly by a desire to cultivate the intimacy of Wordsworth, of whose genius he was already a devout admirer. He purchased the lovely little property of Elleray, where, for some years, he resided almost constantly. Besides Wordsworth, there were available in the district for intellectual converse De Quincey, Southey, and Coleridge (to whose *Friend* he contributed some essays). With all of them he became intimate; and when he wearied a little of "celestial colloquy divine" with them, he sought a variety to life in measuring his strength against that of the far-famed Cumberland wrestlers, the very sturdiest of whom has left it on express record that he found him "a vera bad un to lick." In 1810 he married a Miss Jane Penny, a Liverpool lady, of great personal attractions and much amiability of character, in his union with whom he found the main happiness of his life. He now seriously devoted himself to poetry, and in 1812 published his *Isle of Palms,* which attracted considerable attention, and was followed, in 1816, by *The City of the Plague.* This work showed a marked increase of power; but it is questionable, despite the grace, music, and tender feeling of much of his verse, whether, as a poet, Wilson would ever have succeeded in developing the real force of his genuis. His true field, however, was found on the starting, in 1817, of *Blackwood's Magazine.* Some years previously a pecuniary disaster had befallen him; the fortune of £30,000 left him by his father being so seriously curtailed by the misconduct of a relative as to necessitate the breaking up of his establishment at Elleray. On this he transferred himself to Edinburg, where, in 1815, he was called to the Scottish bar; but it does not appear that he had any opportunity of practice. As one of the briefless, with plenty of spare time on his hands, along with his friend Lockhart, then in similar case, he lost no time in proffering his aid to Mr. Blackwood. The astute publisher was at no loss to estimate the value of their alliance; and it is not too much to say that during its earlier years, Lockhart and Wilson were the soul of the success of the magazine. Presently, Lockhart was withdrawn to succeed Gifford as editor of the *Quarterly Review* in London; and Wilson, though never in any strict sense its editor—Blackwood himself throughout exercising a severe control—became, in the eye of the public, more and more identified with the magazine; in a certain modified, yet very real sense, to all intents for many years he *was* editor of the magazine, and under his famous pseudonym of Kit North, swayed it before the world. In 1820 he was appointed to succeed Dr. Brown, deceased, as professor of moral philosophy in the university of Edinburgh, his friend, sir W. Hamilton, being one of the defeated candidates. His real claims to such a post, though not to be compared with those of Hamilton—who, at that time, however, had given little or no

proof before the public of his consummate accomplishment and ability—have been somewhat unduly depreciated. They were not so by Hamilton himself, whose opinion it was, as reported by Mr. De Quincey, that "Wilson's philosophic subtlety of intellect was not the least wonderful of his many wonderful gifts." Thus much is certain, that as a professor, though somewhat desultory in his methods, he had an almost unexampled power of stimulating the enthusiasm of his students. Out of his class-room, however, it must be admitted he but indifferently succeeded in attaining the staid ideal proper to the learned and respectable class of men with whom he was thus somewhat oddly associated. He was the most "muscular" of "Christians," and on more than one occasion the singular spectacle was exhibited of a Scotch professor of moral science taking off his coat in a public market-place to inflict personal chastisement on some ruffian, whose obnoxious proceedings had done outrage to his nicer sense of the fitness of things. Though sedulous and strict in his discharge of his duties as a professor, Wilson was loyal in his adhesion to Blackwood, and his contributions to the magazine, in their mere amount enormous, continued to form the main part of his activity. In 1840 he suffered an irreparable loss in the death of his wife. His grief for a while nearly prostrated him, and seems to have flung something of a shadow over what of life remained to him. He continued, however, to contribute to *Blackwood*, though now somewhat more intermittently; and in 1842 he published, as *The Recreations of Christopher North*, a selection, in two volumes, from the mass of his essays furnished to it. During the session 1852–53, he was smitten by an attack of paralysis, which permanently incapacitated him for the discharge of professorial duty; and in Edinburgh, on April 3, 1854, he died. During his last years he enjoyed a pension of £200 a year from government, in acknowledgment of his literary services. Besides his poetry and periodical writings, he published, in 1822, a volume of sketches, entitled *Lights and Shadows of Scottish Life*, which was followed the year after by his tale of *Margaret Lyndsay*. In these, as in his poems, the robuster side of his mind is scarcely, if at all, represented; but the tender idyllic grace and charm by which they are pervaded, secured for them an extensive popularity, some portion of which they have since continued to retain. In his miscellaneous prose essays, critical and descriptive, and most especially in the celebrated series of dialogues entitled *Noctes Ambrosianæ*, the true power of his genius is revealed. Of the genius, there can be little question; though as to whether it has succeeded in embodying itself in forms which are likely to be permanent, there may reasonably be difference of opinion. The materials for judgment are before the world in the collected (or rather selected) edition of his miscellanies, published since his death by his son-in-law, Prof. Ferrier. As a magnificent *potentiality*, it is scarcely exaggeration to speak of Wilson along with Burns and Scott as a member of the trinity (so to speak) of Scottish literary genius. Certain it is, that nearly as effectually as they did, he stormed the heart of the Scottish people, and became, in his later years—the great novelist being gone—their idol and accepted literary representative. If he has left behind him no work sacred as his literary *monument*, thus much was almost involved in the conditions under which he wrote. Writing, as he did, from month to month, for the instant purpose of the hour, wise and steady concentration of his energies became more and more difficult for him. Not the less, when all reasonable deduction is made, he holds his place as one of the most notable literary figures in the earlier half of this century. His *range* of power is extraordinary; from the nicest subtleties of feminine tenderness, he passes at will to the wildest animal riot and the most daring grotesqueries of humor; and in what he terms "numerous prose," the prose poem or rhapsody—a questionable and perilous, though, within wise limits, a legitimate form of art—he may be held, in his finer passages, to be at this day unrivaled. See the affectionate and felicitous *Memoir* by his daughter, Mrs. Gordon (1863). A selection from the *Noctes Ambrosianæ—Comedy of the Noctes Ambrosianæ*—by J. Skelton, appeared in 1876.

WILSON, Rev. John, D.D., F.R.S., missionary, orientalist, and for many years one of the most influential Englishmen in Bombay, was born at Lauder, in Berwickshire, Dec. 11, 1804. Educated at Edinburgh university, he went in 1828 to Bombay as a missionary; and as a missionary—from 1843 onward in connection with the Free church of Scotland—he continued to labor zealously till his death, Dec. 1, 1875. But his early and thorough mastery of the languages of western India, his vast and scholarly command of the literature, the history, the faiths, and the social usages of the races of India, combined with his indomitable energy, practical sense, and insight into and sympathy with native feeling, enabled Wilson soon and long to exercise a wide and powerful influence usually denied to the missionary. He organized and extended the Scottish missions in western India; he promoted education, legal reform, the spread of toleration, and philanthropic movements of every kind; and was repeatedly trusted as a valued political adviser of the governor and governor-general, especially during the crisis of 1857. His linguistic labors, especially in Zend, were very memorable; and as a man Wilson was loved by all classes and races in the community. He was twice president of the Bombay branch of the Asiatic society, was vice-chancellor of the Bombay university, and a F.R.S. Among his writings other than those connected with his missionary work may be mentioned *The Parsi Religion* (1843); *The Lands of the Bible* (1847); and *India Three Thousand Years Ago.*

WILSON, JOHN LEIGHTON, D.D., b. S. C., 1809; graduated Union college, 1829; studied theology at the seminary, Columbia, S. C.; sailed as a missionary of the American board for Africa, 1833; was stationed eight years at cape Palmas, and twelve at Gaboon; reduced to writing the Grebo and Mpongwe languages; translated portions of the Bible, and prepared grammars and dictionaries; returned to the United States, and was elected one of the secretaries of the southern Presbyterian board of foreign missions. He has published *Western Africa, its History, Condition, and Prospects; The Agency devolving on White Men in Missions to Western Africa; The British Squadron on the Coast of Africa.* He died 1886.

WILSON, PETER, LL.D., 1746–1825, b. Scotland; educated at Aberdeen university. He came to the United States in 1763, and during the next 25 years was principal of academies at Hackensack, N. J., and Flatbush, L. I. He was an ardent patriot during the revolution, and served in the New Jersey legislature, 1778–83. He was professor of Greek and Latin in Columbia college, 1789–1792; published editions of the Greek Testament, and of Adams's *Antiquities;* and an *Introduction to Greek Prosody* (1811).

WILSON, RICHARD, an English landscape painter of eminence, was born in 1714 at Pinegas in Montgomeryshire. He at first devoted himself to portrait painting; but while studying in Italy in 1749 was advised to forsake portrait for landscape. To landscape painting he now exclusively devoted himself; and before returning to England in 1755, he had succeeded at Rome in establishing a considerable reputation. In London, in 1760, he exhibited his great picture, the "Niobe," and at once secured rank as one of the first painters of his time. Another celebrated work was his "View of Rome from the Villa Madama." Failing, however, to hit the general taste, he fell into the hands of the picture-dealers; and so straitened did he frequently find himself, that in 1770 he was happy to obtain the appointment of librarian of the Royal academy. By the death of a brother, who left him a large sum of money, he was rescued from indigence, and retiring to Llamberris in Denbighshire, he died there some few years after in 1782. Of his numerous pictures, now much prized, many are familiar to the public by engravings; in the National gallery, three very fine specimens of him may be found; and several others form part of the well-known Vernon collection.

WILSON, General Sir ROBERT THOMAS, was born in the year 1777 in London, where his father was a painter. He was educated at Westminster, and afterward at Winchester, and when scarcely 17 he joined the 15th light dragoons, then serving under the duke of York in Belgium, and took part in some sharp service, in which the regiment greatly distinguished itself. Shortly after his return to England, he was married to a lady of great beauty and some fortune, to whom, through life, he seems to have been ardently attached. In 1798, he was engaged in Ireland in the suppression of the rebellion; and the year after, he served in the unfortunate campaign of the Helder, and was present with his old regiment at the battle of Egmont-op-Zee. That in everything he proved himself a capable officer, may be inferred from his appointment soon after to command the small force of cavalry which served under sir Ralph Abercromby in Egypt. Here he formed a warm friendship with Gen., afterwards Lord Hutchinson, who succeeded to the command of the army after the death of Abercromby. His next service was at the conquest of the cape of Good Hope in Jan., 1806, where again he commanded a small cavalry force. In the latter part of that year he went abroad on the staff of his friend, lord Hutchinson, who was sent on a mission to the king of Prussia, then a fugitive from his capital, and awaiting the result of the conflict pending between Napoleon and his allies, the Russians. Wilson had now, for the first time, an opportunity of seeing war on a really gigantic scale, being present at the desperate battle of Eylau (q.v.). The peace of Tilsit ensued, and Wilson thereupon returned to England. The struggle in the peninsula had now commenced, and Wilson was sent to take part in it; he was active in the embodiment and training of the Portuguese army, and subsequently, under Wellington, he commanded a Spanish brigade at the battle of Talavera. From this field of action he was, however, withdrawn; and in 1812, he was attached to the Russian army as English military commissioner. During the tremendous struggle which resulted in the capture of Moscow, and the operations which followed in pursuit of the doomed French army, he rendered important service both in council and in the battle-field; and he seems to have won the especial regard and confidence of the emperor Alexander. Throughout the subsequent campaigns in Germany, and those which followed in France, ending with the capture of Paris in 1814, he was present in a similar capacity in the camp of the allies. At Lützen, he took command of the Prussian reserve, and at a particular crisis of the battle, succeeded in severely checking the enemy. At Bautzen, he also distinguished himself; and a day or two after, the emperor of Russia presented to him publicly the cross of the order of St. George, saying that he gave it "as a memorial of his esteem for his courage, zeal, talent, and fidelity to my service." His services during this period will be found noted in every military history of the time; and they amply prove him to have been a most gallant and accomplished soldier.

After the peace, he became involved in the unfortunate matter of queen Caroline and for his censure of the course pursued by government he was dismissed the army. He was afterward, however, re-instated. In 1841, he attained the rank of gen.; and

from 1842 to 1849 he held the post of governor of Gibraltar. In 1818, he had been returned to parliament in the liberal interest for Southwark, and he retained his seat till 1831. On May 9, 1849, having just returned from Gibraltar, he died suddenly in London. During his life he published several works; in 1804, *An Inquiry into the Military Force of the British Empire;* in 1811, *Campaigns in Poland, with Remarks on the Russian Army;* and in 1817, a *Sketch of the Military Power of Russia.* During his foreign campaigns, he kept copious private diaries; and of these, two most interesting volumes, "edited by his nephew and son-in-law, the Rev. Herbert Randolph, M.A.," were some years since published by Murray of London, who also brought out a life of him.

WILSON, Theodore D., b. N. Y., 1840; became a shipwright and carpenter in the navy; and in 1863 was made inspector of the building and repairing of vessels about New York city. In 1866 he was appointed assistant naval constructor, and served in the Pensacola, Washington, and Philadelphia navy yards. He was afterward instructor in naval architecture and ship-building at the Annapolis academy, and in 1873 was promoted to be naval constructor; in 1886, became chief naval constructor, but resigned 1893. He has written *Ship-building, Theoretical and Practical,* a standard text-book.

WILSON, Sir Thomas, LL.D., 1524–81; b. England; educated at Eton and Cambridge, and took orders in the church of England. He was tutor to the sons of the duke of Norfolk by Mary ex-queen of France, and wrote their lives. He left England in 1553, and was confined in the prison of the inquisition till 1555. He returned to England when Elizabeth came to the throne, and became her private secretary in 1558. He was made ambassador to the Netherlands in 1576; became a secretary of state the next year; and dean of Durham in 1579. Among his works are: *The Arte of Rhetorike for the Use of all Suche as are Studious of Eloquence* (1553), one of the earliest English treatises on rhetoric; and *A Discourse upon Usury* (1572).

WILSON, William Dexter, D.D., LL.D., L.H.D.; b. N. H., 1816; entered the theological department of Harvard university, 1835; was ordained in the Protestant Episcopal church, 1842; published a volume whose final title, adopted on its republication in 1846, is *A Manual of Church Principles;* published several works on *Church Government and History,* 1847–49; made professor of history and of philosophy, intellectual and moral, in Geneva College, 1850; and of the last-named branches in Cornell University, 1868–86; and soon after published *Lectures on Psychology;* followed by volumes on *Metaphysics* and *Political Economy* (1872); is the author of several monographs on mathematical and metaphysical topics, and of a history of philosophy. In his philosophy he pursues a line of thought between the two old schools of idealism and sensationalism, accounting for the element of knowledge in dispute between them by maintaining an *insight* into the nature of the things known. He regards logic as a science of things, of which words are only representatives.

WILSON, William L., statesman, was born in Virginia, May 3, 1843, was educated at the Columbian University, Washington, and the University of Virginia, and after finishing his studies in 1861, served in the Confederate army. After the war he practised law, and took part in national politics, being a delegate to the National Democratic Convention in 1880 and elector-at-large in the same year. In 1882 he was made President of West Virginia University, but in the following year, being elected a member of the Forty-eighth Congress, resigned the presidency. He was elected to Congress continuously till November, 1894, and in the Fifty-third Congress, as Chairman of the Ways and Means Committee, framed the so-called Wilson tariff-bill, which with some modifications became a law August 27, 1894. Mr. Wilson is a statesman of unusual intellectual power, scholarly, dignified, with an attractive personality and a gift of persuasive and eloquent speech. In March, 1895, he became Postmaster-General.

WILSON, Woodrow, LL.D., was born in Staunton, Virginia, December 28, 1856. He graduated from Princeton in 1879, and in law from the University of Virginia in 1881. He practised law until 1883, when he entered the Johns Hopkins University as a student of history and politics, and graduated in 1885. He was associate Prof. of history at Bryn Mawr, 1885–88, and Prof. in Wesleyan, 1888–90. Since then, he has been Prof. of Jurisprudence and Political Economy at Princeton. He is author of *Congressional Government: A Study in American Politics* (Boston, 1885); and *The State: Elements of History and Practical Politics* (1889); *Division and Reunion* (1893); *An Old Master and Other Political Essays* (1894); *George Washington* (1896). He is a contributor also to many leading monthly publications.

WILTON, a market t. and parliamentary borough in Wiltshire, at the junction of the Nadder and Wily, affluents of the Avon, 3 m. w.n.w. of Salisbury. The new church, a magnificent Romanesque edifice, decorated in the richest and most tasteful manner, was erected in 1844 by the right hon. Sidney Herbert. The principal industry of the town is the manufacture of carpets, especially Axminsters, and the carpets called Saxony, made of short staple wool. Pop. '91, 2120.

WILTSHIRE, or Wilts, called by the Anglo-Saxons *Wiltonshire,* from their capital town, Wilton (q.v.), one of the south-western counties of England, bounded on the w. and n. by Somerset and Gloucester, and on the e. and s. by Berks, Hants, and Dorsetshire. Area, 1375 sq. m.; pop. '91, 264,997. The county is divided into two unequal parts—the plains in the n., and the hill district, which comprehends the greater part of south Wiltshire; and the separation between these two parts is very nearly that of the

main line of the Great Western railway, the course of which across the county is from n.e. to s.w., past Swindon and Chippenham. The plains incline n. to the basin of the Thames, which forms in part the northern boundary, and are noted for their agricultural capabilities. The surface of this district is checkered with corn-fields and rich pastures, and here the cheeses for which Wiltshire is favorably known are produced. Inkpen Beacon, 1011 ft. high, at the junction of Wiltshire, Hampshire, and Berkshire, is the nucleus whence proceed the North and South downs of Surrey and Sussex, and the hills which, running s. through this county, become the North and South downs of Dorsetshire. Agriculture is carried on with the assistance of modern improvements; many swine are reared, and Wiltshire bacon is famous. Portland stone is quarried at Swindon, Tisbury, and in other localities; and a fine oolite, known as Bath stone, is extensively worked at Box and the neighborhood; and a stone called forest marble yields coarse tiles and flagstones, and often retains in perfect preservation "the ripple-marks of waves and the footprints of crustaceans." The manufacture of woven goods, carpets, and other woolen goods, silks and linens, is carried on at Trowbridge, Wilton, Bradford, Devizes, Westbury, etc. There are iron mines and blast furnaces at Westbury and Seend, and Swindon is one of the greatest railway workshops in the kingdom.

WIMBLEDON, a town in the county of Surrey, England, 4½ m. s.e. of Richmond, about 8 m. s.w. of St. Paul's, London, on several railways. It belongs to the police district of London. Its population consists largely of people who do business in that city, and the town contains many fine residences, and a fine common covering 628 acres. Pop. '81, 15,947; '91, 25,758; parliamentary division, about 69,200.

WIMPFFEN, Emanuel Félix de, b. Laon, France, 1811; entered the army and distinguished himself in the Algerian wars. In 1855 he was made brig.-gen. of the imperial guard, and in 1859 gen. of division. He was commandant at Lyons, and later governor of Algiers and Oran. In the Franco-Prussian war he was at the head of the 12th and 5th army corps, took the chief command at Sedan after MacMahon was wounded, and signed the capitulation. After the war he resided in Algiers. He pub. *Sedan; Réponse au Général Ducrot; La Nation Armée*, etc. D. 1884.

WINANS, Ross, 1797–1877; b. N. J.; d. Baltimore; was the first to build light wheel cars; also invented the "camel-back" engine. He made the larger part of his great wealth in building railroads in Russia. He was the author of *One Religion, Many Creeds* (1870).

WINCH (Anglo-Saxon, *Wince*). A bar, having a handle projecting from one end, which is made to act like a lever, by being fixed at the opposite end to the axis of a machine, to give it motion, as in the grindstone, windlass, etc. An axle turned by a crank handle for raising weights, as from mines, the hold of a ship and the like; also a wincing machine (q. v.).

WINCHELL, Alexander, ll. d., b. N. Y., 1824; educated at Wesleyan university. He was appointed professor of physics and civil engineering at Michigan university in 1853, and held the chair of geology, zoology, and botany at the same institution, 1855–73, when he was elected chancellor of the Syracuse university. He resigned in 1874, retaining the position of professor of geology and zoology, and becoming special lecturer at Vanderbilt university; in 1879 became prof. geology, etc., in Mich. university. Among his works are: *Sketches of Creation; The Doctrine of Evolution; Reconciliation of Science and Religion; Preadamites;* and *Geological Studies.* Died Feb., 1891.

WINCHENDON, a town in Worcester co., Mass.; on the Boston and Albany and the Fitchburg railroads; 37 miles n.w. of Worcester. It was incorporated in 1764; contains the villages of Bullardville, Centreville, Harrisville, Hydeville, Winchendon Springs, Winchendon Centre, New Boston, and Waterville; has a high school, public library, national and savings banks, and weekly newspaper; and is principally engaged in the manufacture of tubs, pails, chairs, furniture, toys, machinery, and leather. Pop. '90, 4390.

WINCHESTER, a town in Litchfield co., Conn.; on the Philadelphia, Reading, and New England, and the New York, New Haven, and Hartford railroads; containing the borough of Winsted (q. v.), and the villages of West Winsted and Winchester Centre. Pop. '90, 6183.

WINCHESTER, city and co. seat of Clark co., Ky.; on the Chesapeake and Ohio, the Lexington and Eastern, and the Louisville and Nashville railroads; 18 m. e. of Lexington. It is the seat of the Kentucky Wesleyan college (Meth. Epis., S.) and the Winchester female college (non-sect.), and has a high school, college library, national and state banks, electric lights, street railroad, waterworks, newspapers, and considerable lumbering, stock-raising, and manufacturing interests. Pop. '90, 4519.

WINCHESTER, a town in Middlesex co., Mass.; on the Boston and Maine railroad; 8 miles n.e. of Boston. It was incorporated in 1850; contains the villages of Winchester Centre, North Winchester, Cutler's Village, and Symmes Corner; has a high school, public library, savings bank, weekly and monthly periodicals, and many residences of Boston business men; and is principally engaged in the manufacture of school furniture, leather, and machine shop products, and in growing vegetables and flowers. Pop. '90, 4861.

WINCHESTER, city and co. seat of Frederick co., Va.; on the Cumberland Valley and branches of the Baltimore and Ohio railroads; 83 m. n.w. of Washington. It has about 20 churches, national and state banks, gas and electric lights, several academies and institutes, paper, sumac, and flour mills, foundries, and glove, shoe, cigar, and fertilizer factories. On Mar. 12, 1862, it was occupied by the federal gen. Banks, and was during the war the scene of frequent conflicts, and occupied in turn by the federal and confederate army. Pop. '90, 5196.

WINCHESTER, a famous historical city and parliamentary and municipal borough, capital of Hampshire, is situated in the middle of the county, on the right bank of the Itchen, 67 m. s.w. of London by railway, and 60 in a direct line. It consists of one main street, crossed by a number of streets running at right angles to it, and was in early times surrounded by a wall, of which remains exist. The houses for the most part spread over a hill rising from the valley of the Itchen; but the cathedral, and some of the older and more interesting portions of the city, stand on level ground close to the river-bank. The Castle-hill is the site of the old castle or royal palace, built in the 13th c. by Henry III., and of a magnificent hall, of which the only remaining portion is used as the county court. About a mile from the town is the famous hospital of St. Cross, founded in 1136 by a bishop of Winchester, Henry de Blois, for 13 poor men, "decayed and past their strength." It was munificently endowed; but its sources of income have been narrowed, and its ancient charters and grants were destroyed during the 13th century. The hospital is entered by a gateway, after passing which a pleasing view is obtained of the buildings, which occupy three sides of a quadrangle, the fourth side being occupied by a neat, picturesque, ancient church in transition Norman, which formed part of the institution. There is a city library and a museum; the latter contains some very interesting local antiquities. Charles II. commenced a palace here, but the part completed is now used as barracks. The city cross in the High street, dating from the 15th century, is very beautiful in design.

The college of Winchester, originally called "Seinte Marie College of Wynchestre," now Saint Mary's or Winchester college, was founded by William of Wykeham, bishop of Winchester, in 1387, and the buildings were completed in 1393. The buildings are, for the most part, of the age of the founder, and consist of two quadrangles and a cloister, together with recently erected houses for the commoners. The famous *Dulce domum* is sung by all the boys in the courts of the college before the breaking up of the school at the long vacation. The foundation consisted originally of a warden, 10 fellows, 70 scholars, a head-master (*informator*), an usher (*ostiarius*), or second master, 3 chaplains, 3 clerks or singing men, and 16 choristers. By an ordinance of the Oxford university commission, which took effect in 1857, the number of fellowships has been reduced, as vacancies occurred, to 6, the number of scholars being increased to 76, and 8 exhibitions have been founded. The charter of the school, which is in existence, was granted by Richard II. in 1396, and confirmed by all the subsequent sovereigns, Mary excepted, down to Charles II. The visitor is the bishop of Winchester, and the warden and two fellows of New college, Oxford, hold an annual "scrutiny," which, however, is generally merely formal. Winchester possesses 15 fellowships and 30 scholarships at New college, Oxford (also founded by William of Wykeham), open to scholars and commoners alike, and tenable for five years, besides numerous other prizes.

A church is said to have been built at Winchester in the year 169; to have been destroyed in 266, restored in 293, and converted into "a temple of Dagon" (by whom we are to understand Wodin) by the Saxons under Cerdic in 495. In 635 the polluted church was pulled down, and a new one commenced, under the superintendence of Birinus, the first apostle of Wessex; and king Kynegils granted the whole of the land for the space of 7 m. round the city for the support of the episcopal seat and the re-established monks. From the year 674 the succession of bishops of Winchester, of which the celebrated St. Swithin (see SWITHIN, ST.) was one, continues unbroken. Of Birinus's cathedral, however, in which most of the Saxon kings of Wessex (see HEPTARCHY) were interred, and on the altar of which, according to tradition, king Canute hung up his crown after the well-known scene on the sea-shore, no portion remains, and a new cathedral—the present one—was built "from the foundations" by Bishop Walkelin (1070–1097); and after its completion, and the removal into it of the precious relics of Birinus's cathedral, that old edifice was pulled down. William of Wykeham was bishop of Winchester from 1367 to 1404, and has more closely than any other bishop associated his name with his episcopal city and its cathedral. He greatly enlarged and beautified the building, and he began the remarkable transformation of the nave from Norman to perpendicular. The cathedral is 560 ft long—longer than any other English cathedral. Its breadth at the transepts is 208 ft., the length of its nave is 351 ft., its height 86 ft. and a low central Norman tower 186 ft. high. The exterior is somewhat disappointing, owing to its unusual want of decoration, and to the lowness of the tower; but the interior is magnificent, and contains many objects of the highest interest—as the tomb of William Rufus; bronze figures of Charles I. and James I.; mortuary chests which contained the ashes of a number of west Saxon kings and bishops, but which were rifled during the civil war; the golden shrine of St. Swithin, with some excellent specimens of sculpture, both ancient and recent; the tomb of Edmund, the son of king Alfred, and the tomb of Izaak Walton. The various architectural styles to be noted in the cathedral are: Early Norman in the crypt and transepts; early English in the eastern aisles

and chapels behind the presbytery; decorated in the piers and arches of the presbytery; and perpendicular in the nave, which, for beauty and grandeur, is only rivaled by York. After the cathedral, there are some churches of interest in the transition Norman and perpendicular styles; and there are many other buildings of a religious and educational kind. The industries of Winchester are unimportant. Pop. of municipal and parliamentary borough, '91, 19,073, represented by one member.

Winchester, the Roman *Venta Belgarum*, was the site of a British city before the arrival of the Romans in Britain, *Caer-Gwent* (*gwent* = champaign or down). It afterward became a Roman station, and, as such, was a place of considerable importance, and contained temples of Apollo and Concord. When taken by the Saxons in 495, it is said to have contained at least one Christian church. The Saxons called the town Wintanceaster. As the capital of Wessex, Winchester became the capital of England, and even after the Norman conquest was long a chief royal residence. In 1265, during the barons' war, Winchester was sacked, and it never again recovered its commercial prosperity. From the time of Charles II., the town has gradually declined—its chief sources of life and movement being the cathedral and the college.

WINCHESTER, Elhanan, 1751–97; b. Mass.; joined the open communion Baptists, Canterbury, Conn., 1770; ordained pastor of a church, Rehoboth, Mass., 1771; became a close communionist and was excommunicated by his church; resided in South Carolina, 1774–80; pastor of first Baptist church, Philadelphia, 1780; became a preacher of universal restoration, and with a majority of his people formed a new church; went to England, 1787, remaining till 1794, preaching with great success, and publishing various works; returned to America. He published *Five Letters on the Divinity of Christ; Beauties of the Millennium; The Face of Moses Unveiled; Ten Letters to Thomas Paine; Hymns on the Restoration,* and numerous other works. He was a forerunner of the present Universalist denomination.

WINCING MACHINE, the wheel used by dyers for winding out of their dye-vats long pieces of cloth. The vat is often divided by a partition, and the wincing-machine is generally so placed that it will wind the piece of cloth from one compartment to the other, according to the direction given to the handle.

WINCKELMANN, Johann Joachim, well known as the critical expounder and historian of ancient classical art, was born of poor parents in the year 1717, at Stendal, in Prussia. He very early showed an eager desire for knowledge, and being sent to the free school of the place, became so special a favorite with the rector of it, that he was taken into the rector's house as a companion, when age and blindness made some assistance necessary to him. After studying for a time in Berlin, he went, in 1738, to the university of Halle, where he remained two years engaged in the study of theology, which, however, he found so distasteful that, at the end of that time, he relinquished it, accepting a situation as tutor in a private family at Osterburg. In 1743, he became a schoolmaster at Seehausen—a wretched position, from which he was rescued by the count von Bünau, who employed him as secretary in his library at Nothenitz. Here he remained some years. Being in the vicinity of Dresden, he had frequent opportunities of inspecting the famous treasures of art accumulated there. He also made the acquaintance of some artists of eminence, among others, the well known Oeser; and the enthusiasm was awakened which determined his subsequent career. To the theory and history of art he now resolved to devote himself; and on being thrown into the society of the pope's nuncio, cardinal Archinto, he was induced, after some hesitation, to become a Roman Catholic, on a promise of a pension being procured for him, to enable him to proceed to Rome. Thither he repaired in 1755, having previously published at Dresden a treatise, entitled *Gedanken über die Nachahmung der Griech. Werke,* etc. (Reflections on the Imitation of the Antique, 1755). Of this work he issued, in 1756, a new and enlarged edition. At Rome he prosecuted his studies with the utmost ardor, and every facility was afforded him. In 1758, he visited Naples, to examine the celebrated remains of Herculaneum, Pompeii, and Pæstum; and went also to Florence, for the purpose of cataloguing the famous collection of antique gems belonging to baron de Stosch, a labor which occupied him for nine months. Soon after, the cardinal Albani appointed him his librarian, and the salary attached to this post, with the pension continued from Dresden, in itself a somewhat meager pittance, enabled him to prosecute his studies in comfort. The first-fruit of these appeared in his treatise, entitled *Anmerkungen über die Baukunst der Alten* (Remarks on the Architecture of the Ancients), which was printed in Germany in 1762; and two years afterward, the great work of his life, on which he had been long engaged, the celebrated *Geschichte der Kunst des Alterthums* (History of Ancient Art), was issued from the press of Dresden. In 1767 a supplement to it was added. He also gave to the world the result of his researches at Herculaneum; and in 1766, his *Monumenta Antiqua Inedita,* an elaborate work with plates.

In 1768, Winckelmann, by this time famous throughout Europe, set out to revisit Germany. His destination was Berlin; but on the way, a strange yearning seized him for the Italy he had left; on his reaching Munich, it was no longer to be resisted; and he started thence on his return to Rome. He went by Vienna, where the most flattering attentions were paid him; proceeding thence to Trieste, where he came by his tragic

end at the hands of a fellow-traveler, by name Francesco Arcangeli, who murdered him in order to plunder his effects. In this he did not succeed, being scared almost in the act, and presently caught and executed.

Winckelmann was the forerunner of a great movement; and his influence has been deeply felt in all the subsequent literature of the subject to which he devoted himself. Even at this day, when a good deal of it is regarded as obsolete, his great *History* remains as a work not to be neglected by any one seriously concerning himself with the study of this branch of aesthetics. The most complete edition of Winckelmann's works is Fernow, Meyer, and Schultz's (8 vols. new ed. 1828). See the life of Winckelmann by Justi (1866–73).

WINCKELRIED. See Melchtal, Arnold von.

WIND is the air in motion. The force of the wind is measured by anemometers (q.v.), of which some measure the velocity, and others the pressure. The following are a few velocities of wind, translated into popular language: 7 m. an hour is a gentle air; 14 m., a light breeze; 21 m., a good steady breeze; 40 m., a gale; 60 m., a heavy storm; and 80 to 150 m., a hurricane sweeping everything before it. We also add a few comparisons of velocity and pressure: 5 m. an hour is a pressure of 2 oz. on the sq.ft.; 10 m., ½ lb.; 20 m., 2 lbs.; 30 m., 4½ lbs.; 40 m., 8 lbs.; 51 m., 13 lbs.; 60 m., 18 lbs.; 70 m., 24 lbs.; 80 m., 32 lbs.; and 100 m., 50 lbs. During the severe storm which passed over London, on Feb. 6, 1867, the pressure was 35 lbs. to the sq. ft., corresponding to a velocity of 83 m. an hour. A pressure of at least 70 lbs. to the sq.ft. has since been recorded at the Liverpool observatory. Wind is most frequently measured by estimation.

Seamen require more than landsmen to pay attention to every variation in the strength of the wind, as well as its direction, and to adopt such phrases as will render that strength generally intelligible. The *anemometer* (q.v.), which is used on land for this purpose, is unsuited to the wants of seamen. They have found it convenient to divide winds into 12 kinds, in relation to strength, designated thus: *Faint air, light air, light breeze, gentle breeze, fresh breeze, gentle gale, moderate gale, brisk gale, fresh gale, strong gale, hard gale,* and *storm.* This classification was determined in 1806 by Beaufort according to the amount and kind of sail which one of her majesty's ships could safely carry at the moment. The estimate of the wind's force by the scale 0 to 12, means that 0 represents a calm, and 12 a hurricane. If such estimations be divided by 2, and the quotient squared, the result will be the pressure in pounds, approximately.

All wind is caused, directly or indirectly, by changes of temperature. Suppose the temperature of two adjacent regions to become, from any cause, unequal, the air of the warmer, being lighter, will ascend and flow over on the other, while the heavier air of the colder region will flow in below to supply its place. Thus, then, a difference in the temperature of the two regions gives rise to two currents of air—one blowing from the colder to the warmer along the surface of the earth, and the other from the warmer to the colder, in the upper strata of the atmosphere; and these currents will continue to blow till the equilibrium be restored.

Winds are classed into *constant, periodical,* and *variable winds.*

Constant Winds. *The Trade-winds.*—When the surface heated is, roughly speaking, a whole zone, as in the case of the tropics, a surface-wind will set in toward the heated tropical zone from both sides, and uniting will ascend, and then separating, flow as upper currents in opposite directions. Hence, a surface-current will flow from the higher latitudes toward the equator, and an upper current toward the poles. If, then, the earth were at rest, a n. wind would prevail in the northern half of the globe, and a s. wind in the southern half. But these directions are modified by the rotation of the earth on its axis from w. to east. In virtue of this rotation, objects on the earth's surface at the equator are carried round toward the e., at the rate of 17 m. a minute. But as we recede from the equator, this velocity is continually diminished; at lat. 60°, it is only 8½ m. a minute, or half of the velocity at the equator; and at the poles it is nothing. A wind, therefore, blowing along the earth's surface to the equator, is constantly arriving at places which have a greater velocity than itself. Hence, the wind will lag behind, that is, will come up against places toward which it blows, or become an *east* wind. Since, then, the wind n. of the equator is under the influence of two forces—one drawing it s., the other drawing it w.—it will, by the law of the composition of forces, flow in an intermediate direction, that is, from n.e. to s.west. Similarly, in the southern tropic, the wind will blow from s.e. to n.west. All observation confirms this reasoning. From the great service these winds render to navigation, they have been called the trade-winds. It is only in the Pacific and Atlantic oceans that the trade-winds have their full scope. In other parts of the trades' zone, such as southern Asia and intertropical Africa and America, they are more or less diverted from their course by the unequal distribution of land and sea (on which see Monsoon). It is generally stated that in the Atlantic the *north trades* prevail between lat. 9° and 30°, and in the Pacific, between lat. 9° and 26°; and the *south trades,* in the Atlantic, between lat. 4° n. and 22° s., and in the Pacific, between lat. 4° n. and 23½° south. These limits, however, are not stationary, but follow the sun, advancing northward from January to June, and southward from July to December.

Region of Calms.—This is a belt, 4° or 5° broad, stretching across the Atlantic and Pacific, parallel to the equator. It marks the meeting-line of the n. and s. trades, where they mutually neutralize each other. Here also occur heavy rains, and thunder-storms almost daily. This belt varies its position with the trades, reaching its most northern limit in July, and its most southern in January. When the belt of calms nears the African coast, in the gulf of Guinea, the copious rainfall gives rise to the strong steady-blowing gales of that coast, called *tornadoes.*

Periodical Winds. *Land and Sea Breezes.*—These are the most general, as well as most easily explained, of the periodical winds. On the coast, within the tropics, a breeze sets in from the sea in the morning, at first a mere breathing on the land, but gradually it increases to a stiff breeze in the heat of the day, after which it sinks to a calm toward evening. Soon after, a contrary breeze springs up from the land, blows strongly seaward during the night, and dies away in the morning, giving place to the sea-breeze as before. These winds are caused during the day, by the land getting more heated than the sea, consequently the air over it ascends, and the cool air from the sea flows over on the land to supply its place; and during night, by the temperature of the land falling below that of the sea, and the air becoming thereby heavier and denser, flows over the sea as a land-breeze. It is within the tropics where sea-breezes are most marked and constant, because there the sun's heat is greatest, and atmospheric pressure is practically uniform, except in those rare instances where it is disturbed by hurricanes. But in countries such as Great Britain, where atmospheric pressure is most commonly, to some extent, greater or less than that of surrounding regions, the strength of the wind blowing from the high to the low barometer is far stronger than that which would result from the disturbance caused by the unequal heating of land and water; and consequently the sea-breeze is not felt. In the warm months, however, when barometers are nearly uniform over northern and western Europe, there is a gentle sea-breeze all round Great Britain during the heat of the day, and a land-breeze during night. Thus on the coast of Berwickshire, during fine settled summer weather, when the temperature of the land is much warmer than that of the sea during the day, in the morning the wind is n.w. till about 10 A.M., when it veers to n., falling all the time, till finally it sinks to a calm. A little before noon it springs up from n.e. or e., veers to s.e. from 2 to 3 P.M., where it continues till 7 P.M., when it veers to s. and s.w., and gradually sinks to a calm. About sunset it springs up from w. and veers to n.w. during the night, where it continues till next morning. On the other hand, on the w. coast of Scotland, n.w. winds diminish in force toward sunset, giving rise to the weather saying: "The w. wind is a gentleman and goes to bed." Quite analogous to the land and sea breezes are the monsoons (q.v.), which are only the n. trades drawn out of their course in summer by the heated regions of southern Asia—the s.w. monsoon being only a vast sea-breeze blowing on southern Asia, and continuing several months of the year.

Variable Winds.—These winds depend on purely local or temporary causes, such as the nature of the ground, covered with vegetation or bare; the physical configuration of the surface, level or mountainous; the vicinity of the sea or lakes; and the passage of storms. Within the tropics, all except the last of these is borne down, or all but borne down, by the great atmospheric currents, which prevail there in all their force. But in higher latitudes this is not the case; these, therefore, are the regions where variable winds prevail. The most noted of these winds are the simoon (q.v.), sirocco, solano, and harmattan (q.v.). The *bora* is a cold tempestuous wind, blowing from the Alps down on the Adriatic; and the *gregale* is a peculiarly cold, parching, and unhealthy wind, which at certain seasons descends on Malta from Greece. The *puna winds* prevail for four months in the year in a high barren table-land in Peru called the puna; as they are part of the s.e. trade-wind, after having crossed the Andes they are drained of their moisture, and are consequently the most dry and parching winds that occur anywhere on the globe. In traveling over the puna it is necessary to protect the face with a mask from the glare and heat of the day, and from the intense cold of the night. The *east winds* which prevail in the British islands in spring are part of the great northern current which at that season generally descends over Europe through Russia. Their origin explains their dryness and unhealthiness. It is a prevalent notion that the e. winds in this country are damp. It is quite true that many easterly winds are peculiarly damp; all that prevail in the front part of storms (q.v.) are very damp and rainy, they being simply an indraught of the air toward the low barometer which is advancing from the w. at the time; and it is owing to this circumstance that in the e. of Scotland the greater part of the annual rain-fall falls with easterly winds. All of these damp easterly winds, however, soon shift round to some westerly point. But the genuine e. wind, which is the dread of the nervous and of invalids, does not shift to the w., and is specially and intolerably dry. In the third week of May, 1866, this character was strongly marked, when at many places in Scotland the humidity was only 40, and on some occasions as low as 29; the degree of this dryness will be appreciated when it is stated that the dryest month during eleven years ending with 1866, showed a humidity only of 73, saturation being 100. While this wind lasted, the daily range of temperature was double the usual amount, the soil was parched, and the leaves of trees and plants were blackened and destroyed. Deaths from brain-diseases and consumption reach the maximum in Great Britain during the prevalence of e. winds. The *etesian winds* are northerly winds which prevail in sum-

mer on the Mediterranean. They are probably caused by the great heat of North Africa at this season, and consist in a general flow of the air of the cooler Mediterranean to the s., to take the place of the heated air which rises from the sandy deserts. The *mistral* is a steady, violent n.w. wind, felt particularly at Marseilles and the s.e. of France, blowing down on the gulf of Lyons. The *pampero* blows in the summer season from the Andes across the pampas of Buenos Ayres to the sea-coast. It is thus a n.w., or part of the anti-trade of the southern hemisphere, and so far analogous to the stormy winds which sweep over Europe from the s.w. But since it comes from the Andes over the South American continent, it is a dry wind, frequently darkening the sky with clouds of dust, and drying up vegetation.

Lord Bacon remarked that the wind most frequently veers with the sun's motion, or passes round the compass in the direction of n., n.e., e., s.e., s., s.w., w., and n.w. to north. This is from the fact that by far the greater proportion of the storms of north-western Europe follow their course to eastward along paths lying to the n. of the British islands. The late Prof. Dove of Berlin first propounded the *Law of the Rotation of the Winds*, and proved that the whole system of atmospheric currents—constant, periodical, and variable winds—obey the influence of the earth's rotation. See Storms : Weather.

WINDAGE, in a gun, the difference in diameter between the bore of the piece and the projectile with which it is loaded. Formerly, a considerable windage was allowed; but this only served to diminish the force of the explosion, and to give an irregular motion to the shot. In the present rifled artillery, it is sought to reduce the windage to a minimum, as .01 of an inch. Some windage is indispensable, or the shot would jam either going in or coming out.

WINDAGE (from cannon-balls), or Wind Contusions. Military surgeons so often meet with cases in which serious internal mischief (as for instance, the rupture of the liver, concussion of the brain, or even a comminuted fracture of a bone) has been inflicted, without any external marks of violence to indicate its having resulted from the stroke of a cannon-ball, that they were led to the conclusion that solid objects projected with great velocity through the air might inflict such injuries indirectly by aërial percussion; the hurt being inflicted either directly by the force with which the air is driven against the part, or indirectly by the rush of air to re-fill the momentary vacuum created by the rapid passage of the ball. So many observations have, however, been made of cannon-balls passing close to the body (even shaving part of the head, tearing away portions of uniform, or carrying off the external ear or the end of the nose, without further mischief), that this hypothesis is totally untenable, and is now generally rejected. The true explanation of the cases formerly attributed to the windage of cannon-balls appears to rest, according to recent views, "in the peculiar direction, the degree of obliquity with which the missile impinges on the elastic skin, together with the situation of the structures injured beneath the surface, relatively to the weight and momentum of the ball on one side, and hard resisting substances, on the other." See Longmore's article on "Gun-shot Wounds" in Holmes's *System of Surgery*, vol. ii. pp. 18–20, where the subject is fully discussed.

WIN'DERMERE, Winandermere, or Lake Winder, the largest lake in England, called on account of the supposed superiority of its shores, in point of natural beauty, over those of the other lakes of north-western England, the "Queen of the Lakes," is partly in the co. of Lancaster, and partly divides that co. from Westmoreland. It is 14 m. long, and about 1 m. in extreme breadth, is fed by the Brathay and the Rothay, the waters of which become united before entering the lake, and by the streams which drain the neighboring lakelets of Esthwaite, Troutbeck, and Blelham, and discharges its surplus waters southward into Morecambe bay by the Leven. Next to Wast Water, Windermere is the deepest of all the English lakes, its greatest depth being about 240 ft., while Wast Water is 270 ft. deep. It contains a number of islands, the largest being 28 acres in superficial extent, and the chief of which are Rough Holm, House Holm, Lady Holm and Curwen's or Belle Isle. Soft rich beauty is the principal characteristic of the islands of the lake, of the wooded shores, and of the scenery around; there being a total absence of that wildness and sublimity which characterizes some of the other lakes, except at the n. end, where Langdale Pikes, Harrison Stickle, Sca Fell, and Bow Fell stand forward prominently in the landscape. The e. and w. shores are bounded by gentle eminences exuberantly wooded, and numerous villas and cottages peeping out of the woods give an aspect of quiet domesticity to the landscape. About 1 m. from Waterhead, at the n. extremity of the lake, is the town of Ambleside, 1½ m. n.w. of which is Rydal, the residence of the poet Wordsworth; in the vicinity of Waterhead is Dove's Nest, the cottage at one time occupied by Mrs. Hemans; further down the e. shore is Elleray, famous as the residence of "Christopher North;" and half-way down the lake, on the eastern shore, is Bowness.

WIND-FLOWER. See Anemone.

WINDGALLS are puffy swellings about the joints of animals, particularly of horses, correspond to the ganglions of human surgery, and result from irritation and inflammation being set up within the delicate synovial cavities, which thus secrete an unusual quantity of thickened synovia. Rest, moderate work, wet bandages, and occasional

blisters reduce the swellings, but with fast roadwork they are apt to re-appear, especially in old horses.

WINDHAM, a co. in n.e. Connecticut, bordering on Massachusetts ; 520 sq.m.; pop. '90, 45,158, chiefly of American birth, with colored ; drained by the Quinnebaug, Shetucket, and other rivers. Its manufactures are important. Co. seat, Putnam.

WINDHAM, a co. in s.e. Vermont, bordering on Massachusetts and New Hampshire, having the Connecticut river for its e. boundary, drained by the West and Deerfield rivers ; 765 sq.m. ; pop. '90, 26,547, chiefly of American birth. Its mineral resources are important, embracing gneiss, limestone, slate, and granite. Co. seat, Newfane.

WINDHAM, Right Hon. WILLIAM, English statesman, b. 1750, in Golden square, London, was son of Col. Windham of Felbrigg Hall, Norfolk, in which county the family had been settled since the 12th century. He was educated at Eton, and was afterward sent to Glasgow university, where he studied mathematics with success. In 1761 he entered at University college, Oxford. After the usual course of travel, he began to acquire notoriety as an opponent of the administration of lord North. Historatorical exercises were interrupted by a design of visiting the north pole, and he accompanied the expedition in which Nelson, then a youth, took part. He found the sea-sickness intolerable, was put on shore in Norway, and returned home in a Greenland whaler. In 1781 he was returned to parliament for Norwich, and took his seat among the whigs. In 1783, on the formation of the Portland ministry, remarkable for the coalition of lord North and Mr. Fox, he became principal secretary to lord Northington, then lord-lieutenant of Ireland. Before leaving England, he called upon his friend Dr. Johnson, and lamented that his situation would compel him to sanction practices he could not approve. "Don't be afraid, sir," replied the doctor, "you will soon make a very pretty rascal." Ill-health, or, perhaps, conscientious scruples, soon caused him to resign his secretaryship. In 1784 he seconded Burke's motion for a representation to the throne on the state of the nation. There is an admirable and characteristic sketch of Windham in Macaulay's description of the trial of Warren Hastings: "There, with eyes momentarily fixed on Burke, appeared the first gentleman of the age, his form developed by every manly exercise, his face beaming with intelligence and spirit—the ingenious, the chivalrous, the high-souled Windham." Abandoning his old friends the whigs, he followed Mr. Burke, and ranged himself on the side of Mr. Pitt in opposing the speculative doctrines of the French revolution, and supporting the war with France. In 1794 he became secretary-at-war under Mr. Pitt, with a seat in the cabinet. He now attacked his former friends with the utmost ascerbity. He went out with Pitt in 1801, and sided with the Grenvilles in stigmatizing the peace of Amiens, concluded by the Addington administration in 1801. This lost him his seat for Norwich, but he was elected for St. Mawes, and, on the return of the Grenville party to power, he became colonial secretary. In 1806 he brought forward his plan of limited service in the army, proposing that the infantry should be enlisted for seven years only, with liberty to renew their services for another seven years, receiving an increase of pay; cavalry and artillery to be enlisted for ten years, the second period six, and the third five years. He also proposed to increase the pay and pensions of officers and men, and generally to better the condition of the soldier. The plan was strenously opposed, but passed into a law. He went out of office in 1807, when the Portland administration was formed (having previously declined the offer of a peerage), and strongly denounced the expedition against Copenhagen, and afterward the disastrous Walcheren expedition. In 1808 a clause was introduced by lord Castlereagh (who had succeeded Windham in office) into the mutiny act, permitting men to enlist for life, contrary to Windham's scheme of limited service, which was, however, readopted in 1847. In May he underwent a surgical operation for extracting a tumor from his hip, from the effects of which he died June 3, 1810.

Windham was an excellent speaker, and one of the most effective and skillful debaters of his time, as will appear from his speeches collected by Mr. Amyott, his secretary, and published, with a life prefixed, in 3 vols. 8vo. Fox said he had never met a meditating man with so much activity, or a reading man with so much practical knowledge. Pitt declared that his speeches were the finest productions possible of a warm imagination and fancy. Canning described his eloquence as, if not the most commanding, at least the most insinuating that was ever heard in the house of commons. Dr. Johnson, who was much attached to him, declared that, in the regions of literature, Windham was *inter stellas luna minores*. He possessed brilliant conversational powers. Yet, notwithstanding his great talents and rare gifts, he appears in the page of history as the mere shadow of a man. In his lifetime he gained the disparaging nickname of "the weathercock." He was fond of paradox, and once defended bull-baiting in the house of commons with great vivacity and ingenuity. Although a man of refinement and sensitiveness, he had a passion for pugilism, and was a regular attendant upon prize-fights. The publication of his *Diary from* 1784 *to* 1810, by Mrs. Henry Baring (1866) discloses the secret of his weakness. Morbidly self-conscious, he was always watching himself, pulling himself to pieces, and recording the doubts that haunted him as to his mental capacity. Acknowledged by his contemporaries to be one of the manliest of men, he

succeeded in infusing into his mind doubts with respect to his own courage. He got rid of this delusion by going under fire in the trenches at the siege of Valenciennes; but no sooner was he convinced that he was not a coward than he began to be afraid he was discreditably insensible to the scenes which were passing around him! With brilliant faculties, he was in fact an intellectual hypochondriac incapable of achieving anything great.

WINDISCHGRÄTZ, Alfred, Prince von, 1778–1862, Austrian general, fought with distinction in the Napoleonic campaigns of 1813–14, but was more famous for the part he played in the suppression of the revolution of 1848. When the riot broke out in the streets of Prague and the people clamored for arms, W. refused to yield to their demands, and after a sharp contest, in which his wife and son were killed by the revolutionists, he put down the insurrection. He afterwards fought against the Hungarians, but in this campaign he did not accomplish much, and was blamed for his inactivity. Having retired to his Bohemian estates, he published in 1851 *Winterfeldzug* 1848–49 *in Ungarn.*

WIND INSTRUMENTS, musical instruments of which the sounds are produced by the agitation of an inclosed column of air. They are generally classified into *wood instruments* and *brass instruments* (both of which are played by the breath), and the *organ.*

The name wood instruments is applied to musical instruments constructed either of wood or of ivory, of which the principal are the flute, piccolo, clarionet, flageolet, basset-horn, oboe, and bassoon. They are generally characterized by a soft, smooth, aerial tone, resembling the human voice. By the use of holes and keys, considerable compass is given to them; they are capable of producing only one sound at a time, but with considerable command of piano and forte. Of brass instruments the chief are the horn, trumpet, trombone, cornet-a-piston, euphonium, bombardon, and ophicleide. They are generally more powerful, and their quality more piercing than wood instruments; the ophicleide, however, approaching more than the rest to wood instruments in capabilities and tone. In a full orchestra there are generally two flutes, two oboes, two clarionets, two or four horns, and two bassoons, frequently with the addition of two basset-horns, one or two piccolos, and one or two ophicleides or trombones. Each part, except when there is an unusually large number of bow-instruments, is single.

The organ is a combination of a large number of wind-instruments, sounded, not by the breath, but by the admission of air into the wind-chest, by means of keys pressed down by the performer. See Musical Instruments.

WINDLASS is that modification of the wheel and axle which is employed in raising weights, such as bucketsful of water from a well, coals from a pit, etc. Its simplest form is that of an axle supported by pivots on two strong upright pieces, and pierced near one end with four or six square holes, into which handles, known as *handspikes,* are inserted. In other forms, a winch at each end is substituted for the handspikes. If the weight (say a bucket of water) is to be lifted a considerable distance, the length of the rope which attaches it to the axle largely increases the weight, and thus aids the power when descending, and counteracts it when ascending. This difficulty is partially got over by employing a double rope with two buckets, one of which ascends while the other descends; but this modification, though partially effective for the end in view, lends aid to the power when aid is least, and hinders it when aid is most, required. A more efficacious plan is to form the axle not cylindrical, but of a barrel-shape, like two truncated cones placed base to base, and to fasten two ropes, one to each end, so that when coiled up round the barrel they approach the middle; in this case, when one rope is fully uncoiled, and winding-up commences, the gross weight, which is then at its maximum, acts at the minimum leverage of the end, and as the progress in winding up diminishes the weight, its leverage so increases that the momentum is preserved uniform. On the other hand, the empty bucket, when commencing its descent, acts at its greatest leverage, and as the unwinding of the rope adds to the weight, its leverage becomes smaller, so that the momentum of the descending weight always remains the same and thus the strain on the power is preserved uniform. The ratio of the weight to the power it is sometimes found necessary to increase greatly; but with the ordinary windlass this could only be effected by similarly increasing the ratio between the leverage of the handle and the radius of the axle—an object attained by a great increase of the former, rendering the machine too cumbrous, or by greatly diminishing the latter, and so weakening it. The desired result is attained, however, in a manner not liable to these objections, by the use of the *differential axle,* an axle of which one-half is of greater diameter than the other, and the single rope, after being coiled round the whole axle from end to end, is fastened at each end of the axle, and the weight is hung by a pulley, which is supported in a bulge in the center of the rope. As the portion of the rope on one-half of the axle is unwound, that on the other half is wound up; but since the rates of winding and unwinding are different, the bulge of the rope increases when the rope is wound *on* the smaller end of the axle, and decreases when it is wound *off* the smaller end. The more nearly equal the two radii of the axle are, the greater is the weight which can be raised by the power—the ratio between the two being

$$\frac{W}{P} = \frac{\text{radius of circle described by power}}{\text{difference of radii of the portions of the axle}};$$

so that if the radius of the power is 18 in., and the radii of the axle 5 and 4 in., the power balances a weight = 18 times itself; while the strength of the axle requires

to be only equal to that of one of the ordinary kind, in which the power can only balance a weight = $4\frac{1}{2}$ times itself. The same principle is applied to the screw (q.v.). For a very accurate estimate of the mechanical advantage of the windlass, the thickness of the rope must be taken into account, by adding half of its diameter to the radius of the axle.

WINDMILL is a mill for grinding corn, sawing wood, or performing any other species of work for which fixed machinery can be employed, the motive-power being the force of the wind acting on a set of sails in a manner similar to that of a current of water impinging obliquely on the float-boards of a water-wheel. The structure is a conical or pyramidal tower of considerable height, and covered over at the top with a species of dome, *aaa* (see fig.) which is so fastened as to revolve upon it round the upper extremity of the shaft *c*, as a center, the motion being aided by the interposition of "castors" between the wooden rings which form respectively the base of the dome and the top of the tower; the sails, *b*, *b*, are attached to the extremity of the axis *d*, so as to revolve in a plane at right angles to it, and the motion they communicate to the axis is transferred by the beveled wheels *e* and *f* to the upright shaft *c*, by which it is in turn conveyed to the working machinery at the bottom of the tower. The axis *d* of the sails, which is inclined at an angle of about 10° to the horizontal, is fixed at one end to a projection from the top of the shaft *c*, and at the other to a circular orifice in the side of the dome, so that it revolves with the latter, carrying the sails along with it; this arrangement is adopted for the purpose of enabling the plane of rotation of the sails to be placed always at right angles to the direction of the wind. This transference of the plane of rotation was at one time effected by manual labor applied to a winch at the bottom of the tower, the rotation being communicated, by an endless band and wheel-work above, to the dome, the outer circumference of the base of which, was, for this purpose, furnished with a circle of rack-work. But this clumsy arrangement was superseded in English windmills by an ingenious contrivance due to sir William Cubitt, by which the wind itself was made to turn the sails into their proper position. The apparatus by which this is effected consists of a revolving *flyer* or fan, *g*, projecting from a gallery fastened to the dome on the side opposite to the sails; *h*, a long thin shaft to which a revolving motion is communicated by a toothed wheel on its outer extremity, from a corresponding wheel on the axis of the flyer (these wheels are not seen in the fig., being behind the flyer); a pinion at the other end of the shaft acts upon the cog-wheel *k*, which carries, on the lower extremity of its axis, a pinion *l*; and this last can, at pleasure, be put into gearing with the rack-work or cog-circle on the lower edge of the dome. The sails are four in number. Each sail consists of a *whip* or radius of from 33 to 40 ft. in length, firmly fastened at right angles to the sail-axle, and pierced at from $\frac{1}{6}$ or $\frac{1}{7}$ of its length, from the axle to its extremity with about 20 holes, into each of which is inserted a cross-bar of 5 to 6 ft. in length; and this frame-work, strengthened generally by light rods connecting the ends of the cross-bars, is then covered with canvas. The cross-bars, however, are not set in the plane of revolution of the whips, for, in that case, the wind, acting in a direction coinciding with that of the sail-axle, would impinge perpendicularly on the sails, and no rotatory motion would result; the bars, therefore, are set at an angle to this perpendicular direction, yet not all at the same angle, for the velocity of each point of the sail increasing with its distance from the sail-axle, the inclination must vary from the first cross-bar to the outer extremity. It is found that a variation of the angle from 18°, at the first cross-bar, to 7° at the extremity, is a very effective form. The amount of sail that a windmill can carry with advantage is limited, according to Mr. Smeaton (q.v.), one of the great authorities on this subject, to $\frac{1}{3}$ of the area of the circle described by one whip; the velocities of a sail, when unconnected with, and when producing its maximum effect on the machinery below, are as 3 to 2; also, the increase of useful effect varies with the square of the wind's velocity, and is proportional to the cube of the length of the whip, in sails of similar form. A windmill with sails of 40 ft. radius is equivalent to 65,000 foot-pounds per minute. Most of the early improvements in windmills have had for their object the regulation of the sail-area exposed to the wind to counterbalance the variations in the latter's force, and so produce uniformity of motion; but these are too numerous to be here noticed. Within recent years the United States have done a very large business in windmills, and most of the modern improvements in them are also due to this country. Wheels of the types described above are now practically obsolete and those in general use are of the American type, having a large number of narrow blades or sails, either of wood or iron, a rudder or tailpiece for keeping the wheel with its face to the wind, and the high conical tower, usually an open steel-frame structure. In many cases these towers are surmounted by a tank in which water is stored for distribution through adjacent buildings.

UNIVERSITY OF ILLINOIS

The regulation of windmills is a subject on which much ingenuity has been spent, and a number of automatic speed regulators have been patented, most of which are based on one of the two following principles. In one case the wheel is made with immovable slats or sails, and by means of an auxiliary rudder or other device is caused to turn its face at a greater or less angle to the direction of the wind according to its velocity. The maximum speed is attained when the wheel stands vertical to the direction of the wind, and the minimum when it is parallel to it. The other method of regulation consists in turning the slats by a centrifugal governor so as to present more or less surface to the wind. The latter is known as a sectional wheel, and the former as a solid wheel. Windmills were introduced into Europe from the Saracens, and were formerly much more extensively used in England than now. They are, however, still common in the midland and southern districts; on the continent, especially in Holland and France.

WINDOM, William, b. Ohio, 1827; studied law, and was called to the bar. After practising for several years in his native state, he went to Minnesota in 1855; was a member of congress from that state, 1859–69; and in 1870 became a U. S. senator by appointment to fill a vacancy. He was elected for a full term in 1871; re-elected in 1876, and resigned in 1881 to become secretary of the treasury in President Garfield's cabinet. In his short term of service before the president's death he showed high ability. He was returned to the senate, and served till the close of his term in 1883. In 1889 he became sec. of the treasury in Pres. Harrison's cabinet. He died, Jan. 29, 1891.

WINDOW (connected with *wind*, as Lat. *fenestra* with *ventus*) is an opening in the wall of a building for the admission of light and air. In the east, from time immemorial, windows open, not upon the street, but upon the court, and are usually provided with lattices or jalousies. The Chinese use, instead of window-glass, a thin stuff varnished with shining lac, polished oyster-shells, and thin plates of horn. Among the Romans windows were originally closed with shutters; afterward they were made of a transparent stone, *lapis specularis*, which, from the description, can be nothing else than mica; and, in the 2d c. after Christ, of horn. According to some there are traces of glass windows having been used in Pompeii; but the matter is doubtful. The first indisputable mention of glass windows is made by Gregory of Tours in the 4th c. of our era, who speaks of church windows of colored glass. Wilfrid (q.v.), on succeeding to the arch bishopric of York in 669, filled the vacant windows of the cathedral with glass. In 674 abbot Benedict Biscop brought artists from France to glaze the windows of the abbey of Weremouth; and the bishop of Worcester did the same in 726. Leo III., in the end of the 8th c., put glass windows into the church of the Lateran. Glass began to be used in windows of private houses in England as early as 1180; in France in the 14th century. As late as 1458 it struck Æneas Sylvius very much that in Vienna most of the windows were glazed. See Glass.

In ancient temple architecture, windows were unknown—the light being obtained from openings in the roof. In Gothic architecture, however, the window is one of the most important features, giving, by the infinite variety of its outline, and the graceful forms of its tracery, as much character and beauty to the Gothic edifices as the styles and colonnades of ancient art gave to the classic temples.

In the early Gothic or Norman style, the windows were small and comparatively stunted—they were either simple openings with semicircular head, or two such grouped together with a larger arch over both, and with the usual moldings and ornaments of the style. The inside had generally a deep splay, and simple molding on the outside. Small circular windows sometimes occur in Norman work.

In the early English style the windows were more elongated, and had pointed arches. They are frequently grouped in twos or threes, and placed so close that the wall between becomes a mullion. The wall over the group contained within the inclosing arch then becomes perforated with a quatrefoil or other ornamental opening, and thus the simpler forms of tracery become introduced. The interior arches are splayed off, and are frequently very elaborately decorated with shafts and arch moldings. The lancet window (so called from its shape) is common in this style. Circular windows are also used with tracery formed by little radiating shafts with small arches. The triangular window, on a small scale, is also occasionally to be met with.

It is in the decorated style that the windows become enlarged and filled with mullions and tracery. This is at first simple, and composed of geometric figures such as the origin and progress of tracery (q.v.) naturally led to. As the style advanced, more flowing forms were introduced, until, in the 15th c., the tracery passed into the perpendicular (q.v.) style in England, and into the flamboyant (q.v.) in France. The heads of the lights, and the apertures in the tracery, are usually foiled, and the inner jambs are splayed and ornamented with moldings, shafts, etc. In elaborately traceried windows, the jamb and arch moldings are occasionally very small, but they are usually bold and deep.

In the later Tudor style the window-heads became flattened into the four-center arch; and in the time of Elizabeth and James I. the arch gave place altogether to the flat lintel with the opening divided by mullions into rectangular lights, sometimes foiled at top. Circular windows, with elaborate tracery, are chiefly found in the decorated period.

In domestic buildings the windows are similar to the above, but square-headed win-

dows occur more frequently to suit the height of the floors; and the space between the sill and the floor is recessed and fitted with seats. Transoms are also of common occurence. The bow or bay window (q.v.) is also a frequent and very elegant feature in the later Gothic buildings.

In the revived classic styles the windows are almost invariably plain rectangular openings, with either a flat lintel or semicircular arch-head. They have sometimes architraves round the jambs and lintel, or are ornamented with pillars supporting an entablature or pediment above. The architraves are frequently carved, and the cornices carried on trusses at each side.

The style of shop-fronts has been much modified, and the windows enlarged, in consequence of the facilities afforded by the use of plate-glass.

WINDPIPE. See TRACHEA.

WINDSOR, a co. in e. Vermont, bordering on New Hampshire, having the Connecticut river for its e. boundary, drained by the White, Black, and Quechee rivers; 900 sq.m.; pop. '90, 31,706 of American birth, 95 colored. It contains Ascutney mountain in the s.e. rising 3320 ft. above the level of the sea. Co. seat, Woodstock.

WINDSOR, a t. in Hartford co., Conn., on the Connecticut river, and the New York, New Haven, and Hartford railroad; 7 m. n. of Hartford. It was settled in 1635; contains several villages; and has electric railroads connecting the villages and Hartford, young ladies' institute, public library, and manufactories of cheese, canned goods, electrical supplies, tobacco, worsted goods, hosiery, paper, and machine screws. The town has an interesting history, and in its old cemetery are the remains of a number of distinguished people. Pop. '90, 2954.

WINDSOR, a tp. in Bertie co., N. Car.; including Windsor, the co. seat. Pop. '90, 4643.

WINDSOR, properly called NEW WINDSOR, a municipal and parliamentary borough of Berkshire, beautifully situated on the right bank of the Thames, 21 m. s.w. of London. Windsor and Eton in reality form one town. The town is chiefly interesting on account of its being the scene of *The Merry Wives of Windsor,* and the antiquity of its castle and parks, which have been a favorite residence of English monarchs, especially since the time of William the Conqueror. The elevated plateau of natural chalk upon which it stands marked it out, no doubt, as a naturally strong place from the earliest dates, but the deficiency of water which such a position entailed was a serious objection to its being adopted as a permanent residence for many years. The older palace of the English kings was at *Old* Windsor about 2 m. distant, and considerable doubt seems to exist among antiquaries and historians as to the first English king who built solid work of masonry at Windsor Castle. In the time of Edward the Confessor it was probably a wooden structure, as stone was difficult to be had, and wood was abundant. William the Conqueror probably built the first substantial stone buildings, and regularly fortified the place; but the absence of water, except what was carried to it from the Thames, must have for a long time been a serious drawback to its importance as a military station. The history of the existing fabric begins in the reign of Henry III. The buildings may be said to be grouped in three portions—the middle ward containing the round tower; the lower ward on the w., containing St. George's chapel, the houses of the military knights, cloisters, etc.; and the upper ward on the e., containing the sovereign's private apartments. The unfinished chapel which was begun by Henry III., was completed by Edward III., rebuilt by Henry VII., and added to by cardinal Wolsey. Under this chapel is the burial vault of the present royal family. The round-tower, formerly believed to be Norman, but in which there is not a single yard of Norman masonry, was built in the 18th year of Edward III. to receive the round table of the knights of the newly-founded order of the garter. Pop. (1891) 12,327. The park and forest immediately adjoining contain many historic trees, such as Elizabeth's oak; Shakespeare's oak; the long walk, made in the reign of Charles II., and queen Anne's ride of elms, 3 m. long.

WINDSOR, a t. and co. seat of Hants co., Nova Scotia, on the Dominion and Atlantic railroad; pop. '91, 2838. It has churches, schools, banks, a newspaper, iron foundry, several mills, ship-yards, and electric lights. King's college, the most important in Nova Scotia, is here.

WINDSOR, a t. in Essex co., Ont., Canada; on the Detroit river and the Grand Trunk, Michigan Central, and Canadian Pacific railroads; opposite Detroit. It has powerful steamers connecting with Detroit, electric lights and street railroads, numerous churches and public schools, several branch banks and important manufactures. Pop. '91, 10,322.

WINDTHORST, LUDWIG (1812–1891), b. in Prussia; studied at Göttingen and Heidelberg. In 1863 he was Minister of Justice in the Kingdom of Hanover, and after the annexation of Hanover to Prussia in 1866, the leader of the Roman Catholic party in the Prussian parliament and the Reichstag, and a formidable opponent of Prince Bismarck (q.v.). See CULTUR KAMPF; POLITICAL PARTIES, GERMAN.

WINDWARD ISLANDS. See ANTILLES.

WINE, CHEMISTRY AND MANUFACTURE OF. Before entering into the chemistry of this subject, it is necessary that the composition of the grape, from whose juice it is derived, should be understood; and as there is an immense variety of vines yielding grapes

of corresponding variety, and as the same variety* will, under different external influences, produce very different grapes, it is obvious that our researches must be confined to the most typical form of grapes. The principal component of the juice of ripe grapes is water, in which are various substances, either held in solution or very minutely divided. The juice as obtained by pressure, is thick, and exposure to the heat of the sun rapidly changes it into a fermented liquid. As principal components held in solution in the water, Professor Mulder mentions "sugar (both grape-sugar and fruit-sugar), gelatine or pectine; gum, fat, wax, vegetable albumen, vegetable gluten, and some other substances of the nature of extractive matters, which are not, however, accurately determined; tartaric acid, both free and combined with potash (as cream of tartar), partly also combined with lime; in some cases, we find also racemic acid, malic acid, partly quite free, partly combined with lime, and, according to some, tartrate of potash and alumina; further, oxide of manganese and oxide of iron, sulphate of potash, common salt, phosphate of lime, magnesia, and silicic acid may also exist."—*Chemistry of Wine*, p. 5. Although no other ingredients have as yet been discovered in grape-juice, others, which only appear during fermentation, and impart not only the vinous smell common to all wines, but the aroma (bouquet) and the flavor peculiar to each wine, must exist in it in small quantities. In those cases where the skins are allowed, as in the preparation of red wine, to ferment with the juice, the constituents imparting odor and flavor may be drawn from them. Coloring matter and tannic acid are undoubtedly found in the skin, and are thus imparted to red wines. Moreover, the grape-stones, which are left with the skins, yield tannic acid freely during fermentation. The different proportions in which the inorganic matters—the potash, soda, lime, magnesia, iron, manganese, sulphuric acid, phosphoric acid, and chlorine—exist in grape-juice, exert a very great influence upon the quality of the wine, both in relation to its color and its taste. A relative excess of phosphoric acid, or of lime, or of soda, will induce changes sufficiently obvious to the chemist, but which we have not space to discuss. With regard to the acids of grape-juice, or *must*, as it is technically called, professor Mulder observes that, as a general rule, the three—viz., tartaric, malic, and citric—are rarely found together in one fruit, and he doubts whether the presence of citric acid has been fully proved. Malic acid exists in unripe, and tartaric acid in ripe grapes; and while no malic acid exists in wine made from perfectly ripe grapes, a small quantity is present in most wines. In the article Tartaric Acid, it is shown that a nearly allied acid *racemic acid*, exists in exceptional cases in grapes. The quality of wine is only affected if this acid be largely present, because less lime than usual will be found in it, racemate of lime being less soluble than tartrate of lime, and further, because cream of tartar is more soluble than biracemate of potash. Such wines are consequently sweeter, and—if red wines—darker colored, than wines containing only tartaric acid. The quantity of sugar varies extremely. In the juice of very ripe grapes, it may reach 40 per cent. According to Fontenelle, the juice produced in the s. of France contains from 30 to 18 per cent., while in the neighborhood of Stuttgart, Reuss determines it at from 25 to 13 per cent. In the low and variable temperature of Holland, the juice of the best grapes yields only 10 or 12 per cent. of sugar. The composition of the albuminous matter is not clearly determined. In an analysis of the must of the Riessling grapes of Grumbach, Beltz found that the gluten (no albumen was found) was thirty times less abundant than the sugar. It probably varies at from 1 to ½ per cent. The only other ingredient requiring notice is fat, which is chiefly but not entirely derived from the grape-stones, in which it is an abundant ingredient. It occurs in wine, in minute quantity, in the form of a fatty acid.

On the subject of the fermentation of the grape-juice we shall only offer a few remarks. It has been already stated that the saccharine contents of grape-juice range from 12 to 30 per cent. If we regard all this sugar as grape-sugar, $C_6H_{12}O_6$, with an equivalent of 180, then each molecule may be resolved into 2 molecules of alcohol, $C_2H_5 \cdot OH$, with an equivalent of 46, and 2 of carbonic acid gas, CO_2, with an equivalent of 44, according to the equation—

$$\overbrace{C_6H_{12}O_6}^{\text{Grape-sugar.}} = \overbrace{2C_2H_5 \cdot OH}^{\text{Alcohol.}} + \overbrace{2CO_2}^{\text{Carbonic Acid.}},$$

provided that there is no loss; or under the most favorable conditions of fermentation, 180 parts (by weight) of anhydrous grape-sugar, or 198 of the hydrated sugar (with the formula, $C_6H_{12}O_6 \cdot H_2O$), may yield 92 parts of alcohol; or, roughly speaking, 2 parts of sugar yield 1 of alcohol. "According to this," says Mulder, the juice of French and German grapes gives, when analyzed, as a maximum, from 7 to 15 per cent. of alcohol by weight. But some of the sugar remains undissolved, and, during fermentation, more alcohol is evaporated than water; therefore, for such grape-juice, or rather for the wine to be produced from it, the alcoholic contents must be under 15 per cent as a maximum, and 7 per cent as minimum."—*Op. cit.*, pp, 49, 50. According to Mulder, sugar is found

* A certain variety of grape, when grown upon the Rhine, furnishes a species of Hock; the same grape when raised in the valley of the Tagus, yields Bucellas: while in the island of Madeira it produces the wine known as Sercial, which has a flavor quite different from either of the others. See Miller's *Organic Chemistry*, 3d ed. p. 187.

in all wine,* and its quantity depends to a considerable extent upon the treatment to which the grapes are subjected before pressure. Tokay wine, for example, is prepared from grapes which have been allowed not only to get over-ripe, but partly to dry on the vines; *vin de paille* is obtained from grapes dried on straw exposed to the sun; and in both these cases, water is evaporated, and the concentrated juice yields a wine of extra strength. The strong heavy wines used by the ancients were thus prepared. When the grapes are dried on the vine, the wine is called *vin sec;* and when the juice has been evaporated by the aid of heat, the wine is called *vin cotti.*

In consequence of the close connection which exists between the amount of sugar in the grape-juice and the excellence of the wine which it yields, attempts are often made, especially in bad seasons (want of heat and light, and excess of rain), to introduce extraneous sugar into the juice; or, as it is technically called to *doctor* it. For this purpose, a cheap fermentable sugar is added to the sour juice, an adulteration which cannot subsequently be detected by chemistry, although it may be suspected, from the absence of the proper aroma from the wine. Similarly, sugar is often added to good grape-juice, in order to obtain a stronger wine than the natural product. Many imitations of port wine are thus manufactured. The character of the wine is much influenced by the extent to which the process of fermentation is allowed to proceed. If it goes on till all the sugar is converted into alcohol, a *dry* wine is produced; when it is checked before the change is completed, a rich *fruity* wine is produced; and when the wine is bottled while the fermentation is still in progress, effervescent wine is formed.

Shortly after the must has passed from the wine-press symptoms of fermentation appear; the juice becomes more turbid, bubbles rise to the surface, and a froth soon settles there. This process in a moderate climate usually reaches its highest point in three or four days; and before it is quite finished the whole liquid mass is stirred up so as to re-excite the process. For this purpose, in many districts a naked man used (we do not know if the custom generally still exists) to go into the wine-tub, who both accomplished the necessary stirring and promoted fermentation by his animal heat. Several persons have been killed in this way by suffocation from the atmosphere of carbonic acid gas. In two or three weeks the fluid becomes comparatively clear, and a precipitate forms at the bottom. The wine is now removed from the sediment into another vessel, and a slow form of fermentation—*after-fermentation*, as it is termed—goes on for several months, sugar being constantly converted into alcohol and carbonic acid, and a fresh precipitate forming at the bottom. Several similar changes into other vessels are made, to get rid of the sediment, till it is fit for transferring into casks. That the process of fermentation may go on satisfactorily, not only must water, sugar, and a nitrogenous matter in a state of actual change be present, but there must be a certain temperature and a certain amount of atmospheric air present. "Although," says Mulder, "there is a wide interval between the extremes of temperature at which fermentation is possible, the boundary is very narrow which limits good and active fermentation in every kind of wine. The grapes of each country ripened under different degrees of summer warmth and very unequally rich in constituents, require very different temperatures during fermentation; and different temperatures are also required for grapes which are the product of a warmer or a colder summer. But on these points we have little accurate knowledge. All we know is that a high temperature during autumn promotes fermentation, and a low one is detrimental to it; and that inequality of temperature during fermentation is extremely injurious, and not unfrequently spoils the wine altogether."—*Op. cit.* p. 61. To what extent it is expedient to admit atmospheric air to the must, so that the fermentation may go on most favorably, is a point regarding which there has been much discussion, and which is not definitely settled. While some have asserted that no air is necessary to the development of fermentation, others have maintained that the wine is improved by the free admission of air during fermentation. Gay-Lussac proved experimentally that air is essential to initiate fermentation, which would then be continued without any fresh supply; and for many years wine was made in France with an almost total exclusion of air from the fluid by an arrangement intended to prevent the escape of alcohol by evaporation; but when the same chemist proved that by the use of open vats scarcely $\frac{1}{200}$ part of the alcohol was lost, this arrangement fell into disuse. Judging from the method of preparing Bavarian beer, in which air is allowed to enter freely, Liebig recommended the same in the case of wine, and suggested that a large opening should be made in the casks in which fermentation takes place. This method has been tried on a large scale by Von Babo, Crasso, and others, with red wine, which was found to be of a better quality than that which underwent the same process in a cask which was closed, and only provided with a glass tube for the escape of the carbonic acid. But in other experiments made with white wine, the wine in open casks appeared to lose in aroma; and hence the solution of this question apparently depends on the kind of wine. Liebig's opinion has been very fiercely, and, as Mulder thinks, unfairly attacked; the probability is that wines containing much sugar may be allowed

* Dr. Bence Jones, in the appendix to his translation of Mulder's work, declares, on the other hand, that while port, sherry (except in two instances), Madeira, and champagne, always contain sugar; claret, Burgundy, Rhine, and Moselle wine (excepting one sample of sauterne) are always free from every kind of sugar.

with advantage to ferment in closed vessels, while those less rich in that substance may be left in open casks, provided the temperature be low and equable. When the main object is to increase the quantity of alcohol, the admission of much air is injurious, since it promotes the formation of acetic acid, and causes a corresponding loss of alcohol.

The actual substance—*ferment*—which causes the breaking up of sugar into alcohol and carbonic acid, has been submitted to careful chemical and microscopical examination. One hundred parts of sugar require about 1.5 parts of ferment reckoned in the dry state; and as the analysis of ferment shows that about half of it consists of albuminous matter, it follows that $\frac{3}{4}$ of a part of albuminous matter are required for the conversion of 100 parts of sugar into alcohol and carbonic acid. Ferment consists of cells or globules of *torula* (q.v.), which are precisely the same in the production of wine and beer. It is the contents of these cells which contain the active albuminous matter; while the cell-wall, consisting of cellulose, $C_6H_{10}O_5$, and produced from gum or vegetable mucus, is inert.

The leading points in which the constituents of grape-juice and those of wine differ from one another in consequence of fermentation are, that in the wine there is a diminution (1) of the mucilaginous and saccharine matters, in consequence of the formation of ferment and alcohol; (2) of those substances which are insoluble in common water, but are held in solution in the viscid must, as, for example, phosphate and sulphate of lime; and (3) of cream of tartar, tartrate of magnesia, and sulphate of potash, which, being less soluble in spirit than in water, fall as the formation of alcohol increases. Red wines lose a portion of coloring matter and of the tannin, which is withdrawn by these salts, and hence become of a lighter color and less astringent. Before noticing the alcoholic strength of different wines we shall briefly describe the concluding steps necessary for rendering wine fit for use. The process of *clearing* is undertaken with the view of removing all the sediment in which albuminous matters may still occur, and of diminishing the coloring matter and tannin of red wines. Among the substances used for these purposes may be mentioned albumen, isinglass, gum, milk, lime, gypsum, etc. In warm countries gum is preferable to albumen or isinglass. The addition of lime throws down a precipitate of salts of lime, which carries down, in the case of red wine, a considerable quantity of coloring matter; its addition gives a sweeter and less astringent taste to the wine, and an appearance of age. As a general rule clearing increases the durability of wine. *Sulphurizing* is a process which is especially applied to sweet white wines which possess an excess of sugar and albuminous matter, and little tannic acid, and thus become easily decomposed. Its object is to check undue fermentation, and to prevent the formation of mold, which afterward imparts a musty taste to the wine. The process is effected by burning sulphur in bottles or casks, and instantly pouring in the wine, which absorbs the sulphurous acid. Wine intended for exportation to warm climates is usually strongly sulphurized. Of course great care must be taken that the sulphur is free from its common impurity, arsenic. In place of sulphurizing, another method of hindering the fermentation of sweet wine is adopted in some parts of France; it consists in putting $\frac{1}{1000}$ part of powdered mustard into the wine; but how it acts is unknown.

Having traced the chemical history of wine from its original state of grape-juice to the time when, having been clarified, and poured into casks and bottles, it is fit for use, we ought, in order to complete the sketch, to notice the subsequent changes which, in the course of time, it undergoes in the cellar. The ages at which different wines attain their perfection are, as is well known, extremely different. "As a general rule," says Mulder, "wines which have retained a considerable portion of albuminous matter, and possess but little tannic acid, cannot resist the influence of time; they become acid, or undergo some other change. This occurs in the case of Rhine wines, which contain but little alcohol; and all those wines which contain much sugar, or but little tannic acid, cannot be kept long. Wines which can be *cellared* are those which improve; or, to speak more correctly, those wines are stored which improve with age. In these odoriferous substances are formed, and the wine becomes less acid and better tasted. Such wine as is colored often deposits a considerable amount of sediment; and if it be stored in casks there is a constant increase of alcohol."—*Op. cit.*, pp. 105, 106. Wine is improved by being kept in wooden casks, as water escapes by evaporation, and the other constituents are relatively increased. The vinous constituents being thus concentrated exert a stronger chemical action upon each other, and render the wine not only stronger, but better flavored. The change, however, does not stop here. The loss of water must be replaced by the addition of wine, otherwise the action of the air would turn the wine sour, and convert the alcohol into acetic acid; and the diminution of water, which is thus replaced by wine, causes a constant increase of tartaric acid. Wines which are poor in sugar may thus soon become too sour; and consequently all wines cannot undergo this process. The popular idea that wine which has grown old in bottles has therefore become richer in alcohol is altogether false, and is doubtless founded on the fact that it is only the strongest wines that can be preserved. The color, however, of bottled wine is materially affected by age: liqueur-wines and red wines containing no large amount of tannic acid becoming darker, while wines which are rich in tannic acid, as port, for example, deposit a sediment, and become lighter. Old bottled wines contain odoriferous constituents—ethers of various organic acids—which are

not found in new wine. For an explanation of the mode of formation of these compounds, to which wine owes its *aroma*, we must refer to the chapter on "The Odoriferous Constituents of Wine" in Mulder's work; we will here merely remark that diminution of the free acids is necessarily associated with the formation of these compounds, and that this diminution can only occur by the acids being either decomposed or combined with non-acid substances, both of which operations here take place as the result of a very slow chemical process. This effect of time may, however, be imitated by art; and if bottles corked, but not quite filled with wine, are placed for two hours in warm water at a temperature of 185°, and after cooling are filled, their contents possess the flavor and aroma of wine that has been bottled several years. This result was originally obtained by Appert; but Pasteur and others have, during the last few years, again brought the subject before the French academy. Wines which have been long in bottle sometimes acquire a peculiar flavor, which is incorrectly referred to the cork. It is in reality due to the peculiar mold which grows from the outside of the cork inward; and should it reach the inner surface, it imparts to the contents of the bottle a peculiar taste; and this wine is said to be *corked*. Very similar to this is what is known as "the taste of the cask," a peculiar flavor sometimes acquired by wine before bottling. This flavor is regarded as dependent on the development of a peculiar essential oil, during the growth of "mold" on the surface of the wine. It can be removed by the addition to each pipe of about a quart of olive oil, which dissolves the unpleasant flavoring matter, and carries it to the surface.

In submitting matured wines to chemical analysis it is found that they differ materially from one another in their composition; and especially as the wine is, or is not, red. In white wine no special coloring matters are found, and only a trace of tannic acid; while in red wine both are present. In wine generally the principal ingredients are alcohol and water; then sugar, gum, extractive and albuminous matters; then free organic acids, such as tartaric, racemic, malic, and acetic acid; and salts, such as the tartrates of potash, of lime, and of magnesia, sulphate of potash, chloride of sodium, and traces of phosphate of lime; also, especially in old wines, substances imparting aroma, as œnanthic and acetic ethers, and other volatile odoriferous matters (among which Mulder mentions butyric and caprylic ethers, each having a pineapple odor, caproic, pelargonic, capric, and propionic ethers, amylic alcohol, and many of its ethers and other compounds, aldehyde, acetal, and probably racemic, citric, and malic ethers). In red wines, and in many others, a little iron, and possibly some alumina, may be found; and lastly, the best wines contain, according to Fauré, a peculiar matter, which he terms *œnanthin*, and to which he ascribes the substance or body of the wine; but which seems to other chemists scarcely to differ from gum or dextrine. These ingredients, as Mulder observes, vary exceedingly in proportion. The quantity of some is so small that the substance almost disappears during analysis; others can just be determined by a delicate balance; while others, again, are freely present. Putting aside taste and smell as standards of comparison, most of the essential dietetic and therapeutic properties of wine depend upon the *alcohol*, *sugar*, and *free acids*, especially *tartaric acid*, contained in it. In his chapter on "The Amount of Alcohol in Wine," Mulder gives a large number of analyses of different wines in which the percentage of alcohol is determined. We shall here only give the abstract of the analyses made by his translator, Dr. Bence Jones, who found that the alcohol varies in

		Per cent.		Per cent.

Sugar is found in all wines,* although in certain kinds very little exists. According to Fresenius the sugar in four kinds of Rhine wine amounts to exactly six-sevenths of the extract remaining after evaporation, the seventh part consisting of the salts and non-volatile unfermentable matter. In red Bordeaux, on the other hand, very little sugar is found; red sauterne contains less than 1 per cent of extract, and hermitage 1.7;

* In the preceding foot-note we have mentioned that Dr. Bence Jones denies the accuracy of this statement.

hence the quantity of sugar must be very minute; while some kinds of muscat yield 24.5 of an extract, containing about 22 per cent of sugar. Small as is the quantity of sugar in some wines, it is of great importance in diminishing the sharp taste of the free acids, and in imparting an agreeable flavor to the wine. Good red wines should contain at least one-half per cent of sugar, and the quantity is sometimes larger. Some of the sweet wines contain nearly one-fourth of their weight of saccharine matter.

The following results were yielded by the experiments of Dr. Bence Jones:

Sherry (18 samples)	sugar in 1 oz. varied from	4 to 18	grains.
Madeira (9 samples)	" "	6 to 20	"
Champagne (4 samples)	" "	6 to 28	"
Port (8 samples)	" "	16 to 34	"
Malmsey Madeira	" "	56 to 66	"
Tokay	" "	74	"
Cyprus	" "	102	"

Under the term "free acids" are included the acid tartrate of potash, known as cream of tartar, and other soluble bitartrates found in wine, besides such acids as are quite uncombined, such as tartaric, malic, and acetic acid, and a trace of free tannic acid. Sugar has so much power in concealing the free acids, that their amount cannot be estimated with any certainty by the flavour of the wine, and must be estimated chemically by ascertaining how much of an alkaline solution of given strength must be used in order to render a given quantity of wine perfectly neutral to test-paper. Volatile acids, as, for example, acetic acid, may either be determined separately, or included with the others; and, excepting this acid, all the other acids occurring in wine may practically be calculated as tartaric acid. Mulder found that acetic acid was present in 20 different kinds of wine which he examined, the amount of the anhydrous acid ranging from 1.75 thousandth parts in Madeira to 0.25 thousandth parts in Tavella. In the same 20 kinds of wines, the free tartaric acid ranged from 2 to 7 parts in 1000 of wine, Tavella having the largest, and Bordeaux sauterne the smallest quantity. With regard to the tannic acid, traces of it may be found in all white wines, but in no white wine is it sufficiently abundant to be of the slightest importance in a medical or dietetic point of view. On the other hand, it is abundant in Port and heavily loaded Bordeaux wines, especially when new. In the course of time, this tannic acid becomes oxidized into a sparingly soluble compound, which is called by Berzelius the *apothema*, or precipitate of tannic acid—a process which is facilitated by the exposure of the wine in bottles to full daylight. There is no doubt that this acid, by combining with the albuminous matters, tends to increase the durability of these wines. Dr. Bence Jones, in his Appendix to Mulder's treatise, gives numerous results of experiments made regarding the acidity of wines by Prout, Liebig, Fresenius, and himself. His general conclusions are that, "proceeding from the least acid wine to the most acid, we have sherry, port, champagne, claret, Madeira, Burgundy, Rhine wine, Moselle. The least acid fluids examined were Geneva and whisky; then rum, brandy, ale, porter, stout. The wines were all more acid than the malt liquids." See also Dr. Druitt's work on *Cheap Wines*.

The recent decline in French vintages by reason of the phylloxera has developed a new wine-making industry in France. Enormous quantities of dried raisins are imported mainly from Smyrna and the East, are soaked in water for 40 or 50 hours, and then treated as fresh grapes. Every 100 kilogrammes of raisins so treated yield 325 litres of white or straw-colored wine, now recognized by the authorities as harmless; 30,000,000 kilogrammes of raisins and currants were used in 1880 in this way.

The most important diseases of wine are:

1. *The turning of wine.*—This disease is incidental to young wine, and seems to occur under special conditions of the weather. The color becomes darker, and the taste first disappears, and, if the disease goes on, becomes disagreeable; the wine becomes turbid and acid. This disease is caused by a decomposition of tartar.

2. *The ropiness of wine.*—This disease consists in the formation of vegetable mucus from the sugar of the wine, and is known as mucous fermentation. The wines liable to this change are those which are deficient in tannic acid.

3. *The bitterness of wine*—to which Burgundy wines are especially exposed—seems due to a second fermentation, inasmuch as a large amount of carbonic acid is evolved. It has been ascribed, whether correctly or not we cannot say, to the formation of citric ether, which is very bitter. The disease is caused by the sediment, and often ceases on being drawn off into other casks.

4. *The acidifying of the wine* depends upon the conversion of the alcohol into acetic acid, and may be stopped at its commencement by adding alkaline carbonates, which, however, destroy the colour, and affect the taste of the wine.

5. *The moldiness of wine* is a disease in which mold-plants are produced on the surface of the wine. How or under what conditions the mold is formed, is not known, except that the admission of air is favorable to the disease.

For further information on this subject, we may refer, *inter alia*, to Henderson's *History of Ancient and Modern Wines*, Bence Jones's translation of Mulder's *Chemistry of Wine*, and to the recent works of Shaw and Denman, in English; to those of Julien, Chaptal, Fauré (1844), and Batilhat, in French; and to those of Ritter, Balling, Von

Babo, Bronner, etc., in German; also to the chief works on technological chemistry in all languages.

Manufacture.—The mode of manufacturing wine varies in its details in different countries. Pagnierre, in his treatise *On the Wines of Bordeaux*, gives the following description of the manufacture of the superior clarets. The grapes, after being gathered, are picked, all that are likely to injure the quality of the wine being carefully removed. A principal vat of the best fruit, which is called the mother-cask (*cuve-mère*), is then made, into which, after picking, the workmen continue to put the best grapes, without their stalks, and without treading them, till they are from 15 to 20 in. deep; after which they throw about two gallons of old cognac or armagnac upon them, and then another bed of picked grapes, followed by two gallons more of brandy, and so on till the vat is full. Spirit of wine is then added, about four gallons being used for a wine-vat of from 30 to 36 tons. The amount of brandy and spirits that is added varies with the quality of the vintage, the better vintages requiring the less spirit. When there is a deficiency of saccharine matter in the grapes, starch-sugar is sometimes added. The *cuve-mère*, when filled, is closed and well covered with blankets to prevent the entrance of air, and is left in this state for about a month. A small cock or tap is placed in the side of the vat at about a third of its depth from the bottom, in order to allow of the progress of fermentation being observed; and to enable the manufacturer to know when the wine, having become cool and sufficiently clear, may be racked off and put into casks, previously prepared by scalding and rinsing with a little spirit. While the *cuve-mère* is at work, the ordinary vintage goes on as follows: The grapes are trodden or acted on by machinery in the press, and put with their stalks into the vats, when the fermentation takes place naturally. About a foot of the upper part of the vat is not filled, in order to leave space for the fermentation, which in very mature vintages sometimes occasions an overflow of these limits. The term *chapeau* is applied to the floating mass of stalks, seeds, and skins on the surface. The vats are lightly covered, and in from a week to a fortnight the wine is ready for being drawn off; for if it is left upon the lees (*marre*), or in contact with its crust (*chapeau*), it would take the disagreeable taste of the stalks. The barrels in which it is then placed are filled to about two-thirds or three-fourths, after which the *cuve-mère* is emptied, and its wine is poured in equal portions into these casks so as to fill them; and the remainder is used to replace every week what is lost by evaporation, or may have leaked away. All proprietors have not the means of making a *cuve-mère;* but in its absence, and with the employment of small vessels, wine of an inferior character is produced. The casks being full, are left unbunged for about a week, the bung-hole being in the meantime covered with a brick or piece of wood. They are filled up every two days, and after bunging, at least once a week, till the wine is in a state to allow the cask to rest with the bung-hole at the side, which is not till after a year and a half.

White wines are made in a somewhat different manner. The grapes are not, as in making red wine, put into the vat to ferment, but after the removal of the stalks, they are trodden, and when taken from the press, the juice, skins, and seeds are put into casks, in which the fermentation takes place, and wine is formed. When the fermentation has ceased, the wine is racked off from the barrels into smaller casks; and any loss that subsequently occurs from evaporation must be replaced once or twice a week.

The nature of the wine-press possesses many modifications. The wine-presses of the Jews consisted of two receptacles, or vats, placed at different elevations, in the upper one of which the grapes were trodden, while the lower one received the expressed juice or must (see Joel iii. 13). These vats were usually hewn out of the solid rock (Isa. v. 2 (margin), and Matt. xxi. 33). In Wilkinson's *Ancient Egyptians*, vol. i. p. 46, there is a figure of a wine-press thus composed of two vats or receptacles. In the process of treading, which seems to have prevailed from the earliest ages, the treaders were assisted by ropes fixed to the roof of the press. A certain amount of juice was allowed to exude from the ripe fruit by its own pressure before the treading began. This was kept separate from the rest of the juice, and formed the *gleucos*, or "sweet wine" noticed in Acts ii. 13. The first drops that reached the lower vat were called the *dema*, or tear, and formed the first-fruits of the vintage, which were to be presented to Jehovah (Ex. xxii. 29). Although the ancient system of treading the grapes still prevails in many countries, it is being gradually displaced by various mechanical appliances. In some parts of France, two wooden cylinders turning in opposite directions are employed to crush the fruit; and the reader will find accounts of more complicated presses in the various works on wine by Cyrus Redding and later authors.

Commerce.—The manufacture of wine has been carried on in all countries where the grape could be successfully cultivated, from the very earliest periods of history; and during the present century, it has followed the footsteps of man, and become established in the American and Australian continents, and promises to become, especially in the latter, a most important introduction. The vine, like most cultivated plants, is capable of producing very numerous varieties, and these, of course, give rise to different qualities of wine; but far more influence is exerted upon the quality of the wine by climate, soil, and the position of the vineyard as to the sun's influence; so that we not only have wines peculiar to particular countries, but of those, again, we have usually very numerous varieties, produced by special causes within those countries; and in addition to all

these, again, we have other differences, produced by the degrees of skill in the manufacture. The earliest wines of which we have any account were made in Asia, but of these we know very little. Later on, we find abundant evidence of the high esteem in which wine was held by the Greeks, Romans, and other civilized contemporary nations; and the name of one of the choicest Roman wines has continued in use till the present time, viz., the Falernian. From what we learn from Pliny and other writers regarding the extraneous additions made by the Romans to their grape juice, and the treatment of the interior of their casks, we should much doubt whether even Falernian would be appreciated by the English palate. See the article "Vinum" in Smith's *Dictionary of Antiquities*. The mediæval history of wine is involved in much obscurity; but we find such abundant mention of sack and canary, that although we are not quite clear as to the exact history of those wines, we are not left in doubt as to the high appreciation felt for them by the priesthood and nobility of those times. The Greek islands seem to have furnished a large portion of the wine then consumed in Europe, and the merchant ships of Venice in the days of her glory appear to have been largely engaged in carrying Greek and Italian wines. The Malmsey of those times was not the produce of Madeira, but of the islands of Tenedos, Lesbos, Chio, and Candia.

Burgundy is the oldest wine-producing country of central Europe, and centuries ago the wine of this province was the choicest to be found on the tables of the rich and noble. Much of the Burgundy of the present day has excellent qualities—being of good body, velvety, and of delicate bouquet. A few scarce kinds, such as the Romanée-Conti, are really splendid wines. Claret or red wine, for the English market, is chiefly the produce of the Medoc district. It begins below Bordeaux, on the left bank of the Gironde, and stretches almost to the bay of Biscay. White wine, or sauterne, is also produced in the same neighborhood. The general character of the Bordeaux wines, which are of all qualities, is crispness, elegance, and fine bouquet, and they improve by keeping. Sparkling wine of great renown is produced in the Champagne, the finest qualities of which sell at exorbitant prices; but it would appear that in no other corner of the earth can wine of the same high character be obtained. See Bordeaux, Burgundy, Champagne.

Germany produces fine white but very few red wines. They are best known in the British market as hocks and Moselles, and are made both still and sparkling. They have much elegance and a racy flavor, but many wine merchants think they have scarcely the value claimed for them; nevertheless their high price shows that they are much in demand. At the Vienna exhibition of 1873, the jurors on the wine section had before them a sample of Rhine wine made in 1706, the year in which Marlborough gained the battle of Ramillies, another coeval with the war of American independence, and another of the year of the battle of Jena. But all these and others made in the early part of the century, before the days of "fortifying," had lost their characteristic taste and flavor, and were but the phantoms of what they had been. See German Wines; Hochheim; Rhine Wine.

The vineyards of Austria are extensive, and produce a great variety of wines, which are mostly consumed in the country itself, the red Vöslauer being the kind principally exported. Hungary is still more a wine-growing country, producing considerably more than it consumes, and is the home of the renowned tokay (q.v.), which boasts a high antiquity, and commands a more fabulous price than any other wine in the world. Méneser-Ausbruch, Carlowitz, Ruster, Somlauer, and one or two others, are also favorably known. Hungarian wines are finding their way to English and other markets, but the long land-carriage operates as a serious check on the trade with England.

Perhaps the wines best known in Great Britain are the sherries of Spain and the ports of Portugal. The best kinds of the former are those technically called *dry*—that is, free from sweetness. Manzanillo is said to be the purest, but Montilla, Amontillado, and vino de Pasto are also famous kinds of sherry. This wine is chiefly shipped at Cadiz, near which it is made. The Malaga wines, both sweet and dry, are widely known, and from Catalonia come what are known in England as the Spanish reds. Port wine (q.v.) is mostly brought from Oporto, and its consumption in Great Britain has, as a rule, continued to increase for nearly two hundred years. The shipments of it had, however, fallen in 1858 to two million gallons; but from that time they gradually rose to the large annual total of seven million gallons in 1877. Portugal exported to Great Britain, in 1883, 3,101,766 gals. of wine (of all kinds). In the same year Spain exported to the United Kingdom 4,730,818 gals., valued at £1,202,186, a decided falling-off. Nearly all wines passing under the names of port and sherry are fortified, that is, dosed with brandy; but these form only a small portion of the wines produced in the Peninsula. Madeira, where twenty-five years ago the vineyards were almost totally destroyed by the oidium fungus, is now rapidly increasing the yield of its highly-prized wine.

Italy, with great natural advantages, is behind several other nations in the production of fine and especially of sparkling wines; but the Barolo of Piedmont, the Chianti of Tuscany, the Orvieto of the Roman states, the Lacryma Christi of Naples, and other special growths, have a high reputation. The celebrated Marsala, a wine with a sherry-like flavor, comes from Sicily. Not much Italian wine is exported, but the acreage occupied by the vineyards must be very large. The lesser wine-growing countries of Europe are Switzerland, Russia, Turkey, and Greece, which continues as in ancient

times to put resin in what is required for home consumption. Australia can already astonish the best French judges by the excellence of her wines, and the cape continues to yield her luscious Constantia and other growths of fine quality. The following table gives the annual yield of the more important wine-producing countries, but the great destruction caused in many districts since 1865 by the *phylloxera* (q.v.)—impairs the value of such a table:

	Gallons.
France, average from 1885–1890	114,000,000
Spain	450,000,000
Portugal, 1882	125,000,000
Germany, 1882	35,130,000
Austria—Hungary, 1883	76,430,000
Hungary, 1883	101,994,970
Italy	605,000,000

With respect to the high prices realized by old wines of famous vintages, we may state that as much as $10 per bottle has occasionally been given for port and Tokay; and on one occasion, a few years ago, two bottles of old Burgundy were sold at the very extraordinary price of $400 each.

Dietetic and Medical Value of Wines.—It may be laid down as a general rule that the use of wine, even in moderate quantity, is not necessary for young or adult persons enjoying good ordinary health, breathing fresh country air, and not exposed to overwork or any other abnormal depressing agency. As, however, life advances and the circulation becomes languid, wine in moderation becomes an essential, or at all events a valuable article of food; and even in earlier life the physician meets large numbers of townspeople, especially women engaged in sedentary occupations, who cannot digest the national drink, beer, which is admirably suited to our out-door laboring population, and to persons of higher rank who indulge freely in open-air exercises. In such cases the beer is replaced by the more grateful beverage tea, which, however, when taken too freely, and without sufficient solid food, gives rise to a form of distressing dyspepsia, which too often impels the sufferer to seek refuge in spirits. In many such cases cheap wine, which may be purchased in this country at from $0.40 to $0.50 a bottle, mixed with an equal bulk of water, will be found an excellent substitute for the beer or tea. We shall first notice the medical uses of those numerous cheap French, German, and Italian wines which have been during the last few years so prominently brought before the attention of the British public by certain enterprising wine merchants; and then briefly notice the uses of the more expensive wines, such as port, sherry, champagne, etc. In the first department of the subject we shall take Dr. Druitt's *Report on Cheap Wines* as our chief authority, and we shall regard as cheap wines those whose price does not exceed $0.75 a bottle. In prescribing wine, whether cheap or dear, the physician desires to give not merely alcohol, for that might be given far more cheaply under the form of gin or common brandy, but a compound liquid containing not only more salts or mineral ingredients than many a mineral water, but also the extractive parts of grape-juice, and the powerful oils and ethers which give to wine its special flavor or bouquet form of gin or common brandy, but a compound liquid containing not only more salts or mineral ingredients than many a mineral water, but also the extractive parts of grape-juice, and the powerful oils and ethers which give to wine its special flavor or bouquet and its singular exhilarating properties. "The distinctive elements of wine," says Dr. Druitt, "are to be had in abundance in cheap Bordeaux, Burgundy, and other French wines; in Rhine wine; in the Hungarian, Austrian, and some Greek wine; and in all with a natural and not injurious quantity of spirit. In prescribing *pure wine*—i.e., light natural, virgin wine—the practitioner has a perfectly new article of both diet and medicine in his hands."—*Op. cit.*, p. 22. In cases of debility and indigestion, such wine as that which we are now considering, diluted with cold water, may often be freely prescribed with great advantage in place of tea at breakfast, as well as at luncheon or dinner, or dinner and supper, according as the patient arranges his meals. The best of the cheap wines are those of Bordeaux: they are pure, light, and exhilarating; moderately strong, seldom containing 20 per cent of alcohol; free from sugar and other materials likely to induce gout or headache; and are admirably adapted, according to Dr. Druitt (who has experimented largely upon them), for children with capricious and bad appetites, for literary persons, and for all whose occupations are chiefly carried on indoors, and which tax the brain more than the muscle. They should be taken *at*, not *after*, meals; and in many cases, when judiciously prescribed, they will be of more service to patients suffering from anæmia, chlorosis, dyspepsia, or gouty or rheumatic tendencies, than any form of medicine. The Bordeaux wines are, moreover, of great use in relieving the restlessness, nightly wandering, and thirst that accompany scarlet fever and measles in children; one part of wine with one or two of cold water, according to age, being an excellent drink, acting at once as a diaphoretic, saline, and sedative. The Burgundy wines are fuller, stouter (on an average from 2 to 4 per cent stronger in alcohol), and higher flavored than the Bordeaux of equal price. The cheap Burgundies are inferior to the Bordeaux as medicinal agents; but the higher-priced wines (at and above 4s. a bottle) are of extreme service in cases of debility with nervous exhaustion, and, as Dr. Druitt remarks, "what Bordeaux is to the blood, that is Burgundy to the nerves." Some of the Hungarian wines which are being now introduced in America are excellent substitutes for Bordeaux; and not having the acidity, austerity, and cold-

ness of the latter, are often preferred by patients. Among the most important of the *dearer* kinds of wine are port, sherry, and champagne. Good old port is a tonic of great value in cases of fever and other forms of extreme debility; but many persons past 40 dare not take it if they have any predisposition to gout. Port wine given with warm water, administered with a biscuit at bedtime, often induces a good night's rest during convalescence from fevers or other weakening diseases. But during the last 30 or 40 years its price has risen from 30 to 100 per cent; and the port purchased at a vintner's by a poor invalid at $1. a bottle is usually nothing but doctored British spirit that has been sent to Hamburg to be transmuted into wine. In place of good port, now unattainable by the poor, the physician had better prescribe good native brandy if a strong stimulant be required, or such wines as the Hungarian Ofner or French Madeira, if it is the nutritive value of wine that is required. Sherry is, in a dietetic point of view, the wine in most general use in America, and if pure it agrees well with most constitutions. It is the only wine admitted into the pharmacopœia, in which it is employed in the composition of aloetic, antimonial, colchicum, and other medicated wines. It is a wine that suits the stomach in many cases of dyspepsia, but it is not often prescribed medicinally. Champagne is a wine that acts as a most valuable medicine in cases of vomiting, irritable stomach, etc., and when the appetite flags and there is great general debility. Genuine Tokay is so rare a wine that it is almost unnecessary to notice it; it is, however, when procurable extremely valuable as a cordial for aged persons of broken-down constitution. See American Wines, French Wines, German Wines, Greek Wines, Italian Wines, Portuguese Wines, Spanish Wines, Vine.

WINEBRENNER, John, 1797–1860; b. Md.; was originally a minister of the German reformed church, and had charge of four small congregations at Harrisburg, Penn., 1821; withdrew, 1830, with some other preachers, and formed a new sect, which they called the *Church of God,* but generally termed Winebrennerians (q.v.). The church has three positive ordinances, baptism by immersion, feet-washing, and the Lord's-supper. For several years Mr. Winebrenner edited the *Church Advocate.* He published *Regeneration; Brief View of the Church of God; Revival Hymn Book; Practical and Doctrinal Sermons.*

WINEBRENNERIANS, or The Church of God, a denomination of Baptists in the United States, organized, 1830, at Harrisburg, Penn., by John Winnebrenner, formerly a minister of the German reformed church. Their doctrines are a belief in the Bible as the authoritative revelation of God; in the trinity, in human depravity, in the vicarious atonement, the freedom of the will; they reject Calvin's doctrine of election; they consider faith and immersion essential to baptism; that the ordinance of feet-washing should be practiced by all Christians, and that the Lord's-supper should be often administered. The church has a domestic and foreign missionary society, and a printing establishment at Harrisburg, Penn. They had in 1890 several colleges, 560 churches, and 36,000 members.

WINES, Enoch Cobb, d.d., ll.d., 1806–79; b. N. J.; graduated at Middlebury college, 1827; took charge of Edge Hill school, Princeton, N. J., 1833; was made professor of languages in the Philadelphia high school, 1838; had a boarding school at Burlington, N. J., 1844–48; became a Congregational preacher, 1849; and was pastor at Cornwall, Vt., and Easthampton, L. I.; professor of languages in Washington college, Penn., 1853; president of St. Louis university, 1859; secretary of New York prison association, 1862; and of National prison association, 1870; went to Europe as a representative of the national government and assembled the first international congress on prison discipline, 1871–72; was chairman of a commission which met at Brussels, 1874, and at Bruchsal, 1875; made arrangements for a second international congress at Stockholm, 1877. Of his published works the principal is *Commentaries on the Laws of the Ancient Hebrews.*

WINFIELD, city and co. seat of Cowley co., Kan.; on the Walnut river, and the Atchison, Topeka, and Santa Fé, the St. Louis and San Francisco, and the Missouri Pacific railroads; 38 miles s.e. of Wichita. It is the seat of St. John's college (Luth.), and Southwest Kansas college (Meth. Epis.), and has a high school with library, Winfield Chautauqua assembly occupying Island park, street railroads, gas lights, waterworks, about 12 churches, several national banks, and daily, weekly, and monthly periodicals. The principal industry is farming. Pop. '90, 5184.

WINGATE, Charles Frederick, b. N. Y., 1847; for some time a N. Y. correspondent of the Springfield *Republican.* He was subsequently connected with the *Housekeeper,* which he founded, the N. Y. *Express,* the *Plumber and Sanitary Engineer,* and other journals. He became a consulting sanitary engineer in New York, and has been an active worker in the cause of civic improvement. He published *Views and Interviews on Journalism* in 1875.

WINGFIELD, John Henry Ducachet, d.d., ll.d., b. Portsmouth, Va., 1833; graduated at St. Timothy's coll., Md., 1850, and at the college of William and Mary, 1853. He was ordained priest in the Prot. Epis. church, 1859, and held several rectorships in the south until 1874, when he became rector of St. James's church, San Francisco. He was consecrated missionary bp. of Northern Cal., 1874.

WINKELMAN, Hermann, b. Germany, 1849. He adopted the profession of a singer after he had reached manhood. While singing in Darmstadt he was heard by Pollini,

of Hamburg, who brought him to the latter city. He became identified with Wagnerian drama, 1882, when he took the part of "Parsival" at Bayreuth, with such success that he was engaged by the Imperial opera at Vienna. Here he sang in Wagner's operas, with Mme. Friedrich-Materna and Herr Scaria. The famous trio made a tour of the U. S., 1884. He has a clear tenor voice of wide register and great power.

WINKLER, a co. in Texas; 800 sq.m.; unorganized; pop. '90, 18.

WINLOCK, Joseph, an American astronomer, was born at Shelbyville, Ky., Feb. 6, 1826, and died at Cambridge, Mass., June 11, 1875. On graduating at Shelby College in 1845, he became professor of mathematics and astronomy, but in 1852 he removed to Cambridge to become a computer of the *Nautical Almanac*. He was professor of mathematics in the navy, 1857–65; and of astronomy at Harvard, 1865–75, and director of the observatory, where he made many important improvements in astronomical equipments.

WINN, a parish in n.w. Louisiana, partly bounded on the e. by the Castor bayou, on the w. by the Saline bayou, drained by the Dugdemona river; 960 sq.m.; pop. '90, 7082. Parish seat, Winfield.

WINNEBAGO, a co. in n. Illinois, having the state line of Wisconsin for its n. boundary; 552 sq.m.; pop. '90, 39,938 of American birth, with colored; drained by the Rock river and its tributaries. Co. seat, Rockford.

WINNEBAGO, a co. in n. Iowa, having the state line of Minnesota for its n. boundary, drained by the head-waters of Iowa river; 408 sq.m.; pop. '90, 7325. Co. seat, Forest City.

WINNEBAGO, a co. in central Wisconsin, bounded on the e. by Winnebago lake, drained by Fox and Wolf rivers and large lakes in the n. portion; 460 sq.m.; pop. '90, 50,097. Co. seat, Oshkosh.

WINNEBAGO, a lake at the e. of Winnebago co., Wis., and entirely comprised within the state. Its area is about 212 sq.m., its length 26 m., and its greatest width 11 miles. The chief ports are Oshkosh, Fond du Lac, and Menasha; the lake is navigated by steamboats.

WINNEBAGOES, a tribe of Indians belonging to the Dakota family. They were, in early times, found about Green bay. Early in the 17th c. they were attacked by a strong alliance of other tribes, defeated, and terribly reduced in numbers. In the French and Indian war they were allies of the French, but during the revolution aided the British forces, and again in 1812. They took part in the Miami war, and were defeated by Wayne. In 1826–27 they made treaties fixing their boundaries, but intrusion on their territory was common; murder of whites followed, and by the treaty of 1832 they gave up all their lands on the Wisconsin and Fox rivers. A reservation was provided for them on the Mississippi, n. of the Iowa. They were removed again in 1846, not to the reservation promised them, n. of the St. Peters, but to one near the Wataub, a shameful transaction. In 1853 they were moved to Crow river, and in 1856 to Blue Earth, Minn., where they were advancing in civilization when the Sioux war broke out, and the whites urged their removal. Again they were taken to an unsuitable place, Crow creek, Dakota, and the greater part fled to the Omaha reservation. In 1866 they were given land at Winnebago, Neb., and in 1869 were placed under the charge of the Friends. They have since advanced greatly in civilization. They now number about 1500.

WINNER, Septimus, American song-writer, b. in Philadelphia. He studied the violin, pianoforte, organ, and other stringed and wind instruments, and began to teach music at the age of twenty. In 1847–57 he was a violinist in the Musical Fund orchestra and in various theaters in Philadelphia. In 1853 he established a music shop in Philadelphia, has been secretary and treasurer of the board of music trade, a manager of the Philadelphia musical fund, and for several years editor of the musical department of Peterson's Magazine. He has made more than 2000 arrangements of airs for the violin, guitar, and pianoforte, and has published numerous books of instruction for the pianoforte, violin, organ, violoncello, guitar, flute, banjo, accordion, clarinet, flageolet, cornet, and concertina. He is the author of the words and music to numerous songs, many of them written under the pseudonyms of "Alice Hawthorne," "Percy Guyer," "Mark Mason," and "Paul Stenton." Among the most popular are, *How Sweet are the Roses*, 1850; *What is Home without a Mother*, 1854; *Listen to the Mocking-Bird; Whispering Hope;* and *Give us back our old Commander*. His son, Joseph, has gained a reputation as a song-writer under the name of "Joseph Eadburn."

WINNESHIEK, a co. in n.e. Iowa, having the state line of Minnesota for its n. boundary, drained by the Upper Iowa, the Turkey, and other rivers; 696 sq.m.; pop. '90, 22,528. Co. seat, Decorah.

WINNIPEG, the largest of the lakes belonging wholly to the Dominion of Canada, lies 90 m. n. of the state of Minnesota, and about 350 m. n.w. of lake Superior, in lat. 50° to 54° n., 96° to 99° west. It is 275 m. long, 4–60 m. broad, has an area of 9000 sq. m., and lies 710 ft. above sea-level. It is connected by navigable channels with lakes Winnipegosis and Manitoba, which lie to the w., and run almost parallel with it. Its tributaries

drain an area of 400,000 sq.m. Of these the largest is the Saskatchewan (q.v.), which flows eastward from the Rocky mountains, through a rich alluvial country, and joins the lake near its northern extremity. The Winnipeg river, 300 m. long, and flowing in a north-westerly direction, connects lake Winnipeg with the lake of the Woods and Rainy lake. The Red river and its great branch, the Assiniboine, discharge their waters at the southern extremity of lake Winnipeg, after flowing through the region to the s. and s.w.—a region which presents a singular and important combination of prairie and woodland. Nelson river, issuing at the north end of lake Winnipeg, is its principal outlet, and connects it with Hudson bay.

WINNIPEG, the capital of the province of Manitoba, Canada, and one of the most important places in the Dominion, whether regarded in a material, political, or historical light, is situated at the confluence of the Red and Assiniboine rivers, the two principal streams of the province. Through the Red river, there is access to lake Winnipeg, and the city is entered by the Canadian Pacific, the Northern Pacific, the Great Northern, and the Manitoba and Northwestern railroads.

Fort Garry, as Winnipeg was originally called, was an old post of the Hudson Bay Company and was associated with the earliest days of trapping and fur-trading. The so-called fort was situated about 400 yards from the mouth of the Assiniboine, and in 1835 was replaced by a larger structure, now dismantled and almost obliterated, which was the centre of the colony of Assiniboia. The fort figures prominently in the history of that colony and of Manitoba, and is noted in later history as the place where Wolseley made his name, and as the seat of Louis Riel's short-lived government, 1869–70. The place had a civil population of 215 only, in 1870, and in 1873, when it was incorporated under its present name, it had less than 2000 inhabitants, but with the establishment of railroad communication in 1878, its prosperity increased rapidly. Up to 1870 the only communication with the nearest places of any size, St. Paul and St. Cloud, in Minnesota, was by carts, and in 1871 an irregular service was established by river in summer and by stages in winter. In 1881 an inflation of values in real estate occurred with subsequent depression, but in a few years the city began to prosper on a firm foundation. Considering its remoteness from the seaboard, it is remarkably cosmopolitan.

The city is irregularly laid out, except the old part contiguous to Fort Garry. Main street, 132 feet wide, was laid out by the government of Assiniboia in 1835 and was originally a colonist road. Portage avenue is another colonist road and both are winding. River Avenue is a favorite driving boulevard. The principal residence portion of the city is south of Portage Avenue, but there are many handsome residences in Fort Rouge, as the part of Winnipeg south of the Assiniboine is called. The city is the headquarters of the provincial government, and has the residence of the lieutenant governor, the parliament house, and the public departments of the province. One of the largest and most ornate buildings is the city hall, and the government offices, the post-office, the General Hospital, custom house, and several of the churches and banks are handsome. The University of Manitoba, situated here, includes Manitoba College (Presby.), St. John's College (Anglican), St. Boniface College (R. C.), and a medical college. The trade of Winnipeg is large, the exports being grains, vegetables, flour, fish, cheese, butter, and furs. There are numerous branch banks and several daily papers and other periodicals. There are large machine and engine shops and car works belonging to the Canadian Pacific railroad, lumber mills, flour mills, and other factories. St. Boniface, a town with over 1500 population, chiefly French, lies on the east bank of the Red river, opposite Winnipeg, and contains St. Boniface college, hospitals, and schools. It is connected with the city by an iron toll bridge. Winnipeg is the seat of bishops of the Anglican and Roman Catholic churches. The city is governed by a mayor and a board of twelve councilmen. The population in '81 was 7985, in '91, 25,642.

WINNIPEGO'SIS (or LITTLE WINNIPEG) **LAKE**, in the Dominion of Canada, emptying into lake Manitoba, s.e. of it, by Water Hen river; about 2000 sq. m.; Red Deer and Swan rivers, and lake Dauphin empty into it. Its length n. and s. is about 120 miles. It is shallow, navigable for vessels drawing 10 ft. of water.

WINNIPISEOGEE, or WINNEPESAUKEE, a lake in N. H., in Belknap and Carroll cos.; length, 25 m.; greatest breadth, 10 m. Its waters are discharged by the Winnepesaukee r., which unites with the Pemigewasset to form the Merrimack. The Merry-Meeting and Smith rivers are the largest streams which enter the lake, which is supposed to be also fed by springs at its bottom. The lake is irregular in outline, and near its shores are many steep and picturesque hills; the water is remarkably clear, but not deep, its greatest depth being 200 ft. At its outlet a dam has been erected to store the water for the manufacturing cities on the Merrimack, which raises it six ft. above its natural level of 472 ft. above tide. It is much renowned for the beauty of its scenery, which has been celebrated in the poetry of Percival and Whittier. An archipelago in the lake contains 264 islands, several of which are inhabited. W. is interpreted to mean The Beautiful Lake of the Highlands.

WINO'NA, a co. in s.e. Minnesota, having the Mississippi river on the n.e., separating it from Wisconsin, drained by the Minneiska and affluents of Root river; 630 sq. m.; pop. '90, 33,797, chiefly of American birth. Co. seat, Winona.

WINO'NA, city and co. seat of Winona co., Minn., on the Mississippi river, and the Burlington route, the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, the Green Bay, Winona, and St. Paul, and the Winona and Western railroads; 104 miles s.e. of St. Paul. It is built on a level plain, and contains a U. S. government building ($150,000), public library (building erected by a citizen at a cost of over $40,000), high school ($60,000), public hospital, the First State normal school, St. Mary's academy, Winona seminary, commercial colleges, opera-house ($50,000), three iron railroad and highway bridges across the rivers, gas and electric light and electric street railroad plants, and waterworks, supplied by artesian wells and wells on the river bank. There are about 25 churches, several national, state, and savings banks, and manufactories of lumber, flour, wagons, carriages, and agricultural machinery. The city was settled in 1851, and chartered in 1857. Pop. '90, 18,208.

WINSLOW, EDWARD, 1595–1655; b. England; member of a good Worcestershire family. He was well educated, and while making a tour on the continent became acquainted with John Robinson, minister of the Independent church in Leyden, which had separated from the church of England. Winslow became a member of the Leyden congregation, and in 1620, with his wife and brother, sailed in the *Mayflower*. He was one of the party that landed at Plymouth. His wife died, March, 1621, and his marriage with Mrs. Susannah White was the first in New England. In 1623 and 1624 he visited England as agent of the Plymouth colony. He became a magistrate that year, went to England again in 1625, and was elected governor in 1633. While on a visit to England in 1635 he went before the council and prevented an attempt to destroy the self-government of the Plymouth colony. The same year he was imprisoned for 17 weeks by Laud on the charge of giving instruction in the church, being a layman, and of performing civil marriage. He was governor again in 1636 and 1644; visited England, 1646 and 1649, but did not return. He became one of the founders of the society for propagating the gospel in New England. In 1655 he was appointed by Cromwell one of three commissioners to take charge of an expedition against the Spaniards in the West Indies, but he died on the voyage. Among his works are *Good Newes from New England* (1624); and *Hypocrisie Unmasked* (1646).

WINSLOW, FORBES BENIGNUS, D.C.L., 1810–74; b. London; studied medicine in New York, then at the Royal college of surgeons, and at Aberdeen. He made a specialty of the treatment of insanity, and was for some time superintendent of a private asylum at Hammersmith. He then devoted himself entirely to consultation-practice in London. He founded in 1848 the *Quarterly Journal of Psychological Medicine and Mental Pathology*. Among his works are: *The Anatomy of Suicide* (1840); *Plea of Insanity in Criminal Cases* (1843); and *Obscure Diseases of the Brain and Disorders of the Mind* (1860).

WINSLOW, HUBBARD, D.D., 1799–1864; b. Vt.; graduated Yale college, 1825; studied theology, New Haven; pastor of First church (Cong.), Dover, N. H., 1828–31; of Bowdoin street church, Boston, 1832–44; traveled in Europe; principal of Mount Vernon young ladies' institute, Boston, 1844–53; edited the *Religious Magazine;* preached at Geneva, N. Y., 1857–59; pastor of 50th street Presbyterian church, New York, 1861. He published: *Controversial Theology; Young Men's Aid; Doctrine of the Trinity; Christianity Applied to our Civil and Social Relations; Intellectual Philosophy; Moral Philosophy; Appropriate Sphere of Woman; Relations of the Natural Sciences to Revelation.*

WINSLOW, JOHN A., 1811–73; b. N. C.; entered the navy as midshipman, 1827. In the Mexican war he took part in the attack on Tobasco as lieut. of the *Cumberland*. In 1861 he had command of the Mississippi flotilla, and was present at fort Pillow. In 1863 he took command of the *Kearsarge*, and in June, 1864, waited off the Cherbourg harbor for the famous confederate privateer *Alabama*, which came out from the neutral port in response to his challenge. The *Kearsarge* was protected by chain armor and met with little loss. The *Alabama* was sunk, and her capt., Semmes, escaped in an English yacht. Winslow was made commodore for this success, 1864, and rear-admiral in 1870.

WINSLOW, JOSIAH, 1629–80; b. Marshfield, Mass.; had command of the military band, and in 1656 captured Alexander, the son of Massasoit, and restored security to the colony. In 1675 he was appointed general-in-chief of the forces of the united colonies raised for king Philip's war, and held the position until 1671. He was governor's assistant in 1673, and the same year became governor of Plymouth.

WINSLOW, MIRON, D.D., LL.D., 1789–1864; b. Vt., a descendant of Kenelm Winslow, who came from England in the *Mayflower;* graduated at Middlebury college, 1815; Andover theological seminary, 1818; married Miss Harriet Wadsworth Lathrop of Norwich, Conn.; sailed for Jaffna, India, from Boston, June 8, 1819, as a missionary of the American board; with Mrs. Winslow he established the Oodooville seminary for girls, 1824. After her death he sailed for America in 1833, having in charge ten little girls, from the missionary families, sent for education to America. Returning, he established in 1837 the American mission in Madras. To the main work of preaching the gospel to the natives, and teaching and superintending native schools, he added the preparation of school and reading books in Tamil, assisted also in the translation of the Bible, wrote

some works on missions, and contributed occasionally to American and European periodicals. His chief literary work was a dictionary of the Tamil and English languages, completed in 1862. It was in part based on materials in manuscript left by the Rev. Joseph Knight of the London missionary society, and the Rev Samuel Hutchings of the American mission. It contained 67,452 words in both high or poetical, and low or common Tamil. It is said to be the most elaborate and complete dictionary hitherto prepared in any of the languages of India, except the Sanskrit lexicon of Prof. Wilson. Prompt and firm in judgment, dignified and courteous in manner, he commanded marked respect from the natives and from English officials in India. After 44 years' service in India, he died at the cape of Good Hope on his third voyage toward America.

WINSOR, Justin, b. Boston, 1831; graduated at Harvard, and continued his studies at Paris and Heidelberg. He was superintendent of the Boston public library, 1868–77, when he was appointed librarian of Harvard university. He was one of the most eminent librarians in the United States, and did much to increase the efficiency of libraries. Besides many bibliographical lists and catalogues he has written several books, and edited *The memorial History of Boston* (1880); *Narrative and Critical History of America* (1884–9); *Christopher Columbus* (1891); *The Mississippi Basin*, 1895). He died in 1897.

WINSTED, a borough in the town of Winchester, Litchfield co., Conn.; on Mad and Still rivers, and the New York, New Haven, and Hartford, and the Philadelphia, Reading, and New England railroads, 25 miles n.w. of Hartford. It has the Gilbert school, Gilbert school library, Gilbert home for the friendless (endowed with $400,000), Beardsley library, electric lights, national and savings banks, waterworks supplied from Crystal lake, Soldiers' memorial park and tower, Highland lake (3 miles long), and manufactories of knit goods, clocks, coffin trimmings, cutlery, spool silk, scythes, leather, shoes, edge-tools, etc. Pop. '90, 4846.

WINSTON, a co. in n. Alabama, drained by Sipsey creek, the Blackwater, and other small rivers; 630 sq. m.; pop. '90, 6552, chiefly of American birth, with colored. Co. seat, Double Springs.

WINSTON, a co. in central Mississippi, drained by the head-waters of the Pearl river; 640 sq. m.; pop. '90, 12,089, chiefly of American birth, includ. colored. Co. seat, Louisville.

WINTER, William, b. Mass., 1836; graduated at the Harvard law school; removed to New York in 1859; was a writer for *Vanity Fair*, memoirs of two of whose best known contributors, George Arnold and Fitz-James O'Brien, he has since published; he wrote the dramatic criticisms for the New York *Albion*, 1861–65. He has since been dramatic editor of the New York *Tribune*. He has published the poems *My Witness*, (1871); *Thistledown* (1878); *The Wanderers* (1888); *Poems* (1880). His verse has singular gracefulness and charm. His prose works include: *Edwin Booth in twelve characters* (1871); *The Trip to England* (1879); *The Jeffersons* (1881); *English Rambles* (1883); *Henry Irving* (1885); *Shakespeare's England* (1888); *Gray Days and Gold* (1891); *Life and Art of Edwin Booth* (1894).

WINTERBERRY, a name applied to two species of *ilex*, *I. verticulata*, or black alder, and *I. lævigata*, or smooth winterberry, and therefore closely related to *I. Glabra*, or inkberry (q.v.) and *I. cassine*, or yaupon, and to the holly (q.v.), *I. opaca* (Gray). Indeed they all belong to the holly family (*aquifoliaceæ*). See Holly. The common winterberry, or black alder, has obovate, oval or wedge-lanceolate leaves, serrate, downy on the veins beneath; flowers, which appear in May and June, are all very short-peduncled. It grows on moist, preferably rich ground, from 6 to 12 ft. high, bearing in November great quantities of brilliant crimson or scarlet-crimson berries, which are often gathered and used as vase ornaments or wreaths. If carefully dried they retain much of their brightness for some time. The smooth winterberry (Gray) has lanceolate or oblong-lanceolate leaves, pointed at both ends, shining above, beneath mostly glabrous. It grows in wet grounds from Maine to the mountains of Virginia.

WINTERGREEN, the popular name of plants of the genera *pyrola* and *chimaphila*, of the natural order *pyrolaceæ*, which, according to some botanists, is a sub-order of *ericeæ*, distinguished chiefly by difference of habit, but also by declinate styles, seeds with a loose-winged skin, and a minute embryo in the base of fleshy albumen. Only about twenty species of *pyrolaceæ* are known. They are natives of woods throughout the whole of the northern hemisphere, and are herbaceous or half-shrubby plants, with a corolla of four or five segments, which are almost petals, but are slightly united at the base. Several species of *pyrola* are natives of America, perennial herbaceous plants, with flowers of some beauty. Two species of *chimaphila*, half-shrubby plants, with beautiful evergreen leaves, natives of North America, *C. umbellata* and *C. maculata*, are valued for their tonic, diuretic, and narcotic qualities, and are used in dropsy, calculus, strangury, and other diseases.

WINTERGREEN, Oil of, or *gaultheric acid*, is an essential oil yielded by the flowers of the *Gaultheria procumbens* (see Gaultheria), abundant in New Jersey, and consisting chiefly of methyl salicylate, $CH_3 \cdot C_7H_5O_3$, mixed with a small quantity of a hydrocarbon, termed *gaultherilene*, which is isomeric with oil of turpentine, and which, being more volatile than the salicylate of methyl, is easily separated from it. The salicylate of

methyl is much the more abundant constituent of the oil (see SALICYLIC ACID). This oil is not only yielded by the distillation of other plants, as the leaves and flowers of *monotropa hypopitys*, and the bark of *betula lenta*, but may be artificially formed by distilling a mixture of 2 parts of crystallized salicylic acid, 2 of anhydrous wood-spirit, and 1 part of oil of vitriol. In whatever mode it is obtained, it presents the appearance of a colorless or yellow oil, of a powerful, agreeable, and persistent odor; and hence it is largely used in perfumery.

WINTERHALTER, FRANZ XAVER, 1805–73; b. Baden; studied art at Freiburg and Munich, and in Italy. He became a fashionable portrait painter, and among his sitters were queen Victoria, the prince of Wales, and the empress Eugénie. He also painted groups of the royal family of England and of the French court. Of his pictures other than portraits "Dolce far niente" and "Roderick the Goth seeing Florinda for the First Time," are generally considered the best.

WINTER MOTH *Cheimatobia brumata*, a species of moth, the caterpillar of which is very injurious to plum trees. It has long been well known as common in many parts of the continent of Europe, and has of late begun to be very abundant also in some parts of England, as in the vale of Evesham, in Worcestershire, celebrated for its plum plantations, where damage has been done by it to the extent of £20,000 or £30,000 in a year. It is an insect about half an inch long, of a light-brown color. The male alone has wings; the female, as in a few other moths, is wingless. The eggs are hatched early in spring, and the caterpillars, at first very minute, feed upon the buds of the plum. The eggs are deposited on trees, chiefly around the base of the buds, and in chinks of the bark. Like most of the moths, this insect is nocturnal in its habits. It is during night that the males fly about the trees, and the wingless females creep up their stems. The best mode of preventing its ravages is to surround the stems of the trees with something over which the females cannot climb from the ground, in which they pass their chrysalis stage. Boxes are used for this purpose in Germany, in which the ascending insects are trapped. A more easy method is to coat the trees with a composition of tar and greese in the beginning of winter, the time at which these moths appear in their perfect state, and when, of course, the laying of eggs takes place. By visiting the plantation of plum trees with a lantern at this season, the gardener is often also successful in killing great numbers of them.

WINTER'S BARK, a stimulant, aromatic, and tonic bark, resembling cinnamon, and used for the same purposes. It derives its name from capt. Winter, who first brought it from the strait of Magellan in 1579. It is the produce of *drimys Winteri*, a native of some of the mountainous parts of South America, and abundant in the lower grounds of cape Horn and Staten island—an evergreen shrub with laurel-like leaves, corymbs of white flowers, and many-seeded berries. This shrub belongs to the natural order *magnoliaceæ*, and to a section of it which has by some been constituted into a separate order, *Winteraceæ*, chiefly distinguished by dotted leaves and aromatic qualities. The star anise (*illicium*) is nearly allied to it. The bark of other species of *drimys* has similar properties to Winter's bark, as that of *D. granatensis*, much used in Brazil as a remedy for colic, and of *D. axillaris*, a New Zealand tree.

WINTERTHUR, one of the most industrious and beautiful of the smaller towns of Switzerland, in the canton of Zurich, stands on the Eulach, 13 m. n.e. of Zurich. Its situation among hills, many of which are clothed with vines, is specially pleasant. Cotton-spinning, cotton-printing, dyeing, and the manufacture of machinery and weapons, are actively carried on. Pop. '88, 15,805.

WINTHROP, FITZ JOHN, 1638–1707; b. Ipswich, Mass.; son of Gov. John of Conn.; educated in England. He held a military commission under Richard Cromwell, but at the restoration returned to Connecticut; served in king Philip's war; was a member of Governor Andros's council, and a magistrate, and in 1698 was appointed maj.gen. of the Canada expedition. From 1693 to 1698 he was the British agent in the colony, and gave great satisfaction. From 1698 until his death he was governor of Connecticut.

WINTHROP, JAMES, LL.D., 1752–1821; b. Mass.; graduated at Harvard, 1769, where he was librarian, 1772–87. He was wounded at Bunker Hill. After the revolution he was chief justice of the state court of common pleas. He wrote books in regard to Scriptural prophecies, and was a contributor to the *Literary Miscellany*.

WINTHROP, THEODORE, 1828–61; b. New Haven, Conn.; graduated at Yale college. He spent some time in a New York counting house, and at Panama. He accompanied Lieut. Strain's expedition to the isthmus of Darien, suffering hardships which seriously impaired his health. He afterward practiced law for a short time in St. Louis, but soon returned to New York. He now wrote tales and stories, none of which were published until after his death. Early in 1861 he went to Washington with the 7th New York regiment. He was soon made military secretary to Gen. Butler, with the rank of maj. He was killed at the battle of Big Bethel, June 10, 1861, at the head of the assault upon the confederate left. His works, of which a complete edition with a memoir by his friend George William Curtis, has been published, are: *Cecil Dreeme; John Brent; Edwin Brotherloft; Canoe and Saddle;* and *Life in the Open Air*.

WINTHROP FAMILY.—John, governor of the colony of Massachusetts, was born in Groton, county of Suffolk, England, Jan. 12, 1588; was bred to the law, appointed justice of the peace at the age of 18, and on account of his excellent and pious character, was, in 1629, elected by the governor and company of Massachusetts bay to govern their colony. He sold his estate, and April 7, 1630, sailed from Yarmouth with 900 persons. During the voyage he composed an essay, entitled *A Model of Christian Charity*. He was re-elected governor every year until 1634, when he became deputy-governor under sir Harry Vane, with whom he had an animated controversy on the doctrines of Mrs. Hutchinson. In 1637 he was elected over sir Harry, and continued governor, with a brief interval, during his life, and had more influence probably than any other man in forming the political institutions of the northern states of America. He was opposed to an unlimited democracy, for he said, "The best part of a community is always the least, and of that best part the wiser part is always the lesser." He kept a journal up to 1649, two books of which were published in 1790; and the third, found in the New England library, kept in the tower of the Old South church in Boston, in 1816. A revised edition was published at Boston, in 2 vols. (1825–26). He died at Boston, Mar. 26, 1649. —John, governor of Connecticut, son of the preceding, was born at Groton, England, Feb. 12, 1606; educated at Trinity college, Dublin; made the tour of Europe; went to America in 1631, was chosen a magistrate in Massachusetts, but returned to England; and in 1635 went to Connecticut, built a fort at the mouth of the Connecticut river, was made governor of the colony, and founded the city of New London in 1646. He obtained a charter for the colony from Charles II., and was first appointed governor under it; and, in 1676, represented his colony in the congress of the united colonies at Boston. He was a man of eminent virtues, and considerable acquirements. Some of his papers are contained in the *Philosophical Transactions*. He died at Boston, April 5, 1676.—John, ll.d., American scholar, a descendant of the first Governor Winthrop, was born in Massachusetts, 1714; graduated at Harvard college, 1732; and in 1738 was appointed Hollis professor of mathematics and natural philosophy. In 1740 he observed the transit of Mercury; and, in 1761, went to Newfoundland to observe the transit of Venus. He published tracts on earthquakes, comets, and other astronomical subjects. Died at Cambridge, May 3, 1779.—Robert Charles, ll.d., American statesman and orator, descendant of the sixth generation from the first governor Winthrop, was born at Boston, May 12, 1809, graduated at Harvard college in 1828, studied law with Daniel Webster, and was admitted to the bar in 1831, but soon abandoned law for politics, and was elected to the state legislature in 1834, where he served five years, three as speaker of the house. In 1840 he was elected to congress, of which he was a member for ten years. In 1847 he visited Europe, and was the whig candidate for speaker, but defeated after a balloting of three weeks. In 1850 he succeeded Mr. Webster, who became secretary of state, as senator from Massachusetts, a place in which he was succeeded by the more radical Charles Sumner. He was also defeated as a candidate for governor of Massachusetts. He published *Life of J. Winthrop, Memoir of N. Appleton* (1861); *Speeches* (1853–67); and *Washington, Bowdoin, and Franklin* (1876). He died 1894.

WIRE and WIRE-DRAWING. The facility with which any metal can be drawn into wire depends upon its ductility. Most metals have this property; but some, like bismuth and antimony, are so brittle that they can only be drawn out with difficulty, and wire made from such metals is useless, from want of tenacity. See Ductility.

Metals largely used for making wire, such as iron, brass, and copper, are drawn by essentially the same process. We may take iron as an example. It is prepared by cutting up flat rolled plates into square rods of a given thickness. This is done by means of a pair of slitting rollers; one of these has grooves, equal to the breadth of the rods wanted, fitting into corresponding grooves in the other, which cut up the metal like scissors. The rods are cleaned of scales of oxide, either by mechanical rubbing, or by chemical treatment with dilute sulphuric acid. If the rod is thick, it has its square edge taken off by rollers. It is then drawn into wire by forcing it through the hole of a *draw-plate*. This is an oblong piece of hard steel pierced with conical holes, gradually diminishing in diameter, and having the smallest ends of these tapering holes carefully prepared to the required size. Sometimes cubical shaped dies, each with a single trumpet-shaped hole, are used. Motion is given to the drawing-block or cylinder by means of beveled wheels connected with a shaft driven by steam or water-power.

The workman commences by making a point on the rod, so as to allow it to pass through the hole, and be grasped by a pair of pincers attached to a chain, which draws it out till the length is sufficient to pass round the cylinder. This much is done by hand, and then the cylinder, being put in gear, is made to revolve and pull the wire through the draw-plate—coiling it round itself as the drawing proceeds. After being once drawn, it is again passed through a smaller hole, and so the process is repeated till it has been reduced to the size required. Fine wire may require from 20 to 30 drawings. The cylinder revolves slowly with a thick wire, and the speed is increased as the size diminishes. After being passed a few times through the draw-plate the metal becomes brittle, and requires to be annealed. Sometimes, a lubricating substance—as wax, grease, or soap—is employed during the drawing, especially for fine wires.

For some very accurate purposes, such as chronometer springs, and for gold and silver lace, the wire is drawn through jeweled holes, that is, holes perforated in rubies and other hard gems. A silver wire 170 m. long, and about $\frac{1}{300}$ of an inch in diameter, has been drawn through a hole in a ruby, and found, by a micrometer, to be of exactly the same size at the end as at the beginning; whereas the drawing of a length of 16 m. of brass wire through a steel draw-plate necessitates a readjustment of the hole.

Platinum wire can be drawn as thin as $\frac{1}{3000}$ of an inch in diameter by first encasing it in silver, drawing down the compound wire, and then dissolving off the silver with nitric acid. By the same process gold wire can be obtained only $\frac{1}{5000}$ of an inch in diameter. It has been shown by Babbage, as an illustration of how greatly labor increases the value of a raw material, that one pound of iron, which costs twopence, will yield 50,000 wire pendulum springs for watches, each weighing about one-seventh of a grain, and selling at the retail price of twopence.

Wire, although mostly cylindrical in form, is drawn of many different sections, such as oval, half-round, flat, triangular, molded, and the grooved pinion-wire from which the small toothed pinions for clocks and watches are cut. Copper wire of different forms is used to form patterns in the blocks used by calico printers.

The following table (given by Dr. Tomlinson) of weights, omitting fractions of a pound, which were sustained by wires 0.787 of a line in diameter, shows the comparative tenacity of a few of the metals: Iron, 549 lbs.; copper, 302 lbs.; platinum, 274 lbs.; silver, 187 lbs.; gold, 151 lbs.; zinc, 110 lbs.; tin, 35 lbs.; lead, 28 lbs. It may be remarked here that some kinds of brass wire have been noticed to become extremely brittle in the course of time, especially if subjected to vibration, and even to break when used to support objects, without any assignable cause.

The quantity of wire used in various manufactures is something enormous, and of late years numerous articles of woven wire, such as mats, baskets, etc., have become very common. Fence wire is now in use all over the world, the two principal kinds being a twisted wire of several strands from which sharp points stick out radially, called barbed wire, and an oval wire which is wavy in the plane of the largest diameter. The telegraph, telephone and electrical work in general have added enormously to the consumption of iron and copper wire.

WIREPULLER. The person who controls by secret wires the movements of a puppet, or doll; hence the term is applied to any secret influence or management to give effect to a desire; political intrigue for party purposes, elections, etc.

WIRE-ROPES have come greatly into use of late years for winding purposes in mines and on inclines, for the rigging of ships, and for numerous engineering contrivances; also for the construction of electric-telegraph cables. They are almost alway "galvanized," that is, coated with zinc. A hemp rope 6 inches in circumference, and weighing 9 lbs. per fathom; an iron-wire rope $2\frac{3}{8}$ inches in circumference, and weighing 5 lbs. per fathom; and a steel-wire rope $1\frac{7}{8}$ inch circumference, and weighing 3 lbs. per fathom, are all of equal strength—the breaking strain of each being 10 tons.

WIRE-WORM, a name given by farmers and gardeners to the larvæ of click beetles (q v.), which are long and hard, and often swarm in corn fields, gardens, and pastures, feeding on the roots of crops, and doing great mischief. The best known British species are *elater* or *agriotes lineatus*, *E.* or *A. obscurus*, and *E.* or *A. sputator*. The first of these, which is the largest, is in its perfect state about half an inch long, with brown head and thorax, clothed with cinereous down; the elytra tawny, striped with brown. The larva, when full grown, is fully half an inch long, very narrow, yellowish, hard, and shining, the jaws tipped with black. The second species named is in its perfect state of an earthy-brown color. The third has a black head and thorax, with many dots, the elytra light brown, with dotted lines. It is only about a quarter of an inch in length. Wire-worms are very small when first hatched, and are said to live for years in the larva state. Moles, rooks, and pheasants are useful in destroying them. Clover crops are said to have the effect of increasing their numbers. Farmers and gardeners resort to various means in order to get rid of this pest, as hard rolling after a top-dressing of lime, and mixing spirits of tar, gas-lime, or rape-cake with the soil; but one of the most effectual is the strewing of slices of potatoes or turnips on the ground, under which they soon congregate, and great numbers are thus easily destroyed.

WIRT, a co. in w. West Virginia, bounded on the n. by Hughes river; drained by the Little Kanawha; 290 sq.m.; pop. '90, 9411. Petroleum is largely exported. Co. seat, Elizabeth.

WIRT, WILLIAM, LL.D., 1772–1834; b. Md.; son of a Swiss father and a German mother. He began to practice law at Culpeper Court-house, Virginia, in 1792; 7 years later he was elected clerk of the Virginia house of delegates. For a short time in 1802 he was chancellor of the e. district of Virginia, but he soon resigned. Removing to Richmond in 1806, he gained high reputation at the bar in the trial of Aaron Burr in 1807. He represented Richmond in the house of delegates, 1807–8, where he was a warm supporter of Jefferson. In 1816 he became U. S. attorney for the district of Virginia, and he was attorney-gen. of the United States, 1817–29, when he settled in Baltimore. In 1832 he received the anti-masonic nomination for president of the United

States. His *Letters of a British Spy*, containing sketches of popular orators, appeared in the *Argus* for 1803. Better known is *Life of Patrick Henry* (1817).

WISBECH, or WISBEACH, a market t. in Cambridgeshire, in the isle of Ely, occupies a position of importance in the Fen district, on the Nen, 40 m. n. of Cambridge. Wisbech is a busy and prosperous place. Its principal buildings are the church of St. Peter and St. Paul, lately restored; the corn exchange, the town hall, the cattle market, and the new schools. Wisbech is connected with the Great Eastern, the Great Northern, and the Midland railways. By the Nen, which falls into the Wash, at the distance of 12 m. below Wisbech, communication is maintained between this town and the North sea. The navigation of the river has been much improved within recent years, and Wisbech is considered the port of Cambridgeshire. It is generally well built, contains a number of useful institutions, and carries on rope-spinning, brewing, and general trade. Corn, timber, wool, salt, and seeds are exported; wine, deals, oil-cake, corn, slates and coal imported. Vessels of upwards of 500 tons can ascend from the Wash. Pop. '91, 9395.

WISBY, a once famous seaport of the Swedish island of Gothland (q.v.), capital of the island, and situated on its w. coast, about 130 m. s. of Stockholm. It is of the highest historical and antiquarian interest; and though the time of its foundation is unknown, it was during the 10th and 11th centuries (200 years before the establishment of the Hanseatic league in 1241) one of the most important commercial cities in Europe. It was a principal factory of the Hanseatic league during the 14th and 15th centuries. The eastern trade, which during the 11th and 12th centuries passed through Russia, and thence down the Baltic to Gothland, centered in Wisby, and greatly enriched that port. In 1361 Valdemar IV. of Denmark took the town by storm, and, plundering it, obtained an immense booty. This was a fatal blow to the prosperity of the place. The architecture of Wisby is exceedingly interesting. Its ancient feudal walls and towers exist in almost as entire a state as they were in the 13th c., and render its appearance, as seen from the sea, exceedingly striking. The early grandeur of the town is attested by the fact that it contains, well preserved, the remains of 18 churches, all of which date from the 11th and 12th centuries, are varied in form and ornament, and are a mine of interest to the student of early Gothic. The oldest is the church of the Holy Ghost, built in 1046. Of late it has begun to recover, and promises to regain some of its former prosperity. Pop. '91, 7102.

WISCHEHRAD (old Slav. and Bohem. *wyschehrad*, Pol. *wyszogrod*) is the name of numerous towns and castles in all Slavonic countries, e.g., the original residence of the princes of Bohemia, now a quarter of the city of Prague. The word is composed of the root *wys* or *wysch*, high, and *hrad* (Rus. *gorod*, Pol. *grod*, in some dialects *grätz*), a fort, castle, town. *Hrad* is from the same root as Ang.-Sax. *hreod*, Eng. *reed*, *rod*, another form being *yerde* or *yard*. It signified primarily a place defended by rods or poles, a palisaded fort, and hence a town. See TON.

WISCONSIN, a river of Wisconsin, rises in the northern center of the state, and flows s. and w. to join the Mississippi. Length, over 600 m. A canal from Portage City connects with the Fox river; so that there is steamboat communication between lake Michigan and the Mississippi.

WISCONSIN, a northern lake-state, lying between lat. 42° 27′ and 47° n. and long. 86° 53′ and 92° 54′ w., except the Apostle islands in lake Superior and the islands off the north-east coast in lake Michigan. The state is bounded on the north by lake Superior and the Upper Peninsula of lake Michigan; on the south by Illinois; on the west by Iowa and Minnesota, with the Mississippi and St. Croix rivers as a partial boundary line; and on the east and north-east by lake Michigan and the Upper Peninsula. Its length from north to south is 300 miles; its extreme breadth, 250 miles; and its coast line, over 500 miles. Its land area is 54,450 sq. miles; its gross area 56,040 sq. miles, or 35,865,600 acres. The name Wisconsin was taken from that of its chief river, the word being an Indian one of doubtful etymology, though generally identified with the Chippewa *Wishkosisibi*, "Prairie River." The state is popularly styled "the Badger State," though the badger is only seldom found within its limits. Wisconsin stands seventeenth among states in the order of their admission to the Union.

TOPOGRAPHY.—Wisconsin, for the most part, is a great plain, varied only by the cliffs bordering the rivers and lakes, and elevated from 600 ft. to 1500 ft. above the ocean. The highest lands are those along the sources of the tributaries of lake Superior, which, near the Montreal river, are 1700 ft. to 1800 ft. above the sea, gradually diminishing westward to about 1100 ft. at the western line of the state. From this great water-shed the land slopes rapidly toward the lake, and more gradually toward the south to the lower Wisconsin river, whence there is another slope toward the south, drained mostly by the waters of Rock river and its tributaries. In the southwestern part of the state are elevations called "mounds" of considerable height. These are Blue Mound, in Dane county, which is 1700 ft.; Platte Mound, in Grant county, 1281 ft.; and Sinsinawa, also in Grant county, which is 1169 ft. above the sea. The rivers which discharge their waters into lake Superior are the Montreal, Bad river, Bois Brûlé, and St. Louis. They are all short, and have a descent of about 800 ft. in a length of 30 or 40

miles. The Menominee, Peshtigo, Oconto, Pensaukee, and Fox or Neenah rivers run into Green bay. The last named is an important stream, rising in Green lake, and flowing so near the Wisconsin river that a short canal connects the two, and makes navigation possible between Green bay and the Mississippi. Other rivers are the Kewaunee, Manitowoc, Sheboygan, and Milwaukee, which are tributaries of lake Michigan. The Mississippi, as stated above, forms a part of the western boundary of the state, and receives within the state the St. Croix, Chippewa, Buffalo, Trempealeau, Black, and Wisconsin rivers, as well as several smaller streams. The coast-line on lake Superior and along lake Michigan aggregates over 500 miles. Northern Wisconsin resembles Minnesota in the number and character of its beautiful lakes. Winnebago is 26 m. long and 10 m. wide, and Geneva and Devil's lakes are of considerable size. The Wisconsin, St. Croix, and other streams pass through deep gorges called "dalles," and noted for picturesque scenery. The St. Louis falls 320 ft. in 16 m., and the Menominee 134 ft. in 1½ m.

The scenery of Wisconsin is romantic and abounds in many picturesque and striking features. The deep-cut Rood's Glen and Witches' Gulch near Kilbourn; the imposing Fortification rock and the cliff on lake Pepin; the falls of the Chippewa river; and, above all, the hundreds of little lakes embowered in dense forest or green fields afford the most exquisite studies for the artist. Many of these are deep set in bowls of rock over whose brim the crystal tide washes unceasingly. The largest of these lovely lakes is Winnebago, and, besides those already mentioned, others notable for their great beauty are Green lake, Lauderdale, Elkhart, Delavan, Pewaukee, Spring, Oconomowoc, and the four lakes at Madison.

Mineral springs of great repute are those at Waukesha, 20 miles n.w. of Milwaukee, and now a famous summer-resort. Here is the Bethesda spring, and in connection with it, the Bethesda Baths, open from June to October. Other springs are at Beaver Dam (the Vita springs); and at Madison.

The Apostle islands in lake Superior, which cover some 200 square miles, are included within the state of Wisconsin.

History.—The territory now comprised within the limits of the present state was once inhabited by the mysterious race known as the Mound Builders, whose works in the shape of rude fortifications and tumuli of earth are still to be seen in many places. Many of these structures are made to imitate the human figure, or are in the shape of animals. The more remarkable are in Jefferson county, where a space of nearly 18 acres is enclosed by a wall of earth and burnt clay, with buttresses and mounds. Remains of pottery, flint arrow-heads, and pipes and axes of stone are also found, besides beads and amulets, and tools of hardened copper. No other state possesses so many relics of the prehistoric race, if such indeed it be,—for the United States Bureau of Ethnology has put forth the statement that these various works are to be ascribed to the ancestors of the Winnebagos (the old Dakotas) rather than to a people of different ethnic relations.

In 1634, the Sieur de Frontenac, governor of New France, sent one Jean Nicolet into this territory with directions to induce the Indian tribes dwelling there to enter into commercial dealings with the French of lower Canada. Nicolet ascended the Fox river and then proceeded south through Illinois. In 1658–59 two other Frenchmen, Radisson and Groseilliers, visited Green bay in search of furs, and appear to have descended the Wisconsin river to the Mississippi. In 1661 these traders built a small stockade near the present town of Ashland. In 1665 the priest Father Allouez established a mission at La Pointe on Chequamegon bay, near Radisson's stockade. Depere on the first rapids of Fox river became an important trading station for furs, and was visited by Joliet and Marquette in 1673. Other famous explorers, such as La Salle in 1679, Du Luth and Father Hennepin in 1680, and Nicholas Perrot in 1685, penetrated the rivers and bays of Wisconsin. In 1689, Perrot, who had been made by the French governor, commandant of the west, erected forts on lake Pepin, Prairie du Chien and elsewhere. In 1692, Le Sueur built a stockade at La Pointe. For more than a century, the French and their Indian allies held undisputed possession of the territory, and from it sent out many expeditions against the English settlements further east. It was, in fact, one of these Frenchmen, Langlade, who planned and executed the ambuscade into which Gen. Braddock fell in 1755. When the English gained possession of Quebec, and with it the control of Canada (1763), Wisconsin was united with Canada by George III., though in all externals it still remained essentially French. With the whole Northwest, it was ceded to the United States at the end of the Revolution, by the treaty of 1783, yet the American government took no definite steps toward assuming possession of it until the time of the war of 1812–15. From 1800 until 1809 it had been regarded as a part of Indiana territory; from 1809 until 1818 it was a part of Illinois, and from 1818 to 1836, of Michigan. In the last named year, Wisconsin territory was organized as a separate government, including at that time Iowa, Minnesota, and a part of what was afterward the two Dakotas.

The advent of American settlers did not occur to any extent before 1827, in which year lead mines were opened; and a little later the agricultural possibilities of the territory began to be developed. A sharp conflict with the Indians, the "Black-Hawk War," tamed the truculent Sacs and Foxes; and the tide of immigration from the east set in. Racine and Sheboygan were founded in 1836, Kenosha in 1835, Oshkosh

* Organized since 1890.

and Janesville in 1836; Milwaukee in 1835; Madison in 1836; La Crosse in 1840; Stevens Point in 1843; and Appleton in 1848. In 1846, a convention drew up a state constitution, which was rejected by the people because of its financial provisions. A second constitution was prepared in 1847, and ratified; and the state was admitted to the Union, May 29, 1848. The territorial capital had been first at Belmont, but Madison was selected in 1838, and was adopted as the seat of the state government. During the civil war, Wisconsin furnished 91,327 soldiers to the Union armies.

Geology and Mineralogy.—The geology of the state is the series of rocks extending from the Laurentian to the Devonian period. In the north-central portion there is a large area of archæan rocks, having an extreme length east and west of nearly 240 miles, and a breadth north and south of 160 miles. These rocks are metaphoric in origin, and consist chiefly of granite, gneiss, syenite, diorite, and other hornblendic and allied rocks, quartzite, porphyrite, and a variety of schists and slates. South, south-west, and south-east of this tract, and again on the Lake Superior slope, appears the Silurian period, which prevails over all the rest of the state, several beds of the upper and lower Silurian having been identified as belonging to the well-known New York series of paleozoic groups. In the south-west, the Galena limestone prevails, and in the north are handsome Laurentian limestones or marbles, blue, red, dove-colored, and variegated. All these rocks are older than those of the coal formations, and consequently no coal is found in the state. Lead ore is the most important mineral product, and this is obtained chiefly in Grant, Lafayette, and Iowa counties. Iron ores are found in large quantities at Iron Ridge in Dodge county, at Ironton in Sauk county, at the Black River falls in Jackson county, and in the Penokee iron range in Ashland county, near Lake Superior. Magnetic ores also occur in the archæan region in the vicinity of the Menominee river, in the north-eastern part of the state. Native copper is found in limited quantities in the northern part of the state, and copper ores have been discovered in fissures in Iowa and Crawford counties. Two ores of zinc, associated with the lead, have been smelted at Mineral Point. Limestone, glass-sand, porcelain clay (at Grand Rapids), hydraulic cement, fine brick clays (notably those of Milwaukee), gypsum, plumbago, and peat are found, and traces of silver have been reported.

Zoölogy.—This embraces 62 species of mammals, over 300 birds, 19 species of reptiles, and over 100 mollusks. The elk is occasionally found; and deer, bears, beavers, the fisher, wolf, otter, wildcat, and porcupine are not uncommon; while the rabbit, squirrel, striped gopher, mole, bat, and field-mouse exist in great numbers. The larger birds are the golden and bald eagles, great white owl, quail, partridge; the spruce, willow, prairie, and sharp-tailed grouse, woodcock, wild goose, duck, pelican, and loon. The lakes and rivers abound with fish, especially the whitefish, lake trout, siskewit, muscalonge, perch, pickerel, and sturgeon.

Botany.—Much of the northern portion is covered with forests that furnish many millions of feet of lumber annually. The prevailing trees in this region are the lofty white pine, balsam, hemlock, and other cone-bearing evergreen trees. There are 80,000 acres of white pine along the Wisconsin river and its tributaries. The southern half of the state is partly prairie, though here and there are islands of timber, or, as they are sometimes called, "oak-openings," the trees being mainly the burr oak. The hickory, birch, elm, sycamore, and sugar-maple are widely distributed.

Climate.—The climate of the state is considered, notwithstanding the long and severe winters, healthful. The mean annual temperature of the southern and more settled portion is 41.5°; mean temperature in winter, 20°; in spring and autumn, 47°; and in summer, 70°. At Green bay, the mean annual temperature is 43.65°. Snow usually falls in the north before the occurrence of heavy frost, and continues to cover the ground until spring, protecting the roots of plants from freezing, and hastening the growth of vegetation in the spring. The annual quantity of rain and melted snow is about 30 inches; and the barometer varies in its extremes from 28 to a little above 30 inches, the mean being about 29.5 inches. The Milwaukee river, as a rule, is closed for about 100 days in the year.

Soil and Agriculture.—The soil in the north is broken, with drift and boulders, covered with heavy pine forests, abounding in marshes, and not well adapted to cultivation; the middle and southern region, of prairies and park-like oak openings, is exceedingly rich and productive, raising great quantities of wheat, Indian corn, oats, barley, potatoes, tobacco, etc. Much of the soil is sandy, but naturally productive. In agricultural products the state ranks among the first in the Union. Its annual yield of crops is valued at $60,000,000, and includes 65,000,000 bushels of oats, 39,000,000 bushels of corn, 9,000,000 bushels of wheat, 9,000,000 bushels of barley, 13,000,000 bushels of potatoes, 2,000,000 tons of hay, and 15,000,000 pounds of tobacco. Rye is also largely grown; and apples and cranberries form an important staple. In the production of hops, Wisconsin is surpassed by New York alone. Wild rice grows along the lakes; and flax is largely marketed at Kenosha. The value of the live stock in Wisconsin is given in round numbers as $60,000,000. There are some 633,000 cattle, 421,000 horses, 600,000 sheep, and 2,250,000 swine. The dairy-products are estimated at $15,000,000 annually. The great center for this traffic is Sheboygan.

Manufactures, etc.—In manufactures the state has made excellent progress, and a large number of busy manufacturing towns have come into active existence here and

there. The U. S. census of 1890 reported for Wisconsin, 10,417 manufacturing establishments, employing $246,515,404 capital and 132,031 persons, paying $51,843,708 for wages and $145,437,016 for materials, and having a combined output valued at $248,546,164. The principal manufactures are lumber and mill products from bolts or logs, flour and grist mill products, malt liquors, tanned and curried leather, packed meat, timber products not manufactured at mills, foundry and machine shop products, dairy products, iron and steel, planing-mill products, agricultural implements, paper, furniture, boots and shoes, cigars and cigarettes, and malt. The breweries of Milwaukee are famous all over the world. At Milwaukee are also extensive stove works. At Superior is found the largest system of connected grain-elevators in the world, having a capacity of 50,000,000 bushels. At Racine is the largest establishment for the manufacture of threshing-machines.

Wisconsin is one of the principal iron-producing states, and had (1895) an output of ore, mostly red hematite, aggregating about 650,000 long tons, valued at over $600,000. The production of pig iron was 148,400 long tons; of rolled iron and steel, 85,006 long tons. A great charcoal furnace is situated at Ashland on Chequamegon bay, which place is the main shipping port for the Gogebic iron range opened up in 1885. Along the shores of Lake Michigan are rich deposits of clay, from which common, pressed, fancy, and firebrick are annually made to the value of nearly $1,000,000, used largely in Milwaukee, and from their color giving to that city the title of "The Cream City." Great quantities of quicklime are produced at Pewaukee, Racine, and Watertown; while the central counties yield quartz-porphyry; Waukesha and Prairie du Chien, limestone; and Milwaukee, cement rock.

Banking and Financial.—On Oct. 31, 1896, there were 81 national banks in operation, with combined capital $10,730,000, deposits $35,464,603, reserve $11,190,532, and outstanding circulation $3,199,646, and 126 state banks, with capital $6,827,750, deposits $26,573,706, and resources $36,715,309. There were also 107 private banking houses, four loan and trust companies, and a mutual savings bank.

The state finances are in a very favorable condition. The total indebtedness is to state trust funds, which in 1897 were, school fund $1,563,700, normal school fund $515,700, university fund $111,000, and agricultural college fund $60,600—in all $2,251,000. The assessed property valuations are, real estate $482,799,128, personal property $120,674,398,—total $603,473,526, tax rate $2.27 per $1000, amount of taxes raised, over $1,370,000.

Commerce.—The foreign commerce of the state is not very extensive comparatively, Milwaukee being the chief port of entry; but the coastwise and river commerce is large, and is conducted for the lakes from Milwaukee, Sheboygan, Fond du Lac, and Superior, and for the Mississippi river from La Crosse and Prairie du Chien, while steamers also ascend the Wisconsin, Chippewa, Fox, and other rivers. There is a flourishing coastwise trade.

Railroads.—The first railway in Wisconsin was begun in 1850, and consisted of a track between Milwaukee and Elm Grove, laid by the Milwaukee and Mississippi R. R., and extended to Janesville in 1852. In 1897, there were over 7500 miles of line in the state, the chief roads being the Chicago, Milwaukee, and St. Paul; the Wisconsin Central; Chicago, St. Paul, Minneapolis, and Omaha; Northern Pacific; St. Paul and Duluth; Chicago and Northwestern; Duluth, South Shore, and Atlantic; Green Bay, Winona, and St. Paul; the Minneapolis, St. Paul, and Sault Ste. Marie; and the Burlington route.

Education.—Wisconsin spends nearly $7,000,000 every year upon its fine school system, which is richly provided for by grants of land both Federal and State. Compulsory attendance for 12 weeks each year is required from children between the ages of seven and twelve. There are state normal schools at Platteville, Whitewater, River Falls, Oshkosh, Milwaukee, and Stevens Point; and private normal schools at Milwaukee and St. Francis. The State University of Wisconsin is beautifully situated in a magnifi cent park overlooking Lake Mendota, northwest of the State Capitol at Madison. It has courses in letters, science, engineering, law, and pharmacy. Here is the Washburn observatory, erected in 1880 at a cost of $50,000; and attached to the university is also the state experimental station. Other institutions for the higher learning are Beloit College, founded in 1847, famous for the number of clergymen among its graduates; Racine (Episcopal) College at Racine, with its fine quadrangle of Gothic buildings and handsome grounds; Lawrence University, founded in 1847 by Amos Lawrence of Boston, at Appleton; Ripon College, founded in 1854; Milton College; Gale College, Galesville; Northwestern University at Watertown; Carroll College (Pres.), at Waukesha; Marquette College (R. C.), at Milwaukee; Downer College (Cong. and Pres.), at Fox Lake; and Milwaukee College (non-sect.), Milwaukee (the two last for women only). The Protestant Episcopal Seminary at Nashotah was founded in 1841 and has trained many missionaries. The Lutherans have a seminary at Milwaukee; the Reformed Church Mission is at Franklin; and the Roman Catholic Seminary of St. Francis de Sales at St. Francis. The Wisconsin Sunday-School Assembly owns a park of 30 acres on Monona Lake, with a tabernacle and other buildings, and is a branch of the Chautauqua (q.v.) enterprise. There are many fine public libraries in the state apart from those connected with the schools and colleges. Especially fine are those at Milwaukee and La Crosse, and of the State Historical Society at Madison.

The first newspaper in Wisconsin was established at Green Bay in 1833, *The Green Bay Intelligencer*. There are now upwards of 600, of which over 100 are in German.

RELIGIOUS.— The Protestant Episcopal church has the dioceses of Fond du Lac and Milwaukee, and the Roman Catholic church, the archdiocese of Milwaukee and the dioceses of Green Bay and La Crosse. The leading denominations numerically are the Roman Catholic, Lutheran, Methodist, Episcopal, Congregational, Baptist, Evangelical Association, German Evangelical synod, and Presbyterian. All communicants aggregate over 550,000; church edifices, 3200; halls used for church purposes, 480; and value of church property, $14,500,000.

GOVERNMENT.—The capital is Madison, where there is a handsome capitol and other public buildings. The constitution of the state grants the right to suffrage, with the usual exceptions, to every male citizen 21 years of age, and also to all persons who have declared their intention to become citizens, and who have resided in the state one year. State elections are held biennially in November; for judges and town and village officers in April. The executive power is vested in a governor, lieutenant-governor, secretary of state, attorney-general, etc. The legislature consists of a senate, with 33 members, elected for four years, and an assembly of 100 members, elected for two years. Each member receives $500 for each regular session. The legislature meets on the first Monday in January, and the sessions are not limited in duration. The governor receives a salary of $5000 per annum. The supreme court of the state consists of five justices, and there are 14 district courts, besides those of counties, cities, and towns. United States district courts sit at Madison and Milwaukee.

The state militia has an authorized strength of 3104 officers and men, and an actual strength of 2661, the force liable to military duty exceeds 372,000 men. The State Veterans' home is at Waupaca. The state prison is at Waupun; the industrial school for boys at Waukesha; and that for girls at Milwaukee. At Janesville is the institution for the blind; at Delavan, the institution for the deaf and dumb. At Madison and Oshkosh are the state hospitals for the insane. Near Milwaukee in a great park of 400 acres is the northwestern branch of the national home for disabled volunteer soldiers with a handsome chapel, a library, reading-room, etc.

The electoral vote of Wisconsin has been cast as follows: in 1848, for Cass and Butler; in 1852, Pierce and King; in 1856, Fremont and Dayton; in 1860, Lincoln and Hamlin; in 1864, Lincoln and Johnson; in 1868, Grant and Colfax; in 1872, Grant and Wilson; in 1876, Hayes and Wheeler: in 1880, Garfield and Arthur; in 1884, Blaine and Logan; in 1888, Harrison and Morton; in 1892, Cleveland and Stevenson; in 1896, McKinley and Hobart, 12.

POPULATION. — In 1840, the population of Wisconsin was 30,945; in 1850, 305,391; in 1860, 775,881; in 1870, 1,054,670; in 1880, 1,315,497; in 1890, 1,686,880. In 1890, there were 8896 Indians within the limits of the state and included in the census figures. From 1880 to 1890, the population of Wisconsin increased 27.99 per cent. It stands fourteenth in order of population among the states of the Union.

There are (1897) 70 cos., for whose population see the Census Tables in the Appendix to Volume XV. In 1890 there were 34 incorporated cities in the state, of which 26 had more than 5000 inhabitants, and 12 more than 10,000 inhabitants. These last are Milwaukee , 204,468; La Crosse, 25,000; Oshkosh, 22,836; Racine, 21,014; Eau Claire, 17,415; Sheboygan, 16,359; Madison, 13,426; Fond du Lac, 12,024; Superior, 11,983; Appleton, 11,869; Marinette, 11,523; and Janesville, 10,836.

WISCONSIN, UNIVERSITY OF, at Madison, the capital of the state; organized in 1849; reorganized, 1866. It is a state institution, unconnected with any religious denomination, and open upon equal terms to students of both sexes. Its object is to provide the means of acquiring a thorough knowledge of the various branches of learning connected with scientific, industrial, and professional pursuits. It consists of (1) the college of letters and science, including the school of economics, political science and history, and the Washburn observatory; (2) college of mechanics and engineering; (3) college of agriculture; (4) college of law; (5) school of pharmacy; (6) university extension department; (7) school of music; and the (8) summer school. The college of letters and science includes a wide range of subjects. The college of mechanics and engineering embraces graduate and undergraduate courses in civil engineering, mechanical engineering, electrical engineering, and railway engineering. The college of agriculture includes various instructional courses in general agriculture and dairying, and the agricultural experiment station. The university has funds amounting to over $500,000, chiefly derived from the proceeds of U. S. government land grants, and has an annual income of over $350,000. Its buildings number eighteen, and are valued with contents at $1,119,000. The grounds comprise 300 acres, valued at about $200,000. The library contains about 50,000 volumes. The university is provided with extensive and valuable mineralogical and geological cabinets and collections in natural history. It has 40 laboratories in all departments of science. There is a gymnasium for men and one for women, an athletic field, a boathouse, and a rowing tank. Professors and other instructors, 1896–97, 112; over 1600 students. Charles K. Adams, LL.D., president.

WISDOM, BOOK OF, found in the Apocrypha under the title *Wisdom of Solomon*, contains three parts: The *first*, commending wisdom; the *second*, teaching how wisdom may be gained; and the *third*, illustrating wisdom and folly. See APOCRYPHA.

WISDOM TEETH. See TEETH.

WISE, a co. in n. Texas, drained by the West fork and Denton fork of the Trinity river; 900 sq.m.; pop. '90, 24,134, with colored. Co. seat, Decatur.

WISE, a co. in s.w. Virginia, having the Cumberland mountains on the n.w. separating it from Kentucky, bounded on the s.e. by Clinch river, drained by Russell's fork of Sandy river; 385 sq.m.; pop. '90, 9345. Co. seat, Wise.

WISE, Henry Alexander, American statesman, was b. at Drummondtown, Accomac co., Va., Dec. 3, 1806; graduated at Washington college, Pennsylvania, in 1825; studied law at Winchester; settled and married at Nashville, Tenn., but two years after returned to his native county, and engaged in politics; in 1825, advocated the nomination of Gen. Jackson at the Baltimore convention; opposed nullification, but maintained the state-rights doctrines of Jefferson and Madison as expressed in the Virginia resolutions of 1798, that "each state for itself is the judge of the infraction of the constitution, and of the mode and manner of redress." Elected to congress in 1833, he was involved in a duel with his opponent, whose arm he fractured. On the removal of the government deposits by Gen. Jackson, he went over to the opposition or whig party, but was sustained by his constituents, over whom he had an unbounded personal influence. In 1837 he was the second of Mr. Graves, a member of congress from Kentucky, who shot Mr. Cilley, a member from Maine, in a duel. In 1840 he secured the nomination of John Tyler as vice president; and on Tyler becoming president by the death of Gen. Harrison, had a powerful influence in his administration. Nominated minister to France, he was rejected by the senate, but confirmed for Brazil, where he resided until 1847. He was now once more identified with the democratic party; and in 1854, after an arduous electioneering campaign, in which, though in feeble health, he traveled 3,000 m., and made 50 stump speeches against the "know-nothing" or Protestant native American party, he was elected governor of Virginia. In 1859 he published a treatise on territorial government, maintaining the right of congress over the institution of slavery. In December of this year, he signed the death-warrant of John Brown, hanged for treason in attempting to excite a negro insurrection. In 1861 as member of the Virginia convention, he labored for conciliation; but when his state voted for secession, he entered heartily into the war, and was appointed brig.gen. He died in 1876.

WISEMAN, Nicholas, cardinal, and Roman Catholic archbishop of Westminster, was b. Aug. 2, 1802, at Seville, of an Irish family. He was brought to Ireland in his childhood, and received his first education at Waterford, whence he was removed to the Roman Catholic college of St. Cuthbert at Ushaw, near Durham. In his 16th year, he entered as an ecclesiastical student the English college at Rome, and after a very brilliant course, received holy orders at Rome in 1823, at which time he was also admitted to the degree of doctor of divinity, and was appointed vice-rector of the English college, and professor of oriental languages in the university of the Sapienza. In 1828 he published his *Horæ Syriacæ*, and in the end of that year was named rector of the English college. It was while he held this office that he delivered his *Lectures on the Connection of Science and Revealed Religion* (2 vols. 8 vo, 1836). But in England he first became known by a series of lectures on *The Doctrines of the Catholic Church*, delivered at Moorfields church, and published in two vols. in 1836. In the same year he established, in concert with Mr. O'Connell, the *Dublin Review*, a journal which has since continued to be the quarterly organ of the Roman Catholic body, and to which Dr. Wiseman, even while residing abroad, was a regular contributor. In 1840 he was named coadjutor vicar-apostolic of the central district of England, with the title of bishop of Melipotamus *in partibus infidelium* (q.v.). At the same time he was appointed president of St. Mary's college of Oscott, where he took up his residence. The circumstances of religious parties in England at this period contributed much to bring Dr. Wiseman's very remarkable abilities as a polemical writer into prominence; and the dissensions which arose in the church of England during the Tractarian controversy, were turned to effect by him in various lectures, pamphlets, reviews, essays, etc. In 1846 he was transferred as coadjutor vicar-apostolic to the London district; and in 1849 became himself acting vicar. In the following year, he came still more remarkably into notice, during the progress of a change in the position of the Roman church in England, which, for a time, was the occasion of almost unexampled religious excitement in the country. From the reign of Elizabeth, the sees in England having been occupied by bishops of the established church, and it being penal for a bishop or priest of the Roman Catholic church to officiate in England, the Catholics, for the necessary religious ministrations of their church, had resorted to the well-known expedient of a system of bishops *in partibus infidelium* (q.v.), with the title and authority of vicars apostolic. This form of church government, with some modification, had in substance subsisted from the time of James I.; but from the date of the passing of the Catholic emancipation act, a desire had gradually sprung up among Catholics for the restoration of the normal form of church government by the appointment of regular bishops. This measure was finally determined on by the pope in the year 1850, and a new distribution of the kingdom was made into 12 sees (one of them archiepiscopal), in which, in order that it might not be supposed to clash with the existing episcopal system, the names of the ancient sees were carefully avoided, the titles of the new bishops being taken exclusively from cities and towns which were non-episcopal. Dr. Wiseman was named archbishop of the see of

Westminster, which included great part of the district already under his charge, and was at the same time created cardinal. This measure, for which the Protestant public were but little prepared, and which was made more formidable in their eyes by the language which was employed, although but following the established canonical forms, and bearing altogether on the spiritual concerns of the Catholics, was supposed to involve an invasion of the rights and dignities of the established church and of the crown, and called forth a storm of religious excitement which was unexampled during the memory of the living generation. While this excitement, which was much influenced by a letter addressed by the prime minister to the bishop of Durham, was at its height, the new cardinal, who had gone to Rome to receive the cardinal's hat, returned to England, and published an explanatory address of great ability and moderation, but yet firmly asserting the strictly constitutional rights of his fellow-Catholics, entitled *An Appeal to the Reason and Good Feeling of the people of England on the Subject of the Catholic Hierachy.* This address, as well as certain lectures subsequently delivered by him, and extensively circulated, did much to mitigate the excitement, which nevertheless led to violent debates in parliament, and to the passing of an act prohibiting the use of ecclesiastical titles other than those recognized by the law. See Ecclesiastical Titles Assumption Act. Notwithstanding these unfavorable circumstances of his introduction into notice in England, however, the undoubted abilities and great literary eminence of cardinal Wiseman eventually compelled the admiration of the British public. He took frequent occasion, moreover, by public lectures and addresses on the neutral subjects of education, literature, and art, to identify himself with the spirit of progress, and with the national sentiments of his fellow-countrymen; and notwithstanding the infirmity of his constitution, which began to fail soon after his return to England as cardinal, he published during these years a succession of works which although with the strong religious bias natural to a Roman Catholic churchman of earnest convictions, possessed much, nevertheless, congenial to the sympathies of cultivated Englishmen of every degree. The *Lectures on Religion and Science* already referred to; *On the Connection between the Arts of Design and those of Production;* on the *Influence of Words on Thought and Civilization;* on the *Points of Contact between Science and Art; Recollections of the Last Four Popes,* and other similar works, obtained an extensive circulation; and partly from their effect upon the public mind, partly, no doubt, from the reaction consequent on what was soon felt to have been a groundless and exaggerated alarm, cardinal Wiseman came by degrees to command the respect of the public at large. He died in his 63d year, on Feb. 15, 1865; and his funeral, which was conducted with great solemnity, and excited great public curiosity and interest, was witnessed with every demonstration of respect by one of the largest assemblies seen for many years in London. Besides admittedly high professional learning, he was a scholar of rare and singularly various attainments, an eminent linguist, a well-informed scientific scholar, a distinguished orator, a graceful and vigorous writer, and an accomplished critic and connoisseur of art. In addition to the works incidentally mentioned above, he published *The Real Presence of the Body and Blood of Our Lord Jesus Christ in the Eucharist* (8vo, 1836); *Reply to Dr. Turton on the Eucharist* (8vo, 1839); *Lectures on the Ceremonies of Holy Week* (8vo, 1839); *Essays on Various Subjects* (3 vols., 8vo, 1853)—a selection of articles contributed to the *Dublin Review* and other periodicals, and of other fugitive essays; *Fabiola, or a Church of the Catacombs;* a singularly truthful and life-like picture of early Christian life in classic Rome; *Sermons* (2 vol., 8vo, 1864); with many shorter publications. He also left a large collection of MSS., many of them prepared for the press. In 1866 appeared *The Witch of Rosenburg, a Drama in Three Acts;* and *Daily Meditations* in 1868.

WISHART, George, one of the early reformers of Scotland, is supposed to have been a native of Forfarshire, a son of James Wishart of Pittarrow, justice clerk in the reign of James V. The exact date of his birth is unknown. He first emerges into notice in the beginning of the 16th century. At this time he taught a grammar school at Montrose, and made himself remarkable by introducing the study of Greek. He began also to preach the doctrines of the reformation, and was obliged to flee into England. Here he is found at Bristol about 1538, preaching the same doctrines, but being seized upon and threatened with death, he publicly recanted. Later he is found at Cambridge, in the center of the Anglican reform movement, which had begun there under the influence of Bilney and Latimer. He is described at this time by a pupil of the name of Tylney as a "tall man polde-headed, of melancholy complexion, black-haired, long-bearded, comely of personage, well spoken after his country of Scotland, courteous, lowly, lovely, glad to teach, desirous to learn, abstinent in his habits, and very charitable to the poor." His portrait, which has been preserved in the university of Glasgow, answers to the personal characteristics here mentioned. He returned to Scotland in 1543 or 1544, with the commissioners sent to negotiate a treaty with Henry VIII., and it was then that he entered upon his special reforming mission, terminating in his martyrdom. He appears to have possessed great powers as a preacher, although it is doubtful whether he ever took orders; and he traveled from town to town, and county to county, making everywhere a great impression by his stirring words. Knox has given in his *History*, book i., a very striking description of the effects of Wishart's preaching. Its effect upon himself was the most

important and fruitful of all. When the preacher came to Lothian, Knox, charmed by his character and teaching, attached himself to his person, bearing a "two-handed sword" before him. This precautionary defense was rendered necessary by two attempts supposed to have been instigated by Beaton against his life. His activity and influence were too prominent long to escape notice. Cardinal Beaton had had his eye upon him for some time, and while he rested at Ormiston, after preaching a powerful sermon at Haddington, he was made a prisoner by the earl of Bothwell. Beaton himself was in the neighborhood with a considerable force, in case it should have been attempted to rescue him. He was conveyed to St. Andrews, and immediately put upon his trial before an ecclesiastical tribunal. Arran, the governor, refused to give his countenance to the proceedings; but the reforming preacher was nevertheless condemned to be burned at the stake; and the sentence was carried out before the castle or episcopal residence at St. Andrews on Mar. 12, 1546.

Wishart is reported to have given utterance at the stake to a prophecy of the death of the cardinal, which took place about three months after his martyrdom. "But he who from yonder high place beholdeth us with such pride shall, within a few days, be in the same as ignominiously as now he is seen proudly to rest himself," are the words attributed to him. This has appeared to some recent writers to strengthen the suspicion, otherwise suggested, of Wishart having been accessory to the plot for assassinating the cardinal. The main ground of this suspicion is the discovery of a document in the state paper office, bearing that "a Scotishman called Wysshart," a friend of the laird of Brunstone, was concerned in this plot. Mr. Tytler confidently adopted the view that this friend of the laird of Brunstone and the reformer were the same person, and it cannot be denied that there are reasons in favor of this inference, not in the mere coincidence of the name, perhaps, but in the fact of the association of the person bearing it with the laird of Brunstone, who was a familiar friend of Wishart; and further, in the fact, that Kirkaldy of Grange and the master of Rothes, who are mentioned in the document as conspiring either to "apprehend or slay the cardinal," were afterward really his murderers. At the same time, it cannot be said that there is decisive evidence to prove that the "Wysshart" of the state document was George Wishart, the reformer and the martyr. The coincidences might be accidental, and the question will probably remain among the *questiones vexatæ* of Scottish history.

WISHAW, a thriving t. of Scotland, in Lanarkshire, 13 m. e.s.e. of Glasgow, and near the South Calder water. It was made a police burgh in 1855. There are a number of collieries, blast furnaces, iron and steel works, etc. Pop. '91, 14,869.

WISMAR, seaport of Mecklenburg-Schwerin, at the head of a bay of the same name, an inlet of the Baltic. Its harbor is the best on the Baltic coasts, and is furnished with ship-building docks. Its old fortifications have been removed; but many of its old buildings, which are exceedingly curious and picturesque, remain. Commerce, ship-building, the fisheries, tobacco, playing-cards, sail-cloth manufactures, and agriculture are the principal employments of the inhabitants; there are also breweries and distilleries. Wismar is the terminus of a branch of the Mecklenburg railway, and communication by steamers subsists between it and Copenhagen. Pop. '90, 16,787.

WISNER, Benjamin Blydenburg, d.d., 1794–1835; b N.Y.; graduated with honors at Union college, 1813; had charge of Johnstown academy, 1813–14; tutor at Union college, 1815–18, during which time studied theology; graduated at Princeton seminary, 1820; pastor of old South church, Boston, 1821–32; one of the secretaries of the A. B. C. F. M., 1832–35, and as such was highly efficient and successful, visiting many Congregational and Presbyterian churches, forming missionary associations and awakening great zeal for the cause. He was also an active member of several other benevolent societies, and was author of a history of the old South church.

WISSEMBOURG (German *Weissenburg*), till 1871 a French fortified t., now capital of a district in the German province of Lower Alsace, is on the Lauter, 32 m. n.n.e. of Strasburg. It has a flourishing trade, and a pop. of (1890) 5846. Here was fought, Aug. 4, 1870, the first great battle of the Franco-German war. Besides the fortifications of Wissembourg, demolished in 1872, the lines of Wissembourg are famous—a line of works extending to Lauterburg, 9 m. south-east.

WISTAR, Annis Lee (Furness), b. Philadelphia, 1830; daughter of the Rev. Dr. W. H. Furness, and wife of Dr. Caspar Wistar. She has published several translations from the German of Marlitt, Wilhelmine von Hillern, Huckländer, and others.

WISTAR, Caspar, 1761–1818; b. Philadelphia; received a medical degree from the university of Edinburgh in 1786. He was professor of chemistry and physiology in the Philadelphia medical school, 1789–92, when he was appointed adjunct professor of anatomy and surgery. In 1808 he became full professor in those departments, and held that position till his death. He published, among other works, *A System of Anatomy*.

WISTA'RIA, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, having pinnate leaves and flowers in terminal racemes, the pod leathery. The species were formerly included in the genus *glycine*. Some of them are among the most magnificent ornamental climbers known in flower gardens. *W. frutescens*, a

native of Virginia, Illinois, and other parts of North America of similar climate, found chiefly in marshy grounds, attains the length of 30 ft., and has beautiful racemes of fragrant bluish purple flowers. *W. Chinensis* or *consequana*, a native of China, has larger flowers in pendulous racemes, and its branches run to the length even of 90 feet. In Britain these plants are generally trained on walls.

WITCH-CRAFT * is merely the form that the belief in the arts of magic assumed under the action of certain notions introduced by Christianity. The powers supposed to be possessed by the witches, and the rites and incantations by which they acquired those powers, were substantially the same as belonged to the devotees of the Greek Hecate (q.v.), the Striga and Venefica of the ancient Romans, and the Vala or wise woman of the Teutonic pagans. But when, along with the knowledge of the one true God, the idea of a purely wicked spirit, the enemy of God and man, was introduced, it was natural that all supernatural powers not proceeding directly from the true God, should be ascribed to him. This gave an entirely new aspect to such arts: they became associated with heresy; those who practiced them must be in compact with the devil, and have renounced God and the true faith. Previously, if a witch was punished, it was because she had been guilty of poisoning, or at least was believed to have poisoned or wrought some other actual mischief. Now, however, such power was only the power to work evil; and merely to be a witch was in itself a sin and crime that filled the pious mind with horror. This feeling, zealously fostered, first by the Catholic clergy, and then no less by the Protestant, rose to a frenzy that for four centuries filled Europe with the most shocking bloodshed and cruelty.

Almost all the various notions and practices noticed under the heads MAGIC, DIVINATION, INCANTATION, AUGURIES, CHARM, TALISMAN, ORDEAL, FETICHISM, EVIL EYE, etc., are embodied more or less prominently in the huge mass of superstitions which formed the creed of witchcraft in its full development. A reference, therefore, to those heads, and to the kindred subjects of ASTROLOGY and ALCHEMY, saves the necessity of entering into descriptive details of what witchcraft was. What was new and distinctive in the witchcraft of Christendom was the *theory* of magical arts which it involved. The doctrine of the devil (q.v.), as finally elaborated in the middle ages, established in the world a rival dominion to that of the Almighty. The arch-fiend and his legions of subordinate demons (q.v.) exercised a sway, merely permitted, no doubt, but still vast and indefinite, not only over the elements of nature, but over the minds and bodies of men—all except those who had been admitted by baptism into the number of the "redeemed" (see ATONEMENT), and continued to be guarded by the faith and rites of the church. The faithful could not be led into evil against their will, nor essentially injured in person; but not even they were altogether exempt from diabolic annoyance, for the immunity does not seem to have extended to their belongings. As a strictly logical consequence of this assumed constitution of things, it followed, that those mortals who had the gifts of producing supernatural effects of any kind (and that such gifts had been possessed by individuals in all ages and countries, was not for a moment questioned), must derive their power from the prince of darkness and be acting as his agents—always excepting, of course, those miraculous powers which the church herself claimed to exercise in the name of heaven. Moreover, as the universally coveted powers of fortune-telling, and of controlling the elements for your own benefit or the hurt of your enemies, could not be supposed to be bestowed by a being of the devil's character except as a *quid pro quo*, and as the object dearest to the devil's heart—the very aim and end, in fact, of his struggle with the kingdom of light—was to win back as many as possible of the souls that had been redeemed from his dominion by the death of Christ, it was natural to conclude that the price he would demand for his gifts would be a renuncia-

* Not a little light is thrown on the original conception of witchcraft, and the magic arts in general, by observing the primary meaning of the various terms employed in connection with them. The most striking thing is the number of those terms that come from roots signifying simply *to do, perform*. From this notion the transition is easy to a variety of shades of meaning, as is seen in Lat. *facinus*, which radically signifies a deed (from *facere*, to do), but became restricted to a *bad* deed, a crime. The Greek ερδειν or εργειν (= Eng. work), and the Lat. *facere*, *operari*, were used, without any addition, to signify to perform sacrifice or other sacred or magical rite. Accordingly, in Low Lat., *factura* signified sorcery; and in modern Ital. *fattura* = incantation, and *fattucchiera* = a sorceress or witch. Lat. *factum* becomes in Span. *hecho*, and means a crime; while *hechicero* is a sorcerer, and *hechiera*, a witch. The Portuguese *feitiçao*, magic, is also from Lat. *factum;* and Sans. *kratu*, a sacrifice, is from *kri* (= Lat. *creare*), to make.

The Eng. *witch* is *vicce* in Ang.-Sax., which has also *viccian*, to fascinate, and *viccancräft*, the art of magic; the Low Ger. dialects have similar forms (e.g., Dutch *wikkerij* = witchcraft); in High Ger. there are no cognate names. These words, as is seen in the Dutch form, have clearly no connection with *witan* (Ger. *wissen*), to know, which is usually given as the root of the English witch; and the most probable etymology is that proposed by J. Grimm, who derives them from the Gothic *veihan* (O. H. Ger. *wihan*, modern Ger. *weihen*), which signified to consecrate, but which he infers to have meant primarily to do, make, perform (see *Deutsche Myth.*, pp. 36, 58, 408; *Deutsche Gramm.* iii. 181). *Wiht*, or *wicht*, is evidently a derivative from this root, and signified a thing made (Lat. *factum*), a creature, a person, and, in some Teutonic dialects, a demon. A *vicca* was thus a *doer* of sacred or magic rites (compare the "I'll do, I'll do, I'll do!" of Shakespeare's witches). *Wicked* is a participle from the same root, and signified primarily bewitched, accursed, hence perverse. *Wizard* is probably a masculine form of *vicca*.

Nearly corresponding to English witch were the Lat. terms *saga*, a knowing or wise woman; *strix*, *striga*, a kind of nocturnal bird, hence a witch; *venefica*, literally, a poison-maker, a concocter of drugs. The Ger. *hexe*, old Dutch *hagetisse*, Ang.-Sax. *hägtesse*, or *hägesse* (from which Eng. *hag*), appear to come from *hag*, cognate with Lat. *sagus*. In O. Norse *hagr* signifies dexterous, cunning.

tion of Christianity and entrance into his service. Hence it came to be the established belief, that in order to acquire the powers of witchcraft, the person must formally sell his or her soul to the devil. The idea of a covenant with the arch-enemy was not involved in the early and heathen conception of magic. Originally magic was identical with the lowest form of religion, that is, Fetichism (q.v.). It was grounded on the idea that certain natural objects and certain rites and observances had, in themselves, a mysterious power of producing wonderful effects; and the art of the magician consisted in the knowledge of these mysterious powers, and in the skill to combine and direct them to special purposes. The effects were not conceived as being produced by the interference of any conscious being—god or devil. On the contrary, a human being could, through magical means, acquire control over supernatural beings. The Hindus carry this notion so far, that they represent some of their sages as practicing austerities and performing sacrifices and other rites, until they can control the gods themselves, and even threaten their destruction along with that of the universe (see VISWÂMITRA). The higher kind of European magic in the middle ages, was mixed up with what physical science there then was; and the most noted men of the time were addicted to the pursuit, or were at least reputed to be so. So far from deriving their power from the kingdom of darkness, the scientific magician, by the mere force of his art, could compel the occasional services of the arch-fiend himself, and make inferior demons the involuntary slaves of his will. A belief, however, had early existed that individuals in desperate circumstances had been tempted to purchase, at the price of their souls, the help of the devil to extricate them from their difficulties (see THEOPHILUS); and hence a suspicion began to grow that many magicians, instead of seeking to acquire their power by the laborious studies of the regular art, had acquired it in this illegitimate way. At last, as the system of dualism above mentioned became more perfect, the art of magic was wholly diabolized, and a compact with the evil one was thought to be the sole charter of supernatural power. See FAUST. This transformation took place earlier and more completely (about the 13th c.) in regard to those lower forms of the magical art which constitute witchcraft proper, and which have from ancient times been considered the special province of women. The chief cause of the prominent part assigned to the female sex in this matter is noticed in the article MAGIC. In addition, it may be observed, that their more excitable temperament renders them peculiarly liable to those ecstasies (q.v.) which have been associated with the gift of divination from the priestess of the ancient heathen oracle down to the medium of modern spiritualism. Further, when witchcraft came to be prosecuted as heresy, the part assigned to woman in the Scripture account of the fall led to her being looked upon as specially suited to be the tool of the devil. Founded on this circumstance, a constant element of the creed of witchcraft came to be the belief in a carnal intercourse between witches and evil spirits. The devil was supposed to tempt them in the shape of a wooer, and the unholy compact was consummated in carnal fashion.

The bargain was usually in writing, signed with the witch's own blood. She was rebaptized, receiving a new name, and had to trample on the cross and renounce God and Christ (among Roman Catholics, also the Virgin Mary), in forms parodying the renunciation of the devil in the formula of Christian baptism. A mark was impressed on some part of her body; this mark remained forever after insensible, and was one of the means of discovery employed by the witch-finders. The powers conferred by Satan on these covenanted servants of his were essentially the same as had always been attributed to sorcerers; the mode of exorcising them was also the same, namely, by charms, incantations, concoctions, etc. The only change was in the theory. These mystic rites, instead of producing their effects by an inherent virtue, were merely symbols by which the witch conveyed her behests to the devil and his ministers, who obeyed them according to the compact. Another difference to be noted is, that the power was exclusively directed to work evil—to raise storms, blast crops, render men and beasts barren, inflict racking pain on an enemy, or make him pine away in sickness (which was usually done by making an image of wax, and sticking it full of pins, or setting it to melt away before the fire). If a witch attempted to do good, the devil was enraged, and chastised her. A remarkable circumstance is, that witches seem to have been powerless to serve their own interests, for they remained poor and miserable.

A prominent point in witchcraft was the belief in stated meetings of witches and devils by night, called *witches' Sabbaths*. First anointing her feet and shoulders with a salve made of the fat of murdered and unbaptized children, the witch mounted a broomstick, distaff, rake, or the like, and, making her exit by the chimney, rode through the air to the place of rendezvous. If her own particular demon-lover came to fetch her, he sat on the staff before, and she behind him; or he came in the shape of a goat, and carried her off on his back. At the place of assembly, the arch-devil, in the shape of a large goat, with a black human countenance, sat on a high chair, and the witches and demons paid homage by kneeling to him, and kissing his posteriors. The feast was lighted up with torches, all kindled at a light burning between the horns of the great goat. Among the viands there was no bread or salt; and they drank out of ox-hoofs and horses' skulls; but the meal neither satisfied the appetite nor nourished. After eating and drinking they danced to music played on a bagpipe with a horse's head for the bag, and a cat's tail for a chanter. In dancing, they turned their backs toward one

another. In the intervals they narrated to one another what mischief they had done, and planned more. The revel concluded with obscene debauchery; after which, the great goat burned himself to ashes, which were divided among the witches, to raise storms with. They returned as they came; and the husband was kept from being aware of the wife's absence by a stick being laid in the bed, which he mistook for her. The places of meeting were always such as had feelings of solemnity and awe attached to them, derived from tradition or otherwise; the more noted are known to have been places of sacrifice in heathen times (see WALPURGA).

The *prosecutions* for witchcraft form one of the most deplorable episodes in human history. They show more strikingly than anything else has ever done, on the one hand, what relentless cruelty human nature is capable of under the influence of a fanatical delusion; and on the other, how little reliance is to be placed on the concurrence of any number of witnesses when an extensive excitement prevails on a subject involving the sentiment of wonder. Multitudes will be found testifying, and testifying honestly, to alleged facts which fall in with the prevailing belief, but have no better foundation than their own heated imaginations.

In the early laws of Rome, the twelve tables, there were penal enactments against him who should bewitch the fruits of the earth, or conjure away his neighbor's corn into his own field. A century and a half later 170 Roman ladies were convicted of poisoning under the pretense of charms and incantations; which led to additional laws against such practices. But in all this, the penalties were directed against those who had done, or were believed to have done, positive injury to another; and this is probably the meaning of the Mosaic law against witchcraft. At all events, in the heathen world, the mere possessing, or being believed to possess, supernatural powers, was not in itself a crime. It was feared, no doubt, as being liable to be turned to malicious purposes; but on the whole, magic was looked upon as a beneficial art, being, in fact, the only form of the healing art known, and in part also the religion of domestic life. This view of the subject continued to prevail for many centuries after the reception of Christianity. Constantine, in the 4th c., while ordaining capital punishment for those who practiced noxious charms against the life or health of others, is careful to protect from prosecution all magical means used for good—such as warding off hailstorms and excessive rains (*Codex Justin.* lib. ix. tit. 18); and the distinction between *black* and *white* magic was long kept up. It was through the prosecutions directed against heresy, which were systematically organized in the 11th c. (see INQUISITION), that the magic arts came gradually to be all dyed black alike. Along with errors in doctrine, the heretics were almost always accused of magical practices, and their secret meetings were represented as a kind of devil-worship, attended with all kinds of abominations. Thus sorcery and heresy became synonymous, and to the dread of supernatural power was added the feeling of pious horror. White magic, no less than black, was now looked upon as the work of Satan; and the counter-charms against the malice of him and his agents were to be sought only in the rites of the church as ministered by the accredited servants of heaven. The belief in this ecclesiastical white magic was as zealously cultivated by the Protestant clergy as by the Roman Catholic.

Fostered chiefly by the proceedings against heresy, the popular dread of witchcraft had been on the increase for several centuries; and numerous executions had taken place in various parts of Europe. At last, Innocent VIII., by his celebrated bull, *Summis Desiderantes*, issued in 1484, gave the full sanction of the church to the prevalent notions regarding sorcery, and charged the inquisitors and others to discover and put to death all practicers of these diabolical arts. Two special inquisitors, appointed for Germany (to which country the bull was specially directed), Heinrich Institor and Jacob Sprenger, with the aid of a clergyman of Constance, Johannes Gremper, drew up the famous *Malleus Maleficarum*, or Hammer for Witches; in which the whole doctrine of witchcraft was systematized, a regular form of trial laid down, and a course of examination appointed by which inquisitors everywhere might best discover the guilty. From this we may date the beginning of the witch-mania proper. The edict of 1484 was subsequently enforced by a bull of Alexander VI. in 1494, of Leo X. in 1521, and of Adrian VI. in 1522—each adding strength to its predecessor, and the whole serving to increase the agitation of the public mind upon the subject. The results were dreadful. A panic fear of witchcraft took possession of society; every one was at the mercy of his neighbor. If any one felt an unaccountable illness, or a peculiar pain in any part of his body, or suffered any misfortune in his family or affairs; or if a storm arose, and committed any damage by sea or land, or if any cattle died suddenly, or, in short, if any event, circumstance, or thing occurred out of the ordinary routine of daily experience—the cause of it was witchcraft. To be accused, was to be doomed; for it rarely happened that proof was wanting, or that condemnation was not followed by execution. Armed with the *Malleus Maleficarum*, the judge had no difficulty in finding reasons for sending the most innocent to the stake. If the accused did not at once confess, they were ordered to be shaved and closely examined for the discovery of devil's marks, and if any strange mark was discovered, there remained no longer any doubt of the party's guilt. Failing this kind of evidence, torture was applied, and this seldom failed to extort the desired confession from the unhappy victim. A large proportion of the accused witches, in order to avoid these preliminary horrors, confessed the crime in any terms which were

dictated to them, and were forthwith led to execution. Other witches seemed to confess voluntarily, being probably either insane persons, or feeble-minded beings, whose reason had been distorted by brooding over the popular witchcraft code.

In Germany the prosecutions were carried to a frightful extent. In the small bishopric of Bamberg 600 fell victims to the delusion in the course of about four years; and in Würzburg, which is not much larger, 900. In the small district of Lindheim, a twentieth part of the population were sacrificed in the same space of time. Similar accounts are on record regarding the other countries of Europe. In Geneva, in three months (1515–16), 500 persons were burned. In the district of Como 1000 were burned in one year (1524), and 100 per annum for several years afterward. In France, about the year 1520, fires for the execution of witches blazed in every town; and throughout the century the provincial parliaments were incessantly occupied with witch-trials and enactments against them, especially against that form of the superstition known as lycanthropy (q.v.; see also WERE-WOLF).

In England and Scotland, the witch-mania was somewhat later in setting in than on the continent; but when it did so, it was little if at all less virulent—the reformation notwithstanding. The statute of Elizabeth, in 1562, first made witchcraft in itself a crime of the first magnitude, whether directed to the injury of others or not; and the act of James VI., in the first year of his reign in England, defines the crime still more minutely: "Any one that shall use, practice, or exercise any invocation of any evil or wicked spirit, or consult or covenant with, entertain or employ, feed or reward any evil or wicked spirit, *to or for any purpose;* or take up any dead man, etc.; such offenders, duly and lawfully convicted and attainted, shall suffer death." Many years had not elapsed after the passing of the statute, ere the delusion, which had heretofore committed but occasional local mischief, became an epidemical frenzy, devastating every corner of England. The poor creatures who usually fell victims are thus described by an able observer: "An old woman with a wrinkled face, a furred brow, a hairy lip, a gobber tooth, a squint eye, a squeaking voice, or a scolding tongue, having a ragged coat on her back, a spindle in her hand, and a dog by her side—a wretched, infirm, and impotent creature, pelted and persecuted by all the neighborhood because the farmer's cart had stuck in the gateway, or some idle boy had pretended to spit needles and pins for the sake of a holiday from school or work"—such were the poor unfortunates selected to undergo the last tests and tortures sanctioned by the laws, and which tests were of a nature so severe that no one would have dreamed of inflicting them on the vilest of murderers. They were administered by a class of wretches, who, with one Matthew Hopkins at their head, sprang up in England in the middle of the 17th c., and took the professional name of *witch-finders.* The practices of the monster Hopkins, who, with his assistants, moved from place to place in the regular and authorized pursuit of his trade, will give a full idea of the tests referred to, as well as of the horrible fruits of the witchcraft frenzy in general. From each town which he visited, Hopkins exacted the stated fee of 20s., and in consideration thereof, he cleared the locality of all suspected persons, bringing them to confession and the stake in the following manner: He stripped them naked, shaved them, and thrust pins into their bodies to discover the witch's mark; he wrapped them in sheets, with the great toes and thumbs tied together, and dragged them through ponds or rivers, when, if they sank, it was held as a sign that the baptismal element did not reject them, and they were cleared; but if they floated—as they usually would do for a time—they were then set down as guilty, and doomed. He kept them fasting and awake, and sometimes incessantly walking, for 24 or 48 hours, as an inducement to confession; and, in short, practiced on the accused such abominable cruelties, that they were glad to escape from life by confession. If a witch could not shed tears at command, said the further items of this wretch's creed, or if she hesitated at a single word in repeating the Lord's prayer, she was in league with the evil one. After he had murdered hundreds, and pursued his trade for many years —from 1644 downward—the tide of popular opinion finally turned against Hopkins, and he was subjected, by a party of indignant experimenters, to his own favorite test of swimming. It is said that he escaped with life, but from that time forth he was never heard of again.

The era of the Long Parliament was that, perhaps, which witnessed the greatest number of executions for witchcraft. *Three thousand persons* are said to have perished during the continuance of the sittings of that body, by legal executions, ir dependently of summary deaths at the hands of the mob. Witch-executions, however, were continued with nearly equal frequency long afterward. One noted case occurred in 1664, when the enlightened and just sir Matthew Hale tried and condemned two women, Amy Dunny and Rose Callender, at Bury St. Edmunds, for bewitching children. It is stated that the opinion of the learned sir Thomas Browne, who was accidentally present, had great weight against the prisoners. He declared his belief that the children were truly bewitched, and supported the possibility of such possessions by long and learned arguments, theological and metaphysical. Yet sir Matthew Hale was one of the wisest and best men of his time, and sir Thomas Browne had written an able work in exposition of popular fallacies! Chief-justices North and Holt were the first individuals occupying high places who had at once the good sense and the courage to set their faces against

the continuance of this delusion, and to expose the general absurdity of such charges (1694). Summary executions, however, continued for some years to be still common, in consequence of confessions extracted after the Hopkins fashion. In 1716, a Mrs. Hicks and her daughter, aged nine, were hanged at Huntingdon for selling their souls to the devil, and raising a storm by pulling off their stockings and making a lather of soap! With this crowning atrocity, the catalogue of murders in England closes.

In Scotland, witchcraft as a crime *per se* was first made legally punishable by an act passed in the reign of Mary (1563). On coming to execute the functions of majesty, James VI. made numerous official investigations into alleged cases of witchcraft, and derived a pleasure in questioning old women respecting their dealings with Satan. In 1590, James, it is well known, made a voyage to Denmark to bring home his appointed bride, the princess Anne. Soon after his arrival, a tremendous witch-conspiracy against the happy conclusion of his homeward voyage was discovered, in which the principal agents appeared to be persons considerably above the vulgar. The king had all the accused brought before himself for examination, and even superintended the tortures applied to them to induce confession. One of them, Mrs. Agnes Sampson, declared that one great object with Satan and his agents was to destroy the king: that they had held a great witch-convention at North Berwick for no other end; and that they had endeavored to effect their aim on many occasions, and particularly by raising a storm at sea when James came across from Denmark. The witches demanded of the devil why he bore such hatred to the king, who answered that the king was the greatest enemy he had in the world. On this occasion, 30 persons were executed on the Castle-hill of Edinburgh. These proceedings, no doubt, gave occasion to the famous work on Demonology which James VI. published shortly after. The removal of James to England moderated but did not altogether stop the prosecutions. As the spirit of Puritanism gained strength, however, they again increased. The general assembly was the body in fault on this occasion, and from this time forward, the clergy were the great witch-finders in Scotland. The assembly passed condemnatory acts (1640, 1643, 1644, 1645, 1649), and with every successive act the cases and convictions increased with even a deeper degree of attendant horrors than at any previous time. At a single circuit held at Glasgow, Stirling, and Ayr, in 1659, 17 persons were convicted and burned for this crime. The popular frenzy seems to have exhausted itself by its own virulence in 1661–62. After this period, the dying embers of the delusion only burst out on occasions here and there into a momentary flame. The last regular execution for the crime is said to have taken place at Dornoch in 1722, when an old woman was condemned by David Ross, sheriff of Caithness. The number of victims in Scotland from first to last has been estimated at upward of 4,000.

Cases of "witchcraft" occurred in some of the British colonies of North America during the 17th c. A few trials occurred in Virginia and Maryland; in Connecticut 5 or 6 persons were hung. In Connecticut and Massachusetts the penalty was not only in conformity with the Mosaic code, on which the laws were based, but also was borrowed directly from English common law. Plymouth colony was unvexed by the terrible delusion, but Boston and its vicinity were for a time under its cloud, and in 1692, at Salem, 19 persons were hung and one was pressed to death for the crime, when a complete revulsion of public feeling took place and the frenzy ended. Many histories of New England assert that Cotton Mather (q.v.) and other ministers were responsible for the rise and continuance of Salem witchcraft, but in the *North American Review* (Apr., 1869), Mr. W. F. Poole flatly contradicts the popular belief respecting Mather, and Thomas Brattle (q.v.) declared at the time that the clergymen almost throughout the country were very much dissatisfied with the extreme measures adopted.

Dr. Sprenger, in his *Life of Mohammed*, computes the entire number of persons who have been burned as witches during the Christian epoch at *nine millions*.

Throughout the middle ages, it is doubtful if one person could have been found who doubted the reality of witchcraft; and it was not till the middle of the 16th c. that any one had courage to raise his voice against the enormities which the delusion was occasioning. The first, probably, to do so was a physician of the name of J. Weier (*De Præstigiis Dæmonum*, etc.), in Germany, in 1563. He was followed in 1584 by Reginald Scot (q.v.), "a solid and learned person, beyond almost all the English of that age" (Hallam), who demonstrated the absurdity and impossibility of the prevalent notions. The delusion, however, was still in the ascendant, and found multitudes of defenders, who branded the skeptics as "Sadducees." The most prominent of these champions was James VI. of Scotland, who, through his treatise on Demonology (1597), and his activity in the inquisition of cases, is entitled to rank with pope Innocent and the inquisitor Sprenger, as at the same time a chief enemy and chief encourager of witchcraft. At last the world began to awaken from the horrid nightmare; the feelings of the humane began to be shocked by the continued butchery, and the more intelligent to question, if not the existence of witchcraft, at least the evidence on which the accused were for the most part condemned. Advocates took courage to defend a reputed witch, and judges (like North and Holt in England), to throw cold water on the proceedings; and the frenzy gradually subsided all over Europe. Individual cases occurred later on the continent than in Britain. A man was executed at Würzburg, in 1749, on a charge of sorcery; and a witch was burned at Glarus, in Switzerland, in 1782. Perhaps the latest

instance of a judicial execution for witchcraft occurred in 1793, in the grand duchy of Posen. The laws against witchcraft were formally repealed in England in 1736; in Austria, not till 1766.

The cessation of judicial proceedings, however, did not all at once put an end to popular outrages on supposed witches. In 1751 an aged female pauper and her husband were killed by a mob near Tring, in Staffordshire; and for the murder, one of the perpetrators was tried and executed. Not longer ago than 1863, a reputed wizard was drowned in a pond at the village of Hedingham, in Essex; and it was considered worthy of notice that nearly all the sixty or seventy persons concerned in the outrage were of the small-tradesmen class, none of the agricultural laborers being mixed up in the affair. Besides such violent outbreaks, striking revelations are frequently made in the course of judicial proceedings, how deep-seated and general the dread of witches continues to be throughout the more ignorant strata of European society, especially in rural places; and, concurrent with this, the faith in the skill of certain "wise men" and "wise women" (white witches) to counteract their malicious practices. As recently as March, 1867, a man calling himself Dr. Harris (S. Wales), was committed for trial at the next Radnorshire assizes, for duping various persons, by persuading them that their ailments were caused by their being "witched," and pretending to cure them by giving them written charms to wear. From one man he had extorted £4, from another £6, and so on.

The belief in magic or sorcery, in fact, continues to be the most energetic belief of the ignorant and degraded all over the world, no matter what their nominal religion is. To the mass of the adherents of Buddhism in central Asia, the lama or priest is merely a wizard who knows how to protect them from the malignity of evil spirits; and, according to Livingstone and other travelers, trials and executions for witchcraft are at this day common throughout Africa, as they were in Europe in the 17th c., and under forms ludicrously similar. See ORDEAL, MAGIC.

Of the numerous books written about witchcraft, we note the following: *Sadducismus Triumphatus, Sadducism Vanquished, or, Considerations about Witchcraft*, a work vindicating the belief in witchcraft, by Dr. Joseph Glanvil, chaplain-in-ordinary to Charles II., who was one of the first fellows of the royal society, and wrote a meritorious treatise showing the value of skepticism in science. R. Baxter (q.v.), in his *Certainty of the World of Spirits*, upholds the same side. Balthazar Bekker, a Reformed Dutch clergyman, was the first, at the end of the 17th c., to attack the very foundation of the superstition—namely, the belief in the devil himself, or, at all events, in the possibility of his interference in the affairs of this world. A successor of Glanvil—D. F. Hutchinson, chaplain to George I., in his *Historical Essay concerning Witchcraft* (1718), writes from the skeptical point of view. Sir W. Scott, *Letters on Demonology and Witchcraft*, entertaining, but superficial. Brand's *Popular Antiquities of Great Britain*, edited by sir H. Ellis (1855), gives a collection of witch-beliefs put together without much connection or method. H. Williams's *Superstitions of Witchcraft* (1865) takes a wide historical view of the subject, and evinces extensive reading. C. Mackay gives a good digest of it in brief space in a section of his work on *Extraordinary Popular Delusions* (1841). Thomas Wright's *Narratives of Sorcery and Magic*, 2 vols. (1852), contains a large collection of the most interesting stories of individual cases. Soldan, *Geschichte der Hexenprocesse* (Stutt. 1843); Ennemoser, *Geschichte der Magie*, 2d ed. (Leip. 1844; translated by W. Howitt, Lond. 1854). L. F. Alfred Maury, *La Magie et l'Astrologie dans l'Antiquité et au Moyen Age* (Lond. 1860), attempts to give a philosophy or theory of all superstitious beliefs. J. Grimm, *Deutsche Mythologie*, with his wonted sagacity and prodigality of learning, traces the several elements of the witch-creed to their roots in the beliefs of pagan times. Haas, *Die Hexenprocesse* (1865); Roskoff, *Geschichte des Teufels* (1869); Buckle, *History of Civilization* (1857–61); Lecky, *History of Rationalism* (1865); Tylor's *Primitive Culture* (1871); Conway, *Demonology and Devil Lore* (1878).

WITCH-HAZEL, *Hamamelis Virginica*, a North American shrub of the natural order *hamamelidaceæ*. This order contains only a very small number of species, much diffused over the world, but none of them European; shrubs or small trees, with alternate, stipulate, feather-veined leaves, and small axillary unisexual flowers. The witch-hazel is often not more than 6 or 8 ft. in height, dividing at the base into several cylindrical grayish branches. Sometimes it attains a height of 20 or 30 feet. The leaves are about four inches long, and two or three broad. The flowers are clustered, yellow and showy, with long linear petals. They appear in winter, or at the season when other trees and shrubs are parting with their leaves. The English name is derived from the supposed virtues of a forked twig as a divining-rod. The bark is much esteemed as a sedative and discutient. The name is usually spelled as above, though some insist on the form Wych-Hazel.

WITENA-GEMOT (A.-S. *witena*, genitive plu. of *wita*, a wise man, from *witan*, to know, and *gemót*, assembly, from *metan*, to meet), the great national council of England in Anglo-Saxon times, by which the king was guided in all his main acts of government. Each kingdom had its own witena-gemót before the union of the Heptarchy in 827, after which there was a general one for the whole country. It was composed of the chief ecclesiastics, the ealdormen (see ANGLO-SAXONS) of shires, and some of the chief proprietors of land. It would rather appear, though the latter is not quite free from doubt, that the lesser thanes, who formed part of the *scir-gemót*, or next inferior court, were not

entitled to form part of the general council. In the year 934, there were present at one of these assemblies king Athelstane, four Welsh princes, two archbishops, seventeen bishops, four abbots, twelve dukes, and fifty-two thanes.

The powers of the witena-gemót seem to have been very extensive. The king's title, however, hereditarily unexceptionable, was not considered complete without its recognition, and it possessed the power of deposing him. It could make new laws and treaties; and along with the king it appointed prelates, regulated military and ecclesiastical affairs, and levied taxes. Without its consent, the king had no power to raise forces by sea or land. It was also the supreme court of justice, civil and criminal. The Witena-gemót was abolished by William the Conqueror, and its powers were only in part transmitted to parliament.—See Hallam's *Middle Ages*, c. 8; sir F. Palgrave's *Rise and Progress of the English Commonwealth;* and Kemble's *Saxons in England.*

WITHDRAWING A JUROR, a somewhat clumsy method by which a trial is brought to a close after the impaneling of the jury, without either non-suiting the plaintiff or giving him a verdict. It usually takes place at the suggestion of the court when some unlooked-for event renders further trial at the time obviously improper. The agreement of the parties is necessary. The effect of withdrawing one of the twelve jurors from the box is to put an end to that trial, leaving the parties to pay each his own cost.

WITHER, George, was b. on June 11, 1588, at Bentforth, an estate in Hampshire of which his father was proprietor, and which in due course fell to the son. He was educated at the grammar-school of Colemore, and afterward at Magdalen college, Oxford, which he entered in 1604. He remained there several years, and after passing some time at home, he went to London, and entered himself at Lincoln's inn. His bent was, however, rather to literature than law; and he shortly became known in certain circles as a writer of clever verses. In 1613 he came before the public in a volume of satire, the title of which, *Abuses Stript and Whipt*, in some sort defines its contents. Certain things in the book were considered offensive by the authorities, and he was sent to the Marshalsea prison, and kept there for some months. During his imprisonment were composed his *Satire to the Kings* and his *Shepherd's Hunting*. In 1622 appeared a collection of his poems under the title *Mistress of Philarete*, and in 1635 his *Emblems, Ancient and Modern*. Though he had very much identified himself with the party of the Puritans, among whom his writings were most popular, on the breaking out of civil disturbance, he served as a captain of cavalry in the ill-judged and abortive expedition of Charles I. against the Scotch covenanters in 1639. When a little later, however, the general discontent determined itself into the grand struggle between the king and the English parliament, he promptly sided with the latter, and raised a troop of horse for its service by the sale of his estate. In the army of the parliament he attained the rank of major; but of his special services not much is known. On one occasion he was taken prisoner, and is said to have owed his life to a joke of Denham's, who besought the royalists to spare his life, on the ground that so long as Wither lived, he (Denham) was not the worst poet in England. On the final triumph of the side with which he had ranged himself, it appears that opportunities were afforded him of feathering his nest rather comfortably by the spoil of the defeated party. With the restoration naturally a reverse came; and as the reputed author of a pamphlet entitled *Vox Vulgi*, of a so-called seditious tendency, he was committed to the tower, and an impeachment of him having been ordered, his life for a time seemed to be in some danger. The impeachment was not, however, proceeded with, and sooner or later—the date seems somewhat uncertain—he obtained his liberty. He died in London on May 2, 1667.

WITHERS, Frederick C., b. Somersetshire, Eng., 1828; educated at King Edward's school, Sherborne, Dorset. He was articled to an architect for five years, and having further studied architecture with leading architects in London, he came to the U. S., 1852, at the invitation of the late A. J. Downing. In 1854, he entered into partnership with Calvert Vaux. Afterward he practised his profession in Newburgh, N. Y., designing numerous buildings, among others, the First Pres. church, Newburg. Immediately after the battle of Bull Run, he joined the army, being commissioned as first lieut. of a vol. corps of engineers. After a year's service, he retired, invalided, and again became partner with Mr. Vaux, in New York, the partnership later being increased by the addition of Frederick Law Olmsted. Among the public buildings designed by Mr. W. are the Hudson River State Hospital at Poughkeepsie, the savings bank at Newburg, the buildings of the Columbia institution for the deaf and dumb at Washington, the Jefferson Market court house and prison, in New York, and the Astor Memorial in Trinity church, New York; besides many churches, schools, and private residences. Since the close of the partnership, he has practised in New York. He is the author of *Withers' Church Architecture.*

WITHERS, Jones Mitchell, b. Ala., 1814; graduated West Point, 1835; commissioned in the cavalry and resigned the same year. He served in the Creek troubles and the Mexican war. From 1848 to 1861 he was engaged in business in Mobile, and for the last ten years was mayor of the city. He entered the confederate service in 1861; was made a brig.-gen.; commanded a division at the battles of Shiloh and Stone river, and was promoted to be maj.-gen. After the war he became editor Mobile *Tribune.*

WITHERS, Robert Enoch, b. Va., 1821; educated at the university of Virginia, where he took a medical degree. He served in the confederate army during the civil war, edited the *Lynchburg News*, 1866–68, was lieut.-gov. of Va., 1873; U. S. senator from that state, 1875–81; U. S. minister to Hong Kong (1885).

WITHERSPOON, John, d.d., ll.d., 1722–94; b. Scotland; educated at the university of Edinburgh; minister of different parishes, 1745–68; pres. of the college of New Jersey, 1768–94, and prof. of divinity; during the suspension of the college by the war, was, in 1776, a member of the constitutional convention of New Jersey, and, for six years, of the Continental congress, where he sat "in full clerical dress;" advocated and signed the Declaration of Independence and the articles of confederation; an active member of several important committees and of the board of war, visiting the camps to increase the comfort of the troops; when the college was re-opened lectured there on moral philosophy and rhetoric; raised greatly the reputation of the institution, and improved its financial affairs; visited England in 1783 and 1784 to solicit funds, but with little success; was blind the last two years of his life. His works were collected at New York in 4 volumes, 1800, and at Edinburgh in 9 volumes, 1804. Among them are, *Ecclesiastical Characteristics; Essay on Justification; Serious Inquiry into the Nature and Effects of the Stage; Legislative Authority of the British Parliament; Essays on Important Subjects; Essay on Money;* and *The Druid*. A statue of him was erected at Fairmount park, Philadelphia, during the centennial exhibition, 1876.

WITNESS, a person summoned, or capable of being summoned, by a court of law, or some officer authorized to take evidence relating to a judicial or other proceeding. All persons are liable to be witnesses, either voluntarily or involuntarily, and it is a duty which every citizen owes to his fellow-citizens, to be available whenever his testimony is deemed desirable. It is a compulsory duty, and the presence of any person can be enforced, both in civil and criminal cases. In England the usual mode of summoning a witness in a court of law, is by serving him with a *subpœna*, i.e., a formal writ proceeding in the queen's name, reciting that a certain action is pending in a court named, and a trial is to take place, and commanding the witness to lay aside all and singular business and excuses, and appear at the time and place before the court mentioned, under a penalty (*sub pœnâ*) of £100. This is called a *subpœna ad testificandum*. The corresponding term in Scotch law is diligence (q.v.). If the witness is required to produce a document in his possession, it is called a *subpœna duces tecum*, and he is told in the writ to bring the document. If a witness do not attend at the time and place mentioned, he is liable to be punished, either by attachment, i.e., summary imprisonment for contempt, or by an action for damages at the suit of the party summoning him. The subpœna, or notice to attend, must be served a reasonable time before the witness is wanted, and it is generally necessary to give a day's notice beforehand. During a witness's attendance on this public duty, he is privileged from arrest: thus, he cannot be taken into custody for debt while he is going to, remaining at, or returning from the court. Moreover, he is entitled, before he go to the court, to have his reasonable traveling expenses paid to him, and a sum for subsistence while he remains in attendance. He is also entitled to a reasonable allowance for his lost time while attending a civil trial, and courts of law allow 5s. per day to a laborer or journeyman, 7s. 6d. to a master-tradesman, and £1 1s. to £3 3s. to professional men; to females, according to their station in life. A witness may, in a civil case, but not in a criminal case, refuse to give evidence until his expenses are paid. A witness, before examination, is required to take an oath, which may be in any form which he considers most binding on his conscience; but he must at least believe in a God and a future state of rewards and punishments. When a witness is examined, he is generally asked specific questions, first, by the party calling him, and during this examination in chief, the rule is that he is not to be asked leading questions, i.e., questions which suggest the answer that is required. The opposite party is then allowed to cross-examine the witness, and in doing so, may ask leading questions, or test in every way the truth of witness's statement. After this, the witness is re-examined. There is a technical rule that the party calling a witness is not allowed to impeach his credit, or ask anything having that effect. There are certain questions which a witness may refuse to answer. Such are questions the answer to which might render the witness liable to a criminal charge or penalty; but he cannnot refuse if the effect would merely be to render him liable to a civil action, or merely to degrade him. If a witness live in a foreign country, he cannot be compelled to come to this country by any subpœna, and therefore the only way of getting his evidence is to send a commission to some person in the foreign country to take the examination there. Where, however, a witness residing in Scotland is required for a trial in England, and *vice versa*, he may now be compelled by subpœna to attend in the same way as if he had resided in England or Scotland respectively. If the witness is aged or infirm, so that his attendance at the trial would be dangerous to him, he may be examined by a commissioner or examiner before trial. In England, when a witness is sworn, a New Testament is put in his hand, and after the officer of court repeats the form he kisses the book. This form is "The evidence you shall give to the court and jury, touching the matter in question, shall be the truth, the whole truth, and nothing but the truth." When the witness is a Jew or foreigner, the form varies. In Scotland, the witness, when sworn, stands, holding up his right

hand, while the judge of the court repeats this form: "I swear by Almighty God, as I shall answer to God at the great day of judgment, that I shall tell the truth, the whole truth, and nothing but the truth, in so far as I know or shall be asked."

A witness is incompetent to testify if too young to understand the obligation of the oath, or, for other reasons, insensible to such obligation · if insane or intoxicated, or convicted of infamous crimes, if party to the record or directly interested in the result of the suit, or if in possession of privileged communications (such as an attorney's consultation with clients, or state secrets); husband and wife are incompetent to testify against each other. *These are common law rules*, and are greatly modified by the statutes of the states; the tendency being very strong to admit witnesses, and allow the jury to judge of their credibility. Thus, parties are allowed to testify in their own behalf in civil, and in most states, in criminal cases; and in many cases husband and wife may testify against each other. A party cannot be compelled to testify against himself, nor need a witness answer questions tending to incriminate himself. But an accused person, if he chooses to go on the stand, is subject to cross-examination. The U. S. judiciary act, 1793, provides that in cases not covered by the U. S. constitution, treatises, or statutes, the laws of evidence of the states shall govern in U. S. courts. In all states persons having conscientious scruples against taking an oath are allowed to affirm.

WITNEY, a small market and manufacturing t. of Oxfordshire, in a dreary district on the Windrush, 10 m. w.n.w. of Oxford. It is a neat and well-built town, consisting principally of two streets. There is a spacious cruciform church, a blanket-hall (built 1721), a town-hall, and cross (1683). It is celebrated for its blankets, which are distinguished for their peculiar whiteness, communicated, it is said, by the sulphurous qualities of the waters of the Windrush, used in their manufacture. This branch of industry has, however, somewhat declined, from the introduction of machinery for blanket-making in other towns. Gloves, malt, pilot-cloths, and felting for paper are also manufactured. The Saxon form of the name is *Witaneye*, and means, "the island of the wise men," or "the island of the parliament." Witney is connected by a branch with the Great Western railway. Pop. '81, 3017 ; '91, 3110.

WITTEKIND, a Westphalian chieftain, the most celebrated leader of the Saxons against Charles the Great, made his first appearance as leader in the expeditions which the Saxons undertook in 774 against the fortress of Eresberg, in Westphalia, and the Frankish province of Hesse, while Charles was subduing the Lombards. When most of the Saxon nobles submitted to the emperor Charles at the imperial diet at Paderborn in 777, Wittekind fled to Siegfried, king of Jutland, whose sister Geva he is said to have married. In 778 he returned, and when Charles was absent in Spain, began to lay waste the Rhine country. Charles's return obliged him again to take refuge in Jutland; but in 782 he fell upon the Frankish army by surprise at the Sintleberg, and entirely annihilated it—an act for which Charles took frightful vengeance by the execution of 4,500 Saxons. On this, all the Saxon tribes rose in arms, and the war was again led by Wittekind until 785, when Charles entered into negotiations with him, the result of which was that Wittekind repaired to the emperor's camp at Attigny in Champagne, and received baptism. After that, he appears no more in history. According to the legend, however, that is still current among the people in Westphalia, Charles promoted Wittekind to be duke of the Saxons, and made over Engers to him. From his castle, called Babilonie, situated in the neighborhood of Lübeck, he is said to have ruled with gentleness and justice till 807, when he met his death in a campaign against duke Gerald of Swabia. His bones repose in the parish church of Engers, in the duchy of Ravensberg, where Charles IV., in 1377, erected a monument to him; and on Oct. 18, 1812, another monument in his honor was erected at Minden by the Westphalian society. The higher of the two hills which form the Westphalian gates on the Weser, near Minden, bears the name of Wittekindsberg.

WITTEN, a t. in Westphalia, Prussia, on the Ruhr river, 31 m. n.n.e. of Cologne: pop. '90, 26,310. Much coal is mined in the surrounding district, and there are extensive manufactures of machinery, iron, steel, and glass.

WITTENBERG, a t. of Prussia, province of Saxony, on the Elbe, 55 m. s.w. of Berlin. It is no longer a fortified place, though till 1873 it was a fortress of the third rank. It is interesting as having been the capital of the electorate of Upper Saxony, as the cradle of the reformation, and as containing the remains of the reformers Luther and Melanchthon. The once famous university, in which Luther was professor, and mentioned by Shakespeare as the school where Hamlet studied, is now removed and incorporated with that of Halle. In the *Stadt-Kirche* are two remarkable but poor pictures supposed to be by their contemporary and friend Cranach, in one of which Melanchthon is represented as dispensing the sacrament of baptism, and Luther as preaching to a congregation, of which the two foremost figures are his wife and son. In the *Schloss-Kirche* are the tombs of Luther and Melanchthon, as well as those of Frederick the Wise (with a noble bronze statue by Vischer) and John, electors of Saxony. Upon the doors of this church—burned down by the French, but replaced by others of metal—Luther hung up his 95 theses against the papal doctrine of indulgences. The house of the great

reformer, containing his chair, table, etc., and two portraits of him by Cranach, remains almost unaltered. The houses of Melanchthon and Cranach are also shown. In the market-place is a bronze statue of Luther by Schadow, not far from which is also one of Melanchthon; and outside the Elster gate, a spot is pointed out where Luther burned the papal bull. Manufactures of woolen and linen goods, hoisery, and leather are carried on. Brandy is distilled, and beer brewed. Pop. '90, 14,458.

WOAD, *Isātis*, a genus of plants of the natural order *cruciferæ*, having a one-celled, one-seeded, laterally compressed pouch, with the valves keeled and eventually separating. It contains only a few species, mostly natives of the countries around the Mediterranean. Dyer's Woad (*I. tinctoria*) is sometimes found in cultivated fields in England, but most probably has been introduced, as it was formerly much cultivated both in England and Scotland, for the sake of a blue dye obtained from its root-leaves. The use of this dye has in great part ceased, in consequence of the more general introduction and diminished cost of indigo. Dyer's woad is a biennial plant, with oblong crenate root-leaves about a foot in length, on pretty long stalks; an upright, much branched leafy stem, about 3 ft. high; small yellow flowers, and large seed-vessels, about half an inch long and 2 in. wide, hanging from slender stalks. The leaves when cut are reduced to a paste, which is kept in heaps for about 15 days to ferment, and then formed into balls which are dried in the sun, and which have a rather agreeable smell, and are of a violet color within. These balls are subjected to a further fermentation before being used by the dyer. When woad is now used, it is always in union with indigo, which improves the color. Even by itself, however, it yields a good and very permanent blue. It is supposed that woad was the dye used by the Picts for painting their persons. Woad is now cultivated only to a very small extent in Britain.

WOBURN, a city in Middlesex co., Mass.; on the Boston and Maine railroad; 10 miles n.e. of Boston. It was located in 1640, incorporated as a town in 1642, and chartered as a city in 1889, and contains several villages. There are a high school, public library, electric lights, electric street railroads, waterworks owned and operated by the city, national and savings banks, and weekly and monthly periodicals. Woburn is the largest leather manufacturing place in New England, and also manufactures electric lamps and dynamos, glue, chemicals, and shoes. Pop. '90, 13,499.

WODEN. See Odin.

WODROW, Robert, the second son of James Wodrow, professor of divinity in the university of Glasgow, was b. at Glasgow in the year 1679. He was educated at the university of his native city, and after passing through the classes in arts, studied theology under his father. At an early age he devoted a considerable portion of his time to historical researches, and to this taste he probably owed his appointment as librarian to the university. He did not hold this office long. Having finished his theological studies, in the year 1703 he received a license to preach from the presbytery, and in the month of October of the same year was appointed minister of Eastwood, a parish in the co. of Renfrew, at no great distance from Glasgow. In that parish he remained till his death, faithfully discharging the duties of his office, and declining offers which were made to him of appointments to pastoral charges of more importance. He had been brought up in the strictest principles of Presbyterianism, and he zealously adhered to the party in the established church, which was most strenuous in maintaining those principles, and in resisting what were deemed to be the encroachments of the secular power. Soon after his settlement at Eastwood, he began to devote his leisure hours to what became the chief object of his life—the writing of a history of the church of Scotland from the restoration to the revolution. He spared no pains and no expense, so far as his limited means could afford, in collecting materials for this work. He corresponded with all persons who could give him any information, and transcribed with his own hand the civil and ecclesiastical records bearing on his subject. The work was published in 2 folio vols., the first in 1721, and the second in the following year. It was dedicated to king George I., whom the author styles "the best as well as the greatest of kings;" and in the year 1725 he received an order on the Scottish exchequer for £105, as a mark of the royal bounty. It is probable that this sum was the chief pecuniary recompense of his labors; but considerations of that nature formed no part of the inducements which had led him to undertake the work. A second edition of the history, in 4 vols. 8vo. was published at Glasgow in 1828, under the editorship of Dr. Robert Burns. Wodrow contemplated other works, chiefly of a biographical character, illustrative of the ecclesiastical history of Scotland. None of these were published till the present century. Two vols. of his collections on *The Lives of the Scottish Reformers and Most Eminent Ministers*, and 4 vols. entitled, *Analecta, or a History of Remarkable Providences*, have been printed by the Maitland club. Three vols. of his correspondence were published by the Wodrow society—a literary club called after his name, and instituted in 1841 for the publication of the works of the fathers and early writers of the reformed church of Scotland. This correspondence, which extends from the year 1709 to the year 1731, throws much light on the ecclesiastical history of the time, and contains letters addressed to persons of some note in their day, not only in Scotland, but in England, Ireland, and North America. Wodrow's health was impaired by the eagerness with which he prosecuted his laborious studies. He died Mar. 21, 1734, in the 55th

year of his age. His great work—the one by which his name is generally known—is the history. It is what it professes to be in the title-page, a "History of the Sufferings" of the Presbyterian church, rather than an ecclesiastical history of the period. This of itself implies a one-sided character, and warns its readers that they need not expect an account of events not coming within its limited range. Of its great value as a store-house of materials to the student of Scottish history, no one who has examined its pages can have a doubt. As little hesitation will there be in regard to the absence of every grace of style. The only question will be as to the degree of credit to be given to the facts which the writer relates. So far as concerns his fidelity in transcribing records, and incorporating in the text the narratives furnished to him, there is no reason to doubt his general accuracy. But beyond this nothing can be said. His credulity was so great as to make him entirely unable to give any weight to intrinsic improbabilities or the conflict of external evidence. He could rarely admit a fault in those of his own side, and it is hardly an exaggeration to say that he could never see a virtue in his opponents. Much of his history is gathered from the records of the privy council of Scotland, and an examination of these valuable and voluminous papers will make it pretty evident that Wodrow disingenuously neglected to extract particulars which tell against his party. It is obvious, therefore, that in the perusal of his work, allowance must be made, not only for the absence of whatever does not come within its proper subject, but also for exaggerations of the virtues and sufferings of one party, and the crimes and errors of the other. The fullest memoir of Wodrow is that which is prefixed by Dr. Burns to his edition of the history. Interesting details of his domestic life and of his labors and studies will be found in the printed volumes of his correspondence.

WOFFINGTON, Margaret, 1720–60, b. Dublin, Ireland, of poor parents. When a child she appeared in an itinerant show troupe. Her first appearance as an actress in comedy was in Dublin, and she there made a great success. In 1740 she played at Covent Garden theater, London; became a popular favorite and remained there until 1757, when she retired from the stage. For some years she lived with Garrick, but quarreled with him. The last part of her life was spent in respectable retirement.

WÖHLER, or **WOEHLER,** Friedrich, an eminent German chemist, was born near Frankfort-on-the-Main in 1800, and died in 1882. He studied medicine and chemistry at Marburg and Heidelberg, was for a time professor of technology and chemistry in the Polytechnic School at Cassel, and in 1836 became professor of medicine and director of the Chemical Institute at Göttingen. Among his works are *Principles of Chemistry* (1840), and *Practical Exercises of Chemical Analysis* (1854).

WOJWODA (Polish, *Wojewoda*), an old Slavonic word (composed of *woi*, warrior, and *wodit*, to lead), means, literally, army-leader or general, and was from early times used by most Slavonic nations in this sense. Afterward, it became the title of the elective princes before hereditary monarchies were formed. Thus, at one time, the princes of Walachia and Moldavia were called Wojwodes; from the Greek emperors, with whom they had been in intimate alliance from the year 1439, these princes next received the title of despots, a title they afterward exchanged for that of Hospodar. The name was also given to the elective princes of Transylvania, whether dependent or independent. The same title of Wojwoda was applied to the elective chiefs of the Polish government before the beginning of the Piast dynasty. Later, the name denoted office and dignity; and was given in the former kingdom of Poland, to the governors in the districts, or Wojwodschafts, into which the kingdom was divided. They had at first only a military authority; afterward, however, both the civil and military were united in one person, so that Wojwoda and Palatine were one and the same. The name of Wojwodschaft was preserved in Russian Poland till recent times; now the Polish Wojwodschafts are named uniformly with the other Russian "governments." From 1849 till 1860 the Banat and part of the military frontier constituted a separate Austrian crownland, called "the Servian Woiwodina and Temeser Banat."

WOLCHOW or Volkhov. See Ilmen, Lake, and Ladoga, Lake.

WOLCOT, Dr. John, better known under the pseudonym of *Peter Pindar*, was born at Dodbrooke, in Devonshire, in 1738. He was educated at the charge of his uncle, a respectable surgeon and apothecary of Fowey, in Cornwall. After studying medicine at the London hospitals, he accompanied sir William Trelawny to Jamaica in the capacity of medical attendant, but finding his professional income too small for his wants, he solicited and obtained a church-living in the island. His congregation consisted mostly of negroes, and Sunday being their principal holiday and market, the attendance at church was very limited. Sometimes not a single person came; and Wolcot and his clerk—the latter being an excellent shot—used at such times, after waiting for ten minutes, to proceed to the seaside, to enjoy the sport of shooting ringtailed pigeons. The death of his patron, Trelawny, induced him to abandon both Jamaica and the church. Returning to England, he tried to establish himself as a physician at Truro, in Cornwall, but does not appear to have succeeded. At any rate, he soon removed to London, where he gave himself up to writing audacious squibs and satires in verse, on all sorts of persons, from king George III. down to the liverymen of London, and even lower. Wolcot's line in literature is not a very respectable one, and most people would

probably prefer obscurity to a reputation like his; but, to do him justice, *Peter Pindar* is an excessively clever writer. Unscrupulous, impudent, and coarse, he is yet a master of burlesque humor and comic caricature: his verse is easy, vigorous, and idiomatic; and his fancy rich in the production of ludicrous metaphor. Two of his raciest pieces leveled at his sovereign, are *The Apple Dumplings and a King*, and *Whitbread's Brewery visited by their Majesties*. Besides these we may mention his *Lyrical Odes* on the royal academy exhibition (the earliest of his London efforts, and dating from 1782); *Bozzy and Piozzi, or the British Biographers; Peeps at St. James's; Epistle to a Fallen Minister; Odes to Mr. Paine;* and the *Lousiad, a Heroic-comic Poem*, in five cantos, etc. The *Lousiad* has its foundation in the fact that an obnoxious insect had been discovered in the king's plate among some green peas, which produced a solemn decree that all the servants in the royal kitchen were to have their heads shaved. Some of Wolcot's serious effusions actually possess considerable merit. If the matter, or rather the themes of his verse, had been less worthless, it would have stood a better chance of permanent popularity. In his own lifetime, his pieces were greedily read, and he had an annuity from the booksellers of £250 for the copyright of them. He was considered so formidable a personage that the ministry are said to have endeavored to bribe him into silence. Wolcot, who records this proof of his power, also asserts the incorruptibility of his patriotism. He died Jan. 14, 1819.

WOLCOTT, Edward Oliver, U. S. senator; b. in Longmeadow, Mass., in 1848; served for a few months as a private in the Ohio volunteers in 1864, and two years later began a course of study at Yale. He graduated at the Harvard law school in 1871 and, removing to Colorado, began practice as a lawyer. He was elected to the U. S. senate as a republican in 1888 and re-elected in 1894. He has been one of the prominent members of the free silver party, and in 1897 was a member of the commission sent to Great Britain to ascertain the attitude of the British government on the silver question.

WOLCOTT, Oliver, ll.d., 1726–97; b. Conn.; son of Roger. He graduated at Yale college in 1747; and, during the French wars, commanded a company stationed on the n. frontier. He was sheriff of Litchfield co. in 1751; a member of the council, 1774–86, and in the mean time judge of the court of common pleas, and of the Litchfield co. probate court. In 1775 congress appointed him a commissioner for Indian affairs. The next year he was put in command of the Connecticut forces enlisted to co-operate with the army in New York. The same year he entered congress which he left for the field soon after the promulgation of the declaration of independence, of which he was a signer. He took part in the battle of Saratoga. He still served in congress from time to time till 1783. He was lieutenant governor of Connecticut, 1786–96, and governor from the latter date till his death.

WOLCOTT, Oliver, ll.d., 1760–1833; b. Conn. educated at Yale college. He took part in the revolutionary war as an aid to his father, Oliver, and as an officer in the commissary department. He was called to the bar in 1781; was U.S. controller, 1788–89, and auditor of the U.S. treasury, 1789–91. He was again controller, 1791–95, when he became secretary of the treasury. On leaving that office in 1800, he was appointed U.S. circuit judge, which office he held for 2 years. He was a merchant in New York till 1812, when, in association with his brother Frederick, he founded large factories at Wolcottville, near his native town, Litchfield. He was governor of Connecticut, 1818–27, when he returned to New York.

WOLCOTT, Roger, 1679–1767; b. Windsor, Conn.; commissary of the Connecticut troops in the expedition against Canada in 1711. He served also in the succeeding French wars, and rose to be maj.gen. He was governor of Connecticut, 1761–65, after serving several terms in the legislature, in the council, and on the bench of the county court, and of the superior court. He was also deputy-governor. He was the author of *Poetical Meditations* (1725), containing a poem called *A Brief Account of the Agency of the Honourable John Winthrop, Esq., in the Court of King Charles II.*

WOLF (corresponds to Lat. *vulpes*, a fox), the name of a wild animal of the same genus with the dog, and of which it is indeed doubtful if it constitutes a distinct species; while, as to the different kinds of wolves found in different parts of the world, it must be deemed at present wholly uncertain whether they are to be regarded as species or varieties, although they have, provisionally, received specific names. There exists among them the same close resemblance as in the different kinds of dog, with a similarly marked distinction of characters, which, however, it is difficult to state as specific characters are generally stated. The same difficulty, therefore, occurs in the natural history of wolves as in that of dogs, although the number of different forms is not so great. In their most important characters, and those which, as least subject to variation, are generally regarded as best marking specific distinction, they agree not only with each other, but with dogs. The opinion, that the wolf is the parent of the dog, or of some of the kinds of dog, is favored by the identity of the period of gestation, a point which seems to be pretty well established, and which, in such a question, is to be regarded as of great importance. Dogs and wolves also intermix, but it is not yet fully ascertained that the offspring will continue fertile among themselves. It is further observed that wild races of dogs, whether originally wild, or having become wild (*feral* races), resemble wolves in many respects, in their dull uniformity of color, in their

lengthened muzzle, lengthened limbs, lank form, and gaunt aspect, and even in the bushiness of the tail. It has been alleged, as a reason against supposing the wolf and the dog to be really of the same species, that the wolf is incapable of domestication and of attachment to man. This, however, is not the case. Both the common wolf of the old world and the wolves of America have been found capable of domestication, when taken young, and instances are on record of their having displayed an attachment to their master like dogs.

The COMMON WOLF (*Canis lupus*) inhabits Europe and the northern parts of Asia, its range extending from the Arctic regions as far s. as the northern parts of Africa and of India. It is of a yellowish or tawny-gray color, with strong coarse hair, which is longest on the ears, neck, shoulders, and haunches, but particularly on the throat; the muzzle is black, the upper lip and chin white. The ears are erect and pointed, the muzzle sharp; the legs rather longer than those of the shepherd's dog; the tail bushy, but not curling; the eyes oblique, giving a peculiar vicious expression to the countenance. The wolf is swift of foot, and hunts deer and other animals, packs of wolves associating for this purpose; it also often commits great ravages among sheep, and attacks calves, but seldom full-grown oxen. It seldom attacks man, unless hard pressed by hunger, when it becomes very dangerous. The hungry wolves which sometimes descend, in severe winters, from the forests of the Alps, Pyrenees, and other mountains, are much dreaded by the inhabitants of neighboring regions; and terrible stories are told of travelers chased by packs of wolves in the forest-covered plains of the e. of Europe and in Spain. In general, the wolf is cowardly and stealthy, approaching sheepfolds and farm-buildings by night, in search of prey, and readily scared by any demonstration of watchfulness, fleeing from dogs, and not readily exposing itself within range of shot. It defends itself, however, with great vigor, when compelled to do so. It is not easily trapped, being extremely cautious, and appearing to understand the nature and purpose of a trap almost as well as those by whom it is set. Wolves have often been known even to approach a trap so skillfully as to devour the bait without harm to themselves, getting at it from below.

Diversities appear in the wolves of different countries of Europe and Asia, but not very considerable. The French wolves are generally browner, and rather smaller, than those of Germany; the wolves of Russia are larger, and have longer hair; the wolves of the Alps are brownish-gray, and not of large size; in Italy and Turkey a tawny color predominates. In some very northern regions, wolves become white in winter; and white wolves, probably albinos, sometimes occur in more southern regions. The black wolf is the most marked European variety. It is found in the Pyrenees and in Spain, and is very large and strong. Strings of mules are often followed by these wolves in the passes of the Pyrenees, after evening comes on, and they not unfrequently succeed, notwithstanding all the care of the muleteers, in capturing some of the animals.

Wolves are still very plentiful in some parts of Europe. In the Pyrenees and Ardennes, among the Carpathian mountains, in Turkey and the principalities, they are common; and in the vast forests of Poland and Russia wolves often appear in formidable packs, and still cause much loss by their attacks on cattle, sheep, and horses. As culture increases, wolves become scarce. The wolf was formerly common in Britain, and the Anglo-Saxon name for January, *wolf-month*, is significant of this fact. Places of refuge from wolves were erected for travelers in wild and unpeopled districts, as at Flixton in Yorkshire. King Edgar commuted the punishment of criminals on their producing a certain number of wolves' tongues. Lands in Derbyshire were held on condition of killing wolves. It is not easy to say at what date wolves ceased to exist in England; it was probably about the end of the 15th c., but they continued to commit serious ravages on flocks, in Scotland, in the end of the 16th c., and the last wolf in Scotland is said to have been killed in 1743. They existed in Ireland at least as late as 1770. See Hastings's *British Animals*.

The American wolves are very similar to those of the old world. They have been described as forming several distinct species, but are by some included in one, doubtfully distinguished from the common wolf, and to which the name *canis occidentalis* is given. The fur is thicker, and the form more robust than in the common wolf, the muzzle is less pointed, and the profile not so straight, the legs and ears are shorter, and the tail is more bushy. The GRAY WOLF (*canis occidentalis*, var. *griseo-albus*, or *C. griseus*) is abundant in the northern parts of North America, except in the long-settled districts, from which it has been expelled by man. It is the only kind found in Canada. A few still remain in the mountainous and wooded parts of New England. Packs of wolves hang around the herds of buffaloes (bisons) on the western prairies, not daring to attack strong animals, but ready to seize any sickly straggler that falls behind the rest. They hunt and run down deer. The gray wolf equals the European species in cunning, and has been known to bite off the cord close to the trigger of a set gun, and afterward to devour in safety the bait placed before the muzzle. It has also been known to haul up fishing-lines set in a hole of the ice, and to help itself to the fish. It is frequently taken by means of pit-falls. On the prairies, the Indians kill great numbers of wolves by inclosing them in a circle gradually reduced, but originally extending over many miles. A premium of 10 to 20 dollars a head was formerly paid, in some parts of America, for the destruction of wolves, partly by the state, and partly by the county or

town, because of their ravages among sheep. The range of the gray wolf extends to the coldest northern regions, as Melville island and Banks's Land. In the north-western states, the gray wolf gives place to the DUSKY WOLF (*canis nubilus* of many naturalists); and in the s. is the BLACK WOLF (*C. ater* or *lycaon*); while on the upper parts of the Missouri, the WHITE WOLF appears, and the RUFOUS WOLF in Texas. They differ little in characters and habits from the gray wolf.—The PRAIRIE WOLF (*C. latrans* or *lyciscus latrans*), the COYOTE of the Mexicans, is a very different animal, more resembling the jackal. It is found from Mexico northward to the Saskatchewan, abounding on the vast plains of the Missouri. It is 36 to 40 in. long, with a tail of 16 or 18 in., the muzzle sharp and fox-like, the ears very large and erect, four toes on each foot, and on the fore-feet a sharp claw on the inside, 2 in. above the ground, attached to the rudimentary thumb; the color is usually dull yellowish gray, with black cloudings, the under parts dirty white. It hunts in packs. It is an extremely fleet quadruped, excelling every other in the countries which it inhabits, except the prong-horn. Its voice is a kind of snapping bark. The true wolves never bark, the only sound they emit being a prolonged and dismal howl. See illus., WHALE, ETC., vol. XV.

South America has numerous species of *canidæ*, some of which are known as Aguana wolves, and are nearly allied to the prairie wolf.

WOLF, FREDERICK A., the most gifted classical scholar and first critic of his age, was born Feb. 15, 1759, at Haynrode, near Nordhausen. He was brought up and educated with great strictness by his father, the leader of the choir and organist of the place; but was afterward sent to the gymnasium at Nordhausen. Here, under the training of the rector Hake, were developed in him not only that restless ardor for the thorough study of the ancient languages which actuated him throughout life, but also, what was afterward the predominating trait of his character, the habit of inquiring and judging for himself, and of pursuing only one object at a time. Before leaving the gymnasium for the university, he had read the principal ancient authors, as well as the French, Italian, Spanish, and English; and had also perfected himself in the theory and practice of music. At the university of Göttingen, which he went to in 1777, with the intention of studying philology exclusively, he attended the lectures very irregularly, being already much given to private study. For the rest, he lived very retired, was little visited or known, and was only intimate with a few. However, he gave lessons to several students in Greek and also in English, for which he published Shakespeare's *Macbeth*, with explanatory notes (Gött. 1778). From Heyne (q.v.), who had once excluded him from hearing a course of lectures on Pindar, on account of the irregularity above noticed, he kept himself quite aloof. In order, however, to commend himself to a man who had so much influence as Heyne had, he laid before him, shortly before his departure in 1779, a dissertation, containing some novel views regarding the Homeric poems; which, however, Heyne coldly returned. In the same year, he went as teacher to the pædagogium at Ilfeld, and there first established his fame by an edition of the *Symposium* of Plato, with notes and introduction in German. In 1782, he was appointed to the rectorship of the high school at Osterode, in the Harz; and, in 1783, accepted an invitation to Halle, as professor of philosophy and of pedagogical science. In Halle, Wolf had at first difficulties to encounter, as he rather estranged than attracted students by the high tone of his teaching. However, he soon learned to adapt himself to his audience, and then the crowd of eager pupils was very great. As academical teacher, he went on the principle that classical antiquity should be looked upon chiefly as serving for a model of what is noblest and greatest in public and private life, and as such, is to be employed as a medium of education. He made it the principal duty of his office to provide able teachers and superintendents for the schools of his native country, and to deliver education, as much as possible, from the scientific pedantry of the old school of pedagogues. Literary labors and fame he looked upon more as a subordinate object; and his effectiveness as a teacher was unparalleled during the twenty-three years he lived at Halle. He nevertheless established his reputation as a scholar and critic by an edition of Demosthenes's *Oratio adversus Leptinem* (1789), which attracted much attention, and still more by his celebrated *Prolegomena in Homerum* (1795), in which he unfolded, with prodigious learning and acuteness, his bold theory, that the *Odyssey* and *Iliad* are composed of numerous ballads or rhapsodies by different minstrels, strung together in a kind of unity by subsequent editors (see HOMER). This work made a great sensation through the whole of Europe. Some scholars gave out that they had long entertained similar notions regarding the Homeric poems; and Heyne insinuated that the Prolegomena were only a reproduction of what Wolf had heard at Göttingen. This gave rise to the spirited *Briefe an Heyne* (Letters to Heyne, Berl., 1797), of which the first three may be considered as models of scholarly polemic and fine irony. Some years afterward Wolf published the text of the four orations of Cicero, whose genuineness had been called in question by Markland in England, namely—*Post reditum in Senatu, Ad Quirites post reditum, Pro domo sua ad pontifices, De haruspicum responsis*—appending the previous controversy, and adding striking observations of his own in proof of their spuriousness. He next went still further, and attacked the authenticity of the oration *Pro Marcello*, which had long been studied by the Ciceronians as a model of eloquence and style, pronouncing it to be mere inflated declamation, in a diction hardly Latin, and which Cicero

never could have written. This audacious skepticism produced no little alarm. After having refused a call in 1796 to Leyden, in 1798 to Copenhagen, and 1805 to Munich, his position was considerably improved, and he received the title of privy-councilor. After the disasters of 1806, the university at Halle was dispersed, and Wolf was for a time reduced to great straits. However, he soon found a suitable position as member of the academy of sciences at Berlin, where he took an active part in the re-organization of the university, and became a professor. He was taken into the ministry of the interior as a member of the section for public instruction; but, finding that the duties interfered with his time and strength for teaching, which he considered his mission, he continued only a short time in public office. He next gave up the work of an ordinary professor, and reserved at last only the privilege of lecturing in the university on such subjects as he chose. For the benefit of his health, he took a journey to the s. of France in April, 1824, and died at Marseilles, Aug. 8, 1824. The multitudinous works of Wolf we cannot attempt to enumerate. They consist chiefly of critical editions of classical writings, with dissertations and annotations, and often with admirable translations either in German or Latin. While in Berlin he edited, along with Buttmann, the *Museum der Alterthumswissenschaften* (1807–10), and afterward the *Literarische Analecten* (1817–20), which has been pronounced perhaps the best philological journal that has ever been published, and which contains, among other papers by Wolf, a long notice of Richard Bentley. From the papers which he left, his son-in-law, Körte, published *Ideen über Erziehung, Schule und Universität* (Ideas on Education, School, and University; Quedlinb., 1835).—See Hanhart, *Erinnerungen an Fr. Aug. W.* (Bas. 1825); Körte, *Leben und studien Fr. Aug. W.'s des Philotogen* (2 vols., Essen., 1835); Gottholdt, *Fr. Aug. W. die Philologen und die Gymnasien* (Königsb., 1843).

WOLF, Johann Christian von, a celebrated philosopher and mathematician, was b. in 1679, at Breslau. His father, a rather poor but well-informed artisan, made it his chief object to give a good education to his son, who at an early age showed excellent abilities. Wolf received the elements of his education at the gymnasium of Breslau, and went to Jena in 1699 to study theology. However, mathematics and philosophy were his favorite sciences, and to them he almost exclusively devoted himself. In particular, he studied Descartes and Tschirnhausen's writings, to whose *Medicina mentis* he wrote annotations, which brought him into connection with Leibnitz. In 1703 he delivered at Leipsic a graduation disputation, *De Philosophia Practica Universali, Methodo Mathematica Conscripta*, which made a very favorable impression, and then began to give lectures in mathematics and philosophy, which were very numerously attended. By various works which he published on special branches of mathematics, his name became celebrated even in foreign countries. When the incursion of Charles XII. into Saxony obliged him to leave Leipsic, he received, on the recommendation of Leibnitz, a call to Halle, as professor of mathematics and natural philosophy. He there acquired great celebrity by his systematical method of teaching, as well as by numerous mathematical writings. The clearness and definiteness of the ideas and propositions which he exhibited in his mathematical lectures, were something till then quite unknown. Hence it came that his system of metaphysical and moral philosophy, which he worked out according to this mathematical method, and published, met with universal approbation, and quickly spread through Germany: it became a kind of rage to treat all sorts of subjects in the mathematical method, the effect of which was often ludicrously pedantic. Wolf, however, was violently attacked by his colleagues in Halle, especially by those theologians who favored the pietism then coming into vogue: he was declared to be a despiser of religion, and a teacher of error; and a formal accusation was brought against him to the government. The immediate ground of the accusation was his oration *De Philosophia Sinensium Morali*, in which he spoke with approval of the morality of Confucius, besides which the basest insinuations were brought against him, derived from his doctrine of freedom, which, it was said, encouraged social anarchy. By a cabinet order of Frederick William I., of date Nov. 15, 1723, Wolf was deposed from his office, and was commanded, under pain of death, to quit Halle in 24 hours, and the Prussian dominions in two days. He did so on Nov. 23, and met with a favorable reception in Cassel, and was appointed to a chair in the university of Marburg. The dispute about his philosophical system now became general, and nearly the whole of Germany took part either for or against him. At the same time he received from abroad many marks of honor and advantageous proposals, which last, however, he declined. In the mean time, the Prussian government had begun to regret the steps it had been led to take against him, and had appointed a commission to re-examine the matter. This resulted in his entire justification; and when Frederick II., who had a great esteem for him, and had studied his system, ascended the throne (1740), Wolf was induced to return to Halle as professor of the law of nature and nations, and with the titles of privy-councilor and vice-chancellor. In 1743 he became chancellor in the place of Ludwig, and was raised to the rank of baron of the empire by the elector of Bavaria during the regency. Wolf died in 1754. Before his death he saw his philosophy spread over the whole of Germany and a great part of Europe; he had, however, outlived his reputation as an academical teacher. That he did great service to philosophy, cannot be denied. If he did not enrich it by great and brilliant dis-

coveries, he at least directed attention to systematic method; and by treating scientific subjects in the mother tongue, he did much to create that wide-spread taste for philosophical speculation which has since been characteristic of Germany. Wolf adopted Leibnitz's hypotheses and principles, which he endeavored to carry out into a complete system and popularize. But although the Wolfian philosophy was a great improvement on the scholastic Aristotelianism that had previously prevailed, its dogmatism could not stand the criticism of Kant, and it is now a theory of the past. By his voluminous writings, partly in the German language, and the immense number of his pupils, Wolf had a wide and beneficial influence on his age, more especially as counteracting pietism and mysticism, then rampant. He also did good service to the German language. The multitude and extent of his writings is truly marvelous, even if we look at nothing else than the mechanical labor of writing them. He treated mathematics and philosophy in a double set of works; the one in full in Latin, the other shorter as German school-books, of the most of which several editions have been published. Besides these, are a great number of treatises on single subjects in physics, mathematics and philosophy. His systematic works on all the chief branches of philosophy alone amount to 22 vols. in quarto.—See *Christian Wolf's eigene Lebensbeschreibung* (Christian Wolf's Autobiography), published by Wuttke (Leip., 1841); Ludovici, *Sammlung und Auszüge der Sämmtlichen Streitschriften wegen der Wolf'schen Philosophie, u. s. w.* (Collection and Extracts of the Controversies about the Wolfian Philosophy, etc., 2 vols., Leip., 1737); by the same author, *Ausführlicher Entwurf einer vollständigen Historie der Wolf'schen Philosophie* (3 vols., Leip., 1737).

WOLF-DOG, a kind of dog used for hunting the wolf, formerly abundant in Norway and Sweden, but now almost exclusively found in Spain, into which it is supposed to have been introduced by the Goths. It is of the same group with the shepherd's dog; and is of a large size, little inferior to the mastiff, with pointed nose, erect ears, long silky hair, and a very bushy tail curled over the back. In color it is mostly white, with large clouds of tawny color or brown.

WOLFE, a co. in e. Kentucky, drained by the Kentucky and Red rivers; 190 sq.m.; pop. '90, 7180. Co. seat, Campton.

WOLFE, a co. in s.w. Quebec, dominion of Canada, drained by St. Francis river and other streams; 266 sq.m.; pop. '91, 15,018. Co. seat, Dudswell.

WOLFE, The Rev. Charles, the son of a county gentleman of Kildare, was b. Dec. 14, 1791, at Dublin. The family having come to England on the death of his father, which took place while he was yet quite young, the boy received his chief education at Winchester, where he showed himself an apt scholar. Being transferred in 1809 to the university of Dublin, he succeeded in securing a scholarship, and in 1814 his degree of bachelor of arts. During this period he was actively employed as a tutor: at this time it was also that he composed the greater part of the poetry which he left as his legacy to the world. In 1817 his celebrated lines on *The Burial of Sir John Moore* suggested by reading Southey's impressive account of it in the *Edinburgh Annual Register*, were written; and soon after they found their way into the newspapers. So generally admired were they that even while the name of their author remained unknown, they had won for themselves a secure place in the memory of the British people. As a singularly felicitous and touching poetical record of a noble and pathetic incident in our national history, they are, perhaps, not likely to be forgotten while that history is patriotically read and remembered. Wolfe, after qualifying himself to take orders, became, in 1817, curate of Ballyclog, in the county of Tyrone, from which he was shortly transferred to the larger parish of Donoughmore. His devotion to his duties was extreme, and was repaid by the warm affection of all with whom they brought him in contact. But they seem somewhat to have overtaxed the strength of a constitution at no time robust; symptoms of consumption appeared; and a visit which he made to Edinburgh in May, 1821, developed it. He tried in search of health, successively, England, the s. of France, and finally the sheltered Cove of Cork, in which last place he died on Feb. 21, 1823.

His literary *Remains*, consisting of sermons chiefly and poems, were given to the world, with a Memoir, in 1825, by the Rev. John A. Russell, M.A., archdeacon of Clogher, an attached friend of the deceased. The work, though containing some poetry of real merit, never made any great impression, and is now quite forgotten. The one beautiful piece which preserves for us the name of Wolfe, was attributed by guess, while he lived, to more than one of the most famous writers of the day—as, notably, Campbell and Byron. Since his death, several nefarious attempts have been made to filch from him the fame he continues to derive from it.

WOLFE, James, the most famous English gen. of his time, was b. at Westerham, in Kent, on Jan. 2, 1727. His father was a Lieut.col., afterwards Gen. Wolfe, an officer of merit and distinction, who served under Marlborough and prince Eugene. Along with his brother Edward, who was about a year younger, James received his first education at a small school in that neighborhood. From the first, the boy had resolved to follow his father's profession of arms; and when little more than 13 years old, he started to accompany the col. as a volunteer in the unfortunate Carthagena expedition. An attack of illness, however, made it necessary to put him ashore at Portsmouth just before

the fleet sailed. In 1742 he received his commission as ensign in the 12th, or col. Duroure's regiment of foot, with which he was soon after embarked for service in Flanders. In the year following he took part in the famous battle of Dettingen; and it is evidence of the capacity he already began to display, that we find him, though still the merest boy, acting in the responsible capacity of ajt. of his regiment. After the battle of Fontenoy in 1745—at which Wolfe, who had now become a capt. in the 4th, or Barrell's regiment of foot, was, notwithstanding a current tradition to that effect, certainly not present—the British troops were withdrawn from Flanders to assist in the suppression of the rebellion at home. With the army in Scotland he served in the capacity of brigade-maj., and was present at the battles of Falkirk and Culloden. In 1747 he was again abroad on service. At the battle of Laufeldt he was wounded, though not seriously; and his conduct was so distinguished that he was publicly thanked by his commander-in-chief, the duke of Cumberland. In the beginning of the year 1749 he was appointed maj. of the 20th foot, then stationed at Stirling, whither he proceeded. In the absence of the col., the command of the regiment devolved upon him. In this responsible position, which was rendered much more trying by the disaffection still prevalent, young as he was, Wolfe conducted himself with admirable tact and discretion. With little interruption, he remained in Scotland till the end of 1753, when the regiment returned to England. From the tone of his correspondence, it is evident he was not greatly delighted with Scotland or its inhabitants. In the mismanaged expedition against Rochefort in 1757, Wolfe was appointed to act as quartermaster-gen. of the force. The total failure of the operations brought disgrace to nearly all concerned; but it became sufficiently known that, had Wolfe's prompt and daring counsels been followed, the result would have almost certainly been different; and his reputation, already a brilliant one, rose considerably in consequence. In particular, it appears that the attention of Pitt was now first decisively drawn to him as an officer of whom, in any enterprise intrusted to him, great things might be expected. As marking approval of his conduct, the full rank of col. was conferred on him. The high opinion thus formed of him, was signally confirmed the year following, when he was intrusted with the command of a brigade in the expedition against cape Breton, under Gen. Amherst. A great success was obtained in the capture of Louisburg; that it was mainly due to Wolfe's skill, boldness, and activity was quite clearly understood, and he became popularly known as "the hero of Louisburg." Presently came the opportunity which was to consummate his glory, in the instant of heroic death. Pitt was now organizing his grand scheme for the expulsion of the French from Canada; it was his just boast that he "sought for merit wherever it was to be found;" and the expedition, which had for its object the capture of Quebec, the enemy's capital, he confided to the care of Wolfe, allowing him, as far as possible, a *carte blanche* for the choice of his subordinate officers. On Feb. 17, 1759, Wolfe, advanced to the rank of maj.gen., and commanding an army of between 8,000 and 9,000 men, set sail from England. At Louisburg he had news of the death of his father, the state of whose health had for some time been such as to prepare him for the event. On June 26 Wolfe landed his forces on the isle of Orleans, opposite Quebec, and proceeded to concert his plans for the attack upon it. This, of which he had shortly before written as likely to be found "a very *nice* operation," proved, on a closer examination, to be one of stupendous, and, indeed, nearly hopeless difficulty. The system of defense adopted by his adversary, the skillful and wary Montcalm, was such as to offer him no point of advantage. In all his attempts, though seconded most ably by Admiral Saunders, who commanded the fleet, he found himself completely foiled. The season wore fast away during which operations could be continued; and an abortive result seemed imminent of the expedition from which so much had been hoped. But at last, at day-dawn of Sept. 13, he found himself at the head of his little army on the Heights of Abraham, above the city, where Montcalm, sorely against his will, was forced to risk decision of the struggle by battle in the open field. Resolving to stake all on a final effort, Wolfe had, during the night, succeeded in scaling the cliffs at a point insufficiently guarded—an operation of such frightful risk and difficulty as in war has scarcely a parallel. Of victory he had no doubt; his little force now—exclusive of detachments necessarily left behind—reduced to something like 5,000 men, was indeed opposed to near 8,000 of the enemy, besides Indian auxiliaries; but of these it was well known that only a part could be depended on as trained and veteran troops. The result justified his confidence; after a short struggle, the enemy was driven from the field in complete rout; the capitulation of Quebec followed some days after; and its fall decided the fate of Canada. But Wolfe did not live to reap the fruits of his victory; he died in its very hour. In person he led the right; twice wounded, he refused to leave the front; a third bullet prostrated him; and he was carried, plainly dying, to the rear. He lived only long enough to know that the battle was decisively won; then, rallying his last strength to give one final order, and saying: "Now God be praised! I die in peace," he expired. The gallant Montcalm also fell, paying, with almost his last breath, the tribute of a true soldier to the valor of the troops who had beaten him: "Since," said he, "it is my misfortune to be discomfited and mortally wounded, it is a *great consolation* to me to have been vanquished by so brave an enemy. If I could survive, I would engage to beat three times the number of such forces as mine were, with a third of British troops."

The news of the victory was received in England with a tumult of exultation, dashed with grief for the loss of the hero to whom the nation owed it. When parliament met in November, the house of commons addressed the king, praying that his majesty would order a monument to be erected to the memory of the dead soldier in Westminster Abbey; where, accordingly, an *effigies* of him may be seen, with allegorical adjuncts as tasteless and absurd as usual. He was buried beside his father, in the family vault under the parish church at Greenwich.

A single military achievement, however brilliant, cannot be made ground of a claim for the successful soldier to take rank as a great capt. But that Wolfe had the true genius for command, which needed only time and further opportunity to win for him a fame still more splendid, it is scarcely permitted us to doubt. Through the lower regimental grades he rose rapidly by sheer force of personal merit, at a time when the service was a mere hotbed of corruption; and on attaining to higher commands, he in every instance gave evidence of the higher military qualities which proved him eminently worthy of them. He had only reached the age of 33. when in his last, and properly his one great achievement, he died, seemingly cut off in the mere opening of a brilliant career. He was of warm affections, and frank and generous nature; though his temper was somewhat eager, impulsive, and irascible, few men have ever been more generally beloved; and not many men so famous have left behind them a memory in every way so pure and spotless.

Till lately, no memoir of him in the least adequate existed; but in *The Life of Major-general James Wolfe—founded on Original Documents, and illustrated by his Correspondence,* by Robert Wright (Lond. Chapman and Hall, 1864), the want is now competently supplied.

WOLF'ENBÜTTEL, a very old t. of Brunswick, Germany, a low marshy district on both banks of the Oker, 7 m. s. of Brunswick by railway. Its old fortifications have been converted into promenades. There are several churches, schools, charities, and a college. In a handsome building formed after the model of the pantheon at Rome, is the famous library placed here in 1644, of which Lessing was sometime librarian. It consists of nearly 300,000 volumes, and upward of 10,000 manuscripts, and contains some of the finest missals in Europe, an immense collection of bibles, including Luther's bible with autograph notes. In the same institution are preserved the great reformer's marriage-ring, spoon, drinking-glass, and portrait by Cranach. The cultivation of vegetables is carried on to a great extent, and there are manufactures of lacquered and japanned wares, paperhangings, leather, tobacco, and liqueurs; a trade in corn, cattle, and linen-yarn. Pop. '90, 14,484.

WOLFENBÜTTEL FRAGMENTS. See LESSING; REIMARUS.

WOLFF, ALBERT, b. Germany, 1814; studied sculpture there and in Italy. He was appointed professor in the Berlin academy of fine arts in 1866. Among his works, which are noted for their severe taste, are the statues of Frederick William III. at Berlin, and of Galileo at the university of Pesth. He died 1892.

WOLFF, EMIL, b. Berlin, 1802; studied sculpture with his uncle Schadow, and at Rome. He was some time prof. in the Berlin academy of fine arts. His *genre* statues and those on mythological or classical subjects are among his best works. Among his best busts are those of Bunsen, and of Thorwaldsen. He d. 1879.

WOLFF, JOSEPH, D.D., LL.D., 1795–1862; b. Weilersbach, Germany; was the son of a rabbi; early became a Christian; taught Hebrew at Frankfort; studied at Munich, Weimar, and Vienna; became a Roman Catholic at Rome, 1815, but was expelled for heresy, 1817; went to England, united with the church of England; studied two years at Cambridge, embarked as missionary to the Jews, 1821; traveled in the east; returned to England, 1826, by way of the Crimea and Circassia; married a daughter of the earl of Oxford, 1827; embarked on another missionary tour, leaving his wife in Malta; was taken prisoner and sold as a slave, but escaped to Bokhara, laboring 3 months there among the Jews; started for India, passing through Afghanistan and Cashmere, reaching Calcutta, 1833; visited the Jews at Cochin and Goa; spent some time in Abyssinia; returned to England *via* Malta, 1834; visited Abyssinia again, 1836, and the Rechabites of Yemen; sailed from Bombay for New York, 1837; preached in the principal cities of the United States; returned to England, 1838; was curate at Smithwaite; went in 1843 to Bokhara to effect the release from imprisonment of Col. Stoddart and Capt. Conolly; was himself made a prisoner and condemned to death, but escaped through the interference of the Persian ambassador; reached England, 1845. He published *Journal of Missionary Labors; Mission to Bokhara.*

WOLFF, WILHELM, b. Brandenburg, 1816. He is a sculptor of merit, his best work being representations of animal life. Among his best known works are "The Lion's Ride," a buffalo fighting with wolf dogs, and a bacchante sporting with a panther. Wolff has also produced busts of Joachim II., Herder, and Bach. He died 1887.

WOLFF'IAN BODIES, important organs in the vertebrate embryo, in which they serve a temporary purpose, except in the lowest class (fishes, amphibia), where they remain permanently. In the development of the chick, these bodies may be seen as early as the fourth day, lying along either side of the vertebral canal, from the region of the heart

downward and backward, and consisting of a series of cæcal or blind appendages, corresponding with the so-called kidneys of fishes, which in reality are true persistent Wolffian bodies. On the fifth day, the appendages become convoluted, and the body which they collectively form increases in mass. The appendages are then seen to possess a secreting property, and the fluid which they secrete is conveyed by the duct of each side into the *allantois*, a sac which, at the same time, acts as a temporary respiratory organ, and is also used as a urinary bladder. Hence these organs may be regarded in the light of temporary kidneys. In the chick, the true kidneys begin to form from the Wolffian bodies at the fifth or sixth day, and gradually increase in size as the temporary organs diminish; and at the end of fetal life, only a shrunken rudiment of them can be observed. In man, the process is very similar, the Wolffian bodies beginning to appear toward the end of the first month; while in the seventh week, the true kidneys first present themselves. From the beginning of the third month, the Wolffian bodies begin to decrease, the kidneys increasing in a corresponding ratio, and at the time of birth, scarcely any traces of the former can be seen. It was formerly believed that the essential parts of the generative apparatus—the testes in the male and the ovaria in the female—were also developed from these bodies; but this is not the case, as they have an independent origin in a special mass of blastema peculiar to themselves, in the immediate vicinity of the Wolffian bodies.

WOLFFIAN BOTTLES, the name given to a set of apparatus employed for the distillation of hydrochloric acid (q.v). It consists of a retort, in which chloride of sodium (common salt) is submitted to the action of sulphuric acid, gradually added through a funnel and the vapor evolved passes out into the first bottle and is absorbed by water. This process continues till the power of absorption of the water in the first bottle ceases (or, in other words, till the water becomes *saturated*), when the vapor collects in the neck of the retort and in the tube leading to the first bottle, till it acquires sufficient tension to force its way through the water, and enter the second bottle by a tube. In turn, the water in the second bottle becomes saturated, after which the gas is forced to find its way into the third bottle through the other two by means of the connecting tube. After the force of reaction in the retort has become weakened, the evolution of the gas is quickened by the application of a flame, which requires to be gradually increased. Considerable heat being generated during absorption, it is desirable that the bottles should be immersed in cold water. A third tube entering each bottle, except the last, admits atmospheric air to prevent the rarefaction in the retort tending to force the contents of the bottles back into it.

WOLF-FISH, *Anarrhichas*, a genus of fishes of the family *blenniidæ* (see BLENNY), having no ventral fins, the pectorals very large, a single dorsal fin extending from behind the head almost to the tail-fin, a long anal fin, the tail-fin rounded; the head round, smooth, and blunt; the teeth large and strong, not attached immediately to the jaws; but to bony processes connected with them by sutures. The jaws are powerful, the front teeth resemble the canine teeth of mammals, while the vomer and palate are furnished with teeth which have the form of rounded tubercles. One species, the COMMON WOLF-FISH, also CAT-FISH and SEA-CAT (*A. lupus*), is found on the coasts of Britain, and is plentiful in more northern seas. It is frequent on the coasts of Scotland, particularly in the n., but is more rare on the English coasts. It is of a light gray color, brownish on the back; the lower parts exhibiting ten or twelve dark transverse stripes. The skin is covered with much slime. It attains the length of 6 ft., and is a creature of formidable and even repulsive appearance: it bites savagely when caught, and fishermen therefore generally dispatch it as soon as possible by knocking it on the head. It preys chiefly on mollusks and crustaceans, which its jaws easily crush. It is often very destructive to nets, being an active and powerful fish. Notwithstanding its ugliness, it is in esteem for the table, and it is often found in the Edinburgh market. It is much used in Iceland, both fresh and salted; and a kind of shagreen, used for bags and pouches, is made of its thick skin. A very similar species, *A. vomerinus*, is found on the American coast from New York to Greenland, and is not only used fresh, but also split, salted, and smoked.

WOLF'RAM is a native compound of tungstate of iron and manganese, from which the metal tungsten (q.v.) is usually obtained.

WOLF'S-BANE. See ACONITE.

WOL'GAST, a commercial t. and sea-port of Prussia, in Pomerania, stands on the Peene, about 10 m. from its entrance into the Baltic, and 53 m. s.w. of Stettin. The shallowness of the water admits only the smaller class of sea-going vessels entering the harbor. There is a public dockyard and a school of navigation; and the inhabitants, who numbered (1890) 7880, are occupied in shipbuilding, seafaring, and in the manufacture of candles, soap, and tobacco. The larger ships discharge and take in cargoes at Ruden, a small island and pilot-station opposite the mouth of the Peene, known as the landing-place of Gustavus Adolphus in 1630. Wolgast is a very old town; it was strongly fortified as early as the 12th c., and was once the residence of the dukes of Pommern-Wolgast; it was taken and retaken five times between 1628 and 1675; the Russians plundered and burned it in 1713, and the Swedes retook it in 1715.

WOLLASTON, William Hyde, M.D., a distinguished physicist, was the second son of the Rev. Francis Wollaston, of Chiselhurst, in Kent, and was born Aug. 6, 1766. After the usual preliminary education, he was entered of Caius college, Cambridge, where he studied for the medical profession, and took the degree of M.D. in 1793, in which year, also, he was elected a fellow of the royal society. After practicing as a physician at Bury St. Edmunds, he removed to London; but being beaten by Dr. Pemberton in a competition for the post of physician to St. George's hospital, he determined thenceforth never to write a prescription, "were it for his own father," but to devote himself wholly to scientific investigation. This sudden resolution proved ultimately most beneficial, leading him rapidly to wealth and fame; for unlike many eminent investigators of nature's laws and phenomena, Wollaston combined "the genius of the philosopher with the skill of the artist," and succeeded in making industrial application of several of his important discoveries. His researches were prosecuted over a wide field, but were pre-eminently fruitful in the sciences of chemistry and optics. To the facts of the former science he added the discovery of new compounds connected with the production of gouty and urinary concretions, such as phosphate of lime, ammoniomagnesian phosphate (a mixture of these two forming the "fusible" calculus), oxalate of lime, and cystic oxide; also the discovery in the ore of platinum of two new metals, palladium (1804) and rhodium (1805). By his ingenious discovery of a mode for making platinum malleable, he is said to have gained £30,000, and his mode of hardening steel, and some other discoveries of a practically useful nature, were also very lucrative. His contributions to optics were the celebrated "goniometer" (q.v.), a most valuable gift to mineralogists; an apparatus for ascertaining the refractive power of solid bodies; the "camera lucida" (q.v.); the discovery of invisible rays outside the violet band of the spectrum; and an immensity of valuable and interesting observations on single and double refraction. He died Dec. 22, 1828.

WOLSELEY, Sir Garnet Joseph, first Viscount; b. near Dublin, in 1833. He entered the army in 1852, and since then has been constantly engaged in the service of his country, and has steadily risen to greater eminence in his profession. He served in the Burmese war of 1852–3; he was severely wounded in the Crimea, and received the cross of the legion of honor for his bravery there. He was in India during the mutiny, and in the Chinese war of 1860. Next year he went to Canada, and in 1870 successfully managed the Red river difficulty. On the outbreak of the Ashantee war, Wolseley, now knight commander of the Order of Saints Michael and George, was appointed to the command; and on his return received the thanks of parliament and a grant of £25,000 for the "courage, energy, and perseverance" he had displayed in the conduct of the expedition. In 1875, become a maj.gen, he was dispatched to Natal to superintend the affairs of the colony; in 1876 was nominated a member of the Indian council. In 1878 he was made high commissioner and commander-in-chief in Cyprus, from which post he was recalled in 1879 in order to proceed to the seat of the Zulu war, with supreme civil and military command in Natal, the Transvaal, and adjacent disturbed territories. He arrived just before the power of the Zulu king was broken at Ulundi, and arranged the terms of peace with the Zulu chiefs. He organized, in 1879, the government in Zululand, and conducted a campaign against the Secocoeni. Upon his return to England, in 1880, he was made quartermaster gen.; and in 1882, became adj. gen. He was placed in command of the English forces sent against Arabi Pasha in rebellion. At the battle of Tel-el-Kebir, Arabi's army was completely overthrown by Gen. Wolseley, and the insurrection brought to an end. For his success in this campaign he was raised to the peerage. After Gordon had been surrounded at Khartoum, during the Soudan rebellion, Lord Wolseley was sent up the Nile with an expedition for his relief. He failed in this object, and remained in command of the forces in Egypt. He is the author of a number of essays and military handbooks.

WOLLSTONECRAFT, Mary. See Godwin, William.

WOLSEY, Thomas, cardinal, was born in 1471 at Ipswich, in the county of Suffolk, and is reputed to have been the son of a butcher of that place. Though thus of humble origin, it is certain that by some means a good education was secured him, and at an unusually early age, he was sent to Magdalen college, Oxford, of which he became a fellow. It is said that while at Oxford, he was brought into somewhat intimate relations with the great Erasmus, unquestionably then in England. He afterward acted as tutor to the sons of the marquis of Dorset, through whose favor he became in 1500, rector of Lymington, in Somersetshire. On one occasion he appears to have got himself into difficulties. At a fair in the neighborhood, it was his misfortune one day, it is said, to be found drunk and disorderly; and by a certain knight of the shire, by name sir Amias Poulet, he was put in the stocks for the misdemeanor. That he figured in the stocks is certain; that he did so on the score of drunkenness there is no adequate evidence. When the power to retaliate came to him, he took his revenge on sir Amias by having him imprisoned for six years.

Wolsey, who was plainly one of the most insinuating of men in Somersetshire, became intimate with a Sir John Nafant, a man of considerable mark. Through the influence at court of this gentleman, he was appointed chaplain to Henry VII., with whom he speedily ingratiated himself. Being sent by the king on a special embassy to the continent, he acquitted himself so dexterously, that he rose still higher in favor; and in 1509 the deanery of Lincoln was conferred on him. The year after, Henry VIII. succeeded

to the throne left vacant by the death of his father. Nearly from this time forward, the life of Wolsey, previously noted, indeed, as a rising man, yet of no special public importance, is in effect the history of the England of which he implicitly became the ruler. From Henry he enjoyed the most unbounded favor and confidence; and the influence which he thus exerted in the conduct of affairs was such as has seldom been exerted by a subject. The most valuable ecclesiastical preferments were showered upon him; and finally, in the same year (1514), he obtained the bishopric of Lincoln and the archbishopric of York. The year following the dignity of cardinal was conferred on him by the pope, who, not long after, appointed him also legate. Besides these ecclesiastical honors, he was made by the king, in 1515, his prime-minister, and lord high-chancellor of England. From this time, up to that of his forfeiture of the royal favor, Wolsey was one of the most important men in Europe; and at home his power was almost without limit. The revenues derived from his various offices were of princely magnitude; and they were further enlarged by subsidies from foreign potentates, eager to conciliate his favor. He did not bear his honors meekly; in his way of life he affected a sumptuous magnificence, and a state only not royal, while in bearing he was arrogant and imperious. He openly aspired to be pope; and there seemed more than once ground for supposing that this crowning object of his ambition was really within his reach. He was, however, disappointed; and it has been surmised that his resentment against Charles V., to whom he attributed his failure, determined, to a considerable extent, the foreign policy of the country.

Such a man could not fail to have many enemies, eager, as occasion might offer, to discredit him with his royal master; and an occasion at length came, of which they did not fail to take advantage. To the project on which the king had set his heart, of divorcing Queen Catharine, and marrying Anne Boleyn, Wolsey showed himself hostile; of the latter part of the scheme he was known to disapprove; and his negotiations with a view to securing the consent of the pope to the divorce were conducted, as it seemed to the king, in a dilatory and half-hearted manner. Henry, where his passions were interested, could little brook contumacy of this kind; his displeasure was carefully fanned, and the disgrace of Wolsey was accomplished. In 1529 he was stripped of all his honors, and driven with ignominy from the court. Symptoms of relenting showed themselves, however, next year in the mind of the monarch, and it seemed as if Wolsey might again be taken into favor. The prospect, as it proved, was delusive. Being at the time in Yorkshire, the archbishopric having been restored to him, along with others of his minor preferments, he was arrested on a charge of high treason, and ordered to be conveyed to London for trial. On his journey he was attacked with dysentery, and at the monastery of Leicester, in Nov. 1530, he died.

The faults of Wolsey's character are obvious; but if his pride, ambition, and rapacity were inordinate, his luxury and ostentation somewhat unbeseeming a successor of the primitive apostles, he was not without redeeming qualities. Haughty and insolent to his enemies, and those whose claims ran counter to his own, to his dependents and inferiors he was generous, affable, and humane; and not a few of them showed their honorable sense of this by devotion to him in his misfortunes. Of learning he was a most liberal and enlightened patron; and the endowment of Christ Church college, Oxford, survives as a monument to attest this. He was plainly a man of large and splendid capacity; and he seems, on the whole to have been a diligent, faithful, conscientious, and salutary counselor and servant of the monarch who so long and entirely trusted to him. There are lives of Wolsey by Cavendish (1641), Galt (1812), Martin (1862), and Creighton (1888).

WOLVERHAMP'TON, a municipal and parliamentary borough of Staffordshire, is the most populous town of its county, and a center of iron manufactures and tin-plate goods, 13 m. n.w. of Birmingham. Of its numerous churches, that of St. Peter's, built in the 14th c. and recently restored, is a stately edifice, with a lofty embattled and pinnacled tower. The leading public schools are—a thriving grammar school, founded 1714, an orphan asylum, instituted 1850, for orphans from all parts of the kingdom, with 250 scholars, and a school of practical art, opened 1854. Among its philanthropic institutions, a general hospital and dispensary, opened 1849, and, like the orphan asylum, supported by voluntary contributions, is the chief. Wolverhampton sent members to parliament first in 1832, and became a municipal borough in 1847. It has quarter sessions of its own, a spacious cattle market, and a market hall. A commodious and handsome town hall has been erected; there is a system of deep sewerage; and its abundant water supply is in the hands of the corporation. There is a handsome bronze equestrian statue of prince Albert standing in Queen square. The town possesses an exchange where iron masters and merchants assemble; and an agricultural hall for the use of farmers and corn dealers. Wolverhampton stands upon the western edge of the extensive coal and iron-mining district of South Staffordshire, and is the metropolis of that district. On the s. and e. the vicinity is covered with coal-mines, iron-stone pits, blast-furnaces, forges, rolling-mills, and foundries; but on the n. and w. it is rural and picturesque. Its chief manufactures are tin-plate and japanned goods, enameled hollow wares, locks and keys, edge-tools, iron braziery and galvanized iron goods, gas and water tubes, cables and railway fastenings, iron-foundry goods, machinery, mills, cut nails, tips, cast hinges, electro-plate and papier-mâché goods, brass castings, and finished iron. Besides the establishments engaged in the hardware manufacture, there are several flour mills. Pop. '91, 82,620.

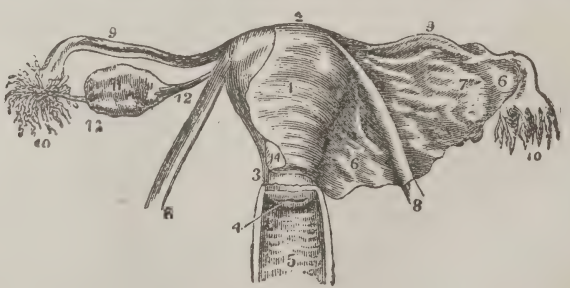
WOLVERINE STATE. See STATES, POPULAR NAMES OF.

WOMAN'S NATIONAL CHRISTIAN TEMPERANCE UNION, THE, was organized in Cleveland, O., in 1874, by the state temperance unions, which were the outcome of the "temperance crusades" undertaken by women in 1873. Its first annual meeting was held in Cincinnati, Nov. 17–19, 1875. It now has unions and loyal legions in every state and territory, and in some foreign countries. It has departments of preventive, educational, evangelistic, social, and legal work; labors, in schools, prisons, etc.; among foreigners as well as Americans; in the interests of international arbitration; of Sabbath observance; aids in suppressing impure literature and art; prepares and presents petitions relating to reforms to judicial bodies. In 1896 there were about 11,000 unions and legions; membership of about 500,000, and a W. C. T. U. temple (cost $1,000,000) in Chicago. Leading newspaper, *The Union Signal.* Pres., Miss Frances E. Willard.

WOMB, THE, professionally known as the *uterus,* is a flattened, pear-shaped organ, whose position and various parts will be best understood by a reference to the fig. It consists of a body (1), a base or fundus (2), a neck or cervix (3), and a mouth or *os uteri* (4). It lies in the line of the axis of the outlet of the pelvis (q.v.), with base directed upward and forward, and the neck directed slightly backward. In the unimpregnated condition, which we are now considering, it is about three inches in length, two in breadth, and one in thickness, and weighs about an ounce and a half. On laying it open, or exploring its interior by the introduction of an instrument through the *os uteri,* its cavity is found to be very narrow, and to contain a little mucus. Its walls are nearly half an inch thick, and are mainly composed of muscle-cells and fibers running irregularly in all directions except round the *os,* where they make a partial sphincter. This muscular coat, which constitutes the bulk of the organ, is covered externally with a serous coat, derived from the peritoneum, and is lined internally by a mucous coat continuous with that of the canal called the *vagina,* by which the interior of the womb communicates with the outer surface of the body. This mucous coat abounds in small mucous follicles, and is provided with ciliated epithelium (q.v.). The neck or *cervix* of the womb is distinguished from the body by a well-marked constriction. The mouth, or *os,* projects slightly into the vagina (which is shown as laid open anteriorly in the figure). This opening is nearly round in the virgin, and transverse after parturition. It is of considerable size, and is named the *orificium uteri externum;* it leads into a narrow canal which terminates at the upper end of the *cervix* in a smaller opening, the *orificium internum,* beyond which is the shallow triangular cavity of the womb, of which it forms the lower angle, while the two upper angles, which are funnel shaped, constitute the beginning of the Fallopian tubes (q.v.), whose apertures are so small as only to admit the passage of a fine bristle. The blood-vessels and nerves enlarge in a very remarkable way during pregnancy, so as to adapt themselves to the increased wants of the organ, which, at the ninth month of utero-gestation, weighs from two to four pounds. The term *appendages to the uterus* is given to the Fallopian tubes and ovaries (q.v.) which are inclosed by the lateral folds of the peritoneum called the broad ligaments. The womb is suspended in the pelvic cavity in such a way as, by its mobility, to escape rude shocks from without or disturbance from the varying conditions of the surrounding viscera, while at the same time to allow of its vastly increasing in bulk with comparatively little discomfort when pregnancy occurs. This is effected by several duplicatures of peritoneum, containing variable quantities of fibrous and muscular tissue, and known



THE UTERUS AND ITS APPENDAGES VIEWED ON THEIR ANTERIOR ASPECT:

1, the body of the uterus; 2, its fundus; 3, its cervix; 4, the os uteri; 5, the vagina laid open; 6, the broad ligaments of the uterus on left side; 7, a convexity of the broad ligament caused by the ovary; 8, 8, the round ligaments; 9, 9, the Fallopian tubes; 10, 10, their fimbriated extremities; 11, the right ovary; 12, the utero-ovarian ligament; 13, the Fallopio-ovarian ligament, on which some small fimbriæ are continued for a short distance; 14, peritoneum of anterior surface of uterus. The membrane is removed on the right side to show the parts imbedded in its folds.—From Wilson's *Anatomist's Vade Mecum.*

from their form or connection as the *broad*, the *round*, the *utero-sacral*, and the *utero-vesical* ligaments.

The uterus is an organ peculiar to the mammalia, and in comparatively few of them (excepting the apes and cheiroptera) is it of the simple oval or triangular form which we have described. It is *two-horned* in the ruminantia, pachydermata, solipedia, and cetacea; and it is said to be *divided* where it has only a very short body, as in most of the carnivora and edentata, and some rodentia, which speedily divides both externally and internally, and is continuous with the oviducts or Fallopian tubes. The uterus is actually *double* in some of the edentata, and in most of the rodentia, including the mouse and hare; in which each Fallopian tube passes into an intestiniform uterus, which has two completely distinct openings lying near to each other within the vagina. In the marsupiata and monotremata, the modifications of this organ are still more singular.

It is impossible to do more than name the chief offices or functions of the womb. They may be divided into those which relate to (1) menstruation (q. v.), (2) insemination, (3) gestation, and (4) parturition.—For a complete account of the anatomy, physiology, and pathology of the uterus and its appendages, we must refer to a masterly article by Dr. Arthur Farre on that subject in the last volume of the *Cyclopædia of Anatomy and Physiology*.

WOMB, Diseases and Derangement of the. In this article we shall not include the ailments of the pregnant or of the puerperal state, some of which, as *phlegmasia dolens* and *puerperal fever*, have been noticed in special articles. Many of the diseases, however, which we shall have occasion to notice may be traced to pregnancy, miscarriage, or severe delivery, that had occurred months previously. A common result of inflammation that often succeeds miscarriage or a bad delivery is to check that process of involution by which the womb ought to be restored in a few weeks to the size and condition in which it existed previous to the occurrence of pregnancy. For a lucid description of the processes which act on the enlarged womb to restore it to its original state, we must refer to Dr. West *On Diseases of Women*, 2d ed. p. 90. How inflammation acts in interrupting these processes, is not easily explained; but after it has passed away, its effects may remain in the enlarged size and altered structure of the womb, changes which render it likely to suffer from the alternation of activity and repose to which the female generative system is liable. In this condition, the enlarged and heavy uterus is very likely to become prolapsed, or to become a seat of permanent congestion or chronic inflammation; and excessive menstruation and a feeling of weight in the pelvis are almost always present. Besides this form of enlargement, there is a far less common form in which the enlargement of the womb takes place independently of previous pregnancy, and is the result of true hypertrophy. The symptoms are, according to West, "a sense of weight in the pelvis, pain usually of a burning character, hemorrhages having gradually come on, and forced themselves by their slowly increasing severity on the patient's notice." The treatment is much the same in both these forms of enlargement—viz., the recumbent position on a hair or spring mattress, attention to the bowels, and local leeching every fortnight, to be continued for several months, together with the careful use of iron associated with small doses of iodide of potassium. Temporary separation from the husband's bed should also be insisted on. There is also a form of hypertrophy which is confined to the neck of the womb, which occasions great discomfort to the patient, and acts as a mechanical impediment to sexual union. In these cases, no relief can be afforded except by a surgical operation, which is described in West, *op. cit.* p. 77.

From these results of "simple errors of nutrition," leading to increased growth of the organ, we pass on to the debatable and much-trodden ground of *inflammation of the womb*. *Acute inflammation* of the unimpregnated womb may arise from unaccustomed and excessive sexual intercourse, sudden suppression of the menstrual discharge, the extension of gonorrhœal inflammation, etc.; but, as it is comparatively rare, and seldom dangerous to life, we shall at once pass on to an affection which by most practitioners is regarded as one of the commonest to which woman is liable—viz., *chronic inflammation and ulceration* of the neck of the womb. It is not forty years ago since a French physician, M. Recamier, invented an instrument—the speculum—for the application of local remedies to the neck of the womb in cancer; but the light which this instrument threw upon uterine conditions generally, led, among other results, to the conclusion, that leucorrhœal discharges (popularly known as *the whites*) were often derived from, and associated with, various morbid appearances of the mouth of the womb, and could often be removed by remedies directed to that part. Almost ever since the speculum began to get into general use, a large number of old-fashioned practitioners raised up a cry against its employment, on the grounds of its indelicacy, its inutility, etc., and denied the very existence of various morbid conditions, which the employers of the instrument declared they saw with its use. Hence two parties have arisen—one who believe in the speculum and its revelations; and another who reject the recent modes of investigating uterine diseases, who take small account of the new facts regarding *local* disease which have been revealed, and who regard uterine ailments as resulting from constitutional derangements, and who therefore trust mainly to general treatment. Now, although the view that the local disease is everything, may not be universally true, the opposite view is certainly untenable; and Dr. West and other writers on this

subject have pointed out that there are reasons why the womb should more frequently than perhaps any other organ be the seat of certain forms of local ailment, and should consequently require the frequent employment of local treatment. It would be out of place in these pages to describe the characters of the ulcerations or abrasions of the mouth of the womb, which are so frequently revealed by the speculum, or to enter into any detail regarding the high pathological importance attached by some writers to them. The conclusion which Dr. West draws from a prolonged investigation of this subject is, that "the condition of so-called ulceration or abrasion of the os uteri is far from infrequent, even in cases where no uterine symptoms were complained of during life; but that it is usually unassociated with other important affections of the uterus, such as may be supposed to be the effects of inflammatory action; and, further, that such affections do not seem to be readily excited by causes acting on the neck of the womb, either when displaced, or when the organ is in its natural position."—*Op. cit.* p. 120. Since uterine pain, disordered menstruation, and leucorrhœal discharges—the symptoms usually associated with ulceration of the mouth of the womb—are met with by impartial observers almost as frequently *without* as *with* ulceration, it may be fairly inferred that this ulceration is neither a general cause of uterine disease, nor a safe index of its progress; and although the local application of caustic to the os uteri is doubtless often successful in restoring the patient to health, it must not be considered as a general rule that the attempt, by local remedies, to remove this condition is the one and all-important point in the treatment of uterine disease. There is no doubt that, in the great majority of these cases (excepting a few of the more severe ones), temporary separation from the husband's bed, the recumbent position (which facilitates the return of blood from the womb and adjacent parts), due attention to the diet and state of the digestive organs, and the use of injections of nitrate of silver, which may be applied by the patient, are sufficient in a few weeks to effect a cure. Chronic uterine inflammation of a more general nature (as of the interior, or body of the womb), with very similar symptoms, is by no means rare. If the disease is met with in the acute form, leeches should be applied to the womb itself; in the chronic form, which is generally observed, the pain in the back is best relieved by a croton-oil liniment, composed, according to Dr. West's directions, of one part of croton oil to ten of the camphor liniment (of the London Pharmacopœia) which should be applied (without rubbing it in) with a sponge twice a day on the back, at the seat of pain. Belladonna plaster or liniment also gives temporary relief. The irritability of the bladder, which is a common symptom, is usually associated with abundant phosphatic deposits in the urine, and is best relieved by a combination of ten or fifteen minims of dilute hydrochloric acid, half a dram of tincture of henbane, and two ounces or more of decoction of pareira-brava (see CISSAMPELOS), three times a day; and the tepid hip-bath may be used with benefit. The same general rules as to rest, diet, etc., which have been already given, must be attended to. Under the best management, a tendency to relapse is liable to occur at each monthly period, and after several such relapses, the womb is found (on surgical examination) to be enlarged and hardened, and less movable than natural. This condition is best removed by the careful and prolonged use of bichloride of mercury in small doses, which, as it is a deadly poison, must only be taken by professional advice; but the pain in the groin which usually accompanies this change, may be relieved or removed by the application of a small blister. The profuse discharge—both menstrual and leucorrhœal—is best relieved by chalybeate preparations, of which the following is a useful and favorite compound: Take of sulphate of iron, 6 grains; sulphate of magnesia (Epsom salts), 3 drams; dilute sulphuric acid, half a dram; syrup of orange peel, half an ounce; caraway water, sufficient to make a mixture of 6 ounces, of which 1 ounce may be taken thrice daily, after meals; or if there be much hemorrhage, a mixture of alum and sulphate of iron (4 grains of the former to 1 of the latter, dissolved in a small tumbler of water) may be taken three times a day. A hip-bath, containing half a pound of alum to every gallon of water, is often very useful as an astringent. It should be taken in the morning before dressing, and the patient should remain in it at least a quarter of an hour. For the first time or two, the water may have the chill just taken off. The same importance is not at present attached to vaginal injections as when it was believed that the vagina (and not the womb) was the main source of leucorrhœal discharge. In a case of leucorrhœal discharge of long standing, an excellent astringent injection may be formed by dissolving two drams of tannin and half an ounce of alum in a quart of water. Special forms of female or vaginal syringes are sold for this purpose. Of the application of caustics to the mouth of the womb, we say nothing, as that is a matter which must be left solely to the medical attendant.

From these remarks on the diseases of this important organ, we pass on to a very brief notice of its occasional *misplacements*. The singular mobility of the womb (without which pregnancy would be almost an impossibility) exposes it to the risk of displacement to such a degree as often to give rise to great personal discomfort. As all the causes which tend to produce displacement (such as increased weight of the organ during pregnancy, pressure of the superincumbent viscera, etc.) act in a downward direction, the obvious tendency of the womb is to be thrown downward, or to suffer *prolapsus* (q.v.), an affection which, in its extreme degree, when the organ is more or less protruded externally, is termed *procidentia*. Causes sometimes come into play which incline

the upper part of the uterus either backward or forward, giving rise to *retroversion* and *anteversion*, instead of mere prolapse. Prolapsus is sufficiently considered in the article bearing that title; and for a description of the symptoms and treatment of the two last-named misplacements, we must refer our readers to the standard works on the diseases of women.

The tendency of the womb to hypertrophy has been noticed at the beginning of this article; its individual tissues have a similar tendency to overgrowth, showing itself at particular parts, and thus giving rise to tumors or outgrowths, which are more common in this than in any other organ. Under this head may be mentioned several varieties of *polypus*, which differ essentially in structure, but all of which are invested by the mucous membrane which lines the uterus, and are liable to be the source of hemorrhage. Their removal by surgical means is generally a matter of no difficulty. Much more important than these is the *fibrous tumor*, which is frequent in its ocurrence, serious in its effects, and very slightly amenable to treatment. These tumors are of a spherical form and firm texture, resembling that of the womb itself, and usually occur in groups; several being frequently present, while one or two are considerably larger than the others. The symptoms to which they give rise vary extremely according as the chief tumor lies on the outer part of the womb, and grows into the abdominal cavity, or is developed within the walls of the womb, or projects into the interior. They may be of almost any size, cases being on record in which they weighed from 70 to 80 pounds. In regard to the symptoms of this affection, it must be premised that sometimes these tumors exist without exciting any disturbance, and that growths on the outer surface give rise to comparatively unimportant derangements, compared with those which are imbedded in the walls, or occupy the cavity of the womb. It will be readily understood that women who have passed the change of life (as it is popularly called) suffer less from these tumors than younger women. The diagnosis of fibrous tumor is effected partly by manual and instrumental examination (into which we shall not enter), and partly by the symptoms—such as (1) hemorrhage occurring in about 50 per cent of cases independently of their nature; (2) disturbance of the menstrual discharge in 62 per cent of cases, it most commonly being excessive and often painful; (3) pain, usually constant, and occasionally only at the menstrual period, described by some patients as a burning sensation, by others as a sense of bearing down, and by a few as occurring in paroxysms of intense agony; (4) dysuria—pain in voiding urine, or difficulty in discharging it, or frequent desire to pass it. It is usually hemorrhage, or inability to void the urine, that first directs the attention of the patient to her malady. Its tendency to excite abortion often leads the physician to suspect its presence. Although, as we previously mentioned, this is an affection little amenable to treatment, a woman with these symptoms should at once consult a physician (if possible, the physician-accoucheur to a large hospital), who, by his advice as to the general management of the case, especially during the menstrual period, may do much to palliate her sufferings. Iodine, bromine (and certain mineral waters containing these elements), and mercury have been vaunted as specifics, but nothing positive can be said regarding their successful action; and certain surgical operations have been recommended, which are accompanied with so much danger to the patient that it is needless to refer to them. But although the action of medicines on these growths is avowedly uncertain, nature in this as in many other cases not unfrequently strives toward a more or less complete cure. For example, if the tumor is pediculated, and lies in the uterine cavity, the pedicle may finally give way, and the tumor may be expelled; or certain changes may take place in the interior of a tumor, leading either to its disintegration and elimination, or to its conversion into a chalky mass, which, though not eliminated, induces no local disturbances. These spontaneous cures are by no means rare, although we can hardly lead the patient to expect them in any special case.

We shall conclude with a few words on a disease which is the most painful and hopeless of all the disorders to which humanity is liable—*cancer of the womb*. It is a disease whose leading features as thus graphically—we may almost say, painfully—described by Dr. West: "Pain, often exceeding in intensity all that can be imagined as most intolerable, attended by accidents which render the sufferer most loathsome to herself and to those whom strong affection still gathers round her bed; the general health broken down by the action of the same poison as produces the local suffering, and all tending surely, swiftly, to a fatal issue, which skill cannot avert; from which it can scarcely take away its bitterest anguish." The three most constant symptoms are pain, and hemorrhage, and discharge. From an examination of 132 cases by the above-named physician, the first symptom was found to have been,

In 58 instances,	or	43.9	per cent,	hemorrhage without pain.
" 26	"	19.6	"	pain of various kinds.
" 18	"	13.6	"	hemorrhage with pain.
" 18	"	13.6	"	leucorrhœa or other discharge without pain.
" 12	"	10.3	"	pain and discharge sometimes offensive.

It is unnecessary to enter into further details regarding the symptoms of this disease, as cases of this nature must always be under medical superintendence, and for the same reason we need only say regarding the treatment, that it is divisible into the *palliative*

and the *curative*, the former being directed toward the three great symptoms, and the general symptoms of the cancerous cachexia (or constitution), while in the latter are included the operation of extirpating the whole womb, or removing the neck of the womb by ligature or excision. It is difficult to speak with accuracy regarding the frequency of this disease. An approximate estimate may be formed from the fact that, in 1877, the mortality from cancer in England amounted to 3,923 males and 8,038 females; the excess in the latter case, amounting to 4,115, must be due to cancer of the breast or womb; and according to Tanchou, a French pathologist, cancer of the womb is more frequent than that of the female breast in the rate of 26 to 10. Hence the yearly deaths from uterine cancer in England amount to about 2,972. The last-named writer calculated, from ten years' observation of the French records of mortality, that this disease causes 16 per 1000 of all female deaths. The disease is very rare before the 25th year, and by far the most common period of its appearance is between the ages of 40 and 50 years. Its average duration is 16 or 17 months, but it may prove fatal in 3 or 4 months. On the subject of cancer of the womb, Walsh *On Cancer* may be consulted; and for further information on the subject of this article generally, the reader is referred to the standard works of Churchill, Lever, Simpson, West, etc.

WO'MBAT, *Phascolomys,* a genus of marsupial quadrupeds, constituting a distinct family, *phascolomydæ,* and of which only one species is known, *phascolomys wombat,* a native of Australia, abounding chiefly in mountainous districts of New South Wales, Victoria, South Australia, and Van Diemen's land, and in the islands of Bass's strait. In many of its characters, it resembles the *rodentia.* The incisors are two in each jaw, long, and chisel-like; they are hollow at the base, and continue to grow as they are worn away; there are no canine teeth; and the molars are five on each side in both jaws. There is a wide gap between the incissors and the molars. The wombat is an animal of clumsy form, having stout limbs and a blunt muzzle. It is 2 or 3 ft. long, plump, with a thick coat of long, grayish brown, coarse wooly hair; the head large, flat, broad, with small eyes and ears, the upper lip cleft; the feet five-toed, the claws long, except those of the inner toes of the hind feet; the tail very short. It is plantigrade, and the soles of the feet are broad and naked. It is nocturnal in its habits, slow in its motions; feeds on vegetable substances, and digs up roots with its claws; it makes its abode in holes among rocks, or in burrows dug by itself. It produces three or four young at a birth. It is a creature of little intelligence, but gentle, and easily domesticated to a certain extent, not seeming to care much for any change of circumstances, so long as its wants are supplied. It shows considerable snappishness, however, if provoked. Its flesh is preferred to that of any other quadruped of Australia. It is generally fat, and in flavor resembles pork. The remains of a fossil species have been found in the caves at Wellington valley, Australia. See illus., MARSUPIALIA, vol. IX.

WOMEN, MEDICAL EDUCATION OF. The medical education of women is recent. Facilities are now offered to women for the study of medicine in the United States, England, and the continent of Europe. Diplomas have been granted to women by the faculty of Paris, where the range of study is extensive and arduous. The German universities are not so favorable to the pursuit of medical studies by women, but the German cities are visited by them for private instruction. The University of Zürich in Switzerland is attended most by women, where a number always are in attendance upon full courses of lectures and instruction. There is an independent medical school for women in London, which was established principally in consequence of the exertions of Dr. Elizabeth Blackwell of New York. More encouragement, however, has been given to the medical education of women in the United States, and there are now numerous institutions which afford ample opportunities. In the commencement of the movement, the teaching was done by irresponsible and irregular persons, so that for a time there was necessarily a considerable want of confidence among intelligent people in female doctors, but recently much of this has been corrected, and many institutions pursue a thorough course. The Women's Medical College of Pennsylvania at Philadelphia has been in existence over thirty years, and has an efficient faculty composed of both men and women of good professional standing and attainments. The New York Infirmary for women and children is now nearly half a century old. It was founded by Drs. Emily and Elizabeth Blackwell. From the first this institution was conducted by women. During the past fifteen years, it has maintained an associate medical college, with a full faculty of regular professors and teachers. The New England Woman's Hospital of Boston is in good standing, and the medical department of the university of Michigan at Ann Arbor admits both sexes. Other institutions for the medical education of women are the Women's Hospital Medical College of Chicago, Ill., and the University of Wooster, at Cleveland, Ohio.

WOMEN, PRIVATE COLLEGIATE INSTRUCTION FOR. See COLLEGIATE EDUCATION FOR WOMEN.

WOMEN'S RIGHTS. In 1851 an article in *The Westminster Review* attracted attention to the novel subject of the enfranchisement of women. Since that time the agitation for women's rights has in Great Britain, and to a still greater extent in America, attained the dimensions of a political movement. The subject has, therefore, become one of general interest. The following is an account of the claims included in women's rights, and a brief statement of the chief arguments by which those claims are supported:

1. *The Political Rights of Women.*—The discussion has hitherto turned upon the right to the suffrage. The right to vote is claimed in accordance with the principles of political reasoning that are held conclusive in the case of men. The argument applies with peculiar force to a democratic constitution. Democracy involves two ideas. It is a protest against privilege and against despotism; it maintains that every individual is born with an equal right to the protection and consideration of the law; and it affirms that every one must have a vote in order to secure this fundamental right. The practice of the United States shows a gradual approach to those principles. Till lately, the negroes were refused the benefit of them; but the privilege founded on color has perished, and there remains now only the privilege founded on sex.

In England the right to vote has been made to rest on the principles of English law. A petition of women to the house of commons, presented on June 7, 1866, set forth that the possession of property in this country carries with it the right to vote in the election of representatives in parliament. From the earliest times the principle of the English constitution, and the spirit of the English people, have required that no man's property should be taken for the purposes of government without his consent. Since, therefore, the English law permits women to hold and manage property, it seems anomalous and inconsistent that it should refuse them a vote to protect their property from inordinate taxation. Other persons allowed by the law to hold property, but excluded from the suffrage, are minors, idiots, lunatics, and criminals. But the principle of disqualification in those cases does not apply to women. Moreover, there is alleged to be historical evidence that women have voted both in counties and boroughs. The disuse of the privilege is traced to historical causes. Such was the violence of the time that women were often unable to administer their property, and it was therefore natural that they should take little part in elections. Besides, the right to vote was at first regarded, not as a privilege, but as a burden; for the power of the commons was low, and the expense of paying members of parliament was considerable. The disfranchisement of women is therefore held to be an anomaly in the constitution, as it was an accident in history.

The objections to female suffrage are various. In an argument in the *Times* it is said: "There exists, as it were, a tacit concordat guaranteeing to the weaker sex the protection and deference of the strong, upon one condition only: that condition is the political dependence of women." This asserts a claim on the part of men to make laws for women, in return for protection and deference. Now, protection to person and property every one has a right to who obeys the laws and contributes to the support of the government. The reason for refusing votes to women must lie deeper. It may be said that, inasmuch as women are weak and at the mercy of men, men abstain from abusing their superiority only on one condition; that condition is, that women shall have no legal rights except those that men are pleased to give them. In the last resort the rights and privileges of any class of men depend on their might. The nobility established their privileges when they had power. The working-class has been admitted to the franchise because its power has increased. But women have no physical power to enforce their rights. If rights are to be measured by might, women will occupy the bottom of the scale. This is their position among savages. But, as civilization has advanced, men have learned to renounce the advantage of their physical superiority, and freely to give women privileges that could not have been extorted. It would, therefore, seem that the rights women actually enjoy do not depend upon, and are not to be measured by, their physical strength. The rights of women flow from the prevailing sense of justice, and justice now means that the interests of women be consulted with as much impartiality as the interests of men. An unjust preference of either would be mischievous to both. Since, then, the interests of women should be fairly considered, what reason can there be to prevent them voting, and thereby intimating what views they take of their own interests?

Another objection to the enfranchisement of women is that women have no business with politics, and that politics would withdraw them from their proper duties. Is this apprehension well founded? Granting that domestic life is the proper sphere of women, is it really impossible to unite an interest in politics with attention to a family? Upon this subject we are not altogether without experience. In the great dissenting churches in Scotland women, though excluded from office, vote equally with men in the appointment of ruling-elders, ministers, and in everything that is decided by a popular vote. But this privilege has not "hardened" them or made them "unfeminine," or interfered with their household work. On the other hand it has largely contributed to the success of the voluntary system, and to the strength of the church. The chimerical nature of the alarm felt on this subject has been illustrated by the objections that might be made against allowing clergymen to vote. "We should be told that clergymen have no business with politics; that it was their province to attend to spiritual matters, and that they ought to confine themselves to their proper sphere; that if they were permitted to participate in political affairs, it would deteriorate from the sanctity of their character; that the passions roused by political contests were inconsistent with that spirit of meekness and holiness which we look for in preachers of the gospel." Women are not wholly excluded from politics. In some countries a woman may be sovereign; and history affords many examples of women that have had the highest capacity for government. Women in Great Britain if they have the same qualification as men, have parochial

votes. And few would go so far as to propose that women should not only be shut out from public affairs, but also be kept ignorant of politics. Even if family-life be made their sole occupation, it surely is not to bound the horizon of their knowledge and sympathies.

The remaining objections may be taken together. They are of the same kind as those recently employed against the enfranchisement of the working-class. They are briefly: That the interests of women are not neglected, for they are represented by their male connections; that women are ignorant of politics; that they would be exposed to intimidation at home, and to violence at the polling-booths; and lastly, that women do not want votes. It is not allowed that women are sufficiently represented by their male connections. Such indirect influence is not considered, in other cases, to be a reason for withholding the suffrage. Rich men have a great indirect influence, but they have also votes. It is an old argument that operatives were represented by their employers; but that argument never convinced the operatives, and it has now ceased to affect the legislature. Why, then, should a *vicarious* representation, which is repudiated by every class of men, be considered sufficient for women? On the contrary, if women had votes their interests would be better attended to, because no member can disregard with impunity any important section of his constituents. It would be the policy of statesmen to devise and carry out measures for their benefit.

But, it is said women are ignorant of politics. This objection has lost much of its weight, now that household suffrage has been established. Educated women are surely not behind many of the new voters in political knowledge. Still, women, in general, know less of politics than men. They are constantly told that politics form no part of their business, and their opinions, like those of non-electors, have little direct and palpable influence on affairs. Political knowledge generally follows political power. Women have not the stimulus that acts on men; they have not the knowledge that their opinions form part of the legislative power.

There is little reason to fear that the possession of a vote would expose women to coercion and improper influence. The law has already defied a more serious danger. It permits women, and by special arrangement, even married women, to hold property, and it trusts its ability to protect them from the importunities of relations. If women can defend their property from greedy relatives, they will be no less able to give independent votes. The objection that women would be exposed to violence at the polling-booths, is not formidable. If such were the fact it would be no argument against female suffrage; it would be an argument against polling-booths. Should the police, however, be unable to protect female voters, there is the easy resource of voting-papers, already in use in the elections in the English universities.

The last objection is, that women do not want votes. A large number petitioned the commons in favor of extending the franchise to women that possessed a household qualification; those petitioners represent a very much larger number, who are kept back by the various social checks that prevent women taking part in political agitation. Nor can there be any doubt that a proposal that makes way with men simply on the ground of justice, will find still more favor with women, since their interest is ranged on the same side.

The claim of women to the suffrage is not without support from practical considerations. History teaches that women must have votes in order to protect their interests; men, through all the vicissitudes of history, have shown a constant preference of their own interests. In the words of lord Macaulay: "If there be a word of truth in history, women have been always, and still are, over the greater part of the globe, humble companions, playthings, captives, menials, beasts of burden. Except in a few happy and highly civilized communities, they are strictly in a state of personal slavery. Even in those countries where they are best treated, the laws are generally unfavorable to them, with respect to almost all the points in which they are the most deeply interested."

Till very lately there was in Great Britain no provision for the highest education of women. Many of the charitable endowments for education were destined by the founders for girls as well as boys, but have generally been appropriated to the latter. Christchurch hospital, in London, for example, educated 1100 boys and 26 girls. But of late much has been done for women's higher education. Girton and Newnham colleges (see CAMBRIDGE UNIVERSITY), Cambridge, were opened for female undergraduates in 1873 and 1875 respectively. Oxford now extends similar privileges. The Scotch associations for university education of women have obtained lectures for women by university professional teachers. In the facilities for education, women still suffer serious disadvantages.

English law is unfair to women, especially the law of marriage. Marriage is based on free consent, and is supposed to imply the approval of both parties. Now, it would be a hard bargain, where one of the parties was offered all the terms of it in the lump, and was therefore obliged to take everything or reject the whole; yet all the incidents of marriage, all the terms of the contract, are fixed by the law, and the law is made by men. In constituting the relation of marriage—a relation of even greater importance to women than to men—women have no voice, they have only a barren and impracticable veto. The result is familiar to every lawyer. By the law of England, the custody of a woman's children, after seven years of age, belongs exclusively to her husband; after they reach that age, she has no right even to see them. The common law strips a

woman of her property, and leaves her fortune at the mercy of her husband; the husband also can seize his wife's earnings, unless she is protected by a judicial separation, or by an order from a magistrate. A married woman cannot enter into contracts. In practice, this bad law is avoided by settlements made before marriage; but this protection involves expense, and is in a great measure confined to the rich. More recent legislation is as unfair as the older law. In 1857 the divorce court was established, and it was enacted that, for adultery on the part of a wife, the husband could obtain a divorce; but for the adultery of a husband, a wife was not allowed a divorce. In addition to adultery, the husband must be guilty of cruelty or desertion. (The Married Women's Property acts of 1881 and '82 give a woman powers over her movable and personal estate, whether acquired before or after marriage; which, secured on herself, will not be liable to arrestment for the husband's debts. This does not effect ante-nuptial contracts). The law of the realm is comparatively lenient in punishing brutal assaults by husbands on wives; garroters are flogged, but not wife-beaters. Finally, in the words of lord Brougham, "There must be a total reconstruction of the law, before women can have justice."

2. *The Industrial Rights of Women.*—These embrace admissibility to all offices, occupations, and professions; also admission to the universities, or some adequate provision for the education of women so as to fit them for high posts. This raises the question of the proper sphere of women. The prevailing ideas point to marriage as the true, if not the sole end of a woman's existence; but this theory is inadequate to meet our social difficulties. Many women are unmarried. What is to be done with them? To hinder them from doing the best they can for themselves, would be a manifest injustice; therefore, in the interests of single women, all occupations should be open. But the claims on behalf of women do not stop there. It is denied that men have any right to exclude women from active life, and so drive them into marriage as their only livelihood. On grounds of justice, the right of women to enter into industry is conceived as almost too clear for argument.

The objections to the industrial rights of women must be noticed briefly. It is said that the proper sphere of women is domestic life, and that she is by nature unfit for the struggles of industry. It appears from the census that just one-half of women above twenty years of age are confined to domestic life. About a third of the adult female population are either of independent means, or support themselves by non-domestic industry; the rest occupy a secondary position in the industrial world, by assisting their husbands in business. But though the number of women engaged in industry is great, they are confined to poorly-paid occupations, and their labor is for the most part unskilled. Generally speaking, the women of the middle class take no part in industry. The real issue is therefore narrow. It is not, shall women be admitted to industry? for that is settled; but, shall skilled and educated female labor be allowed? There is no evidence that women have no capacity but for the meanest employments. What they are fit for, can be finally determined only by actual trial. All that the advocates of women's rights ask is, do not anticipate the result, or foreclose the experiment. Some think that while it is desirable women should not be left unoccupied, they should not be admitted to industrial occupations, but society should seek a field for unmarried women, in some works of charity or religion, or in some semi-domestic pursuit. This proposal is an attempt to establish, in Great Britain, that provision for unmarried women that is supplied by the monastic system in Roman Catholic countries. The objection to it is clear. If this semi-domestic pursuit is the most agreeable and lucrative to women, they will, of course, hail the discovery of it with gladness; but if it is not, they may decidedly object to make martyrs of themselves.

A common objection is, that to take women from domestic work would harden them, and destroy the peculiar traits of their character. Now, a great part of what used to be the work of the household has passed to another province; spinning, weaving, brewing, and baking were at one time domestic work. If women are to do their ancient customary work, they must follow it abroad. Those who believe that the peculiar attributes of women are an artificial product of civilization, may feel alarmed at any disturbance of the present condition. But the genuine distinctions between the sexes flow from organization, and will not be obliterated by similarity of education and employment; on the contrary, no feminine charm would be lost, but women would be more spirited, more intelligent, and fitter companions for men.

It is an argument sometimes relied upon that an admission of women to industry would be prejudicial to men, because it would increase the supply of labor, and thereby lower the rate of wages. This objection is founded on the principle that, when the wage-fund is constant, the rate of wages falls as the laborers are more numerous, and rises as they become less numerous. But the competition of women is, to some extent, an exception, for if they do not work for themselves they must be supported out of the wages of men. If, however, wages were to fall below the ordinary standard of comfort, the tendency would be, by fewer births or emigration, to reduce the excess of laborers till the supply of labor should be adjusted to the required standard of wages; and experience shows that wages are not permanently lowered by the admission of women to industry. In the working-class wages adjust themselves to a scale enabling a workingman to maintain a wife and family.

In the last place it is said that active life is inconsistent with the cares of maternity. This, of course, has no application to the large class of childless women; and there can

be no necessity for prohibiting women from entering into industrial life if their situation renders it impracticable. The incompatibility between active life and maternity may safely be left to look after itself. From the returns in the census it appears that one out of eight married women are employed in non-domestic labor; but, since many of their occupations are not incompatible with household duties, and since many have no children to attend to, it seems probable that only among a small number of the working-class the duties of maternity are sacrificed to outdoor employment. It is, however, a moot-point how far maternity interposes a barrier to the industrial education and employment of women. In the working-class the mother usually nurses her children, for she could seldom make a profit by engaging in an another employment, and hiring a servant; but if women were employed in skilled and well-paid occupations, they would probably leave nursing, which at present is unskilled labor, to servants. The solution of the problem must, however, be left to trial and experience. One principle, at any rate, is clear; except in so far as women are occupied as mothers, they should be employed in the most remunerative work. That would be beneficial to men, for it would relieve them of a pecuniary burden; it would be beneficial to women, for it would make them independent.

The women of the middle class, led astray by a mistaken aspiration to aristocratic leisure, have held aloof from the struggles and rewards of industry. This operates injuriously in various ways. It creates an unnatural competition with working-women, as in needle-work. Middle-class women often discharge duties that might well be left to upper servants. If they entered into commerce and trade they would fit themselves for, and require, a higher kind of occupation than those thankfully accepted by poor and untaught women. At present the higher walks of business, and even subordinate offices of trust and skill, are monopolized by men; hence women engaged in the lower employments derive little pecuniary benefit from trustworthiness, experience, or judgment, and have no hope of rising. If they should attempt to better their condition they are left without encouragement or support. The exclusion of women of the middle class from industry is hurtful to themselves. It often leads to poverty of the bitterest kind—the poverty of gentlewomen. It leaves them without occupation, a prey to *ennui* and bad health. It also forbids perfect companionship and sympathy between the sexes. The whole scope of a man's education is toward industry. In it he lives, and moves, and has his being. But of this world women have no direct knowledge. Hence a want of intellectual sympathy between men and women and an absence of any common standard of reasoning and evidence. Nor is this all. The virtues upon which industrial and public life repose do not derive due support from women. They are ignorant of the difficulties that beset moral problems under circumstances of which they have no experience, and their moral wisdom can hardly go beyond traditionary saws. Indeed, their influence is sometimes on the wrong side. A man will be reluctant to injure his family in their pecuniary interests for some point of conscience that his wife does not sympathize with, or for objects that she does not understand.

No account of women's rights would be complete without some notice of the claim to equality in marriage. This is the goal to which history points. "Among tribes which are still in a primitive condition, women were and are the slaves of men for purposes of toil. All the hard bodily labor devolves on them. In a state somewhat more advanced, as in Asia, women were and are the slaves of men for purposes of sensuality. In Europe there early succeeded a third and milder dominion, secured, not by blows, nor by locks and bars, but by sedulous inculcation on the mind; feelings also of kindness, and ideas of duty, such as a superior owes to inferiors under his protection, became more and more involved in the relation. But it did not for many ages become a relation of companionship, even between unequals." That stage has now been attained, and, "for the first time in the world, men and women are really companions." Women cannot be good companions for men unless they are equals. If they are kept inferior in education and knowledge their influence will tend to drag men down to their own level. The intercourse, moreover, that is of value is not intercourse between an active and a passive mind, but between two active minds. The theory of the subordination of women involves several bad consequences; for, women being unable to attain their ends directly, have recourse to management and artifice.

In the year 1869 an important step was taken toward the recognition of the claim for the concession of political franchises to women. In a bill passed in parliament respecting municipal elections a clause was inserted extending the right of voting at such elections to women. Similarly, by the English and Scotch education acts of 1870 and 1872, women are permitted to vote at the elections of school-boards.

Women's rights in the United States have very sensibly advanced within the last 20 years in important particulars. The right of suffrage is not generally conceded as yet, nor is it likely soon to be, but important experiments have been made in that direction. Thus the territory of Wyoming in 1869 gave women the right of suffrage and admitted them as jurors; the state of Massachusetts allows women to vote in town elections for members of the school committees, and to be eligible for the position; and in both cases the experiment seems to have been fairly successful. The more prominent members of the woman's suffrage associations have claimed the right to vote under the U. S. constitution as it now stands, but all test cases have been decided adversely. The

most noted of these cases are the appeal of Virginia L. Minor from the Missouri supreme court, in which an adverse decision was given by Waite, chief-justice of the U. S. supreme court, in 1874, and that of Susan B. Anthony and others, tried in 1873 before Justice Hunt, of the supreme court, in the U. S. circuit court for northern New York. Salutary legal reforms as to the property rights of married women have been made in New York, Connecticut, and many other states, the general result being to give a married woman control of her separate property and of that acquired by her own skill or labor after marriage. There are at present two great branches of the women's suffrage movement in this country—the national association, of which Elizabeth Cady Stanton, Susan B. Anthony, Matilda Jocelyn Gage, and others are prominent members; and the American woman's suffrage association, with which Mrs. Lucy Stone, Julia Ward Howe, and Mrs. Livermore are connected.

WOOD, a co. in n. Ohio, having the Maumee river for its n.w. boundary, drained by the Portage river and Beaver creek; 623 sq.m.; pop. '90, 44,392, chiefly of American birth. It is intersected by numerous railroads. Co. seat, Bowling Green.

WOOD, a co. in n.e. Texas, having the Sabine river for its s. boundary, drained by the Lake Fork; 700 sq.m.; pop. '90, 13,932. Co. seat, Quitman.

WOOD, a co. in w. West Virginia, having the Ohio river for its n.w. boundary, separating it from the state of Ohio, drained by the Little Kanawha river; 375 sq.m.; pop. '90, 28,612. Co. seat, Parkersburg.

WOOD, a co. in central Wisconsin, drained by the Wisconsin and Yellow rivers and Mill creek; 828 sq.m.; pop. '90, 18,127, chiefly of American birth. Co. seat, Grand Rapids.

WOOD, Alphonso, 1810–81; b. N. H.; graduated at Dartmouth in 1834; studied at Andover seminary one year; taught at Kimball Union academy, Meriden, N. H., 1834–49; followed civil engineering; president of Ohio female college, 1851–57; professor in Terre Haute female college, 1857–60; principal of Clinton female seminary, Brooklyn, N. Y., 1860–65. He was a distinguished botanist. His publications are: *Class-Books of Botany*, which has had an extensive sale; *First Lessons in Botany; The American Botanist and Florist; Leaves and Flowers; Flora Atlantica.*

WOOD, Anthony, of some note as an antiquary, was born at Oxford in the year 1632. His school education he received chiefly in the place of his birth, and in 1647, he was entered at Merton college as a gentleman commoner. In 1652, he took his degree as bachelor, and in 1655, became master of arts. Deriving from his father an independence, he seems at first to have aimed at being a sort of Jack-of-all-trades, as not bound in penalties of hunger to follow out any particular one. He practiced the fiddle assiduously, and is said to have attained considerable skill. Painting was also one of his innocent hobbies, but none of his pictures has been preserved to enable us to test his proficiency. In addition to these accomplishments, it was his whim to concern himself with heraldry and other antiquarian pursuits. He labored much in the libraries, and presently came to be noted for his curious turn that way. In 1656, he came upon Dugdale's *Antiquities of Warwickshire*, shortly before published, the perusal of which greatly delighted him, and awoke in him the fire of emulation. He now worked still more assiduously; and went about among the tombs, copying old inscriptions. As the fruit of these learned labors, he gave to the world, in 1669, his *History and Antiquities of Oxford.* For the copyright of this work Wood received £100 from the university; and Dr. Fell, dean of Christ Church, thought so highly of it that he employed one Peers, a student, to execute a Latin translation of it. The *Historia et Antiquitates Universitatis Oxoniensis* was published at Oxford in 1674.

Subsequently, in 1691, as result of his further investigations, Wood published his *Athenæ Oxonienses*, containing a full and particular account of all the authors, bishops, etc., who had adorned that seat of learning from 1500 to 1690. In this work, he attacked the character of the great lord Clarendon, deceased; a misdemeanor for which he was prosecuted at the court of the university, and expelled. He did not long survive this disgrace, dying Nov. 28, 1695. His books, and a selection of his manuscripts, he left to the university of which he had ceased to be a member, and they are preserved in the Ashmolean Museum. His life may be found at large in the edition of his *Athenæ Oxonienses* issued by Dr. Bliss in 1848.

WOOD, De Volson, A.M., an American engineer and physicist, was born at Smyrna, N. Y., in 1832, and was educated at the State Normal School at Albany and at the Rensselaer Polytechnic Institute at Troy, where he graduated in 1857. He taught mathematics in the normal school, 1854–55. He was professor of civil engineering in the University of Michigan, 1857–72, and in 1872 was called to the chair of mathematics and mechanics in the Stevens Institute of Technology, at Hoboken, N. J. He has published the treatises *On The Resistance of Materials* (1871); *On Bridges and Roofs* (1873); *The Elements of Analytical Mechanics* (1876); *Co-ordinate Geometry* (1879); *Reaction Motors*, etc.; and has invented a rock-drill, an air-compressor, and a steam-pump.

WOOD, Ellen (Price), 1814–87; b. England; became a magazine and story writer, and published a large number of novels, mostly sensational, but very popular. Among those most read are *East Lynne*, *The Channings*, *Trevelyn Hold*, and *Red Court Farm.*

WOOD, Fernando, 1812–81, b. Philadelphia, went to New York in his youth, engaged successfully in business, and became a ship-owner. He took part in local politics and in 1840 was elected to congress, serving in 1841–43, 1863—65 and from 1867 to the time of his death. He was mayor of New York, 1854 and 1861, and in the latter year, during the civil war is said to have made the astounding recommendation that New York should secede and become a free city. Though opposed to the war against secession he favored its prosecution after it broke out. He was one of the ablest leaders of the democratic party in congress; and the tariff bill of 1878, reported by the committee of which he was chairman, was one of the most important measures introduced of late years.

WOOD, George B., ll.d., 1797–1879, b. N. J.; graduated at the university of Pennsylvania, which gave him a medical degree in 1818. He held the chair of medicine at the Philadelphia college of pharmacy, 1822–31, and of materia medica at the same institution, 1831–35. He was professor of materia medica at the university of Pennsylvania, 1835–50, and of the theory and practice of medicine, 1850–60. Among his works are *A Treatise on the Practice of Medicine* (1847), and *Therapeutics and Pharmacology* (1856).

WOOD, Gen. Sir Henry Evelyn, V.C., K.C.B., G.C.M.G., K.C.S.I., b. at Cressing, Eng., in February, 1838; entered the English Navy at fourteen years of age, and was present at the siege of Sebastopol. He was wounded in the assault on The Redan (June 18, 1855); received the Crimean medal and other tokens, and was made a knight of the French Legion of Honor. He subsequently entered the British army as ensign in the 73d Regiment. He was promoted in rank, after his excellent service in the Indian Campaign of 1858, being major in 1862. In 1860, he won the Victoria Cross for valorous service in India, and was also frequently mentioned with approbation by Gen. Garnet Wolseley, commander of the English forces in the Ashantee War of 1873–74. This brought him the brevet rank of Colonel, and once more the medal with clasp. He served through the Zulu War of 1879, in command of No. 4 Column, raising "Wood's Irregulars," from one thousand friendly Zulus. In more than one hot engagement he defeated the Zulus, and was made K.C.B. upon his return to England. He commanded in the Transvaal War (1880–81) and served in the expedition to Egypt (1882), receiving the thanks of parliament. In December, 1882, he was appointed Commander-in-chief of the Egyptian army, and in July, 1883, he was made Knight Commander of the Star of India. He was made quartermaster-general in 1893 and general in 1895.

WOOD, James, 1750–1813, b. Va.; a delegate to the Virginia convention of 1776. The same year he was appointed a col. in the Virginia militia. He was afterward lieut.-gov. of Virginia, served on the executive council, and was gov., 1796–99. He was a son of Col. James, who founded the town of Winchester. Wood co. was named from him.

WOOD, James Frederic, b. Philadelphia, 1813; educated in England; from 1827 to 1837 resided in Cincinnati and was a bank officer. In 1837 he went to Rome, studied for the priesthood for seven years, and then returned to Cincinnati and became assistant rector in the cathedral. In 1857 he was consecrated coadjutor-bishop of Philadelphia, and in 1860 succeeded to the bishopric. He visited Rome several times and attended the Vatican council of 1869. In 1875 he was consecrated archbishop of the newly-created see of Philadelphia. He d. 1883.

WOOD, John George, b. London, 1827, educated at Oxford, and ordained in the church of England. He has written several popular works on zoölogy, such as a *Popular Natural History;* and *Sketches and Anecdotes of Animal Life.* Among his other works are *Homes without Hands; Insect Life; Natural History of Man; Natural History,* his principal work; *Man and Beast; Insects Abroad;* and *Horse and Man.* He died 1889.

WOOD, Thomas Jefferson, b. Ky., 1823, appointed to the topographical engineers after graduating at West Point in 1845. He served in the Mexican war, and was afterward stationed on the Texan frontier. In 1862, at the head of the 6th division of the army of the Ohio, he was at Shiloh and Perrysville, and was wounded at Stone river. He commanded a division in the 21st corps, in the Tennessee campaign in 1863, and was at the battle of Chickamauga. At Missionary Ridge he commanded a division of the 4th corps, was at the capture of Atlanta, and commanded the 4th corps in the campaign against Hood in Tennessee. He resigned with the rank of maj.gen. in 1869.

WOOD, William Maxwell, 1809–80, b. Baltimore, entering the navy as assistant surgeon, he was appointed surgeon in 1838, was fleet surgeon to the Pacific squadron 1844–46, and to the north Atlantic squadron, 1861–65. He became chief of the bureau of medicine and surgery in the navy department in 1871, was appointed surgeon-gen. in 1871, and retired in 1872. He has published several books of travel.

WOOD and WOOD FIBRE. Flowering plants agree with the higher cryptograms (ferns, club-mosses, horsetails) in the possession of "fibro-vascular bundles" (see Vascular Tissue), longitudinal strands of tougher consistence than the cellular tissue (q.v.) by which they are surrounded. These bundles are always readily distinguished into two main constituents, *wood* and *bast;* which may be arranged either in a *collateral* or in a *concentric* manner; in the former case the wood and bast are placed side by side in the bundle, and in the latter the bast surrounds the wood. In flowering plants the former arrangement prevails; in vascular cryptograms, the latter. In cryptograms and mono-

cotyledons, the bundle is incapable of growth after its first formation, all the embryonic tissue being used up at once; but in dicotyledonous plants (see EXOGENOUS PLANTS), the bundles exhibit continuous increase in thickness throughout the life of the plant by virtue of the persistence in active growth of a layer of embryonic tissue, the so-called cambium (q.v.) which remains in the middle of the fibro-vascular bundle, interposed between wood and bast, both of which thus increase in thickness. Since the bundle lies in the cellular matrix, with its woody portion directed towards the center, and its bast towards the circumference, the interposed cambium deposits each new layer of wood *outside*, and each new layer of bast *inside* the former ones; and the term *exogenous*, commonly applied to the growth of dicotyledonous stems, is thus seen to be applicable as regards the woody portion of their fibro-vascular bundles only.

The fibro-vascular bundles of monocotyledons lie scattered separately through a cellular matrix, the *ground substance* of the stem, which thus rarely possesses any great consistence, and has no separable bark. In dicotyledonous stems, on the other hand, the bundles anastomose at frequent intervals in their course along the stem, and this characteristic distinction can be readily seen by examining the stems of any two types of these groups, say of a lily or a geranium, or, more simply, by inspection of their leaves, in which a similar arrangement of bundles prevails—that of the former exhibiting parallel, that of the latter reticulated venation. The cambium, too, tears readily; thus dicotyledons have a separable bark.

In the dicotyledonous stem, that portion of the cellular ground-substance which remains at the center, within the bundles, is termed *pith*, that which lies wholly exterior to them under the epidermis is the cellular envelope; while the narrow plates of cells lying between and separating the anastomising bundles, and thus connecting the central pith with the circumferential cellular envelope, are the medullary rays, or "silver grain."

In both wood and bast, three main constituents are typically present—first, cells little modified from the ordinary shape, and termed *parenchyma;* secondly, cells greatly elongated, and having their walls considerably thickened, these being termed *fibers* or *prosenchyma;* thirdly, vessels or cell-fusions, formed by the union of longitudinal rows of cells. Wood-vessels are known as dotted, spiral, annular, etc., according to the mode in which their thickening is deposited.

Wood is not only valuable as timber (q.v.), but for fuel, being the chief fuel used in many parts of the world. To woody fiber we are indebted also for great part of our cordage and textile fabrics, including the very finest of them, as muslin and lace. Reduced to pulp, it is used for the manufacture of paper.

A kind of factitious or artificial wood, used for making ornamented articles, has recently been invented in France. It is called *bois duré*. It is formed of sawdust, heated to a high temperature, and subjected to very great pressure. Its compactness and hardness exceed those of wood itself. Another kind is made by mixing blood with sawdust, and compressing. Some kinds of costly wood are also imitated by mixing their sawdust with glue, and casting the mixture into the desired shape.

WOOD'BINE. See HONEYSUCKLE.

WOODBRIDGE, a township in Middlesex co., N. J., on Staten Island sound, and the Pennsylvania and other railroads; 3 m. n. of Perth Amboy. It has a high school, the Barron public library, Masonic hall, electric railroad, iron foundry, and manufactories of fire-brick, drain pipe, tile, and fertilizers. Pop. '90, 4665.

WOOD'BRIDGE, a market-t. and river-port of Suffolk, on the right bank of the Deben, which here expands into an estuary, 11 m. from the sea, and 8 m. n.e. of Ipswich. Vessels of 120 tons can reach the town. There are a custom-house, a bonding warehouse, and docks, in which ship-building is carried on.

WOODBURY, a co. in w. Iowa, bordering on Nebraska, having the Missouri and Sioux rivers for its w. boundary, drained by the Little Sioux and other rivers; 800 sq. m.; pop. '90, 55,632. Co. seat, Sioux City.

WOODBURY, DANIEL PHINEAS, 1812–64; b. N. H.; graduated at West Point, 1836; was commissioned in the artillery, and was soon transferred to the engineer corps. He was employed in constructing fortifications in the west and at Tortugas and Key West. In 1861 he did valuable service in fortifying Washington and in the engineering works of the Potomac army; and later in the war was in great part superintendent of the engineering operations against Yorktown and Richmond. He was made brig.-gen. for gallantry in throwing bridges across the Rappahannock in face of the enemy. In 1863 he was made commandant of Key West and there died from yellow fever.

WOODBURY, ISAAC BAKER, 1819–58; b. Mass.; studied music, became a well-known composer, and compiled the *Anthem, Dulcimer, Cythara*, and the *New Lute of Zion*, all collections of church music. He was for some years editor of the *Musical Review* and the *Musical Pioneer*, both published in New York.

WOODBURY, LEVI, 1789–1851; b. N. H.; graduated at Dartmouth college, 1809, and was called to the bar in 1812. For the next 4 years he practiced his profession at Francestown, N. H. In 1816 he was elected clerk of the state senate, and near the close of the year he received an appointment as judge of the state superior court. He settled in Portsmouth in 1819, was elected governor of the state in 1823, and in 1825 was speaker of the lower house of the legislature. The same year he was elected a U. S. senator. At

the expiration of his term, Jackson called him to the cabinet as secretary of the navy. He was transferred to the treasury department in 1834, and remained there till the whigs came into power in 1841. In that year he was again elected to the U. S. senate, from which he resigned in 1845, to accept the place of an associate justice of the U.S. supreme court, succeeding Joseph Story. His *Political, Judicial, and Literary Writings* were published in 1852. He was among the ablest democratic statesmen.

WOODBURY PROCESS. See POSITIVE PRINTING.

WOOD-CARVING is probably the oldest branch of art. Apparently the first weapon was a club, and the first attempt at decoration was some scratching or carving on it. Among the Egyptians, Greeks, and Romans it was much practiced. As a branch of Christian art it was one of the earliest, and attained a high development in the 15th century. It greatly declined during the last century, but has again revived, and promises to attain great importance. The wood-carvers of Great Britain have shown great capabilities, but hitherto have lavished too much care upon fineness of finish rather than on the artistic excellence of their designs.

WOOD-CHARCOAL is the most important, although not the purest, kind of charcoal. Wood consists of carbon, hydrogen, and oxygen, the last two being in the proportion to form water. When heated in the open air, it burns completely away, with the exception of a small white ash; but if the supply of air be limited, only the more volatile matters burn away, and most of the carbon remains. This is the principle of the process of charcoal burning in countries where wood is abundant, as, for example, in the Harz mountains. "A number of billets of wood are built up vertically in two or three rows into a large conical heap, which is covered over with turf or moistened charcoal-ash, holes being left at the bottom for the air to get in. A hollow space is also left in the middle of the heap, to serve as a flue for the gaseous matters which are evolved. The heap is set on fire by throwing burning pieces of wood into the central opening, near the top of which, however, a kind of grate, made of billets of wood, is placed, to prevent the burning fuel from falling at once to the bottom. The combustion then proceeds gradually from the top to the bottom, and from the center to the outside of the heap; and as the central portions burn away, fresh wood is continually thrown in at the top, so as to keep the heap quite full. The appearance of the smoke shows how the combustion is proceeding: when it is going on properly, the smoke is thick and white; if it becomes thin, and especially if a blue flame appears, it is a sign that the wood is burning away too fast, and the combustion must then be checked, by partially stopping up the holes at the bottom, or by heaping fresh ashes on the top and sides, and pressing them down well, so as to diminish the draught. As soon as the combustion is completed, the heap is completely covered with turf or ashes, and left to cool for two or three days. It is then taken to pieces, and the portions still hot are cooled by throwing water or sand upon them: 100 parts of wood yield on the average from 61 to 65 parts by measure, or 24 parts by weight of charcoal."—Watts's *Dictionary of Chemistry*, vol. i. p. 759. The charcoal thus prepared is the best suited for fuel. In England, a large quantity of charcoal is obtained in the dry distillation of wood in cast-iron cylinders, for the preparation of crude acetic acid. The charcoal thus prepared is preferable for making gunpowder, but is inferior for other purposes. A peculiar kind of charcoal of a reddish-brown color, and hence termed *charbon roux*, is prepared in France for the manufacture of the gunpowder used for sporting purposes, by subjecting wood in iron cylinders to the action of superheated steam under a pressure of two atmospheres. Powder made with this charcoal absorbs moisture more rapidly than ordinary gunpowder.

The general properties of wood-charcoal are, that it is black and brittle, and retains the form of the wood from which it was derived; it is insoluble in water, infusible and non-volatile in the most intense heat; its power of condensing gases is noticed in the article on that subject; and from its power of destroying bad smells, it has been regarded as possessing considerable antiseptic properties. It is frequently stated that charcoal is a bad conductor of heat, but a good conductor of electricity; these properties depend upon the nature of the charcoal, the lighter wood, such as willow, yielding a porous charcoal, with little power of conducting heat or electricity; while boxwood yields a very compact charcoal, which is a good conductor of heat and electricity, and is admirably adapted for the exhibition of the electric light. Charcoal never consists entirely of pure carbon, the degree of purity varying directly with the temperature; thus, charcoal charred at 480° contains 65 per cent of carbon, while that charred at 750° contains 80, and that charred at 2,730° contains 96; but the loss of charcoal occasioned by these high temperatures is very great, the three percentages of charcoal corresponding to these temperatures being 50, 20, and 15.

The uses of wood-charcoal are numerous and extensive. It is very largely employed as a fuel, taking the same place in many countries that coal occupies here. From its being proof against all ordinary chemical agencies, "a superficial charring is frequently resorted to, with the view to protect wood from decay, as in the case of piles which are driven into mud or into the beds of rivers to serve as foundations. For the same reason, it is a common practice to char the interior of tubs and casks destined to hold liquids."—Miller's *Inorganic Chemistry*, 3d ed. p. 77. In a finely-divided state, it is com

monly regarded, as has been already stated, as an antiseptic; and there is no doubt that the offensive effluvia from animal matter in an advanced stage of putrefaction disappear when the putrefying substance is covered with a layer of charcoal; but in reality the decay goes on, without the emission of any odor, till at length the whole of the carbon is dissipated as carbonic acid gas, and the hydrogen as water, while the nitrogen remains as nitric acid. For these explanations we are indebted to Dr. Stenhouse, who has shown that the action consists in a rapid process of oxidation, dependent upon the power which finely-divided charcoal possesses of condensing oxygen. In a finely-divided state, charcoal not only condenses gases to a marvelous extent, but has the power of absorbing coloring matters, bitter principles, etc.; and hence it is of extensive use in the laboratory. From the rapidity of its absorbing action, "Stenhouse has proposed to use a respirator filled with charcoal to protect the mouth and nostrils in an infected atmosphere; and the employment of trays of powdered wood-charcoal in dissecting-rooms, in the wards of hospitals, and in situations where putrescent animal matter is present, is found to exert a most beneficial influence in sweetening the atmosphere, by absorbing and decomposing the offensive gases. These properties render charcoal a valuable material in the construction of filters, not only for decolorizing purposes, but likewise for assisting in purifying water for domestic use. It is now also employed most successfully to prevent the escape of noxious vapors at the ventilating openings of the sewers, as it allows the free passage of air, but condenses the offensive effluvia in its pores, where they are destroyed by a process of oxidation.—Miller, *op. cit.* p. 78. Besides its employment in the manufacture of gunpowder, it has many applications in the arts. In medicine, it is at present chiefly used to destroy fetor; for which purpose it is applied in the form of powder or poultice to gangrenous sores, phagedenic ulcers, etc.; it is also largely employed in tooth-powders, as by its mechanical action it removes incrustations, while by its chemical action it destroys fetor of the breath. In indigestion, accompanied by much flatulence, it may be given in doses of two or three teaspoonfuls suspended in water, or may be administered in the form of charcoal-biscuits. Very finely divided poplar charcoal is regarded as the best for medicinal uses.

WOOD'CHAT, *Lanius rutilus*, a bird which, notwithstanding its name, is not a species of chat, but of shrike (q.v.). Its whole length is about 7½ inches. The upper parts are mostly black, the under parts white; but there is a white spot on the wing when closed, and other small portions of the wing-feathers are white, as well as the outer tail-feathers, and there is a narrow streak of white above the base of the bill on each side; the crown of the head and nape of the neck are rich chestnut red. The woodchat is a rare bird in Britain, but is abundant in the southern parts of Europe. It may be regarded as an African bird, being found from the Mediterranean to the cape of Good Hope. In Europe it appears only as a summer visitant, but in Africa it occurs at all seasons of the year.

WOOD'CHUCK, *Arctomys monax*, a species of marmot (q.v.), inhabiting North America, from Hudson's Bay to South Carolina. It is from 15 to 18 in. long, blackish or grizzled above, chestnut-red below; the form thick, the head broad and flat, with almost no apparent neck, the legs short and thick, the feet large, the tail bushy. The hair is rather soft, the whiskers long and stout. This animal digs deep holes in fields, on the sides of hills, or under rocks in woods; its burrow slants upward, so that water may not enter, and within are several compartments. It passes the winter in the burrow, in a lethargic state. The food of the woodchuck is vegetable, and it is particularly destructive to crops of red clover. It is easily tamed, and may be fed on bread, milk, and vegetables. It fights successfully with a dog of equal size. The name of ground-hog is sometimes popularly given to it. Its flesh is sometimes eaten, but is rank.

WOOD'COCK, the popular name of certain birds commonly regarded as of the same genus with the snipes (q.v.), but of more bulky form than the true snipes, and having shorter and stronger legs. The Common Woodcock (*scolopax rusticola*), well known as a game-bird in Britain, and highly esteemed as a delicacy for the table, is found also in all parts of Europe and the n. of Asia. It is one of the birds of Japan. It is only a winter visitant of most parts of Britain, very rarely breeding in England, but it more frequently breeds in the northern parts of Scotland. Its summer haunts are chiefly the pine-forests of the northern parts of Europe and Asia; but in summer it inhabits higher and drier ground than in winter, when it is chiefly to be found in moist woods and swamps, seeking for worms, snails, and slugs as food, boring with its long bill in the soft ground. The quantity of food which it devours is very great; a single woodcock has been known to consume in a night more earth-worms than half filled a garden-pot of moderate size. The woodcock is about 13 in. in length; the upper parts varied with ruddy, yellowish, and ash color, finely intermingled, and marked by large black spots, the lower parts yellowish-red, with brown zigzag lines; the quills striped with red and black on the outer edge; the tail-feathers tipped with gray above and white below. The female is rather stouter and larger than the male, and sometimes attains a weight of 14 or 15 ounces. A woodcock of 27 ounces is on record. The woodcock makes its nest in warm, dry situations, on the ground, of dead leaves loosely laid together. It lays only three or four eggs of a pale yellowish or reddish-brown color. As woodcocks usually breed in very dry situations in the recesses of thick woods, the young ones would be

left to starve but for the peculiar adaptation which enables the parent to transport them to moist feeding-grounds. It was long believed that the female woodcock used only her feet for carrying her young from place to place; but Mr. Charles St. John, in his *Natural History and Sport in Moray*, says, that from close observation he found "the old woodcock carries her young, even when larger than a snipe, not in her claws, which seem quite incapable of holding up any weight, but by clasping the little bird tightly between her thighs, and so holding it tight toward her own body." The woodcock feeds chiefly by night. Great numbers sometimes appear in some parts of Britain, in their migrations. Besides falling to the gun of the sportsman, they are sometimes caught by nets placed in the tracks or open glades in woods, by which they proceed from their retreats to their feeding-grounds, and by nooses or springs set about the places which they frequent.—The AMERICAN WOODCOCK (*scolopax* or *philohela minor*) is a smaller bird than the woodcock of Europe, being only about 11 in. long; very similar in plumage and habits. Three transverse black bands mark the hinder part of the head. It is found in all parts of North America. See illus., OSTRICH, ETC., vol. XI.

WOOD DUCK, or SUMMER DUCK, the *aix sponsa*, one of the most beautiful members of the duck family (*anatidæ*). It is about 20 in. in length; bill shorter than head, high at the base, nail very large and hooked, lamellæ broad and distant, nostrils large and open; tail truncate at tip; head green, glossed with purple; jugulum and sides of tail purple; under parts white; sides yellowish, banded with black; primaries silver white at the tips. It ranges over most of North America, being permanent in the warmer regions, but only visiting the northern parts in summer, whence often called "summer duck." It usually builds its nest in a hollow tree, whence its name "wood duck." It frequents deep, muddy, solitary creeks and ponds in the interior. It usually lives in pairs, and there is rarely more than three or four in a flock (Wilson). It feeds on acorns, wild seeds, and insects. Its flesh is much like that of the "red-head" duck.

WOODEN WEDDING. See WEDDING ANNIVERSARIES.

WOOD-ENGRAVING, OR **XYLOGRAPHY**, the art of engraving designs on wood, differs from copper and steel plate engraving by having the parts intended to print on the paper, in *relief*. While *plates* are printed from the engraved lines by a laborious and necessarily slow process (see ENGRAVING), wood-engravings, having the object to be represented on the surface, in the manner of a type, may be printed along with the matter it is intended to illustrate in the ordinary printing-machine. This, of course, is an important point in the illustration of books, on the grounds of cheapness and expedition. Another advantage wood-engravings possess is, that they can be multiplied to any extent by means of the stereotyping (q.v.) and electrotyping (q.v.) processes.

The invention of wood-engraving, like that of gunpowder, has been claimed for the Chinese, whose books have certainly been printed from engraved wood-blocks for ages. It has indeed been asserted that the art of cutting figures in relief, and printing impressions on them on paper, was known and practiced by that nation as early as the reign of the renowned emperor Wu-Wang (1120 B.C.). There is no doubt that wood-stamps were used by the ancient Egyptians and Romans for stamping bricks and other articles of clay; and that wood and metal stamps of monograms, etc., were used in various European countries, for attesting deeds and other documents, at a very early period, when the ability to write was an extraordinary accomplishment even for princes. It is not, however, until the beginning of the 15th c. that we find any evidence of the existence of wood-engraving, as we now understand it. It appears to have been used in Germany at that time for printing playing-cards and figures of saints. The earliest print of which any certain information can be obtained is in the collection of earl Spencer. It was discovered in one of the most ancient convents of Germany—the Chartreuse of Buxheim, near Memmingen in Bavaria—pasted within the cover of a Latin MS.; it represents St. Christopher carrying the infant Saviour across the sea, and is dated 1423. It is a work of some merit, notwithstanding its apparent roughness; the infant Saviour and the drapery of the saint being drawn with considerable skill and vigor. The inscription at the bottom has been thus translated: "In whichever day thou seest the likeness of St. Christopher, in that same day thou wilt, at least, from death no evil blow incur—1423." Shortly afterward, a series of books, printed entirely from wood-engravings, called block-books, were issued. They consisted principally of religious subjects, with short descriptions engraved on the same block. The most important of them were the *Apocalypsis, seu Historia Sancti Johannis;* the *Historia Virginis ex Cantico Canticorum;* and the *Biblia Pauperum*, the last containing representations of some of the principal passages of the Old and New Testaments, with explanatory texts. The illustrations, of which Mr. Jackson, in his treatise on the *History and Practice of Wood-engraving*, gives an elaborate account and several specimens, seem to be drawn with a supreme contempt for perspective and proportion, but bear evidence of the draperies, and hands and faces, having been carefully studied. One of the cuts in the *Apocalypsis* represents St. John preaching to three men and a woman, with the inscription, *Conversi ab idolis, per predicationem beati Johannis Drusiana et ceteri* (By the preaching of St. John, Drusiana and others are withdrawn from their idols). One figure in the *Biblia Pauperum*, is curious as showing the general manner of representing the creation of Eve during the 15th c., the same subject frequently occurring previous to 1500. It has the appearance of a careful drawing "spoiled in the engraving." Previous to the invention of movable types, whole books

of text were also engraved on wood, and the impressions had evidently been taken by *rubbing* on the back of the paper, instead of steady pressure, as in the printing-press, the ink used being some kind of distemper color.

The Psalter printed by Faust and Schöffer at Mentz in 1457 (see GUTENBERG) is illustrated with initial letters engraved on wood, and printed in two colors, blue and red, which Mr. Jackson considers "the most beautiful specimens of this kind of ornament which the united efforts of the wood-engraver and the pressman have produced. They have been imitated in modern times, but not excelled." It is worthy of note, that although printed upward of 400 years ago, the freshness and purity of the colors remain unimpaired.

As printing spread, the publication of illustrated books became general in Germany and Italy, and reached England in 1476; in which year Caxton (q.v.) published the second edition of the *Game and Playe of the Chesse*, with figures of the different pieces. They are very rude, compared with the earlier German works. An engraving known as the "Knight," is interesting as one of the first wood-engravings executed in this country; several works followed, all, however, in the same rude manner. The first attempt at something finer than simple lines appears in the frontispiece to the Latin edition of Breydenbach's *Travels*, printed at Mentz by Erhard Reuwich, 1486. It is by an unknown artist, and is an elaborate and really very beautiful specimen of the art. It is also remarkable as being the first engraving introducing *cross-hatching* to represent dark shadows. The *Hypnerotomachia Poliphili*, printed at Venice by Aldus, in 1499, is worthy of mention for the extreme beauty of the designs, which have been ascribed by some authorities to Raphael, and by others to Mantegna. About the beginning of the 16th c., a complete revolution in the art of wood-engraving was accomplished by the genius of Albert Dürer. His productions exhibit not only correct drawing, but a knowledge of composition and light and shade, and attention to the rules of perspective, which, with the judicious introduction of subordinate objects, elevated them to the rank of finished pictures. Dürer, however, in common with most of the German artists of his day, paid very little attention to the propriety of costume in his religious subjects; one of his drawings in the *History of the Virgin* (1511), for instance, representing the birth of the Virgin, shows the interior of a German burgomaster's house of his own day, with a number of gossips drinking from flagons, and otherwise enjoying themselves. There has been considerable discussion as to the probability of Dürer having also *engraved* his drawings. Most of the best authorities on the subject, including Bartsch, Jackson, and Firmin Didot, agree in the negative. Mr. Jackson, who speaks with the experience of a practical engraver, says: "In most of the wood-cuts supposed to have been engraved by Albert Dürer, we find cross-hatching freely introduced; the readiest mode of producing effect to an artist drawing on wood with a pen or a black-lead pencil, but which, to the wood-engraver, is attended with considerable labor. Had Albert Dürer engraved his own designs, I am inclined to think that he would have endeavored to attain his object by means which were easier of execution." The reader is referred to the article DÜRER for an account of some of his numerous works. The best of Dürer's contemporary artists on wood were the painters, Hans Burgkmair (q.v.), Lucas Cranach (q.v.), and Hans Schäufflein. A series of works projected by the emperor Maximilian, including *The Adventures of Sir Theurdank, The Wise King, The Triumphs of Maximilian*, etc., were illustrated by these artists; but they are not equal to those of Dürer.

During the first half of the 16th c., the publication of books illustrated with wood-engravings still increased, and prevailed to a greater extent than at any other time, with the exception of the present day. The superiority of talent, both in drawing and engraving, however, still remained with the Germans. In France, although their figure-subjects were inferior to those of their German neighbors, their ornamental borders in prayer-books, etc., of which a great number were printed at this time, were extremely beautiful. In Italy and England the art was very far behind. The most remarkable work published at this time was the *Dance of Death* (q.v.), issued at Lyons, 1538. The original edition of this curious work contained 41 engravings, representing the struggle between Death, generally in the form of a skeleton, and different individuals, such as the pope, the emperor, a judge, monk, doctor, duchess, old man, etc. The drawings, which are characterized by great vigor and skill, are generally understood to have been executed by Hans Holbein (q.v.); but whether he also engraved them, as has been alleged, is more than doubtful. Towards the conclusion of the century, however, the art had made considerable progress in Italy, where some of the best productions of Germany were equaled, if not excelled. In England, it did not make much progress. John Daye published almost the only illustrated books of the time, notably queen Elizabeth's prayer-book, which contains a tolerably well-executed portrait of her majesty. There is no certain knowledge about any of the artists or engravers, although John Daye is supposed to have engraved some of his cuts himself. At this time also, the practice of printing wood-engravings in colors from different blocks became somewhat common, although the attention of artists in that line was mostly confined to ornamental subjects. From the beginning of the 17th c., the decline of wood-engraving may be dated; Germany, the cradle of the art, being the first to forsake it; the only works worthy of notice were a series of blocks on various subjects—designed by Rubens, and engraved by Christopher Jegher of Antwerp, one of the best wood-engravers of that

period—some of which are of great beauty. From this time the art fell into a state great neglect, not, apparently, for want of engravers, for wood-cuts of a certain kind were always produced, but for want of artists able, or willing, to make drawings worthy of preservation.

Nothing particularly deserving of notice occurred until 1766, when John Michael Papillon, an enthusiastic professor of the art in France, published an elaborate history of the subject in an unsuccessful attempt to restore it to its former importance. But it was not until the genius of Thomas Bewick (q.v.) was brought to bear on it, that wood-engraving received that impetus which has made it what it now is—one of the most important of the illustrative arts. Bewick's most important works are his *Histories of British Quadrupeds* (1790) and *British Birds* (1804); all the quadrupeds, and almost all the birds were drawn and engraved by himself. The birds especially are executed with a truthfulness and skill which has rarely ever been equaled. These works are also famous for their collection of tail-pieces, which display an infinite amount of humor and pathos. One of them—a poor ewe, in the starvation of winter, picking at an old broom in front of a ruined cot—represents a scene, trifling as it seems, which tells a woful tale of suffering. He entirely abandoned the elaborate system of "cross-hatching" which prevailed so much in the works of the older engravers, and produced his light and shade by the simplest possible means.

Since Bewick's time, wood-engraving has continued to flourish without interruption. He left behind him several pupils, the most successful of whom were Nesbet, Clennell (who engraved some of the tailpieces in the *British Birds*), and William Harvey. Harvey, however, forsook the burin for the pencil; and his drawings illustrating Milton's *Paradise Lost*, Thomson's *Seasons*, etc., especially such as were engraved by John Thomson (perhaps the most skillful engraver that ever lived, and a pupil of Robert Branston, a self-taught engraver), still retain a first-class place as specimens of wood-engraving. The establishment of the *Illustrated London News* (1842) tended greatly to familiarize the public with the beauties of wood-engraving. In the pages of that periodical appeared the first drawings on wood of Messrs. John Gilbert and Birket Foster. The spirited figure-subjects of the former, and the exquisite landscapes of the latter, have done much to raise the art to the very high place it now occupies in England.

Of late years, the art has also made very great progress in France and Germany. The style of engraving, however, is quite different from the English, so much so, that a practiced eye can distinguish a French wood-cut at a single glance. The professors of the arts of drawing and engraving on wood at the present day are so numerous, and their works generally so well known, that it would be needless, even if our space permitted, to attempt even to enumerate them.

Practice of Wood-engraving.—The wood used for engraving is boxwood, which has the closest grain of any wood hitherto discovered. It is principally imported from Turkey for the purpose, as the English box is too small to be of much use. It is cut *across* the grain in slices, which are dressed to the same height as type, for convenience in printing. Inferior kinds of wood, such as American rock maple, pear tree, plane-tree, etc., are used for coarser purposes; and for very large and coarse subjects, such as posting-bills, common deal is used, and cut on the *side* of the wood with chisels and gouges. When *blocks*—as the pieces of wood are termed—are required of a larger size than a few inches square, it is necessary to join two or more pieces together, as the amount of *sound* wood to be got out of even a large slice is extremely limited. There is, however, for all practical purposes, no limit to the joining process, as blocks have been printed consisting of from 50 to 100 pieces. The wood having been made very smooth on the surface, and squared to the required size, is prepared for the artist by being covered with a preparation of white (commonly water-color Chinese white); this gives a very good surface for the pencil to work on. The subject is then drawn in the ordinary way, the tints being generally washed in with India-ink, and the details filled in with pencil. When the drawing is finished, it is given to the engraver, who, previous to commencing, carefully covers the block with paper, fastened round the edges with beeswax; this is necessary to avoid rubbing the drawing out in the process. As the engraving proceeds, he gradually tears the paper off.

The tools or gravers necessary in wood-engraving are of three kinds—viz., gravers proper; tint-tools; and scoopers, or cutting-out tools for clearing out the larger pieces. They are arranged in different sizes, to suit the different portions of the work. Most engravers use a glass of slight magnifying power, more for the purpose of relieving the eyes from the strain of fixing both eyes closely on a small object, than for magnifying the work. When gas or other artificial light is used, a glass globe filled with water, slightly tinted with blue (to neutralize the reddish glare of the light), is placed between the flame and the work; this serves the double purpose of concentrating the light on the block, and keeping it out of the eyes. When the drawing is in outline, or mostly so, the engraving is very simple; the process consists of engraving a line along each side of the pencil lines, which are, of course, to be left in relief, and afterward cutting out the pieces between. It will thus be understood that every part of a woodcut which prints on the paper is the surface of the wood left untouched, and that every white part is cut or hollowed out. When it is complicated with much shading, trees, etc., it becomes much more difficult, and brings into play the artistic talents of the engraver to preserve

the proper shades, or *color*, as it is technically termed, and texture of the different objects. Some engravers of the present day are celebrated for their power of producing beautiful pictures altogether by "graver-work" from drawings made entirely with the brush. Skies and flat tints are engraved with tint-tools which, from their shape, are best adapted for cutting straight lines; and by the judicious use of the different sizes, the lines are left wider or closer, thicker or thinner, as the tint is wanted darker or lighter. As already mentioned, the tools are arranged in sizes—i.e., those for light tints are broader at the points than those for dark tints, so as to cut out more white. Trees, foregrounds, etc., are cut with *gravers*, which, as they are like a lozenge in shape, give more scope for freedom of handling.

When the drawing is all engraved, a proof is taken by inking the surface gently with printing-ink on a dabber (a ball of cotton covered with silk), and, a piece of *India-paper* being laid on it, by rubbing the paper with an instrument called a *burnisher*, until it is all printed. The engraver then sees what touching up is required—a light part to be softened here, a hard dark part to be toned down there, etc.—before it is finished and ready for the printer.

When large blocks are to be engraved, the pieces of wood are joined with screw-bolts, and the drawing prepared in the usual manner: after which the pieces can be taken separate for convenience in engraving, and also for the purpose of getting it quicker finished, by having an engraver working at each piece.

Wood-engraving, however, is at the best but a slow process, and it is not improbable that before many years it will become a practically lost art. The introduction of mechanical and photographic processes for reproducing drawings has become so general, and reproductions of this kind are so superior to what can be accomplished by wood-engraving, that very little of the latter is seen at present. The cost of mechanical processes is also trifling compared to wood engravings. Many processes have been invented for this purpose. Two of them which deserve mention are the *graphotype process* (q.v.), and *Leitch's process*. In the former, the drawing is made on finely-prepared chalk, with silica; this hardens the lines drawn, and the soft parts are rubbed out with a brush, leaving the lines in relief. From this a stereotype is taken. In Leitch's process, the drawing is transferred to stone like an ordinary lithograph (q.v.), and a proof—printed in ink capable of resisting acid—transferred to a plate of rolled zinc, and the white parts bitten out. The drawing may also be photographed directly on the zinc. This process has been extensively applied to the reproduction of maps, etc. Compare articles Photograph and Photographic Processes.

See Jackson and Chatto's *History and Practice of Wood-engraving* (new ed., Lond. 1861); Papillon's *Traité de la Gravure en Bois* (Paris, 1766); Bartsch's *Peintre-graveur;* Ottley's *Inquiry into the History of Engraving on Copper and Wood;* Firmin Didot, *Essai sur l'Histoire de la gravure sur Bois* (1863).

Wood-engraving in the U. S. is dated from the year 1794, when Alexander Anderson (1775–1870), b. New York, an engraver on copper and type-metal, was stimulated by the sight of some of Bewick's work to experiment on wood. Many reprints of English books during the early part of this century contain his work in the line of reproductions, and the publications of the American Tract soc. may be mentioned among the many to which he contributed original work. Among his pupils was Garret Lansing, of Albany, who produced his first engraving about 1812, and eventually settled in Boston as engraver and printer. Alexander Adams (b. New Germantown, N. J., 1803) came to New York, 1824, as a journeyman printer; took up wood-engraving without an instructor; was encouraged by Anderson, and attained success. The plates in Harper's *Illustrated Bible* (1843) are considered fine specimens of his workmanship. John W. Barber, b. Windsor, Ct., 1798, settled in New Haven in 1823, and engraved the rude but faithful illustrations in his well-known histories of Connecticut, New England, etc. There was so little demand for anything besides cuts for newspapers and handbills, that as late as 1838, according to Linton, there were but five wood-engravers in the country; and the first work of any value, says Woodberry's *History of Wood-Engraving*, was done in 1834 by Anderson. In Linton's estimation, the edition of Irving's *Sketch Book* (1852), and the *Life of Napoleon Bonaparte* (1855), both published in New York, were the best illustrated books (with original cuts) that had yet appeared in America. The American Tract soc. about this time did much to advance the art by improving the quality of the engravings in its books and papers, but the work of Herrick, Whitney, Childs, and others, however true to English traditions, was monotonously "pretty," and lacked individuality. *Harper's Monthly* (established 1850) and *Harper's Weekly* (established 1857) in their early years relied much on blocks cut abroad, or on coarse reproductions of these, and where original engraving was acknowledged it was that of a few men, Lossing, Barret, and Borthwick, for example. The many periodicals and papers that arose in imitation made little, if any, attempt at improvement. In 1862 Harris' *Insects Injurious to Vegetation* was published, and the engravings it contained, by Henry Marsh, scarcely distinguishable from copper-plate work, marked a decided change in method and artistic feeling. The increasing demand for finely illustrated books compelled engravers to keep pace with designs, and in the publications of

Ticknor & Fields, J. R. Osgood & Co., Scribner & Co., D. Appleton & Co., and other leading houses, the progress of wood-engraving, 1860–70, may be more satisfactorily traced, probably, than in our magazines and newspapers—the manual labor and supervision of Messrs. A. V. S. Anthony (q.v.) and W. J. Linton (q.v.) being especially worthy of note. The editors of *Scribner's Monthly* (established 1871) gave great encouragement to the profession by offering prizes to non-professionals, by liberal expenditures, and by bold experiments in the face of traditions. A "new school" arose, fostered by this magazine, and particularly by its successor, *The Century*, and in their pages the failures and brilliant successes of its disciples are conspicuously displayed. The characteristics of the new school, in the words of one of its defenders, are "originality of style, individuality, and chiefly faithfulness in the reproduction of a wide range of subjects by diverse methods—the development of originality in the engraver without damage to the personality of the artist. It attempts to combine the distinctive qualities of a good photograph with those of an engraving; to reproduce as far as possible all the idiosyncracies of an original while securing a work of art valuable for its own artistic sake." This "imitative" process is flatly opposed to the old methods of cutting in fac-simile (as seen in Holbein's work), and white-line independent engraving (as practiced by Bewick), which are, in the opinion of Linton (the most able representative of the old school in this country), the only legitimate ones. "The most striking portion of recent engraving," says Woodberry (*History of Wood-Engraving*, New York, 1883) "is characterized either by a great refinement of line or a practical abandonment of it." There is "a disregard of substance, shape, and material; a neglect of relief and perspective; a crowding the ground with meaningless lines, undirected, misdirected, or uselessly refined; an attempt at an effect by an arrangement of color almost independent of form; the attempt being to make a momentary impression on the eye, instead of to give lasting pleasure through the artistic sense." Hamerton, in his *Graphic Arts*, admits that the Americans ("the best printers in the world") have formed a school of engravers "superior to all others in delicacy of execution and in manual skill; their two leading qualities being tone and texture." The use of photography in transferring designs to the block, so general with the engravers of the new school, though not original with them, is defended on the ground that it enables the artist to work freely in any manner and with any medium he chooses, and that many masterpieces of art can in this way alone be reproduced in popular form. The leading names of this school are Cole, Muller, Closson, Speer, Juengling, and Kingsley. See Linton's partizan but valuable *History of Wood-Engraving in America* (Boston, 1882); Lossing's *Memorial* of Dr. Anderson; Dunlap's *Arts of Design in the U. S.*; and many articles in *Scribner's* and *The Century* magazines.

WOODFORD, a co. in central Illinois, bounded on the w. by the Illinois river and Peoria lake; drained by Mackinaw and Crow creeks, 540 sq.m.; pop. '90, 21,429, chiefly of American birth. Co. seat, Metamora.

WOODFORD, a co. in central Kentucky, having the Kentucky river for its w. and s.w. boundary, drained by the s. fork of Elkhorn creek; 247 sq.m.; pop. '90, 12,380. Co. seat, Versailles.

WOODFORD, James Russell, d.d.; b. England, 1820; graduated at Pembroke college, Cambridge, 1842, with high honors. He took orders, held livings at Easton and Kempsford, became an honorary canon in Christ-church, Oxford, 1867, was select preacher to the university at Cambridge in 1864, 1867, and 1873, and was consecrated bishop of Ely, 1873. Dr. Woodford published several collections of sermons and lectures. He d. 1885.

WOODFORD, Stewart L., ll.d.; b. N. Y., 1835; graduated at Columbia college, 1854; became a lawyer, and in 1861 was made assistant U.S. district attorney. From 1862 to 1865 he served in the army, reaching the rank of col. and brevet brig.gen. In 1866 he was elected lieut.gov. of New York, but 4 years later was defeated when republican candidate for governor. He was a member of congress, 1872–74; and in 1877 was appointed U. S. district attorney for New York by Pres. Hayes, and in 1881 was re-appointed by Pres. Garfield. He is an excellent speaker on political and financial subjects. He is a trustee of Cornell university. In 1897 he was appointed U. S. minister to Spain.

WOODFORD, William, 1735–80; b. Va. In the French and Indian wars he distinguished himself by gallant conduct. In 1775 he was made col. of a Virginia regiment and had chief command at the victory of Great Bridge. He was present at Brandywine and at the siege of Charlestown, was taken prisoner.

WOODHOUSE, James, M.D., 1770–1809; b. Philadelphia, Pa.; graduated at the University in that city, and in medicine; was surgeon of St. Clair's expedition in 1791; and professor of chemistry in the University of Pennsylvania, 1795–1809. Author of *Experiments and Observations on Vegetation*, etc.

WOODHOUSE, Robert, 1773–1827; b. England; educated at Cambridge, where he was appointed fellow in 1798, prof. of mathematics in 1820, prof. of astronomy and experimental philosophy in 1822, and director of the observatory in 1824. Among his works, which had much influence on mathematical studies are, *Plane and Spherical Trigonometry* (1809), and *A Treatise on Astronomy* (1818–23).

WOODHULL, Nathaniel, 1722–76; b. N. Y.; a soldier in the French war, 1755–63, and col. of a regiment in Amherst's army. He was a member of the N. Y. legislature, 1769–75, and a warm advocate of the patriotic side in the disputes then in progress between the colonists and the mother country. He was president of the N. Y. provincial congress, when the British invaded Long Island, and at once took command of the militia. Soon after the battle of Long Island, he was surprised by some light horse troops, who killed him after he had surrendered.

WOODITE. For years the attention of naval experts has been directed to the discovery of some elastic and buoyant packing material, which, while subject to the penetration of projectiles, would be so elastic as to immediately close the opening made and prevent the inflow of water. Woodite, that has recently appeared in England, is used aboard the war vessels of that country, and is proposed for the men-of-war building in the United States, has a base of India-rubber, from which it is prepared by a process which does not deprive it of its elasticity, and which is said to preserve it from deterioration from fire, water, and all other usual causes of decay. It is now manufactured in two types—the buoyant and the elastic. Buoyant woodite has the appearance of cork chips held together by India-rubber, and, as its name implies, is intended to be used only to supply buoyant properties. It weighs about 14 pounds per cubic foot, and experiments show that about four per cent. of the space it occupies is taken up by water after an immersion of 24 hours.

Elastic woodite is made up in rectangular blocks, is very elastic, and has only obturating qualities claimed for it. It weighs about 64 pounds per cubic foot, and a thickness of one inch is said to be sufficient to stop the inflowing of water from the penetration of 6-pounder projectiles. In some experiments made, blocks 8 inches in thickness were vulcanized to a $\frac{3}{8}$-inch iron plate backed by a second plate of the same thickness, and fired at from a distance of 50 yards by Nordenfeldt 3-pdr. and 6-pdr. rapid-fire guns. Six shots were fired in all, the holes closing up so completely that water with a head of 40 feet failed to find its way through. Very small marks were visible on the woodite where the shots had entered, while large holes had been made in the backing.

WOOD'-LOUSE *Oniscus*, a Linnæan genus of crustacea, now forming the family *oniscidæ*, of the order *isopoda*. The antennæ are four in number, but two of them are very short, consisting of two joints at most; the other two are long and slender. The tail is very short, but is composed of six segments. Wood-lice are terrestrial, and the respiratory organs are completely infolded by plates developed from the abdominal members; the anterior plates being perforated by a row of small holes, through which the air has access to the gills. They frequent damp situations, and are generally found in dark and concealed places, under stones, in holes of walls, under the decaying bark of trees, etc. They feed on decaying animal and vegetable matter. They run with some celerity when apprehensive of danger, and sometimes also roll themselves up into a ball, so as to exhibit only the plates of the back. The eggs are inclosed in a pectoral pouch. See illus., Crustaceans, vol. IV.

WOOD'PECKER, *Picus*, a Linnæan genus of birds, now divided into a number of genera, and belonging to the family *picidæ*, of the order *scansores*. The toes are in pairs, two before and two behind, with sharp strong claws; the bill is rather long, straight, and wedge-shaped, with a hard tip, the tip and sides compressed; the tail is usually lengthened and rigid, although in some it is short and rounded; the vertebræ of the neck are greatly developed, and the last of the caudal vertebræ is very large, with a long ridge-like spinous process; the whole structure adapting these birds to run and climb with the greatest facility on the stems and branches of trees, in which they aid themselves by the tail, like creepers (q.v.), and to seek their food, which consists chiefly of insects and their larvæ, by digging into the bark and wood of trees with their bill. In addition to the particulars already noticed, they have the tongue fitted to serve as an important instrument in obtaining their food; the branches of the hyoid bone being greatly elongated backward, and in front moving as in a sheath; a peculiar arrangement and development of muscles enabling them to extend the tongue far beyond the bill; its tip being horny, and furnished with barbed filaments, while its surface is covered with a glutinous saliva, secreted by two large glands. Their powers of flight are very moderate, and the keel of the breast-bone is small. The barbets (q.v.) and wrynecks (q.v.) are referred to the family *picidæ*. Woodpeckers are diffused over almost all parts of the globe, but abound chiefly in warm countries. The species are very numerous. They are mostly solitary in their habits, and live in the depths of forests. They feed in part on fruits and seeds as well as on insects; but much of their time is spent in pursuit of these, and they may be heard at a considerable distance, tapping the wood of trees with their bills, to discover the place where an insect is lodged, and to get at it when discovered. The common notion, that they are very injurious to trees, is erroneous, as they do more good by preventing the ravages of insects than harm by their pecking. They strike out chips of wood with their strong bill, and in this way enlarge holes in decayed parts of trees for a roosting-place or a nest, carrying away the chips to a distance, especially in the case of a nest, as if for precaution that it may not be discovered. The nest consists of a mere hole in a tree, perhaps with a few chips in the bottom of it, but with no other lining. The plumage of woodpeckers is generally of strongly con

trasted colors, black and white, or green and yellow, with red marks about the head. There are several well-marked groups of wood-peckers, differing in form, plumage, and habits, which also are of different geographic distribution, some of them being entirely, and some chiefly, confined to particular parts of the world.

Only four species are found in Britain, and one of them, the GREAT BLACK WOODPECKER (*picus* or *dryocopus martius*), is of rare occurrence. It is about sixteen inches long; black, with a red cap on the head. It is found in the pine-forests of many parts of Europe.—The GREAT SPOTTED WOODPECKER (*P. major*), also called FRENCH PIE and WOOD PIE, is not uncommon in some parts of England, but is rare in Scotland. It is found on the continent of Europe from Norway to the Mediterranean. It is about nine inches and a half in length. The color is black, varied with white, the under parts grayish-white; the back of the head in the male bright scarlet. The LESSER SPOTTED WOODPECKER (*P. minor*) is not uncommon in the s. of England. Its whole length is about five inches and three-quarters. It is widely distributed in Europe and the n. of Asia. Its colors are similar to those of the last species, but differently arranged. It is frequently to be seen searching for insects on the moss-covered branches of orchard trees.—The most plentiful of all the British species of woodpecker is the GREEN WOODPECKER (*picus* or *gecinus viridis*). It is found in the wooded parts of Scotland as well as in England, but is rare in Ireland. It is common on the continent of Europe from Scandinavia to the furthest south. It is about thirteen inches in length; and is mostly of a dark-green color, tinged with yellow; the feathers over the nostrils and round the eyes black; the crown and back of the head, bright scarlet, a black mustache extending backward and downward from the base of the lower mandible, with a brilliant scarlet patch along the middle of it; the edges and tips of the wings spotted, black and white. It chiefly inhabits elm and ash trees, making its roosting-place and nest in them in the manner already described. Among its popular English names are *woodspite, yaffle, whetile,* and *woodwall.* The green woodpecker belongs to a group or section of woodpeckers entirely confined to the old continent, and which are more frequently to be seen seeking their food on the ground than the more typical species. The American species of woodpecker are very numerous, and some of them, which want of space prevents us from describing, are among the best-known birds of the United States and Canada; as the HAIRY WOODPECKER (*picus villosus*), which is to be found at all seasons in woods, orchards, fields, and even in the midst of cities, visiting farm-yards in winter to pick up grain—a lively, noisy, and active bird; the IVORY-BILLED WOODPECKER (*picus* or *campelophilus principalis*), which inhabits the southern parts of the United States and Mexico: is called *carpentero* by the Spaniards, from the great quantity of chips which it makes; and is valued by the Indians for its ivory-like bill and scarlet crest, which they use as ornaments. The RED-HEADED WOODPECKER (*picus* or *melanerpes erythrocephalus*) is very common in most parts of North America, and feeds much upon fruits and upon young heads of Indian corn, so that a reward is given for killing it. The largest species in the northern parts of America is the BLACK WOODPECKER, or LOG-COCK (*picus* or *dryotomus pileatus*), which is about eighteen inches long, the general color greenish-black, with stripes of white from the eyes along the neck and sides.—The genus *picumnus* is the type of a group of *picidæ* called *piculets,* very small birds, with bill hard at the tip, broad rounded wings, and a short tail with broad rounded feathers, not used for support, departing from the typical characters of the family. They inhabit the warm parts of South America, India, and the eastern archipelago. See illustration, BIRDS, vol. II.; LARKS, ETC., vol. VIII.

WOOD-PRESERVING. Several processes have been employed of late years for the purpose of preventing the decay of wood from damp, atmospheric action, or the destructive operations of animals and parasitic plants. The principle in all has been the same —viz., the injection into the vessels of the wood of some mineral material, which, by combining with the albumen of the woody tissue, prevents its decomposition, or gives it a poisonous character. The chief of the methods in use are that called kyanizing (q.v.), creosoting, in which the preserving material is the so-called creosote, or crude carbolic acid of coal-tar, and the Boucherie process, chiefly used on the continent. In this last a solution of sulphate of copper is used. While the tree is still growing the head of the tree is cut off, and the top of the bare stem is hollowed into the form of a bowl, which is then filled with the solution, which is afterward supplied as required. The liquid penetrates downward, killing the tree as it goes, but giving to the wood a most remarkable degree of durability.

WOOD'RUFF, *Asperula,* a genus of plants of the natural order *rubiaceæ,* containing a number of annual and perennial species, with whorled leaves, natives of the northern parts of the old world, and distinguished by a funnel-shaped or bell-shaped corolla, a bifid style, capitate stigma, and dry didymous fruit. The SWEET WOODRUFF (*A. odorata*) is common in shady woods in Britain and all parts of Europe. It has a creeping root, a stem 5 to 10 in. long, weak and sub-erect, four or five whorls of lanceolate leaves, 6 to 8 in the whorl, rough at the edge and keel, and small white flowers. The plant, when dried, has a very agreeable fragrance, similar to that of *anthoxanthum odoratum* (see VERNAL GRASS) under similar circumstances. It forms an agreeable herb-tea, and enters into the composition of the popular *May-drink* of the Germans.—DYER'S WOOD-

RUFF (*A. tinctoria*) is a native of the continent of Europe and of Siberia, a perennial, with reclining stems about a foot in length, whorls of six or four linear leaves, the upper leaves opposite, the flowers whitish. The root is used in Dalmatia and elsewhere instead of madder; but the crop obtained from a field is inferior in quantity to that of madder.

WOODRUFF, a co. in central Arkansas, having the White river for its w. boundary; drained by the Cache; 577 sq. m.; pop. '90, 14,009, chiefly of American birth, 4483 colored. Co. seat, Augusta.

WOOD-RUSH. See LUZULA.

WOODS, CHARLES R., b. Ohio, 1827; educated at West Point, and appointed to the engineers. He was stationed on the frontier or in garrison till 1861. As col. of an Ohio regiment, he fought through the West Virginia campaign, and was at fort Donelson, Shiloh, the siege of Corinth, and the siege of Vicksburg. He was made brig.-gen. of volunteers in 1863, participated in Sherman's campaign, and was retired from the service in 1874, with the brevet rank of maj.-gen. He d. 1885.

WOODS, LEONARD, D.D., 1774–1854; b. Mass.; graduated Harvard college, 1796; ordained pastor of Congregational church at Newbury, 1798; contributed controversial papers to the *Panoplist*, 1805, in defense of Calvinism; professor of theology, Andover seminary, 1808–46. He was prominent in the formation of the Am. tract society, Am. education society, and the Am. board of foreign missions; was the champion of Calvinism in opposition to Unitarian theology. He published *Letters to Unitarians; Reply to Ware; Letters to Rev. N. W. Taylor; Lectures on Inspiration; Memoirs of American Missionaries; Infant Baptism; Lectures on Church Government; Lectures on Swedenborgianism; Doctrine of Perfection; History of Andover Seminary.* His collected works were published in 5 vols.

WOODS, LEONARD, Jr., D.D., LL.D., 1807–78; b. Mass.; graduated Union college, 1827; ordained 1833; tutor Andover theological seminary, 1831; professor of sacred literature Bangor theological seminary, 1836–39; edited *Literary and Theological Review*, New York, 1834–37; president Bowdoin college, 1839–66; visited Europe in 1867 to obtain materials for a history of Maine. He published *Address on Life and Character of Parker Cleaveland; The opening of the New Hall of the Medical School;* translated Knapp's *Theology*, and De Maister's *General Principles of Political Constitutions.* He was a broad and vigorous thinker, with large learning and literary taste.

WOODSON, a co. in s.e. Kansas, drained by the Neosho river, Owl and Turkey creeks, and the Verdigris river in the s.w.; 504 sq. m.; pop. '90, 9021, chiefly of American birth. Co. seat, Yates Centre.

WOOD-SORREL. See OXALIDEÆ.

WOODSTOCK, a town in Windham co., Conn., consisting of six villages — Woodstock, Woodstock Valley, East, West, North, and South Woodstock; pop. '90, 2309.

WOODSTOCK, a small town and parliamentary borough, Oxfordshire, 8 m. n.w. of the city of Oxford. The pop. (1891) of the borough (which includes several adjacent villages and hamlets) is 7308, and is much larger than that of the town, which contained only 1628 inhabitants. The manufacture of fawn-skin gloves gives employment to many persons, residing in the town and neighboring villages. Woodstock, or rather Old Woodstock, a little to the north of the present town, was a residence of the early English kings; but no remains of the ancient palace exist. Edward, the Black Prince, was born here; Elizabeth was held prisoner by her sister Mary; and Chaucer resided here for some time. Woodstock is also famous in connection with Fair Rosamond, the celebrated mistress of Henry II. It is now doubted, however, if the labyrinth or maze which Henry is said to have constructed for her behoof ever existed. In the immediate vicinity is Blenheim park, the seat of the duke of Marlborough.

WOODSTOCK, town, port of entry, and co. seat of Oxford co., Ontario, Canada; on the Thames river, Cedar creek, and the Grand Trunk and the Canadian Pacific railroads; 30 miles e.n.e. of London. It has a large trade, good waterpower, more than a dozen hotels, several branch banks, about a dozen churches, excellent schools, and manufactories of woolen goods, grist, oat-meal, furniture, organs and pianos, stoves, boots, engines, leather, etc. The town is a favorite summer resort of citizens of the United States, because of the beauty of its scenery. Pop. '91, 8612.

WOOD-SWALLOW, *Artamus*, a genus of birds, resembling swallows in many of their habits, but differing in the structure of their bills and feet, and belonging to the family of *ampelidæ*, or chatterers (q.v.). The bill is very broad at the base, and arched; the upper mandible thick, but not ridged; the gape furnished with bristles; the nostrils wide apart, naked; the feet short and strong; the wings very long and pointed; the tail short. Their flight is rapid. Their food consists chiefly of seeds. They are natives of the East Indies and of Australia. An Australian species (*A. sordidus*) is sometimes seen in great numbers, and is remarkable for the habit of suspending itself in clusters on dead branches, like a swarm of bees, one bird clinging to another.

WOOD, UNINFLAMMABLE. By the use of certain mixtures the tissues and superficial parts of wood can be rendered uninflammable. In 1880 the French soc. for the

encouragement of national industry awarded a prize to M. Martin, of Paris, for his preparations, which were tested by a committee. For all light tissues his preparations consisted of pure sulphate of ammonia (8 kil.), carbonate of ammonia (2.5), boric acid (3), pure borax (2), starch (2), water 100. Another mixture for painted decorations consists of chlorhydrate of ammonia, boric acid, glue, gelatine, water, and lime. These preparations are said to have been used with success at some of the French theatres in cases where fire was simulated upon the stage.

WOODWARD, a tp. in Clearfield co., Penn. Pop. '90, 5596.

WOODWARD, Bernard Bolingbroke, 1816–69; b. England; tutor in a private school; clerk in a banking house; studied theology in the Independent college, Highbury, 1839, 1840; graduated London university, 1841; minister of an Independent church, Wortwell; aided in preparing a new edition of Barclay's *Universal Gazetteer;* settled in London and wrote for the press. He published *History of Wales from the Earliest Times to its Final Incorporation with England; History of the United States of N. America to the end of the Administration of President Polk; First Lessons on the English Reformation; Windsor Castle, Thirty Photographs printed in Permanent Colors with Descriptive Text.*

WOODWARD, Samuel Peckworth, ph.d., 1821–65; b. England; educated at the London university. From 1839 to 1845 he was sub-curator of the London geological society; from 1845 to 1848 professor of botany and geology in the Cirencester agricultural college; and for three years assistant in geology and mineralogy at the British museum. He published many scientific papers, a geological map of England and Wales, and *A Manual of Mollusca, or a Rudimentary Treatise on Recent and Fossil Shells.*

WOODWAXEN. See Wood; Dyers' Broom.

WOODWORTH, Samuel, 1785–1842; b. Mass. He learned the printer's trade, and in 1823 was joint owner with George P. Morris of the *New York Mirror.* He wrote several poems, of which one, the *Old Oaken Bucket,* has gained popular appreciation. In 1861 a collection of his poems was published.

WOOL is a variety of hair (q.v.). The term hair is applied, in ordinary language, to a smooth, straight-surfaced filament like human or horse hair, without serrations of any kind on its surface. Wool, on the other hand, is always more or less waved; besides which, externally each woolly filament is seen under the microscope to be covered with scales overlying each other, and projecting wherever a bend occurs in the fiber. Upon minute points of difference the value of wool chiefly depends, especially with regard to the great variety of its applications. If each fiber were straight and smooth, as in the case of hair, it would not retain the twisted state given to it by spinning, but would rapidly untwist when relieved from the force used in spinning; but the wavy condition causes the fibers to become entangled with each other, and the little projecting points of the scales hook into each other, and hold the fibers in close contact. Moreover, the deeper these scales fit into one another, the closer becomes the structure of the thread, and consequently of the cloth made of it. This gives to wool the quality of *felting* (q.v.). By combing, or drawing the wool through combs with angular metal teeth, some of the scales are removed, and the points of many more are broken off, so that wool which has been combed has less of the felting property, and is consequently better adapted for light fabrics; and yarn made of such wool is called *worsted,* and the cloths made of it *worsted goods.* But such is the variety of wools obtained by careful breeding and selection, that these differences can be got without combing, some wools being found to have naturally fewer serratures, and a less wavy structure, than others. These are consequently kept separate, and are called *combing-wools;* whilst those which are much waved, and have many serratures, are called *carding-wools,* from their being simply prepared for spinning by carding-machines. The serratures or points of the scales are exceedingly small, and require the aid of a good microscope to see them. They vary from 1200 up to 3,000 to an inch.

Wool is the most important of all animal substances used in manufactures, and ranks next to cotton as a raw material for textile fabrics. Its use as a substance for clothing is almost universal in the temperate regions of the globe.

Previous to 1791 British woolen cloths were made almost wholly of native-grown wools. At that time the whole supply of the country could not have much exceeded 100,000,000 lbs. The merino wool of Spain then began to displace them in the best kind of goods, and the imports from that country reached their maximum in 1805, being in that year 7,000,000 lbs. Before 1820 the German wool had begun to supersede the Spanish, and was imported largely till 1841. After that, the cheaper wool of the British colonies to a great extent took the place of the German, and the latter is now chiefly used for only the finest cloths.

Wool varies in character according to the peculiar breed of sheep which yields it, and also with the nature of the soil, food, shelter, and climate. In a wool of first-rate quality, the fibers are fine, soft, elastic, sound, of good color, and free from deleterious or troublesome impurities: the commercial value of any sample depends, therefore, upon the extent to which it possesses these properties. If it be a combing-wool, it will also depend upon its length of staple.

For technical purposes, shorn fleeces are divided into two classes, one called *hogs* or *tegs,* the other *wethers* or *ewes.* The former are the first fleeces shorn from the sheep,

the latter are those of the second and succeeding years; but the meaning of these terms varies a little in different districts. The fleeces of yearlings are, as a rule, longer in the staple, and otherwise of superior quality to the wool of older animals. In the s. of England, it is customary to clip lambs, and the wool so obtained is called *shorn lamb's wool*. Wool taken from the skins of slaughtered sheep is called *skin-wool* or *pelt-wool*, and is of a more variable quality than fleece-wool, on account of its being obtained in all stages of growth.

Some of the British colonies are very important wool-producing countries, Australia in this respect standing far in advance of all other countries whatever. The Australian wool has in general a beautiful, short, silky staple, well adapted for the manufacture of soft, pliable, and elastic fabrics. All the settled districts of this continent have been found well adapted to the growth of fine-wooled sheep, and the extraordinary increase in the flocks forms one of the most remarkable features of the colony.

The wool of Cape Colony has of late years been greatly improved by the introduction of merinos, and the exports from it are increasing very rapidly.

Turning now to European countries, it is somewhat sad to think that Spain, the native country of the merino, which not so long ago sent all the wool for the best English cloths, has allowed its quality to degenerate, and its once large supply to dwindle away. The wool of Saxony, Silesia, and some parts of Austria, which is obtained from sheep of the merino breed, is the finest produced in any country; and notwithstanding the lower price and nearly equal quality of the Australian, German wool is still employed for the finest broadcloths, some kinds of ladies' shawls, and a few other purposes. Great attention is paid to the breeding and rearing of sheep in Germany, and large flocks are reared for their wool alone. In Austria, the number of sheep is estimated at 45,000,000, and the annual yield of wool at 100,000,000 lbs., most of it being of fine quality, and all of which is consumed in Austrian manufactures. France produces a large quantity both of fine and coarse wool. In Italy, the production of wool from mixed merino breeds has become a source of great wealth. Russia, as might be expected from its great extent, rears many qualities, from the finest merino to a very coarse kind. The wools of the remaining countries of Europe are of minor importance.

Independently of the vast amount of home and foreign-grown wool which finds its way into our markets as wool that is in the condition fit for spinning and weaving, considerable quantities are retained on the skins, and made into rugs or mats for house and carriage use. For this purpose skins of the very best qualtity are chosen, and it is necessary that the wool should be very long in the staple. After being carefully curried, the long silky locks of wool are dyed usually some bright color, and combed.

Official statistics show that the production of wool in the U. S. increased from 60,264,913 lbs. in 1859, to 391,487,000 lbs. in 1889, and that the consumption in the same period increased from 65,749,635 lbs. to 388,083,000 lbs. The total number of sheep in the country in 1890 was estimated at 44,326,072, and their value, $110,000,000. Texas was first in both the number and actual value of its sheep; California was second in number, though in actual value the sheep of Ohio exceeded it. The wool of Ohio, indeed, with respect to quality, condition, and length and strength of fibre, is deemed superior to the wool of any other state. An act passed in 1867, March 2, established a classification of wool, for customs duties, into clothing wool, combing wool, and carpet wool; and this classification is maintained by the existing revenue laws. It is based upon distinctions in the characteristics of the wool of the different breeds of sheep, and applies also to hair of the alpaca goat and similar animals. Clothing wool, which is the fleece of sheep of Merino breed, either immediate or remote, is of fine, short fiber, remarkable for its felting quality, and is prepared for spinning by carding rather than combing. The Merino sheep are common in the middle, eastern, and western states, in W. Va., and in Tex. Few sheep of other blood are found w. of the Missouri river. The highest type of the race is found in Vt., in portions of N. Y., O., and Mich., and scattered throughout the western states. Combing wool, which, as the name indicates, is prepared for spinning by combing, includes the coarse, long, and medium wool of English and other breeds popularly known as mutton breeds. Nearly all the sheep of the south, exclusive of Tex. and W. Va., are of this breed, with occasional infusions of better blood from the northern states; and this breed is also scattered through the western states. The carpet wools are represented in the U. S. only by the Mexican sheep found in Col., New Mex., and parts of Ariz. Of the total wool product of the U. S., the proportion of clothing wool, as defined by the tariff, is more than two-thirds of all, and the combing wool comprises most of the remainder, the carpet wool constituting but seven per cent. of the entire product. At present the distinction between clothing and combing wools is somewhat arbitrary, as with the improvements in combing machinery a staple 2½ in. long can be combed with facility, and there is little wool grown e. of the Mississippi river which does not have that length. All grades of wool, from the coarsest to the finest, may be combed. Any wool can be carded, though some of the long, coarse breeds of wool would make trouble with the cards. In 1883, March 3, a tariff act was passed which considerably reduced the duties on raw and manufactured wool. Wool imported, 1887, 114,038,030 lbs.

WOOL, JOHN ELLIS, 1784–1869; b. N. Y., studied law, but in 1812 was appointed capt. in the U. S. army. In the war with Great Britain he distinguished himself at Queenstown heights, where he was wounded, and at Plattsburg. He rose through the various grades, and in 1841 reached the rank of brig.gen. In 1832 he went to Europe, studied military science, and was present at the siege of Antwerp. In the Mexican war he organized 15,000 volunteers, selected the ground for the battle of Buena Vista and was second to Gen. Taylor in command. For his services he was brevetted maj.-gen. He afterward served in the Indian warfare. On the attack on fort Sumter, he reinforced fortress Monroe and prevented its seizure. He was made commander of the department of Virginia, and in 1862 captured the city of Norfolk. In the same year he became a maj.-gen. In 1863 he commanded the department of the east.

WOOLEN AND WORSTED MANUFACTURES. The spinning and weaving of wool into fabrics dates back into a very dim antiquity. At the time of the Macedonian conquest, about 336 years before Christ, the natives of India wore shawls of great beauty. Herodotus speaks of the use of *felt*, an unwoven fabric of wool and fur, agglutinated and matted together with the aid usually of moisture and heat. It was used not only for coverings for the head, but for many domestic purposes, even to the making of table covers, mats for the floor, and was the principal substance of clothing as well as habitations. The following sentence gives a history in itself of its use and benefit. Speaking of the Argippæi, he says: "They live under trees, covering the tree in winter with strong and thick undyed felt, and removing the felt in summer." Woolen felt is also mentioned by the same writer, as a covering for tombs. Felt does not differ much if any in the present day from that manufactured by the ancients, except perhaps in the improved methods of manufacture.

It is evident that fine woolen goods were in use long before the time of Alexander, not only because of the high art exhibited in their manufacture at that time, but in the many allusions both in sacred and profane history in reference to the matter. The Greeks learned many processes of woolen manufacture from the Egyptians; the Romans from the Greeks; and from the Romans the knowledge has generally pervaded the occidental world.

Among the ancients, the method of manufacture was to, after thoroughly cleansing the wool, whether of sheep or goats, or even camel's hair, which was submitted to the same process, sort, card, and spin the material entirely by hand. The loom for the weaving was remarkably simple, even crude, but under the delicate manipulation of dextrous fingers, skilled operators produced fabrics that have never been excelled in fineness of texture or delicacy of construction, even at this later day.

Woolen garments were worn by the Romans at a very early period. Tacitus speaks of a factory whence the Roman army was supplied with woolen clothing. It is very probable that the early lessons our modern ancestors in Britain received in the art were derived immediately after the Roman conquest, and woolen manufacture as carried on in England was at the outset but a repetition, and afterward an elaboration and improvement on the methods previously known. The product of certain looms had such a reputation that the statement was made, "the wool of Britain is often spun so fine that it is in a manner comparable to a spider's thread." It is generally supposed that certain Flemish weavers went to England in the time of William the Conqueror, and obtaining the royal patronage, established the first manufactories of woolen goods. At various periods in the reigns of succeeding monarchs, other Flemish weavers were imported, and established at differents points in the kingdom. Henry II. established guilds of weavers in his reign; and the exclusive privilege of exporting woolen cloth was by him granted to the city of London. In the 13th century, Spain produced her own cloth, and the beauty of her fabrics was celebrated far and wide. Italy followed, and employed processes apparently superior to any in use. It is difficult to tell which country produces the best fabrics at the present day, so great is the competition and the desire to be the first in the battle of manufacture.

Woolen manufactures are divided into two principal divisions, known as *Wool* and *Worsted*. For the first, *carded* wool is used, and the thread is loosely spun, giving a soft and pliable texture. The goods are technically designated as *Woolen Fabrics*. For the second, *combed* wool is used, and the thread is twisted until it becomes very hard. It is technically designated as *Worsted Fabrics*.

Sheep Washing.—The surface of a fleece of wool has almost invariably a thick coating of dirt adhering to it, and in the finer wool breeds of sheep, there are many solid masses of dirt and wool caked together. There is an exudation from the skin of the animal of an oily yolk, or *suint*, which lubricates the wool, and attracts in eminent degree surrounding particles of dust. While it forms a protective covering to the sheep, rendering the fleece impervious to moisture, and preserving the inner coating of wool in a soft, pliant, and silky condition, it must nevertheless be removed before the wool can be properly handled for manufacture. It has been until recently the habit of sheep washers to select a running stream, and securing the sheep in a close pen on the bank, take them singly, and while one man held the victim, a second did the washing. The operation has been deemed objectionable in many localities, owing to the pollution of the water by the dissolving of the potash salts contained in the sticky masses in the wool, and the custom has been generally abandoned. Destruction of fish

life in the streams very frequently resulted, as well as losing the potash salts, so valuable for fertilizing. These considerations resulted in the adoption among many wool growers of sheep-washing appliances. The best is a pen into which the sheep are driven, and subjected to a strong spray of water of proper temperature, which soaks the fleece and softens the dirt. This done, the sheep are obliged to swim in a tank for rinsing purposes, and when they pass out are subjected to a final *douche* of pure water. They are then driven into a clean yard, where, after a few days, they are ready for the shearing or clipping.

Shearing.—A skillful user of the shears sits upon the ground, takes the sheep in his lap or across his knees, and will remove the fleece from the sheep in one unbroken, continuous sheet, retaining the form and relative positions of the mass almost as if the creature had been scientifically skinned. Different operators begin at differents parts of the body, as fancy dictates, but all have the same object in view—viz., the giving an unbroken fleece from the cutting.

Sorting, or *Stapling,* is usually regarded as a distinct industry. It consists in determining the different qualities that shall be mixed for a given quality of cloth. *Carding* wools are separated from and classed differently from *combing* wools, and differing races of sheep are very carefully considered. Generally speaking, the choicest brand of wool is that which comes from the side of the sheep. It is the cleaner in growth and less liable to be affected by accidental circumstances. The upper or back portions are liable to receive and retain a certain amount of impurity in the way of dust and burrs that produces an irregularity in growth; the wool on the rump of the sheep is coarser than the wool on the side; and the wool of the under parts of the body is generally short, worn, and dirty, as compared with the other portions.

The sorter works at a table having a fine wire netting, through which any dust and dirt contained in the wool he is handling may fall, and not be liable to annoy him by a possible subsequent stirring up. He examines each fleece as it is spread out before him, and with marvelous precision and certainty picks out his separate qualities, throwing each lot into its proper receptacle. His labor is sometimes extremely difficult, for, in individual fleeces, qualities and proportions differ in marked degree, and it is only by long experience that a stapler is enabled to rightly divide up his lots so as to produce *even* qualities of raw material.

The grades of wool are given as follows:

Fine and superfine.....Wool taken from near the ear;
Semi-fine.....wool taken from the shoulder;
Medium.....wool taken from the flanks;
Coarse.....wool taken from the upper thigh;
Very coarse.....wool taken from the lower thigh.

The above grades are classified as *high-quality* fleeces. The *low quality* is divided into four grades, in the following order:

First.....Wool taken from the lower belly and forehead;
Second.....wool from the lower parts of the thighs;
Third.....wool from the breech locks;
Fourth.....wool bearing tarry-marks (marks put on the animals for identification).

Beating.—After being sorted, the wool is subjected to a process of beating, not only for the purpose of eliminating dust and other impurities, but the procedure has the effect of disposing the staple to open and thus render the material softer and less resisting when washed and worked over in the various machines. The wool must be thoroughly dry, else many difficulties will be encountered. If the beating process be well carried out, it will not only dispose of many impurities, but will invariably treble and even quadruple the volume of the fibre.

Scouring.—The washing received by the live sheep before the removal of the fleece is not enough for the purposes of the manufacturer. There is a subsequent cleansing which could by no possibility be given while the material was a part of the animal. Soft water is invariably required, because the insoluble lime soap formed in dissolving soap in hard water is deposited on the woolen fibre and becomes inextricably entangled. Wool washed with hard water is always harsh to the touch; it takes on dyes unevenly, and is not readily cleansed. Soft water is therefore an absolute necessity for the production of good fabrics. The wool is immersed in an alkaline lye which forms a soap with the natural grease of the fleece. This acts as a detergent, and cleans the wool most thoroughly.

Drying.—The more gently and uniformly this can be accomplished, the better the result. The wool is spread as evenly as possible over a frame-work of wire netting, with steam pipes underneath. In the later and more approved methods, the wool is entered by continuous feed on one side of a heater chamber; the strength of the blast carries it up and deposits it at the further end, where it passes out well and equally dried. The process consists of a system of circulation through the machine until the drying is complete.

Teasing.—The wool having been dried is still found to retain many objectionable features that were not disposed of in the previous manipulations. There are bunches,

matted locks, dust, sand, and other impurities, all of which must be removed before the article can go toward final manufacture. The process of removing these objectionable features is termed *teasing* or *willying* (the latter term being given in honor of the inventor, Willey). It is accomplished by a machine consisting of a large drum and three small cylinders mounted in an enclosed frame. Powerful hooked teeth are geared on a drum which rotates with great rapidity, and the matted sections of wool, being fed into the drum, pass on to the spikes of the lesser cylinders ; the matted locks are gently torn asunder, and the whole wool is delivered in a light, free, and disentangled condition. In various of the South American products, there is a difficulty which requires additional care. There are little burrs and small adherent seeds which insist on remaining in the wool, no matter what the processes previously described may have accomplished. One method of eliminating them is chemical ; another mechanical. The chemical treatment consists in steeping the wool in a dilute solution of sulphuric acid, and quickly drying it at a point of 250° F. The process will leave the wool uninjured, while the vegetable matter will be found to have been completely carbonized by the action of the acid, and can be readily removed. A solution of the chloride of aluminum has also the same effect, and is thought by some to be less harmful to the fibre of the wool and less hurtful to the workmen than the sulphuric acid process. A mechanical appliance is sometimes used, but the removal of the burrs and other foreign articles carries away so many fragments of wool that it is not regarded with great favor.

Oiling.—The wool having been thoroughly cleansed is more or less harsh or wiry to the touch, owing to the removal of the yolk, or natural lubricant. In order to make it soft and pliant, a sprinkling of olive oil is given. This has the advantage of securing a certain adhesiveness of the fibre in the subsequent spinning process, and prevents loss from the flying off of separate fibres. It is sprinkled in an exceedingly fine spray as the wool, thinly distributed, is carried by an endless cloth through the machine under the sprinkler.

Raw Material.—Up to this time the material is designated as *raw*—that is, unmanufactured material. Wool is the raw material of yarn, as yarn is the raw material of cloth. It is the material for fabrication, in its natural state, or with reference to the processes of manufacture, in the partially manufactured state to which it must be brought prior to treatment by those processes.

Carding.—The final process connected with the *raw* material is the *blending* and carding. By blending is meant the addition to pure wool of other grades, as well as, to no inconsiderable extent, the added material of shoddy, mungo, or extract wools. Blending with cotton is also practised, and for some purposes silk and wool are mixed. The carding process is complex, delicate, and expensive. A series of card-covered cylinders of different diameters, running at different rates of speed and in different directions, contend with each other for the wool supplied to the machine. The wool is entered by a carefully equalized and distributing mechanical feed, and when it leaves the machine is in the form of a continuous equally distributed *lap*, which is wound on a revolving roller. To prepare the lap for spinning, it is divided into a series of strips or ribbons, and these are condensed into a rounded carding or *sliver* sufficiently compact to bear winding on a bobbin. This is the first condition of the yarn—that is, the *first drawing*. The condenser for accomplishing the act is attached to the finisher-card of the machine, and consists of rings or bands of card cloth, of the width of the strip to be made. By a peculiar oscillating motion, the effect desired is obtained, and in the subsequent operations the rounded, loose, untwisted fibres are drawn out to the degree of tenuity required in the yarn to be made.

Gilling.—Leveling the fibres and making them parallel. The machine by which this is accomplished consists of a pair of rollers which catch the wool, and of a second pair of rollers, which draw it forward over heavy steel bars, called *fallers*, covered with projecting steel pins. The machines are generally used in sets, each successive machine having the pins on the rollers finer and more closely set than that preceding. The wool is fed to the rollers ; is caught by the rows of steel pins which rise in close and constant succession and penetrate the wool presented to them, traveling forward with it to the second pair of rollers which in their turn catch the fibre and draw it away. The *fallers* are so called because when they have accomplished their journey, they, by the agency of an endless screw mechanism, fall down, and by the action of other endless screws are returned to their original position. There is thus a continuous line of fallers traveling between the feed-rollers and back-rollers, and there is a steady and constant drawing of wool away from the front rollers and through the teeth of the fallers. Five or six of these machines usually constitute a set. They are all constructed on the same principle, but with the pins finer and more closely studded as the fibre travels onward. In the first three machines it is usual to have the wool delivered in the form of a broad *lap*, but in the later machines, or *boxes*, as they are also called, the product is condensed into a *sliver*, and is received in large cylindrical tin cans. Six of these cans are brought to the front of the next gilling machine, and the six slivers are fed in, and passing through are drawn into and delivered as one. This operation is repeated three or four times, and the fibres are brought even with each other, and a very level and uniform strand produced.

Slubbing.—A preparatory spinning. It consists in drawing out the wool into a soft, weak thread. Several spindles are set in a frame and receive a turning motion. The

frame, or, properly speaking, the carriage, travels backward a distance of about six feet. As it moves away from the rollers the thread is twisted, and as it returns, the twisted portion of the thread is wound upon the spindles. The complicated motions of the machine are regulated by gearing and belting from headstocks on the stationary frame. The full twist is given while the carriage remains standing at the end. The yarn at this stage of the proceeding is known as *singles*. It is wound on bobbins, and when two-, three-, or four-ply yarn is wanted, the bobbins are placed on pegs in a twisting frame. The twist is given in the reverse direction from that in which the singles are spun. Numerous variations of the method are employed in order to produce loops, knots, and other irregularities, for convenience in weaving or knitting fancy textures. Great care has to be exercised in order to produce the fineness and firmness requisite for weaving. In view of the variable lengths of the filaments of wool, the drawing rollers between which the wool passes in spinning, are so mounted as to be adjustable at different distances, and prevent the soft thread from parting because of an undue length, or broken when too short, for want of space for the fibres to slip one upon the other.

In worsted work, the bobbins of elongated rovings (the slightly twisted slivers) are placed on pegs on a frame canted forward, so that the roving, as drawn off, comes away at right angles from the bobbin. Passing between a pair of rollers, the rovings are carried on to other rollers covered with leather, the lower roller being grooved, or furrowed. Between these two sets of rollers the final drawing is effected, and the amount of attenuation effected is dependent on the relatively faster rate at which the front rollers rotate as compared with the rear set. During the short journey, the twist is imparted by a spindle working in an apparently erratic manner, nevertheless with wonderful regularity. The doubling, and subsequent treatment are much the same as with wool.

Shoddy.—This belongs to wool, and is the fibrous material obtained by tearing into fibres, refuse woolen goods of any kind, especially rejected stock. It differs from *mungo*, in being of an inferior quality, and is spun into yarn with a little fresh wool, and made into a coarse cloth. It has but little elasticity, and is tender. The term was formerly one of opprobrium in connection with woolen manufactures, yet the substance is universally recognized as a material of great utility for many purposes when warmth is more essential than toughness and elasticity. Shoddy and mungo are prepared by dusting the rags and fragments, classifying them according to color and quality, then passing them into a machine, technically called the *devil*, where they are literally rended to fragments, which have the appearance of dust more than of fibre. Shoddy is practically a new source of textile material. Its employment is a utilization of waste, and furnishes cheap, serviceable textures. The wool consumption in the United States in 1895 was 6.32 pounds per capita, of which 46.1 per cent. was foreign material. The world's supply of wool in 1896 was 2,582,103,000 pounds, of which the United States produced 272,474,708 pounds. According to the census of 1890 the value of the woolen goods produced for the census year amounted to $337,768,524. Of this, $137,930,014 was for woolen goods proper, and $72,194,642 was for worsted goods. The remainder was for felted goods, carpets, hosiery, etc. Massachusetts is the leading state in the manufacture of woolen goods.

Weaving is a matter of such importance that it must of necessity be treated particularly under its special title. As a matter of fact the most important features connected with woolen manufacture are those which are carried on subsequent to the weaving process. The cloth from the loom is called *roughers*. It has an irregular, slack aspect, and is in an exceedingly crude condition as compared with the elegant broadcloth on the merchant's counter. The web, as it leaves the loom, is still saturated with the oil sprinkled on it while yet in the wool, and impregnated with the size subsequently given to the yarn for tenacity and consistency in weaving. For the removal of these objectionable features there is a scouring process with hot soap suds in a trough having a convex bottom, and fitted with wooden mallets which perform a beating almost unexampled. After the scouring process, the fabric is subjected to a stretching in a frame specially designed, and every imperfection is carefully removed. This latter is designated as *burling*, and consists of critically examining the whole texture for imperfections. These may be of knots, or burrs, all of which must be skillfully removed. If holes are discovered, they must be carefully darned. It is the process preparatory to *fulling*.

Fulling.—The process of cleansing, scouring, and pressing is embraced under the term *Fulling*. The fabric is fed into a machine, where, by means of rollers, stampers, and beaters, it is, while immersed in suds and *fuller's earth*, cleansed, beaten, rolled, and pressed. By this procedure, it is felted together till the required texture is obtained. There is invariably a certain shrinkage, but this is regarded as unavoidable. The hotter the water, the greater the shrinkage of any woolen fabric. It is caused by the serrated, wavy structure of the wool. The operation of fulling, or milling, as it has been termed in later years, is to saturate the cloth with hot soap and water, when it is worked either by the falling stocks of the fulling machine, or pressed and rubbed between rollers in the more modern milling machine. The more the cloth is soaked and beaten, the more it will shrink, and the operation can be carried on till the cloth is reduced to half its original length and breadth. The degree of fulling is a distinctive feature of many

varieties of goods. In broadcloths, and all kinds of nap-finished goods, the milling is carried on until the fibres become densely matted, and the appearance of weaving is entirely obliterated. Venetian cloths and diagonals, to which no pile-finish is given, are fulled or milled only enough to give them solidity and strength. Tweeds have still less. The proper stage of beating or rolling having been reached, the soap suds is gradually supplanted with pure water, tepid at first, but each new supply being cooler, until the fabric is finally worked in thoroughly pure and cold water.

On being taken from the machine the cloth is stretched uniformly in all directions by hooks on a frame, that it may dry without wrinkle or curl. At this stage the operation of *teasling* is entered upon. This is the raising of the *pile* or *nap* by the agency of the cone-like spike-head of the teasel, a plant of the genus *dipsacus*. The head is covered with imbricated scales which end in sharp recurved hooks of great elasticity, but stiff enough to do the work required. The work was formerly done by hand manipulation, but is now accomplished by the *gigging-machine*, or *gig-mill*, where the teasels are arranged on the face of revolving cylinders before which the fabric is made to pass. By this operation the loose ends of the wool are drawn to the surface, thereby forming the nap. Wire teasels are sometimes used, but nature's creation of the vegetable teasel is regarded as having never been improved upon.

Cropping.—Trimming the pile to produce uniform surface. Formerly the work was done by hand with huge shears, but now by a machine containing a cylinder armed with a series of helical knives, and made to revolve with great rapidity. The machine was invented by Leonardo da Vinci, but not brought into practical use until 400 years later.

The final process is the brushing of the cloth, winding it tightly around a huge drum, and immersing it in water heated to 180° Fahrenheit. It remains in that condition for three or four hours, when it is unwound, the ends reversed and rewound, and again the cloth is subjected to the hot water process. The closing act in its manufacture is the pressing in an hydraulic press, during which time steam is forced through it, this last proceeding adding to the solidity and smoothness of the cloth, and developing the lustre characteristic of a well-finished fabric.

WOOLLETT, WILLIAM, one of the most eminent of English engravers, was b. in the year 1735 at Maidstone. He went early to London ; studied his art under a practitioner of the name of Tinney, now only remembered as having taught him little or nothing; taught himself, however, a good deal, notwithstanding the aid of Tinney, and develop ing a manner of his own, soon became known as one of the most accomplished engravers of his time. In recognition of his merit, he was ere long appointed engraver to George III. As to his life, except as he is proved to have existed by his works, familiar at this day to every one, nothing is known. He died in London, in the year 1785, after a life of continuous and conscientious labor, as reward of which, a monument was erected to him in Westminster abbey. His works, more especially in landscape, continue to be much prized by connoisseurs.

WOOLMAN, JOHN, 1720–72 ; b. in w. N. J.; worked on a farm till the age of 21; became clerk in a store at Mount Holly; opened a school there for poor children; became a tailor; desiring to visit the Friends (to which denomination he belonged) in the back settlements of Virginia, went on a tour with Isaac Andrews, 1746; visited the societies of Friends in different parts of the colonies, supporting himself by work at his trade; spoke and wrote frequently on slavery; visited the Indians on the Susquehanna, 1763; went to England for health, 1772. He was a faithful, self-denying Christian worker. He published: *Some Considerations on the Keeping of Negroes; Considerations on Pure Wisdom and Human Policy, on Labor, on Schools, and on the Right Use of the Lord's Outward Gifts; Considerations on the True Harmony of Mankind; The Journal of the Life and Travels of John Woolman in the Service of the Gospel.*

WOOL, MINERAL, called also, SILICATE COTTON, is a vitreous substance converted to a fibrous condition, by allowing a steam blast to strike against a small stream of melted cinder or slag. In appearance it consists of a mass of very fine soft fibres interlacing each other in every direction, thus forming an innumerable number of minute air cells. Furnace slag, if not containing too much silica, is the cheapest and most abundant substance for the manufacture of mineral wool, but a better cinder from which to manufacture it is produced by mixing four parts orthoclase feldspar with six parts dolomite limestone. Its general color is white, but the presence of manganese or potash produces a green color, while cinder from some furnaces produces a beautiful pink tinge. Among the many important properties of mineral wool may be noticed particularly its power to resist the transmission of heat and cold, and its non-combustibility, it being practically indestructible by heat, hence it is being largely adopted by architects and builders. It also possesses especial value as a non-conductor of sound, and thus is desirable in school buildings, music halls, or wherever insulation of sound is desirable. It was first manufactured in Osnabruck, Germany, in 1871, and in this country in 1875.

WOOLSACK, the name given to the seat of the lord chancellor of England in the house of lords, which is composed of a large square bag of wool without either back or arms, and covered with red cloth, The woolsack was first introduced in the house of lords as the chancellor's seat in the time of Elizabeth, as a memento of an act which was passed against the exportation of wool, that commodity being then the main source of the national wealth of England.

WOOLSEY, Sarah Chauncey ("Susan Coolidge"), b. Ohio, about 1845; a descendant of Jonathan Edwards, and niece of ex-Pres. Woolsey of Yale coll. Her life has been mainly spent in New Haven, Conn., and Newport, R. I. She published her first book, *The New Year's Bargain*, a child's story, in 1871. Among other works are, *What Katy Did* (1873); *Eyebright* (1878); *A Guernsey Lily*, and a volume of poems (1880). She also edited *The Diary and Letters of Mrs. Delany* (1878); and *The Diary and Letters of Frances Burney, Mdme. D'Arblay* (1880). Her children's stories are humorous and natural and her poetry is marked by deep religious feeling.

WOOLSEY, Theodore Dwight, d.d., ll.d., b. N. Y., 1801; graduated at Yale, 1820, and then studied at the Princeton theological seminary. In 1823–25 he was a tutor in Yale College; 1827–30 he studied at the German universities, and on his return was made professor of the Greek language at Yale. Fifteen years later he was made president of the college, and held that office until 1871, when he resigned on account of increasing old age, but continued for some years to give instruction in international law, and occasionally preached at the college chapel. As the head of the college Dr. Woolsey was most successful, not only from his learning, but also from his executive ability. As a publicist his reputation was international. The most important of his writings are his editions of the *Alcestis* of Euripides, the *Antigone* and *Electra* of Sophocles, the *Prometheus* of Æschylus, and the *Gorgias* of Plato; *An Introduction to the Study of International Law* (1860)—his most important work and a standard authority; *An Essay on Divorce and Divorce Legislation* (1869); *The Religion of the Present and of the Future* (a collection of sermons); *Communism and Socialism*, and *Political Science*. Pres. Woolsey also edited and added notes to Lieber's *Civil Liberty* and *Political Ethics*. He was the chairman of the American branch of the committee having charge of the revision of the New Testament issued in May, 1881. He d. 1889.

WOOLSON, Constance Fenimore, b. Claremont, N. H., in 1838; grandniece of Fenimore Cooper, the novelist. She received her early education in Cleveland, O., whither her parents had removed, and then attended school in New York. Her first literary work was a short sketch in *Harper's Magazine* (1870), which was followed by other sketches and stories in various magazines. She has published, *Two Women, a Poem;* a collection of her stories called *Castle Nowhere; Lake Country Sketches; Rodman the Keeper; Southern Sketches; Anne*, a novel which appeared first in *Harper's*, 1881–2; *For the Major* (1883); *East Angels* (1886); *Horace Chase* (1894). She died in 1894.

WOOLSTON, Thomas, a heterodox divine of the English church, equally remarkable for ingenuity and learning, and for the singularity of his opinions, was born at Northampton in 1669. He was educated at Sidney Sussex college, Cambridge; was elected a fellow of his college; entered into holy orders, and in due course proceeded to the degree of bachelor of divinity. Gifted with a lively fancy, he became a diligent and appreciative student of the works of Origen, and by them seems to have been first imbued with a taste for the allegorical interpretation of the Scriptures. That he was disposed to carry this principle of interpretation much too far for his contemporaries, appeared at once from his first work, published in 1705. This was, *The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles revived.* In this work, Woolston maintained that Moses was only an allegorical person, and all his history typical of that of Christ; that the miracles of the Pentateuch were allegorical, and the miracles attributed to Christ and the apostles pure allegory too; and he stigmatized as atheists and apostates all who received the Scripture narratives as literally, historically true. In subsequent publications he went further in the same direction; also maintaining that the Quakers approached more nearly in doctrine and organization to the primitive church than any other religious body; and denouncing clergymen, because they made a profession of the pastorate, as "hireling priests," worshipers of the beast, and ministers of Antichrist. In 1721 he published *The Moderator between the Infidel and the Apostate*, dialogues tending to show that the gospel miracles, by themselves, could not prove Christ to be the Messiah. This work occasioned great scandal: it abounded in expressions considered indecent and blasphemous; and it was only through the intervention of Whiston, who was friendly to him, and in favor of toleration in matters of opinion, that the author escaped a prosecution. Up to 1720 Woolston had continued to live in his college, leading a studious and blameless life, and showing great kindness to the poor. In 1720 he went to live in London; and in 1721 his college, upon some pretext—really on account of the scandal made by his writings—deprived him of his fellowship. The views set forth in the last-mentioned work, Woolston developed more fully in a series of six discourses during the years 1727, 1728, 1729, republished under the title *Discourses on the Miracles of Christ.* He maintained—representing himself, as in all his works, as the defender of true Christian doctrine—that Christ's miracles, in themselves, were open to the gravest doubts; that, in fact, the gospel narratives, if they were to be taken literally, were only a tissue of absurdities; and that the authority of the ancient church was against the literal, and in favor of an allegorical acceptation of them. These views were supported with a good deal of warmth, and mixed up with them were fierce denunciations of the order of clergy. The freethinkers, both in England and on the continent, were now triumphantly quoting Woolston in their favor; and people who had previously been disposed to treat him as a maniac, whose rhapsodies were too wild to call for refutation, began to think it time to rescue the Christian faith from so dan-

gerous and dubious a defender. No less than sixty answers were made to the *Discourses* Now, too—Whiston no longer intervening—an indictment, at the instance of the attorney-general, was brought against Woolston, on account of the blasphemous and irreligious character attributed to his works. He was tried before chief-justice Raymond at Guildhall, found guilty, and sentenced to be imprisoned for a year, and to pay a fine of £100, and ordered to find securities to the amount of £2,000 that he would not repeat his offense. He was imprisoned in the queen's bench prison; and being unable to pay the fine, and both unable and unwilling to provide the requisite securities, the remainder of his life was spent within the rules of the prison. It was not long protracted. He died on Jan. 27, 1731.

WOOL'WICH, a market-t. and parish of Kent, the seat of the chief government arsenal of Great Britain, stands on the s. bank of the Thames, and 9 m. e. of London. It stretches along the bank of the river for two m., and reaches back from the river for half a mile, as far as the brow of the hill, where are the royal artillery barracks and hospital. The general appearance of the town has little to recommend it; but the southern suburbs are handsome and regular. There are numerous places of worship—Established, Roman Catholic, and dissenting, and there are numerous schools, a theater, etc. Its dock-yard, its government manufacturing establishments for the production of material of war of every description (except gunpowder), and the fact that it is a great depot for naval and military stores, and also the headquarters of the great corps of royal artillery, combine to render Woolwich a place of great importance. A royal dockyard existed here as early as 1515, and the *Henrye Grace de Dieu*, which conveyed Henry VIII. to the field of the cloth of gold, is said to have been built here, though this statement has been disputed. The *Royal George* (q.v.) was built here in 1751. The royal dock-yard and ship-building establishment was, however, closed on Oct. 1, 1869. The yard comprised large dry-docks, and a basin 400 feet long by 300 feet wide, and was furnished in every respect with the newest and most efficient apparatus. The royal arsenal, the largest in Britain, contains not only the largest stores of all kinds—shot, shells, cannon, etc.—which are required for our armies, navies, and forts, but it comprises also establishments for manufacturing them, and for constructing gun-carriages, and preparing ammunition for cannon and small-arms. These works are carried on in the three departments called respectively the gun factories, carriage department, and laboratory. On the common, south of the town, is the royal military academy, for the education of cadets destined for the artillery and engineers. See MILITARY ACADEMY, ROYAL; and GUN FACTORIES, ROYAL. Pop. '81, 36,600; '91, 40,848.

WOONSOCKET, a city in Providence co., R. I.; on the Blackstone river, and the New York, New Haven, and Hartford, and the New England railroads; 16 m. n. of Providence. Its area was enlarged in 1871 by the annexation of a portion of Smithfield. In 1867 it was incorporated as a town, and in 1888 was chartered as a city. The city is widely noted for its extensive manufactures of cotton, woolen, and rubber goods, and machinery. The U. S. census of 1890 reported for it, 201 manufacturing establishments, employing $10,096,619 capital and 6417 persons, paying $2,361,617 for wages and $5,532,286 for materials, and having a combined output valued at $9,613,264. There are a high school, public library, several public parks, fair grounds, soldiers' monument, national and savings banks, electric lights, waterworks, and daily and weekly newspapers. Pop. '90, 20,830.

WOO'RALI POISON. Since the original publication of the article CURARI, which is one of the synonyms of this substance, the physiological action of this fearful poison has been carefully studied by Drs. Weir Mitchell, and Hammond, of the United States; and the essay in which their joint labors are recorded is published in Hammond's *Physiological Memoirs* (1863). This essay is so valuable, and contains so much original matter regarding two other allied poisons whose native names are *corroval* and *vao*, that we shall give a brief abstract of its contents; premising that, for the best account of the history of this remarkable poison, the reader should consult Bernard's *Leçons sur les Effets des Substances Toxiques* (1857, p. 238). We shall notice the physical and chemical properties of this poison before describing its physiological action. The best of the earlier investigations of the poison is that of Roulin and Boussingault in 1828, who obtained from the crude "woorala" an alcoholic extract, to which they gave the name of *curarin*. This curarin was a solid transparent mass, of an excessively bitter taste, and possessed in an eminent degree of all the virulence of the woorali. Heintz has subsequently examined the precipitate which tannic acid throws down from the watery solution of the poison, but only found that it contained no nitrogen, and was composed of apparently inert substances, as sugar, gum, resin, extractive matter, tannic and gallic acids, etc. He sought in vain for strychnine in it. Among the chief experimenters on the subject may be mentioned De la Condamine (*Mem. de l'Académie des Sciences*, 1745, t. 62, p. 391); Brocklesby (*Philosophical Transactions*, 1747, vol. xliv. p. 408); Herissant (*Philosophical Transactions*, 1751–52, vol. xlvii. p. 75), who killed a bear with a poisoned arrow in less than five minutes; and nearly killed himself and a small boy who was evaporating an aqueous solution of the poison; both, however, recovered under the influence of fresh air, a pint of wine, and a quantity of sugar; Fontana (1781), who showed that (notwithstanding the above experiment) the vapor is not deleterious, and that the state of the stomach at the time when the poison was inhaled modified the result, an animal with a full

stomach being able to resist the action of a dose that would prove fatal to one of the same size when fasting; Brodie (*Philosophical Transactions*, 1811–12); Virchow and Münter (published in vol. i. of Schomburgk's *Reisen in Britisch Guiana*), who, *inter alia*, showed that the poison, even after being kept dry for five years, is still intensely active—that its physiological action corresponds with the result of analysis in showing the absence of strychnine, and that it rather belongs to narcotic than to tetanic poisons—and that death takes place not from any direct result of the poison, but indirectly, by causing the cessation of the respiratory process; Bernard and Pelouze (*Compt. Rend.*, 1850, t. xxxi. p. 534); Vulpian (*Compt. Rend.*, 1854, t. i., 2d series, p. 73); and Kölliker (*Proceedings of the Royal Society*, 1857), who, among other important conclusions, arrives at the following: (1) That the *urari* (as he terms it) causes death very rapidly when injected into the blood or inserted into a wound; and that when introduced by way of the mucous membrane, its effects are slow, and require a large dose for their production; when applied to the skin of frogs, it is inoperative; (2) it acts through the blood, and destroys the excitability of the motor nerves, while the sensory nerves are hardly at all affected; (3) when artificial respiration is carried on in animals under its influence, many of the secretions are increased, owing to the paralysis of the vascular nerves, and the consequent dilatation of the vessels; (4) that in mammals, the poison causes death by the paralysis of the respiratory nerves and suppression of the respiration, which brings on convulsions as a collateral effect.

WOOSTER, city and co. seat of Wayne co., O.; on Killbuck creek and the Baltimore and Ohio and the Pennsylvania Co.'s railroads; 25 miles w. of Massillon. It is the seat of Wooster university (Pres.) and of the state agricultural experiment station, and has a high school, national banks, electric lights, waterworks, daily, weekly, and monthly periodicals, and manufactories of machinery, pianos, furniture, wagons, brushes, etc. The city is the center of a rich agricultural region. Pop. '90, 5901.

WOOSTER, David, 1710–77; b. Conn.; graduated at Yale college, 1738. Soon after the beginning of the war between Great Britain and Spain he commanded a vessel for coast defense, and was capt. of a sloop-of-war at the siege of Louisburg, in 1745. Ten years later he was col. of the 3d Conn. regiment. He was a brig.-gen. through the campaign in the n., 1758–60, and was one of the first to propose the Arnold expedition against Ticonderoga early in 1775, and in the same year was made brig.-gen. in the continental army. He succeeded Montgomery in Canada, and was mortally wounded defending Danbury, Conn., against Tryon.

WOOTZ is a finely damasked hard cast-steel, which is obtained from India. Faraday found aluminium in a sample which he analyzed, and referred its peculiar properties to the presence of this metal; but other chemists have failed in finding aluminium in wootz.

WORCESTER, a co. in s.e. Maryland, bounded on the w. by the Pocomoke river, adjoining Delaware and the Atlantic ocean; about 475 sq. m.; pop. '90, 19,747. Co. seat, Snow Hill.

WORCESTER, a co. in central Massachusetts, bounded on the n. by N. H., on the s. by R. I. and Conn.; 1551 sq. m.; pop. '90, 280,787. Its dairy products and its manufactures are important. Co. seats, Worcester and Fitchburg.

WORCESTER, city and one of the co. seats of Worcester co., Mass.; on the Blackstone river, and the Boston and Albany, the Boston and Maine, the Fitchburg, the New England, the New York, New Haven, and Hartford, and several branch railroads; 44 miles w. of Boston. It was settled in 1674, incorporated as a town in 1722, and chartered as a city in 1848. The city contains the villages of Barnardville, Blithewood, Bloomingdale, Greendale, Jamesville, Lake View, Leesville, New Worcester, North Worcester, Northville, Quinsigamond, Tatnuck, Trowbridgeville, South Worcester, and Summit, and is connected with Millbury, Leicester, and Spencer by electric railroad. It is built in the valley of the river and on and beyond the neighboring hills, and has an area of 36 sq. miles. Worcester is regularly laid out with broad, well-shaded streets. Main and Front are fine business streets, with Belgian pavements, and Oak avenue, Grant square, Harvard, and Elm are among the beautiful residence streets. There are 11 parks, with an aggregate of 360 acres, the most noteworthy ones being Elm, Institute, Normal Hill, North, University, and Crompton. The grounds of the Agricultural society (25 acres) are used for horse, foot, and bicycle-racing, for ball-playing, and for the annual county fair and cattle show. Waterworks, costing about $2,000,000, collect from the elevated water-shed in the vicinity an abundant supply of the purest water. There is an efficient fire department and an admirable drainage system, with works where the sewage is purified by chemical precipitation. Among the prominent public buildings are the co. court houses, city hall, classical and English high schools, Y. M. C. A. and Y. W. C. A. buildings, the quarters of the American Antiquarian society, Mechanics' hall, free public library, armory, city hospital, isolation hospital, Worcester lunatic hospital, Worcester insane asylum for chronic cases, Washburn memorial hospital for women and children,

St. Vincent's hospital, Hahnemann hospital, and co. jail. Of the many churches, the New Old South, Central Congregational, All Saints' (P. E.), and St. Paul's (R. C.), are most noteworthy. Worcester is famed for the number and superiority of its educational institutions. There are a state normal school, the Worcester polytechnic inst., Worcester academy (Bap.), Highland military academy, College of the Holy Cross (R. C.), and Clark university for post-graduate study (q.v.). There are several convents and Roman Catholic parochial schools. There are homes for aged women, old men, orphans, and various other beneficent institutions.

Although 45 m. from the sea-coast, bringing all its raw materials from a distance, and having but little water-power, yet the inventive genius of its mechanics and the energy of its business men have made Worcester a most prosperous manufacturing center. Special machinery for making wire goods, cotton, woolen, and silk fabrics, hydraulic elevators for folding envelopes, for wood-working, and other notable inventions, have here been made or perfected. For the census of 1890, 996 establishments, representing 134 different industries, reported a combined capital of $25,230,620; persons employed, 21,729; wages, $11,694,121; cost of materials, $21,208,904; value of products, $39,533,869. The principal manufactures are wire, woolen goods, Brussels carpet, corsets, envelopes, machinists' tools, cotton and woolen machinery, mowing machines, agricultural tools, wood-working machinery, boots and shoes, bicycles, and leather belting and hose. There are several national, savings, and co-operative banks, insurance companies, and daily, weekly, and monthly periodicals. The first printing-press was established by Isaiah Thomas in 1775, and the first paper issued was the *Massachusetts Spy*, still published. Pop. '90, 84,655.

WORCESTER, an English city, and capital of the county of the same name, and a county of itself, stands almost in the center of the Severn valley, and is situated principally on the eastern bank of the river, about 27 m. s.w. from Birmingham. Worcester is of great antiquity; there are abundant traces of ancient iron-smelting works on the banks of the river, adjudged by antiquaries to belong to the times of the Roman occupation; and the frequent discovery of other remains proves that the city was a Roman station. The chief object of antiquity now existing is the cathedral, which is beautifully placed on a gentle elevation on the e. bank of the river, and stands within its own precinct, but which, since the passing of the act abolishing the isolation of "peculiars" and "non-parochial places," has been incorporated in the city parish of St. Michael. A cathedral, dedicated to St. Peter, was founded here as early as the 7th c. In 1084 bishop Wulstan laid the foundation of a new cathedral, many portions of which remain in the present structure, such as the crypt (one of the oldest and most interesting in England), the bases of, and fragments in, many of the walls, chapter-house, refectory, and cloisters. In the civil wars much damage was done to the building, but none of its leading features were destroyed. It is now distinguished by the simplicity, if not plainness, of the exterior, but which is amply compensated by the fine perspective, the lofty roof, and generally charming effect of the interior. A thorough restoration was commenced in 1855 under the late sir G. G. Scott, and completed at a cost of about £100,000. The cathedral is 450 ft. long, 78 ft. wide at the nave, and 126 ft. wide at the w. transepts, and it is 67 ft. high. The central tower is 196 ft. high. The cathedral grammar school occupies the refectory, a fine hall dating from the 14th century and recently restored. The tombs of king John and of Arthur, prince of Wales (eldest son of Henry VII.), are the chief ancient monuments in the building. The episcopal palace in the city has been transformed into the deanery; and the bishop of Worcester, since the ecclesiastical commissioners assumed the management of the episcopal and capitular estates, has his residence at Hartlebury castle. There is also a city grammar school, founded by queen Elizabeth, and largely attended. The parish churches of the city, 11 in number, are poor specimens of architecture. The city does not shine in public buildings. Next to the cathedral, the most important are the shire-hall, the guild-hall (110 ft. long, with a number of statues of monarchs, and containing a brass cannon used at the battle of Worcester), and the county prison; but there are also the city library, the Worcester museum, a corn-exchange, and music-hall. The battle of Worcester, fought in 1651, is memorable in history. Its inhabitants were thoroughgoing royalists, and when Charles II. in 1651 entered the city with the Scottish army he was received with enthusiasm. Cromwell soon followed and took his stand on the Red Hill near the city gates. Lambert with a considerable force had advanced along the other side of the river, and Charles, seeing his enemy divided, made an attack on Cromwell's force, and was at first successful, but Lambert succeeded in throwing his division across the river to Cromwell's support. The result was a complete overthrow of Charles's army and he was obliged to resort to disguise in order to escape from the city. Charles II., to commemorate the fidelity of the citizens to his cause, granted the motto to the city arms: "Civitas in bello et in pace fidelis." Pop. of the city, '91, 42,905. The people are employed in glove-making, including leather-dressing and staining; in porcelain factories, iron-works, including locomotive-engine factories; tanning and currying, horse-hair weaving, vinegar, British wine and sauce-making, and coach-building. Chemical manures and agricultural implements are also manufactured on a considerable scale. Glove-making is still considered the staple manufacture of the city; but one large factory has absorbed a large portion of the business, and now

there are not above two dozen of master-glovers, great and little, whereas 40 years ago there were nearly 100 in the trade. There are royal porcelain factories, and the number of hands employed by them in all departments is about 600.

WORCESTER, a town and village in Otsego co., N. Y.; on a tributary of the Susquehanna river, and the Delaware and Hudson railroad; 63 miles w. of Albany. The principal industries are farming, dairying, milling, and hop-raising. Pop. '90, 2741.

WORCESTER, Edward Somerset, Marquis of, 1601–67; b. England; his father being the first marquis of the name. He was a royalist in the revolution, and for a long time defended Raglan Castle against the Puritans. He was the first to invent and make an engine worked by the power of steam. This was described in *An Exact and True Definition of the most Stupendous Water-Commanding Engine, invented by the Right Honorable (and deservedly to be praised and admired) Edward Somerset, Lord Marquis of Worcester*, and may also be found described in a life of Worcester published by Dircks in 1865.

WORCESTER, Joseph Emerson, ll.d., 1784–1865; b. N. H.; graduated at Yale college in 1811. While teaching school at Salem, Mass., he was engaged upon his *Geographical Dictionary*, or *Universal Gazetteer*, which appeared in 2 vols. 1817, and was followed the next year by *The Gazetteer of the United States*. In 1819 he took up his residence at Cambridge, Mass., where the rest of his life was spent, with the exception of a visit to Europe in 1830, which he employed in making researches and collecting materials for his studies in lexicography and philology. He edited the *American Almanac*, 1831–43; published an edition of Johnson's *Dictionary* in 1827; made an abridgment of Webster's *American Dictionary* in 1828, and published a *Comprehensive Pronouncing and Explanatory Dictionary* in 1830. His *Universal and Critical Dictionary of the English Language* appeared in 1846. His quarto *Dictionary of the English Language* was published in 1860. An edition, with additions, was published in 1881. Among his other works are an *Epitome of Geography* (1820), and *Pronouncing Spelling-Book* (1857).

WORCESTER, Noah, d.d., 1758–1837; b. N. H.; served three campaigns in the revolutionary war, being a fifer at Bunker's hill and a soldier at Bennington; resided at Thornton, N. H., and was sent to the legislature; published in 1787 a *Letter to the Rev. John Murray on the Origin of Evil;* pastor of the church in Thornton; employed by New Hampshire missionary society, 1802. He published, 1810, *Bible News, or Sacred Truths Relating to the Living God, His only Son, and Holy Spirit*, which was condemned as heretical by the Hopkinton association; edited *Christian Disciple*, Boston, 1813–18; published, 1814, *A Solemn Review of the Custom of War, by Philo Pacificus;* was one of the founders of the Massachusetts peace society, and its secretary, 1816; edited *Friend of Peace*, 1819–29. His other works are: *The Atoning Sacrifice a Display of Love, not of Wrath; Causes and Evils of Contentions among Christians; Last Thoughts on Important Subjects.*

WORCESTER, Samuel, d.d., 1770–1821; b. N. H.; brother of Noah Worcester; graduated, Dartmouth college, 1795; pastor Congregational church, Fitchburg, Mass., 1797–1802; of Tabernacle church, Salem, Mass., 1803 till his death. He was elected corresponding secretary of the American board of missions, 1810. He was prominent in the Unitarian conflict. He published *Six Sermons on the Doctrine of Eternal Judgment; Discourses on the Covenant with Abraham; Three Letters to Dr. Channing on Unitarianism; Watts's Entire and Select Hymns.* A posthumous volume of sermons was published.

WORCESTER, Samuel Melancthon, D.D., was a son of Rev. Samuel Worcester, and was born in Fitchburg, Mass., in 1801. He graduated at Harvard in 1822, and then spent one year in Andover Theological Seminary. He was tutor in Amherst College, 1823–25; professor of rhetoric and oratory, 1825–34; and pastor of the Tabernacle Congregational Church in Salem, 1834–60. He was for a time in the state senate and house of representatives. He wrote his father's life; *Essays on Slavery* (1826), etc. D. 1866.

WORCESTER, Thomas, 1795–1878; d. Waltham, Mass. He was the first pastor of the New Jerusalem church in Mass., holding a charge in Boston as early as 1818. He was for many years pres. of the convention of his church. By both his character and his abilities he commanded universal esteem.

WORCESTER COLLEGE, Oxford, was founded, like Trinity and St. John's, on the site of an old monastic college. The ancient institution was known by the name of Gloucester college, because it belonged to the Benedictine monks of that city. After the dissolution of th monasteries, it passed through various hands; and latterly was a hall attached to St. John's college. In 1701, however, sir Thomas Cookes left £10,000 for the purpose of endowing some existing college or hall. This bequest led to the erection of Gloucester Hall into a college, for a provost, six fellows, and six scholars, by letters-patent of queen Anne, 1714. Various fellowships and scholarships were afterward added, until the number of fellows became 21, of scholars 16, but almost all restricted to certain counties, or to founders' kin. The commissioners under 17 and 18 Vict. c. 81 reduced the number of fellowships to 15, open without restriction, except that candidates for a fellowship on the Eaton foundation must be sons of clergymen of the church of England and Ireland, and must not be possessed of property or income exceeding £150 a year. The scholarships are now 16 in number—six on the foundation of sir Thomas Cookes, for persons educated at Bromsgrove school; one on the founda-

tion of Dr. Finney, for natives of Staffordshire; five on the foundation of Mrs. Sarah Eaton, for sons of clergymen of the church of England; and three on the foundation of Dr. Clarke, and one on the foundation of Robert Barnes, esq., which are entirely open. Most of the scholarships are of the value of £75, tenable for five years. There are also six exhibitions—four on the foundation of sir Thomas Cookes, value £42 a year, for persons educated at Bromsgrove school. There are ten benefices in the gift of this college.

WORCESTERSHIRE, one of the west-midland counties of England. The conterminous counties are those of Warwick and Stafford on the n., Warwick and Oxford on the e., Gloucester on the s., and Hereford and Salop on the west. Area, 480,560 acres, whereof about 404,000 are cultivated. Its greatest length is 38 m., and greatest breadth, 26. The surface is undulating, and there are depressed valleys and hilly ranges; two of the latter are of considerable extent, and adorn its eastern and western sides. On the west, the range terminates in the Malvern hills, one of the highest points of which is the Worcestershire beacon, about 1444 feet above the level of the sea. Its name is derived from its shape, a cone towering beacon-like above the lesser eminences of the chain; but the highest peak of the range is named the Herefordshire beacon, which stands within the county of Hereford. The eastern range is the Bredon hills, which form part of a chain extending from Bromsgrove Lickey, near Birmingham, to the Cotswold hills, near Gloucester. The county is well watered, and finely timbered, especially with fruit-trees. The elm grows very luxuriantly, and indeed is so common in every corner as to have obtained the name of "the weed of Worcestershire." The oak, beech, and other timber trees thrive well, and of late the larch has been much planted. The principal rivers are the Severn, the Teme, and the Avon. Other streams there are, such as the Stour, the Salwarp, etc., but except in flood-times, these are mere brooks, and scarcely deserve the name of river. The Severn is navigable for vessels of 80 tons as high as Worcester, and for those of 60 tons to Stourport, 14 m. further; and smaller boats can reach Shrewsbury, the river being navigable for 180 miles. There are three canals communicating with the Severn—viz., the Staffordshire and Worcestershire at Stourport; the Droitwitch, a little way above Worcester; and the Birmingham and Worcester, in the immediate neighborhood of the city. The w. portion of the vale of Severn is about 30 m. long; the climate is mild and healthy; but the rainfall is comparatively small, and nearly the minimum of England. There are mineral springs at Malvern, Evesham, Dudley, and Kidderminster. Nearly the whole of the county is on the red sandstone formation, but the Malvern and Lickey hills are of igneous origin. The soil consists of almost every variety suitable for vegetation, from strong deep clay and rich vegetable mold, to light friable sandy ryeland, with tracts of alluvial deposit, marl, and loam. The vale of Evesham is dependent on the Avon for its fertility, which has long gained for it the reputation of being the garden of the mid-west. It produces abundance of table-fruit, and vegetables of the finest quality. The agriculture of Worcestershire has been greatly improved during the last thirty years, and high-farming is now much in vogue. Excellent crops of wheat and other grains, turnips, and potatoes are raised; a large portion of the land remains in the form of meadow, and much of it ancient pasture.

Hop-gardens are beautiful in the western division of the county, and their produce ranks, in the estimation of brewers, next to that of e. Kent. Worcestershire is *par excellence* a perry county, as Herefordshire and Devonshire are cider counties. Its pear orchards are very beautiful in the time of blossom; and there is a splendid variety, called the "black pear of Worcester," which attains a great size, and is supposed to be the traditional pear blazoned on the county's shield of arms.

There is no distinctive local breed of stock, either cattle or sheep. The cattle in most favor are Herefords and shorthorns; and among sheep, the favorite varieties are Shropshire downs, Leicesters, Cotswolds, and cross-breeds. Pigs are abundantly bred and fed. The markets are well supplied with butcher-meat, bred and fed in the county; and London, Birmingham, and the "black country" draw large supplies from Worcestershire. Poultry are raised in considerable quantity, and the Worcestershire farmers' wives have deservedly obtained a good name for the condition and neatness in which they are sent to market. The county possesses great mineral wealth in coal, iron, salt, lime: the first three are found in the north-eastern quarter of Worcestershire, but lime is very generally distributed. Coal and iron mines are largely worked in the neighborhood of the populous borough of Dudley. Iron-works abound between it and Stourbridge, where glass manufactures of an ornamental character, on a large scale, have taken root; and there are abundance of coal-mines in the neighborhood. Quarries of limestone are largely wrought near Evesham and Pershore.

The textile fabric manufactures are nearly confined to carpet-weaving, which has long been carried on successfully at Kidderminster; but the town has almost ceased to produce that description of goods known by its name, "brussels" and "tapestry" being principally manufactured. At and in the neighborhood of Worcester a considerable number of persons are engaged in glove-making. Worcestershire china, which has gained a world-wide reputation, is also produced upon a large scale in the capital city. At Redditch, the needle and fish-hook manufacture is carried on to a greater extent

than in any other place in England; nail-making has been practiced for centuries at Bromsgrove, and at Droitwich, about 6 m. from Worcester, salt has been manufactured for many centuries from an inexhaustible supply of brine. Pop. (1891), 413,755. The majority of the inhabitants are engaged in the mines and manufactories, and the remainder divided between agriculture and trade. The manufactures include hardware, nail-making, the manufacture of iron and steel, glass and porcelain, needles, fish-hooks, tools, fenders, fire-irons, shovels, screws, rivets, swords, cutlery, and steel toys. The county is in the Oxford circuit, and in the district of the Birmingham court of bankruptcy. The county sends three members for the boroughs of Evesham, Droitwich, and Bewdley and five others—making a total of eight members from Worcestershire. In the time of the Romans this country was all forest and jungle, but the English added it to Mercia in the 7th century and its growth began.

WORD, in time of peace, a signal notified in the orders of the day, in virtue of a knowledge of which a sentry will allow the utterer to pass. In the field the officer commanding fixes daily upon a word and countersign (for which any arbitrary terms are taken), and communicates them to the sentries on guard, and to such other persons only as he may choose to permit to pass through the lines. Any person then approaching a sentry without knowing the *word*, has a fair chance of being shot; if he knows not the countersign, the sentry will take him into custody, and deliver him to the officer of the guard. Care has to be taken that the "word" should not suggest the "countersign." Any arbitary combination is therefore adopted.

WORDE, Wynkin de. In returning to England about 1477 to introduce the art of printing, William Caxton (q.v.) brought with him Wynkin de Worde, a native of Lorraine, whose acquaintance he made at Cologne. De Worde superintended Caxton's printing-office till the latter's death, and afterward succeeded him. He made great improvements in the art of printing, and especially in that of type-cutting, which then formed a branch of the profession. He is said to have first introduced Roman letters into England, using them as we now use italics. In some of his books he even introduced a sprinkling of Greek, Hebrew, and Arabic, which were produced in wood-cut. He also made extensive use of engravings, which, however, appear to have been mostly obtained from the continent. The books printed by him are generally distinguished by their neatness and elegance, and far exceed in number those of his predecessor, being 408 distinct works against 99 by Caxton. De Worde died in London about 1534.

WORDEN, John Lorimer, b. N. Y., 1818; entered the navy as midshipman, 1835. In 1861 he was sent to fort Pickens with dispatches, and while returning was made prisoner and detained seven months. In 1862 he was given command of the experimental iron-clad *Monitor*, and on Mar. 9, fought the famous battle with the confederate ram *Merrimac*, in Hampton roads. His eyes were partly blinded by a shell striking the look-out hole of the pilot-box. In 1863, in command of the *Montauk*, he destroyed the privateer *Nashville*, and took part in Dupont's attack on Charleston. From 1869 to 1874 he was at the head of the U. S. naval academy at Annapolis. Retired, 1886. D. 1897.

WORDSWORTH, Charles, d.c.l., b. England, 1806; graduated with honors at Oxford, 1830; tutor at Cambridge, 1830–33, having William E. Gladstone and cardinal Manning among his pupils; second-master of Winchester college, 1835–46; first warden of Trinity college, Scotland, 1846–54, contributing largely to its establishment, and building the chapel at an expense to himself of $44,000; consecrated bishop of St. Andrews, 1853; has zealously endeavored to obtain "a united church for the United Kingdom;" is author of several theological works and of a popular Greek grammar, and is a member of the New Testament revision committee. He died 1892.

WORDSWORTH, Christopher, d.d., 1774–1846; b. Cumberland, Eng.; graduated at Cambridge and became a fellow of Trinity college, of which he was master 1820–41. He published *Ecclesiastical Biography* (1810); *Who Wrote Eikon Basilikè?* (1824); *Christian Institutes* (1837); and a volume of sermons.

WORDSWORTH, Christopher, d.d., b. England, 1807; son of Dr. Christopher, of Trinity college, Cambridge, and a nephew of the poet. He was educated at Winchester and Cambridge, took orders in the church of England, and was head-master of Harrow school, 1836–44, when he became a canon of Westminster. In 1868 he was consecrated bishop of Lincoln. Among his works are an edition of the Greek Testament; *The Memoirs of William Wordsworth; Greece; St. Hippolytus and the Church of Rome.* D. 1885.

WORDSWORTH, William, a distinguished English poet, was b. April 7, 1770, at Cockermouth, in Cumberland. He was the second son of John Wordsworth, attorney, and agent on the estates of the first earl of Lonsdale. He was sent to school at Penrith, where his parents had gone to reside; and after the death of his mother in 1778, was transferred to Hawkshead, in Lancashire, at the public school of which his earlier education was completed. In 1783 his father died, leaving his family in some difficulty. By lord Lonsdale a considerable sum was due to them; but his lordship, a man of most eccentric character, saw fit to resist the claim with all the vexatious impediments which the law so plentifully affords. Enough, however, remained, with some little assistance from relatives, to carry forward the education of the children. Wordsworth remained

at Hawkshead till 1787, in which year he was entered at St. John's college, Cambridge. Here he remained four years. In the studies proper to the place, his interest was slight; but in his own fashion he was a diligent student; and poetry became more and more his favorite pursuit. In Jan., 1791, he left Cambridge, after taking his degree as bachelor. During the autumn of the previous year, he had, along with a fellow-student, made a pedestrian tour through France, then in the early fervors of its great revolution; and thither, after leaving college, he returned. His sympathy with the aims of the revolution was passionate; and with the party of the Gironde he seemed to have cultivated relations of a somewhat intimate kind, which, in the end, might have seriously compromised him, had not circumstances, probably of the pecuniary sort, determined his return to England some little time before his friends were sent in a body to the scaffold. The republican principles which at this time he held, he lived to renounce in favor of a reasoned conservatism; and opposed as he was, in its earlier stages, to the war waged against France, no one more patriotically urged it, when the struggle became in effect a life and death grapple on the part of England with the military despotism of Napoleon.

In 1793 Wordsworth came before the public as an author, in two poems, entitled *An Evening Walk, addressed to a Young Lady;* and *Descriptive Sketches, taken during a Pedestrian Tour among the Alps.* These pieces abound in touches of refined and original observation of nature, but otherwise are not in themselves specially remarkable; and they failed to make any impression, except on a few minds, such as that of Coleridge, then at Cambridge, who afterward professed to have discerned in them the seeds of a great undeveloped genius. Wordsworth was now in a position of much perplexity; his little finances were almost entirely exhausted: for the church, which his friends would fain have had him enter, he had at this time an obstinate aversion; poetry had become with him a passion, to which he longed to wholly dedicate himself; and unhappily it appeared that *his* poetry would not in the least *pay.* As a poet cannot live like a singing-bird by pecking about the hedgerows, it became necessary for him to bethink himself of some means of support; and he was on the point of proceeding to London, to do liberal politics for the newspapers, when unexpected relief came to him in the shape of a legacy. The name of Raisley Calvert deserves to be remembered with that of Wordsworth. An intimate friend of the poet, he had formed a high opinion of his genius; and at his early death in 1795 he was found to have bequeathed to Wordsworth the sum of £900, expressly that leisure might for some years be allowed for the undisturbed development of his powers. Seldom has money been better bestowed; and small as the sum may seem, to a man of the poet's simple tastes and entire singleness of aim, it could suffice over a term of years. With his only sister, Dorothy, his attached companion through life, and always a devout believer in the brother, no little of whose genius she shared, he now settled himself at Racedown lodge, in Dorsetshire, removing in 1797 to Alfoxden, in Somersetshire, in order to be near Coleridge, who had established himself some 3 m. off at Nether-Stowey. Out of the intimacy thus begun came the famous *Lyrical Ballads,* published in 1798 by Cottle of Bristol, as a joint adventure of the two poets. The volume had no success; but probably no man ever lived more serenely self-appreciative than Wordsworth; and he did not allow himself to be disheartened by the neglect meantime of the world. After a short tour in Germany, along with his sister and friend, he returned to his native Cumberland, which he never again permanently left. He settled himself first at Grasmere; in 1808 he removed to Allan bank, in the vicinity; and in 1813 he transferred his household to Rydal mount, the place which, of all others, remains specially associated with his memory. On the death of the old lord Lonsdale, the justice of the claim of the Wordsworths against the estates was admitted; and in 1802 a sum of about £8,000 was by his successor made over to the family. To Wordsworth and his sister their moiety of the money may have been acceptable, as by this time, one should say, they must needs have been seeing pretty nigh to the end of Raisley Calvert's convenient £900. Henceforth a modest competence was secure to them; and Wordsworth was wedded within the year to Mary Hutchinson, a cousin of his own, with whom he had been intimate from his childhood. In 1813, by the kindness of lord Lonsdale, he was appointed distributor of stamps for the county of Westmoreland, a situation which brought him, without much to do for it, a salary of £500 a year. When, the year after, he published his great poem, *The Excursion,* he dedicated it to lord Lonsdale, in a sonnet, expressive of "high respect and gratitude sincere" for this comfortable increase to an income sufficient, perhaps, but certainly not excessive, for a man who had now a family growing up round him. Meantime, and pending the appearance of this elaborate work, the reputation of the poet had been surely, if slowly, rising. In 1800 he had published, in two volumes, a second edition of the *Lyrical Ballads,* disjoining his own from those of Coleridge, and adding a quantity of new matter; and in 1802 and 1805 further editions had been issued. To these succeeded, in 1807, a new collection, under the title of *Poems, in Two Volumes.* In these earlier writings there was a good deal which almost wilfully seemed to invite ridicule; and for a good while Wordsworth was merely the laughing-stock of reviewers, more particularly of Jeffrey, who, as editor of the great *Edinburgh,* at this time figured as chief Aristarchus of the day. The more to popularize the ridicule, a nickname was invented; and "the Lake School," as it was called, which, with Wordsworth, included Coleridge and Southey, who chanced to reside in the same district, passed current as an easy name of scorn. It could not be long concealed, how-

ever, that these volumes of Wordsworth, despite an occasional eccentricity in the choice of mean and impracticable subjects, contained a large body of true poetry of a singularly fresh and original kind. A select circle of passionate admirers, including men like Leigh Hunt, De Quincey, and Wilson, eagerly pressed the true claims of the poet; and after the publication of the *Excursion*, a volume of high and serious verse, gravely defective in plan, and at times heavy and tedious, but with little or no trace in it of the earlier oddities of the writer, it came more and more to be felt that the laughers were getting the worst of it, and that Wordsworth, however he might now and then indulge himself in whimsical tricks, was really a man of true and lofty genius, against whom ridicule could not permanently avail. Their occupation was not yet, indeed, quite done; and the subsequent appearance, in 1819, of *Peter Bell*, a poem not without profound merits, but unhappily with a donkey for the hero of it, allowed them to resume their advantage a little. But, on the whole, the day of idle jeer was over; the tide of genuine appreciation had set in, and it continued to flow steadily, till, long before his death, Wordsworth found himself recognized almost *nem. con.* as at the head of the poetical literature of his country. His later days were passed serenely in honor. In 1839 the university of Oxford conferred on him its honorary degree of D.C.L. In 1842 a pension of £300 per annum was assigned him by government; on receipt of which he ceded, in favor of his son, his situation as distributor of stamps; and on the death of his friend Southey, in 1843, he succeeded to the vacant laureateship. On April 23, 1850, he peacefully closed a life so pure, serene, and priest-like in its consecration to a lofty purpose, that we must go back to Milton in order to find its parallel. It remains only to enumerate the publications of Wordsworth not included above. In 1815 appeared *The White Doe of Rylstone*, which was followed by *The Waggoner*, and a series of *Sonnets on the River Duddon*. In 1822 he published a volume entitled *Memorials of a Tour on the Continent;* some years after, his *Ecclesiastical Sonnets;* and in 1835, *Yarrow Revisited, and Other Poems*, the fruit of a tour to Scotland, memorable by his mournful parting, at Abbotsford, with the dying Scott, which he records in a beautiful sonnet. In 1842 he issued a collected edition of his works, rearranged as we now have them, in a somewhat fanciful fashion of his own. Shortly after his death, a long autobiographical poem, in blank verse, was published, entitled *The Prelude*.

By remanding it to truth and simplicity of natural feeling as its basis, Wordsworth did more than perhaps any other writer of his time to forward the great revival of English poetry which distinguished the opening of the century. But he was scarcely the originator of the movement; the new influence was, so to speak, "in the air;" already Cowper in England, as in Scotland Burns, had preluded to the melodious outburst which was to follow; and to the last of these more particularly, as his early guide and exemplar, Wordsworth has expressly recorded his obligations in a stanza which, so far as we are aware, has hitherto escaped quotation:

> "I mourned with thousands, but as one
> More deeply grieved, for *he* was gone
> Whose light I hailed when first it shone,
> And showed my youth
> How verse may build a princely throne
> On humble truth."

With the charm of natural simplicity of manner, common to him with these his predecessors, Wordsworth, however, combined a depth of philosophic meditation peculiarly his own; there was born with him, moreover, a passionate susceptibility to effects of beauty in the material world, such as few men can ever have been gifted with; and out of these blended elements arose that mystical communion with nature which pervades the whole body of his poetry, and constitutes its truest claim to originality. By diffusion of this, and otherwise, his influence on our subsequent poetry has perhaps been as profound as any of the kind ever exercised, and it has been almost wholly beneficial. Yet we need not admire all we find in him. The early ridicule directed against him, though it sinned by excess and disproportion, was really to a great extent deserved. Had he gone on writing nothing but the "Betty Foys" and "Alice Fells" which Jeffrey laughed at, we should not have had in this place to do a biography of him. It is despite of a good deal of this kind of perverse drivel, besides indifferent matter otherwise, and not in the least because of it, that he continues, and must long continue, to be remembered.—See the memoir by his nephew, bishop Wordsworth; and criticisms by Coleridge, Shairp, Hutton, and others. Knight's complete edition of W. began to appear in 1882.

WORK. To do work is to overcome resistance. If we try to lift a ton-weight, however we may fatigue ourselves, we cannot move it, and therefore we do no work. But we can lift with ease a hundred-weight, and then we do more work in proportion as we raise it higher. In lifting coals from a pit, the work done is evidently in proportion to the depth of the pit, and to the weight of the coals raised. This and numberless other instances are too well known to need further description. We may therefore at once define the *work done by a force as the product of the force into the space through which it moves its point of application in its own direction*, and it is usually measured by engineers and others who do not require absolute accuracy, in *foot-pounds*, the work required to raise a pound one foot high. If the motion of the point of application be in the *opposite* direction to that of the force, the work is done against the force. If the motion be per-

pendicular to the direction of the force, no work is done by or against the force. Thus, the work spent in projecting a curling-stone, in opening a massive gate, or in turning a large fly-wheel or grind-stone, has nothing whatever to do with the force of gravity—the body moved, in all these cases, is, as a whole, neither raised nor lowered as regards its distance above the earth's surface. If the direction of the force be oblique to the direction in which the point of application moves, we must resolve the force, by the law of the parallelogram of forces (see Composition of Forces), into two components, one *in* the direction of motion, the other perpendicular to it. The former is the working component; the latter, as we have just seen, does no work. A good illustration of this is found in the case of raising stones from a quarry by carting them up a series of inclined planes, as contrasted with hauling them up vertically. The work done in either case is measured by the product of the weight of the stones, and the height through which they have been raised; and thus, for the same load of stones, it will be the same whichever process is adopted. This is evident from the property of the inclined plane—viz., that the force required to support a body resting on the plane (which is the force that has to be overcome when we haul it up the plane) is to the weight of the body as the *height* of the plane to its *length*. Hence, this force, multiplied into the length of the plane, gives the same product as the whole weight into the height of the plane; and these are the two quantities of work we are comparing.

When work is done upon a body, there is always an increase of velocity unless other forces act on the body, so that it does an equal amount of work against them. Thus, if we push a movable body, such as a cart, along a road, the velocity gradually increases, and would increase indefinitely were there no friction and no resistance of the air (forces against which work has to be done), and could we move fast enough to keep continually pushing it, however great its velocity may become. If, on the other hand, by means of a rope and pulley, we raise a stone, if once started, it will ascend uniformly, so long as we pull with a force just equal to its weight, because, then, as much work is done on the stone by the hand as it does against gravity. If we pull with a force greater than its weight, we do more work on the stone than it does against gravity, and the upward velocity increases; if with a force less than the weight, the stone has to do more work against gravity than is done on it by the rope, and its velocity upward becomes less. The measure of the excess of work done on a body over that which it does against resistance is *the increase of the product of half the mass into the square of the velocity*—i.e., of what was formerly called the *vis-viva* of the body, what is now called its *actual*, or preferably, its *kinetic energy*. See Force. Hence, as it is evident that if a body, or system, be acted on by a set of forces which are in equilibrium, it will have no tendency to lose or to acquire velocity, its kinetic energy will remain unchanged, and therefore *as much work must be done upon it by some of the applied forces, as it does against the rest, in any displacement so slight as not to change the circumstances of the particular arrangement.* That is, when forces are in equilibrium on a body, if the body be slightly displaced, the sum of the products of each force by the effective component of the displacement of its point of application is zero—the product being positive when the force does work, negative when work is done against it. This is the celebrated principle of *virtual velocities*, the term virtual velocity having been, very inconveniently, applied to what we have called above the effective component of the displacement of the point of application of a force. It was often employed as the basis of the whole of statics, and very curious attempts have been made to give proofs of it (independent of the laws of composition of forces), especially by Lagrange. But the principle of work, or energy, of which that of virtual velocities is a mere particular case, and which is at once applicable to the whole range of dynamical science, is distinctly enunciated by Newton in a scholium to his third law of motion. See Motion, Laws of. His words are memorable, and should be universally known—*Si æstimetur agentis actio ex ejus vi et velocitate conjunctim; et similiter resistentis reactio æstimetur conjunctim ex ejus partium singularum velocitatibus et viribus resistendi ab earum attritione, cohæsione, pondere, et acceleratione oriundis; erunt actio et reactio, in omni instrumentorum usu, sibi invicem semper æquales.* Newton has defined what he means by the velocity of an agent—viz., the component of the velocity of its point of application which is in the direction of the agent. He has also shown what is the measure of resistance arising from acceleration (see Velocity); so that, merely using modern terms instead of those employed by Newton, but in nowise altering the scope of the above remarkable passage, we have the following version of it: *Work done upon any system of bodies* (literally, *the parts of any machine*) *has its equivalent in work done against friction, molecular forces, or gravity, if there be no acceleration; but if there be acceleration, part of the work is expended in overcoming the resistance to acceleration, and the additional kinetic energy developed is equivalent to the work so spent.*

When work is expended in overcoming the resistance to acceleration, i.e., the *inertia* of a body, we have its equivalent in additional kinetic energy. When it is expended against gravity, as in raising a weight or bending a spring, we have it stored up in a dormant form as *potential energy*. See Force. When it is expended in overcoming friction, there appears at first sight to be no equivalent—but the comparatively recent researches of Joule and others have satisfactorily accounted for its disappearance, by proving its quantitative transformation usually into heat, sometimes into other forms of molecular energy. But to pursue this point would lead us again to questions already

treated at some length in the article FORCE. There is one remark, however, which it is important to make. In compressing a gas, in the receiver of an air-gun for instance, we can never recover as useful effect all the work expended. The reason is that a gas is *heated* by compression, so that part of the work spent is converted into this heat, conducted through the metal, and by the principle of *dissipation of energy* lost, at least in part, to man. Had we a gas which could not be heated by compression (take the imperfect analogy of a space filled with fine spiral springs), we should recover, by allowing it to expand, all the work expended in the compression.

One other remark remains to be made. It will be noticed that Newton speaks of the action of an agent as the product of the agent and the component *velocity* of its point of application. This is what we now call *rate of doing work*, or *horse-power*. Watt estimated a horse-power at 33,000 foot-pounds per minute, or 550 foot-pounds per second. This is probably too high; but it is constantly employed in engineering calculations. A curious quantity, sometimes employed as regards steam-engines, especially those employed for pumping mines, is the *duty*, which is measured by the number of foot-pounds of work done by a hundred-weight of coals supplied to the furnace. A similar mode of comparison is now applied to steam-engines for agricultural purposes, etc.

The quantity of work which can be got out of any machine, human, animal, or other, depends in many cases on the rate at which it is done, or the horse-power actually exerted. An average man can easily work at the rate of a horse-power for a few minutes at a time; but if he were to work at no other rate, he would do very little work in a day. Various singular investigations have been made, both theoretically and experimentally, as to the most profitable rate of doing work, and their results are highly interesting. But to discuss them properly would require more space than we can afford.

DESCRIPTION OF WORK.	Weight raised.	Velocity per Second.	Unit of Work per Second.	Length of Working Day.	Total Work in a Day.
	Lbs.	Feet.	Lbs. × ft.	Hours.	Lbs. × feet.
A man mounting an easy staircase, or an incline, without a load, his work consisting simply in moving the weight of his own body	143	0.5	71.5	8	2,059,200
A man raising weights by means of a cord and pulley, which renders necessary the return of the cord without a load	39.6	0.66 (say 0.67)	26.53	6	573,048
A man raising weights by his hands	44	0.56	24.64	6	532,224
A man carrying a weight on his back up an easy incline, and returning without a load	143	0.13	18.59	6	401,544
A man raising materials by a wheel-barrow, on an incline of 1 in 12, returning unloaded	132	0.065	8.58	10	308,880
A man throwing earth by a spade a height of 5 ft. 4 in	5.94	0.66 (say 0.67)	3.98	10	143,280
A man working a pin-wheel or a drum—					
1st, at the level of the axle	132	0.5	66	8	1,900,800
2d, at bottom of wheel	26⅔	2.34	61.8	8	1,779,840
A man walking and pushing, or drawing horizontally, in a continuous manner	26.4	2	52.8	8	1,520,640
A workman acting upon a winch	17.6	2.5	44	8	1,267,200
A workman pushing and pulling alternately in a vertical direction	13.2	2.5	29	10	1,044,000
A horse harnessed to a carriage going at a walking pace	154	3	462	10	16,632,000
A horse harnessed to a carriage going at a trot	96.8	7.22	699	4.5	11,323,800
A horse in a mill, at a walking pace	99.0	3	297	8	8,553,600
" at a trot	66.0	6.56	433	4.5	7,014,600
An ox in a mill, at a walking pace	132	2	264	8	7,603,200
Mule " "	66	3	198	8	5,702,400
Donkey " "	30.8	2.67	82.24	8	2,368,512

The above table, due to Poncelet, gives at least approximate notions of the horse power employed, and the whole work done, in a working day, by men and animals variously applying their exertions.

WORK, HENRY C., 1832–84; b. Middletown, Conn.; d. Hartford. When young he worked as a printer. During the civil war he wrote some songs which proved very popular; among them, *Marching through Georgia*, *Wake, Nicodemus*, and *Babylon is Fallen*. These brought him large profits which he subsequently lost. He wrote over 60 songs, and originated the music for nearly all of them. Among the most popular were *Grandfather's Clock*, *Kingdom Coming*, and *Come Home, Father*.

WORK'HOUSE, the name given to municipal institutions, in England, in which paupers are supported and maintained. The earliest mention of them is to be found in stat. 13 and 14 Car. II. c. 12, authorizing workhouses to be erected in the cities of London and Westminster, to which rogues and vagabonds might be committed, by any two members of the "workhouse corporation," a board created by the act, with the view of restraining them from predatory habits, and compelling them to work for their living. The provisions of this act were, for the first time, carried into effect in the reign of William and Mary. See PAUPERISM; POOR LAWS.

WORKING-DRAWINGS are the large plans prepared by engineers and architects to guide the workmen in executing the design. Many of these are on a large scale, all moldings and ornamental work having to be drawn out of the actual size of the work.

WORK'SOP (anciently *Wirkensop*), a t. of Nottinghamshire, England, 16 m. s.e. from Sheffield, on the right bank of the Ryton, a branch of the Idle, and near the Chesterfield canal, which communicates with the Trent. It is situated near the northern extremity of Sherwood forest. The town is generally well built, and great sanitary improvements of drainage and sewerage have recently been effected. There is a fine old church in the Norman style, with two lofty towers. Worksop was formerly noted for its Augustine monastery, of which there are now few remains. Much barley is grown in the neighborhood, and malting is carried on to a great extent. There is some trade in flour, timber, etc. Worksop is a station on the Manchester, Sheffield, and Lincolnshire railway. Pop. '81, 11,625; '91, 12,734.

WORLD'S COLUMBIAN EXPOSITION. The official title of the great Exposition held at Chicago in 1893 to commemorate the discovery of the western hemisphere by Christopher Columbus.

INCEPTION.—The first formal steps toward the organization of such a celebration were taken in 1885, when the directors of the Interstate Exposition at Chicago passed resolutions looking to this end (November 18th). In July, 1886, Senator Hoar of Massachusetts introduced into the United States Senate a bill providing for a Columbian Exposition to be held at Washington in 1892. Many other plans and projects now began to find supporters in various parts of the country, but they all crystallized into the first bill offered in Congress by Senator Cullom of Illinois in December, 1889. An exciting contest at once began among the various cities of the country for the honor of securing the Exposition, but it soon narrowed down to a struggle between Chicago and New York, and on February 24th, 1890, Chicago was definitely selected. In order to win this distinction, that city was required to furnish an acceptable site, and to pledge the enormous sum of $10,000,000.

On July 2d, 1890, the Directors and the National Commission selected and approved a site whose beauty and extent are as yet unmatched in the history of international exhibitions. It was then part of the South Park system of Chicago known as Jackson Park and the Midway Plaisance, comprising nearly 700 acres fronting on Lake Michigan for a mile and a half, semicircled by trees and shrubbery, and offering possibilities which the taste and ability of the management developed to the full. The Midway Plaisance is a strip which forms a connecting link between Jackson and Washington Parks. It is one mile long and 600 feet wide, thus giving an additional area of 72 acres.

ORGANIZATION.—The management of the World's Columbian Exposition may be described as having been vested in four organizations: The National Commission, authorized by Congress; the World's Columbian Exposition, organized under the laws of the State of Illinois; the Board of Lady Managers, authorized by Congress; and the World's Congress Auxiliary. The National Commission was composed of eight commissioners-at-large with alternates; two commissioners from each State, Territory, and the District of Columbia—one Democrat and one Republican—appointed by the President on the nomination of their respective governors. This Commission, when not in actual session, delegated its authority to eight of its members, who, with a like number selected from the World's Columbian Exposition, constituted a Board of Reference and Control. The officers of the Commission were: President, Thomas W. Palmer; vice-presidents, Thomas M. Waller, M. H. de Young, D. D. Penn, G. W. Allen, and Alexander B. Andrews; secretary, John T. Dickinson. The World's Columbian Exposition was a company of about 30,000 stockholders organized under a charter from the State of Illinois. The stockholders elected annually a Board of Directors of forty-five, citizens of Chicago. On this body fell the burden of raising the necessary money and of the active management. Its first president was Lyman T. Gage. During the progress of the Fair its officers were: President, Harlow N. Higinbotham; vice-presidents, F. W. Peck, R. A. Waller; secretary, H. O. Edmonds; solicitor, Edwin Walker.

The Board of Lady Managers was composed of two members with alternates from each State and Territory, and of nine from the city of Chicago. It had the supervision of the participation by women in the Exposition and of all the exhibits made by women. Its officers were: President, Bertha Honoré Palmer (Mrs. Potter Palmer); secretary, Susan Gale Cooke.

The World's Congress Auxiliary was organized for the purpose of holding a series of congresses to supplement the exposition that was made of the material progress of the world by a portrayal of the achievements in science, literature, education, government, jurisprudence, morals, charity, art, religion, and other branches of mental activity. The Hon. C. C. Bonney, of Chicago was president of the Congress Auxiliary, aided by the Hon. Thomas B. Bryan.

George R. Davis, of Chicago, was Director-General of the entire Exposition, and therefore its chief executive officer.

The most important bureau in connection with the World's Columbian Exposition was undoubtedly the Bureau of Construction. Of this Bureau D. H. Burnham was chief; Edward C. Shankland chief engineer; and F. L. Olmsted landscape architect.

The heads of the various departments of the Exposition were as follows:

Agriculture: W. I. Buchanan; *Horticulture:* John M. Samuels; *Live-stock:* W. I. Buchanan; *Fish and Fisheries:* John W. Collins; *Mines and Mining:* F. J. v. Skiff; *Machinery:* L. W. Robinson; *Transportation:* Willard A. Smith; *Manufactures:* James Allison; *Electricity:* John P. Barrett; *Fine Arts:* Halsey C. Ives; *Liberal Arts:* Selim H. Peabody; *Ethnology:* F. W. Putnam; *Forestry:* W. I. Buchanan; *Publicity and Promotion:* Moses P. Handy; *Foreign Affairs:* Walker Fearn.

CONSTRUCTION.—Some idea of the magnitude of the Exposition may be gained from the following statement of some items of the cost of construction and operation, exclusive of the buildings:

Object.	Cost.
Dredging, Filling, and Excavating	$615,254
Landscape Gardening	492,962
Viaducts and Bridges	120,998
Fountains	140,080
Piers and Breakwaters	326,394
Waterway Improvements	279,255
Railways	659,329
Steam Plant	858,436
Electric Plant	1,233,687
Seats for Grounds	14,868
Water Supply and Sewerage	1,001,316
World's Congress Auxiliary	76,005
Police Protection	1,334,373
Fire Protection	263,095
Janitor Service	212,455
Pyrotechnical Displays	103,141
Music	387,371
Total	$8,792,122

The following sums were expended in the construction of the principal buildings belonging to the Exposition proper:

STATEMENT OF DIMENSIONS, AREAS AND COST OF THE BUILDINGS AT THE WORLD'S COLUMBIAN EXPOSITION, 1893.

BUILDINGS.	Dimensions in Feet.	Area in Acres.	Approximate Cost.
Administration	256 x 256	1.274	$476,529
Agricultural	500 x 800	18.457	699,316
Agricultural Annex	312 x 550		
Art Gallery	320 x 500	6.625	758,781
Art Gallery Annexes—two—each	222 x 136		
Electricity	345 x 671	10.075	447,762
Fisheries	165 x 365	2.672	235,008
Fisheries Annexes—two—diameter	135		
Horticultural	251 x 998	5.491	311,611
Manufactures and Liberal Arts	1687 x 787	44.674	1,817,361
Machinery	492 x 842	19.131	1,282,416
Machinery Annex	492 x 500		
Machinery, Boiler House, and Tool House	1216 x 85		
Mines and Mining	364 x 714	8.346	292,947
Transportation	256 x 960	17.961	554,770
Transportation Annex	801 x 455		
Woman's	199 x 398	4.08	138,623
Anthropology	255 x 415	4.106	87,612
Forestry	208 x 528	2.529	83,289
Shoe and Leather	150 x 574	3.281	93,243
Dairy	95 x 200	.783	27,055
Casino and Music Hall—each	256 x 139	3.375	318,013
Peristyle			
Colonnade and Obelisk			101,495
Terminal Station	163 x 458	5.765	290,031
Perron	85 x 672		
Railway Sheds		2.4	
La Rabida, Children's Service, Choral, Public Comfort, Colonnade,		5.501	223,186
Stock Pavilion	280 x 440	2.43	67,475
Dairy and Stock Barns		10.81	142,951
Miscellaneous			1,396,192
United States Government Building	351 x 421	4.00	400,000
Imitation Battleship	69 x 348	.60	100,000
Total		184.366	10,345,666

The selection of Jackson Park as the site of the Exposition was due to the distinguished landscape gardener, Mr. Frederick Law Olmsted, and his former partner, Mr. Henry Sargent Codman. The choice which they made at first excited surprise. Jackson Park in July, 1890, was a dreary stretch of bog, partly covered by tangled undergrowth and scrub-oak, and noticeable only for its unrelieved ugliness. Its possibilities, however, were plainly evident to the trained eyes of the Commission, and, above all, its proximity to the lake. In the spring of 1891 an army of laborers began the operations that in a few months utterly transformed the appearance of the place. Bogs were drained, the undergrowth and trees removed, canals, lagoons, and basins were cut, long slopes of greensward laid out, and flowers and shrubs lavishly planted. The water of the lake was brought in to touch the site of every one of the great buildings for whose foundations all was ready by June of the same year.

These structures, as originally planned, were ten in number: the buildings for Manufactures and Liberal Arts, Administration, Machinery, Agriculture, Electricity, Mines, Transportation, Horticulture, Fisheries, and the Venetian Village. At this time it was the purpose of the Exposition to establish the exhibit of fine arts upon the Lake Front Park. This plan being subsequently abandoned, the Art Galleries and the Woman's Building were the first of the later structures to find a place upon the plan. As the importance of the work gradually developed, necessity for additional space became clear, and the ten original buildings quickly secured neighbors in the Forestry, Dairy, Stock Pavilion, Terminal Station, Music Hall, Peristyle, Casino, Choral, Anthropological, and so on throughout a list of great and small, until there were nearly three hundred separate and distinct structures under roof in Jackson Park, not including the scores of minor pavilions and shelters of a less important character, built by concessionaires, exhibitors, and others. When those of the Midway Plaisance were added, the total was increased to about four hundred.

The designs were not secured by competition, many reasons existing against the adoption of such a method, the time being short and the work great. Direct selection was, therefore, the method adopted, and the buildings were allotted by the Chief of Construction as follows: Administration, Richard M. Hunt, of New York; Transportation, Adler and Sullivan, of Chicago; Manufactures and Liberal Arts, George B. Post, of New York; Mines, S. S. Beman, of Chicago; Agriculture, McKim, Meade and White, of New York; Venetian Village, Burling and Whitehouse, of Chicago; Machinery, Peabody and Stearns, of Boston; Horticulture, W. L. B. Jenney, of Chicago; Electricity, Van Brunt and Howe, of Kansas City; Fisheries, Henry Ives Cobb, of Chicago. Late in the spring of 1891, after the other buildings were designed and nearly ready for construction, Mr. Charles B. Atwood entered upon his labors with the Exposition, and to him are due the beautiful Art Building; the Peristyle, Music Hall, and Casino; the imposing Terminal Station; the Forestry, Dairy, and other buildings, in addition to his important work as Designer-in-Chief. The Stock Pavilion was planned by Messrs. Holabird and Roche, of Chicago. In unrestricted competition the plan of Miss Sophia G. Hayden was selected for the Woman's Building. The Venetian Village at the end of the great pier being abandoned, Mr. Whitehouse's services were retained for the Choral Building.

A very ingenious choice of building material was made in the selection of a species of plaster called "staff" of a brown color, but when painted white possessing a perfect resemblance to marble. It was, therefore, not only beautiful in its effect, but also inexpensive and easy to work in, so that it was finally utilized not only for the buildings, but for balustrades, basins, ornamental work, and even for statuary—the effect being startling in its pure color, whose predominance gave to the Exposition when finally completed its popular name "the White City."

The buildings of the Fair were designed to fall under three general groups. Those about the Grand Basin—the Administration, Manufactures, Agriculture, Machinery, Electricity, Mines and Art Building—were essentially dignified in style: those lying farther to the north—the Horticultural, Transportation, and Fisheries—being less formal, blended readily with the more or less homelike buildings of the States and foreign governments, which were grouped among the trees of the extreme northern portion of the grounds. Upon the Midway Plaisance no distinct order was followed, it being instead a collection of almost every type of architecture known to man, all combining to form the lighter and more fantastic side of the Exposition.

The chief buildings will be described more in detail in another part of this article.

Publicity.—Among the first and most important Departments of the Exposition to be organized was that of Publicity and Promotion, whose duty it was to make the project known to the people of every civilized nation in the world. The enormous task devolving upon the Department, whose head was Major Moses P. Handy, was begun in December, 1890. Mr. Robert E. A. Dorr, the Assistant Chief of the Department, has given an interesting description of the system adopted, from which the following paragraphs are taken:

"Circulars were sent to every diplomatic and consular representative of the United States telling briefly of the Exposition and its national character; soliciting friendly aid in disseminating information; announcing that the minister or consul would receive a weekly budget from the Fair; and requesting that a list of desirable people to interest in his district be sent at once to the Department.

"A list of nearly five thousand newspapers published in foreign lands was made out, wrappers and envelopes addressed, and a weekly news-letter suited to the character of the publication and in the language of the country was dispatched.

"The American diplomats and consuls responded promptly, and in less than two months a foreign mail-list of individuals, government officials, merchants, bankers, manufacturers, and business firms, aggregating 10,000 names, was duly registered, classified, and indexed in the books of the department, and the weekly news-budget soon became an embarrassing factor in the already overcrowded and overworked Chicago post office.

"While this was being done the home field was not neglected. Circulars were sent to every representative newspaper in the United States and Canada (about thirty thousand) telling that a weekly news-letter would issue from the Department, and that such publications as would write asking for it would be supplied without charge. The names and home addresses of the members of thirty-five State legislatures were secured; of all other State and Territorial officials; of the Senate and House of Representatives of the United States; and of prominent men and women in nearly every pursuit of life. The result was a domestic mail-list containing about fifty thousand names."

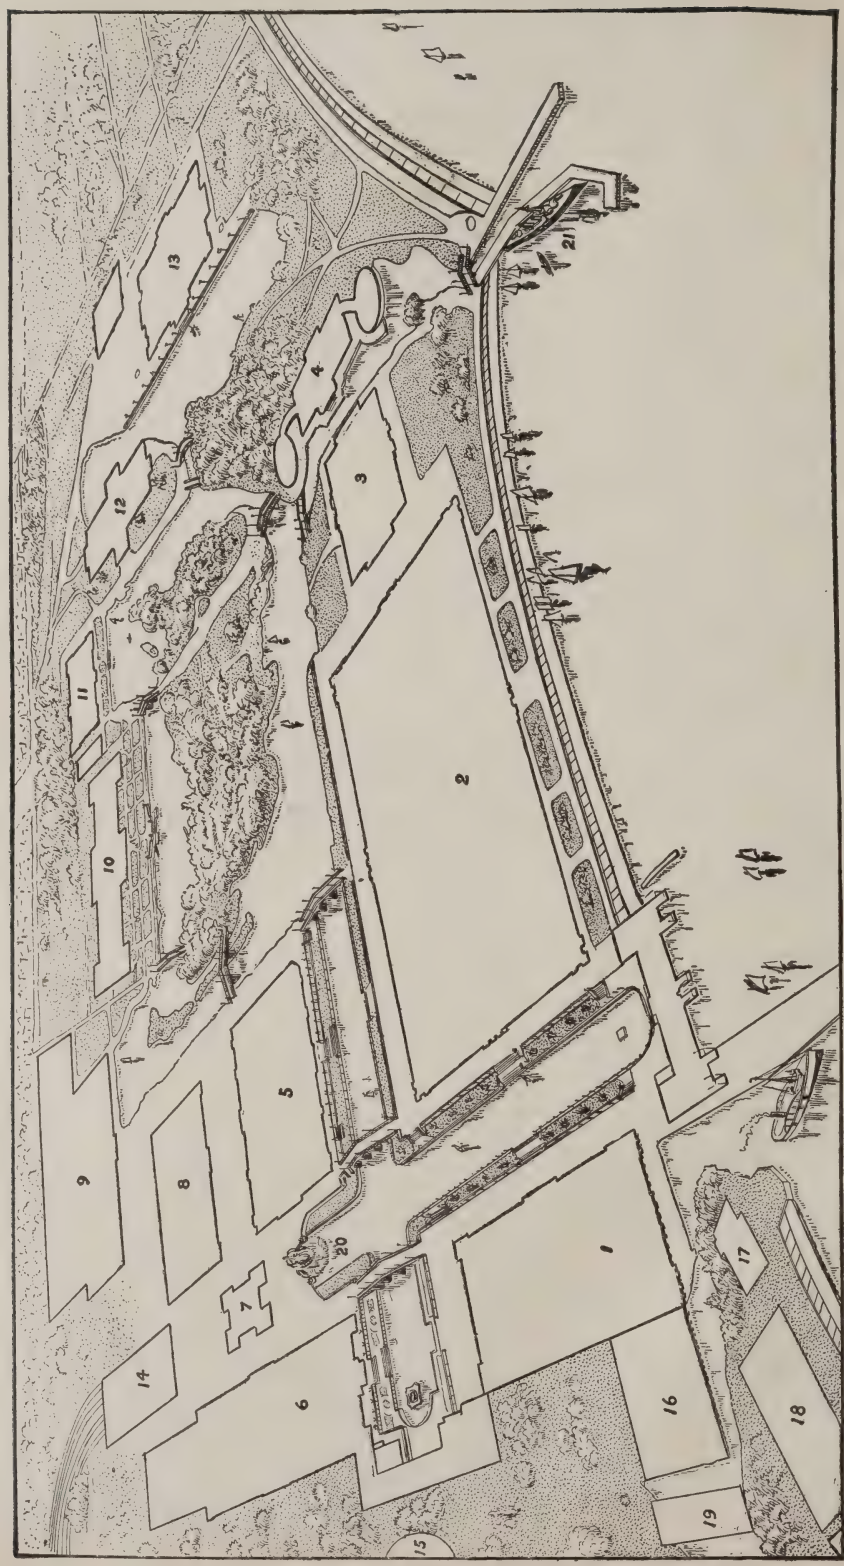
Circulars and documents in fifteen languages were sent out by the Bureau. Every week a budget of paragraphs was mailed to the 60,000 names, domestic and foreign, on the mailing list, at an expense of $600 per week. A very important method of advertising the Fair was in the colored pictures showing the grounds and buildings and lithographed from a design furnished in water-colors by Mr. Charles Graham. These pictures were printed in nineteen colors and tints, and were the finest specimens of the lithographer's art ever produced in this country. One hundred thousand copies, costing $20,000, were mailed to all parts of the world, at an expense for postage of more than $6000.

Participation.—The work of the Department of Publicity and Promotion, aided by the services of the ministers and consuls of the United States, was so effectively done, that a fuller representation of foreign countries was secured for the Columbian Exposition than any previous World's Fair had ever witnessed. The following list shows the nations and colonies that took part, and the sums appropriated by their governments for the purposes of their representation, the sums being reduced to American money:

Argentine Republic	$100,000
Austria	110,000
Belgium	57,000
Bolivia	30,000
Brazil	600,000
Colombia	50,000
Costa Rica	150,000
Denmark	67,000
Danish West Indies	1,200
Ecuador	125,000
France	733,000
Germany	800,000
Great Britain	291,000
British Guiana	25,000
British Honduras	7,500
Canada	450,000
Cape Colony	50,000
Ceylon	125,000
Jamaica	24,333
New South Wales	150,000
New Zealand	27,500
Trinidad	15,000
Greece	60,000
Guatemala	200,000
Hawaii	40,000
Haiti	25,000
Japan	630,000
Liberia	7,000
Mexico	50,000
Netherlands	100,000
Dutch Guiana	10,000
Dutch West Indies	5,000
Norway	56,280
Orange Free State	7,500
Paraguay	100,000
Persia	12,000
Russia	46,320
Spain	200,000

The States of the Union responded generously to the invitation sent them. The subjoined list shows the amounts appropriated by them for the purpose.

Alabama	$38,000
Arizona	30,000
Arkansas	55,000
California	550,000
Colorado	167,000
Connecticut	75,000
Delaware	20,000
Florida	50,000
Georgia	100,000
Idaho	100,000
Illinois	800,000
Indiana	135,000
Iowa	130,000
Kansas	165,000
Kentucky	175,000
Louisiana	36,000
Maine	57,000
Maryland	60,000
Massachusetts	175,000
Michigan	275,000
Minnesota	150,000
Mississippi	25,000
Missouri	150,000
Montana	100,000
Nebraska	85,000
Nevada	10,000
New Hampshire	25,000
New Jersey	130,000
New Mexico	35,000
New York	600,000
North Carolina	45,000
North Dakota	70,000
Ohio	200,000



World's Columbian Exposition. General Plan.

Cuba	$25,000
Sweden	108,000
Switzerland	36,000
Uruguay	24,000

It is estimated that various foreign governments spent, in addition to these amounts, the sum of $2,000,000 in behalf of their exhibitors.

Oklahoma	$17,500
Oregon	60,000
Pennsylvania	360,000
Rhode Island	57,500
South Carolina	50,000
South Dakota	85,000
Tennessee	25,000
Texas	40,000
Utah	50,600
Vermont	39,750
Virginia	75,000
Washington	100,000
West Virginia	40,000
Wisconsin	212,000
Wyoming	30,000
Total	$6,060,350

KEY TO PLAN ON OPPOSITE PAGE.

1. Agricultural Building.
2. Manufactures and Liberal Arts Building.
3. United States Government Building.
4. Fisheries Building and Deep Sea Aquaria.
5. Electrical Building.
6. Machinery Hall, Annex, etc.
7. Administration Building.
8. Hall of Mines and Mining.
9. Transportation Exhibit.
10. Horticultural Hall and Greenhouses.
11. Woman's Building.
12. Illinois State Building.
13. Galleries of Fine Arts.
14. Railway Approach.
15. Part of 63 Acres Reserved for Live Stock.
16. Assembly Hall and Annex to Agricultural Building.
17. Convent La Rabida.
18. Forestry Building.
19. Dairy Building.
20. Fountain.
21. United States Naval Exhibit.

Principal Buildings.—(1) *The Administration Building*, the most conspicuous structure of the Exposition, was designed by Mr. Richard M. Hunt, of New York. Its principal body was octagonal in shape, surmounted by a great dome enclosing an inner one. The octagon was pierced at right angles by four spacious entrances opening into a magnificent reception hall. At the four corners were the pavilions containing the offices of the various administrative departments. The rotunda in the heart of the building was arched over by the inner dome with a finely panelled and decorated ceiling. At the centre was an opening through which could be seen the frescoes of the greater dome, whose skylight at the very apex flooded the whole rotunda with light. The dome was circled on its interior by a gallery 100 feet above the floor, and this gallery gave access to a colonnade surrounding the whole dome without, from which a charming panorama of lakes, fountains, terraces, and countless other domes and minarets were visible beneath the eye. The exterior of the building was highly ornate, the cornices of the pavilions and the piers of the loggia story being lavishly supplied with splendid groups of statuary designed by Karl Bitter. The fresco paintings were the work of Mr. William Leftwich Dodge.

(2) *Transportation Building.*—This very striking building, the only one with polychromatic decoration, was designed by Messrs. Adler and Sullivan, of Chicago. It was in the form of three long halls or sheds, measuring in all 256 by 960 feet and having a floor area of more than nine acres. An annex measured 425 by 900 feet, with nine and a quarter acres of floor area. A cupola, somewhat too small in proportion to the size of the building, rose above it. The architecture was suggestive of the Romanesque, though simple, the most striking feature of the whole building being the main entrance, known as "the Golden Doorway." This was formed by an immense single arch treated wholly in gold-leaf and enriched by carvings, reliefs, and mural paintings. Minor entrances also pierced the walls, and with them were grouped statuary, drinking fountains, and terraces. The interior of the building was modelled somewhat after a Roman basilica, with a broad nave and narrower aisles. The exhibits collected here included everything that could possibly be devoted to the purpose of transportation, from railway-engines, ocean-steamers, and balloons, to cash-conveyers. The statuary of the building, including figures of great inventors, such as Watt, Stephenson, Montgolfier, etc., was the work of Mr. John J. Boyle, of Philadelphia.

(3) *The Mines and Mining Building* was designed by Mr. S. S. Beman, of Chicago. It was 714 feet long and 350 feet wide, and represented a type of the early Italian Renais-

sance modified by French treatment, simple and regular. Its principal fronts had enormous arches overhanging the entrances, and these were richly decorated with sculptural groups and other embellishments symbolical of mining and its kindred industries. The building overlooked the Great Central Court on the south, and the western and middle lakes on the north. In it were displayed 209 classes of exhibits, comprising all kinds of metals, apparatus for mining, illustrations of metallurgical processes, assaying apparatus, and the history and literature of mining and metallurgy.

(4) *Machinery Hall* was designed by Messrs. Peabody and Stearns, of Boston. It represented a blending of the best types of the Spanish Renaissance, and was unsurpassed by any building in the Exposition in its graceful and harmonious proportions. At the first story a covered loggia furnished a promenade which encircled the whole building. This was coated with staff and stained a delicate ivory tint contrasting beautifully with the colors and gold-finish of much of the exterior. The building was ornamented by a number of striking groups of statuary of heroic size by Mr. M. A. Waagen, representing among other subjects "Science," and the four elements, "Earth," "Air," "Fire," and "Water," besides "Columbia," "Honor," and "Wealth." In Machinery Hall were placed 86 classes of exhibits, including specimens of every form of mechanical invention. Most striking among them were the huge Allis engine of 2000 horse-power running two dynamos, each lighting 10,000 incandescent lights; the remarkable printing exhibit; and the immense travelling crane which moved the enormous masses of machinery. Machinery Hall contained seventeen acres of floor area.

(5) *The Agricultural Building* was an attractive structure 800 feet long and 500 feet wide, with a floor area of nearly nineteen acres. It stood near the shore of the lake and was in the shape of the letter T, having only a single story. The architects were Messrs. McKim, Meade and White, of New York. Mr. Philip Martiny, of Philadelphia, designed most of the sculptured groups; Mr. Larkin G. Mead, of Florence, Italy, the Ceres-pediment over the main entrance; Mr. George W. Maynard, of New York, superintended the painted decorations, which were in the Pompeian style. The decoration was in one respect quite unique in choosing subjects so purely American as maize, the potato, the tobacco-plant, and especially the wild turkey which was shown on the cornices about the dome.

(6) *The Electricity Building* was designed by Messrs. Van Brunt and Howe, of Kansas City. Its dimensions were nearly the same as those of the Mining Building, to which it lay parallel. It was a finely delicate structure, with ten towers (*campanile*) and four domes. Its façades were composed of Corinthian pilasters. The main entrance on the south was conceived as a solid pylon pierced by a triumphal arch 92 feet in height and 58 feet wide, framing a great semicircular niche in which stood a colossal statue of Benjamin Franklin. The exterior of the building, besides purely conventional decorations, exhibited devices indicative of its purpose, such as electro-magnets, lamps, etc. The statuary was the work of the Danish sculptor, Carl Rohl-Smith. The electrical display was one of the most attractive features of the whole Exposition. At evening especially the illumination of the buildings, the fountains, and the lagoons by thousands of brilliant lights which gleamed and glistened and threw rainbows of color over the pure white of the domes and towers, proved a never-ending source of wonder and delight.

(7) *The Art Building* was designed by Mr. C. B. Atwood, of Chicago. It was a beautiful specimen of Ionic architecture, measuring 500 by 320 feet, with an intersecting nave and transept crossing the building, and a pedestal at the point of intersection. This pedestal, which for a while displayed a colossal statue of the Winged Victory, was subsequently removed as too heavy. The building had four noble entrances richly decorated with sculptures, and each approached by a broad sweep of steps. Along the several façades ran colonnades. The effect of the whole structure, with its graceful pillars, porches, and picturesque gables, was remarkably beautiful. The main entrance and also the exterior frieze exhibited portraits of the great masters, and were rich with decorative sculpture in bas-relief. This building was constructed with a view to permanent preservation as a feature of the park, and was therefore strongly constructed of brick faced with staff, and having galleries, floors, and roof of iron. The general tone of the exterior is a gray. The whole edifice was fire-proof. On the ground floor statuary was exhibited, and paintings hung upon the walls of both this floor and of the galleries. Over the globe which surmounted the dome was Martiny's winged figure representing Fame. The entrances of the building were guarded by huge lions designed by Messrs. Theodor Baur and A. P. Proctor.

(8) *The Woman's Building* was designed by Miss Sophia G. Hayden, of Boston, and is in the style of the Italian Renaissance. Other ladies took part in the decorations, among them Miss Yandell, of Louisville, who modelled the caryatides; Miss Alice Rideout, of San Francisco, who designed the figure groups on the roof-line; Mrs. Dora Wheeler Keith, of New York, who painted the ceiling of the beautiful library; and Mrs. MacMonnies, whose large composition, representing Primitive Women, was placed at the north end of the gallery, opposite to one by Miss Cassatt representing

Modern Women. The dimensions of the Woman's Building were 199 feet by 398. The building was devoted to exhibits illustrating the work of woman in almost every department of science, art, and industry, which were sent from all the quarters of the earth.

(9) *The United States Government Building* was designed and constructed under the direction of Mr. W. J. Edbrooke, of Washington, D. C., supervising architect to the United States Treasury. It was of the modern Renaissance style, and covered an area of 350 by 420 feet, being surmounted by a dome 275 feet in height. It was used for the exhibits sent by the State, Treasury, Navy, War, Interior, Post Office, Agricultural, and Judicial Departments and the National Fish Commission. It was built from an appropriation of $400,000 made by Congress for the purpose. The situation of the building was one of the finest on the grounds, its eastern façade looking upon Lake Michigan, and its western face fronting the lagoon and the Wooded Island. The building was very substantial, being constructed of brick, iron, and glass, and was largely modelled upon the great Government buildings at Washington, the central dome, in particular, recalling that of the Capitol. No finer collection of exhibits was to be found at the Exposition than that sent by the National Government, and none was more systematically and thoroughly arranged. Its most striking features were the fisheries exhibit, the fine collection of cannon and fire-arms, the magnificent transparencies representing the mountain and cañon scenery of the Far West, the beautiful collection of geological specimens, brilliant in color and exquisite in the taste of their combination—fluorite, malachite, tourmaline, beryl, chalcopyrite, and many others—the sections of the great California trees, and especially the great full-size model of a battle-ship—the Illinois—built of brick, in the lake near by, but covered with armor-plate, and finished, armed, and equipped as the original vessel will be when completed.

(10) *The Horticultural Building* was designed by Messrs. W. L. B. Jenney and W. B. Mundie. Its dimensions were 998 by 250 feet, with a glazed dome in the centre 114 feet high and 180 feet in diameter. The style was of the Venetian Renaissance with the Ionic order, and exquisite sculptured decorations by Mr. Lorado Taft, assisted by his pupil, Miss Julia Bracken. The frieze around the inner surface of the dome, displaying festoons and garlands of the passion-vine, was painted by Mr. C. C. Coleman. Under the dome in the central pavilion was a miniature mountain, under which was a reproduction of the great Crystal Cave in the Black Hills of South Dakota. In the Horticultural Building nearly every remarkable flower and plant of the world found a representative.

(11) *The Building of Manufactures and Liberal Arts* was not only the largest building in the world, but the largest building that has ever yet existed under a roof, being four times as large as the Colosseum at Rome, which could seat 80,000 people, and three times as large as St. Peter's. Its central hall alone could seat 75,000 people, and allow to each one fully six square feet of space. In building it, 17,000,000 feet of lumber, 13,000,000 pounds of steel, and 2,000,000 pounds of iron were used. Its cost was $1,800,000. To fasten the lumber of the flooring to the joists required five carloads of nails. The iron and steel in the roof alone would build two bridges, each the size of the great Brooklyn Bridge. The whole standing army of the Russian Empire could be mobilized under its roof. The architect of this remarkable edifice was Mr. George B. Post, of New York, who showed in his motive a wonderful conception of the architectural means necessary to enable the spectator to receive at once the full impression of the vastness of its proportions. The treatment was severely simple, and the immensity of the structure was not broken and its gigantic proportions were not frittered away by porches, carvings, and balconies; but the gigantic size of the building as a whole was made to smite the mind through the eye at the first glance, and to thrill it with a sense of stupendous achievement. It was in this hall that the Exposition was first dedicated by Vice-President Morton acting for President Harrison (October 21, 1892). The fine Hall of Arches was added to the original design, by Mr. E. C. Shankland, the engineer. The myriad of exhibits that filled this colossal structure comprised those relating to physical training, education, government and law, religion, music, commerce, literature, manufactures, architecture, and engineering, all being minutely subdivided with scientific precision and intelligent system.

Minor Buildings and Special Objects of Interest.—Very picturesque were the buildings erected on the grounds of the Exposition by the various foreign governments, and representing many varieties of national architecture. Noticeable were the *German Government Building*, designed by Johannes Radke, of Berlin, at a cost of $250,000, to suggest the quaint South German architecture, such as still renders Nuremberg so attractive to the traveller; the *Swedish Building*, by Wickman, of Stockholm, in the style of the Swedish manor-houses of the sixteenth century; the *French Building*, with a colonnade and court beautifully decorated with bronzes; the *Venezuelan Building*, of pale green staff; the *Ceylon Building*, of teak, with a beautifully carved façade and roof; the *English Building*, known as "Victoria House"—a typical specimen of an old manor-house of the time of Henry VIII.—and the *Spanish Building*, with its interesting collection of Columbian relics.

Interesting also were many of the houses erected by the various States of the Union, each intended to be a sort of rendezvous for the visitors from those States. The most elaborate were the *Illinois State Building*, in the form of a Greek cross and with a fine dome; the *Pennsylvania State Building*, a stately colonial edifice reproducing the clock-tower of Independence Hall, Philadelphia, and containing in its exhibition-room among other relics the famous Liberty Bell; the *New York Building*—a truly palatial structure, covering an area of 14,538 square feet, besides porticoes, terraces, etc., of nearly 4000 additional square feet; the *California Building*, in the Spanish style; the *Virginia Building*, a reproduction of the Washington mansion at Mt. Vernon; the *Ohio Building*, in the Italian style; the *Indiana Building*, Gothic, with cathedral windows and towers; the *Missouri Building*, massive and commodious; the striking *Idaho Building*, a sort of glorified log-cabin of cedar; and the unique *Florida Building*, which was a reproduction of the old Spanish stronghold, Fort Marion, at St. Augustine, and was justly regarded as historically one of the most interesting objects of the whole Exposition. Many of the other State buildings were handsome and costly, but presented no features that call for especial mention.

A very remarkable Columbian memorial was the *Convent of Santa Maria de la Rábida*, a fac-simile of the monastery, near Palos in Spain, famous in the history of Columbus as having been his asylum and residence during the dark days preceding the final success of his appeal to the sovereigns of Castile. This replica of what one writer has called "the corner-stone of American history" was erected at a cost of $50,000, and contains a large number of interesting historical souvenirs, among them all the original relics of Columbus now existing, including every portrait of Columbus that has ever been painted or engraved, with models or photographs of every monument or statue erected in his honor.

A remarkably artistic composition and one of the most admired sights of the Exposition was the *MacMonnies Columbian Fountain*, on the verge of the Main Basin and fronting the Administration Building. It was designed and executed by Mr. Frederick MacMonnies, of Paris. It represented a mediæval barge surrounded by sea-horses and water-nymphs. Above it sat Columbia enthroned, with Fame in the bow proclaiming, with a herald's trumpet, freedom and renown. Four female figures symbolizing the arts and sciences handled the oars, and Time sat at the helm. The brilliant illumination of this fountain at night by the electric lights furnished a fairy-like spectacle, the myriad jets and the spray of the fountain taking on innumerable tints and colors. Flanking this exquisite group were two other fountains with basins 60 feet in diameter and each having 152 jets of water. When all were illuminated at once by the electric light, a bewildering combination of color and form resulted, resembling a shower of rubies, emeralds, and amethysts falling through a golden mist. The cost of the two auxiliary fountains alone was $100,000, and the nightly cost of operating and illuminating them was nearly $1000. It was from the MacMonnies Fountain facing eastward to the lake that the finest view of the whole Exposition was presented to the eyes of the visitor. Before him lay the *Grand Court of Honor*, approached from the lake under the majestic *Peristyle* designed by Mr. Atwood, with its long stretch of 48 graceful Corinthian columns and surrounded by the four architectural wonders of the Fair, with a bewildering vista of glistening domes, minarets, spires, and statues, revealing an indescribable blending of color against the pure white of the Exposition's palaces and the blue of the summer sky. Opposite the three fountains and at the other end of the Basin stood the colossal *Statue of the Republic*, an heroic figure, by Daniel Chester French, 65 feet in height and resting upon a pedestal of 35 feet. The figure was that of a woman draped in a Greek robe, crowned with laurel, holding in one uplifted hand a staff with the conventional Phrygian cap, and in the other a globe surmounted by an eagle. The open robe revealed a mailed breastplate and a sword girt about the waist. The figure was of staff and richly gilded. Over the water-gate of the Basin was a huge *Quadriga* representing the Triumph of Columbus. Through the arch of the Peristyle access to Lake Michigan was given to the small pleasure-craft that swarmed in the lagoons of the Exposition, among which the most striking were the Venetian gondolas that dotted the water everywhere. At the north end of the Peristyle was a fine *Music Hall* in the style of the Roman Renaissance, with an auditorium capable of seating 2000 people.

Among the other sights of the Exposition that possessed a rare degree of novelty was the great *Ferris Wheel* in the Midway Plaisance. This remarkable wheel was to the Columbian Fair what the Eiffel Tower was to the Paris Exposition of 1889. It was built of steel throughout, and resembled an enormous bicycle-wheel hung between two towers. Its height was 264 feet, and it consisted of two skeleton wheels 28 feet apart, bound fast together by strong shafts of steel. Between the outer rims of this gigantic frame were suspended 36 cars balanced upon trunnion-pins and holding 60 passengers each. The wheel revolved upon an axle 45 feet long and 33 inches in diameter—the largest steel forging ever made—and the motive power was furnished by two engines of 2000 horse power.

Much attention was attracted by the various representations of foreign life given in

UNIVERSITY OF ILLINOIS

the Plaisance, among them *Old Vienna*, a reproduction of the Graben as it was some 200 years ago; the *Irish Village*, created under the direction of the Countess of Aberdeen; the *Dahomey Village;* the *German Village*, with its feudal castle side by side with the quaint mediæval farm-houses; the *Dutch Settlement*, illustrative of the South Sea Islands; the *Turkish Village*, reproducing a street in Constantinople; and especially the *Cairo Street*, identical with the Rue de Caire of the Paris Exposition of 1889, and extremely popular for the realism of its Oriental scenes. Near the Convent of La Rábida were moored the three *caravels* which reproduced the three vessels that Columbus commanded in 1492. These were sent by Spain, and had taken part in the great naval review in New York. In South Pond was the *Viking Ship* from Norway.

A Brief Chronicle of the Exposition.—The Exposition was dedicated by Vice-President Morton, October 21, 1892, in the presence of fully 250,000 people. The dedication address was by Mr. Chauncey M. Depew, of New York, and the ode by Miss Harriet Monroe, of Chicago. On May 1, 1893, the Fair was formally opened by President Cleveland. The Director-General, Col. George R. Davis, delivered an oration, and a poem was read by Mr. W. F. Croffut. The Duke of Veragua, a lineal descendant of Columbus, who had arrived in New York on April 14, was present at the opening as the guest of the city of Chicago. On May 18 the Princess Eulalia, aunt of the King of Spain, reached this country, and soon after proceeded to Chicago as Spain's official representative. On September 11 the Parliament of Religions was opened. October 9 was celebrated as Chicago Day; October 21, as Manhattan Day. On October 30 the Exposition was declared officially closed, the intended ceremonies having been omitted owing to the death by assassination of the Mayor of Chicago, Mr. Carter H. Harrison. The removal of the exhibits was at once begun, as also the gradual demolition of the buildings. On January 8, 1894, a fire, starting in the Casino, swept away the Peristyle, the Music Hall, and the Casino itself.

Attendance, Receipts, etc.—The following tables will be of interest as showing the attendance in each month, and upon some of its commemoration days; and also the statistics of the attendance when compared with that of other great Expositions.

ATTENDANCE AT THE FAIR.

Months.	Passes.	Paid.	Total.	Months.	Passes.	Paid.	Total.
May	481,947	1,050,037	1,531,984	September	1,149,071	4,659,871	5,808,942
June	962,721	2,675,113	3,577,834	October	1,128,995	6,818,884	7,945,430
July	1,217,239	2,760,263	3,977,502				
August	1,172,315	3.515,493	4,687,708	Total	6,052,188	21,479,661	27,539,041

This is exclusive of the paid attendance prior to the opening and after the closing of the Fair.

SPECIAL DAYS.

July 4—Independence day	283,273	October 21—Manhattan day	298,928
October 9—Chicago day	716,881	October 12—Italian day	275,217
October 10—North-Dakota day	309,294	October 27—Coal, grain, and lumber day	254,763
October 11—Connecticut day	309,277		

COMPARATIVE STATISTICS.

Expositions.	Total Attendance.	Expositions.	Total Attendance.
Vienna, 1873	7,254,687	Paris, 1889	28,149.353
Philadelphia, 1876	10,164,489	London, Colonial, and Indian, 1886	5,550,745
Paris, 1878	16,032,725	Chicago, 1893	27,539,041

Thus it will be seen that only one Exposition has ever been more largely attended,—the Paris Exposition of 1889.

From the Auditors' balance sheet for December 31, 1893, the following summary of the finances of the Exposition is compiled.

Receipts from stock	$5,606,495.69	
City of Chicago	5,000,000.00	
United States (souvenir coins)	2,446,699.43	
Admissions at gates	10,601,279.91	
Concessions and other sources	4,769,465.38	$28,423,940.41
Expenses for construction	18,511,618.18	
For operation	8,234,802.31	26,746,420.49
Balance unexpended		1,677,519.92

Against which some minor liabilities remained for payment.

An official history of the Exposition has been promised by the management. The first volume of an account of the remarkable Congress of Religions appeared in December, 1893, edited by the Rev. Dr. Barrows, of Chicago. A popular summary of the Exposition, though with a good many inaccuracies of detail, is Messrs. Rand and McNally's *Week at the Fair* (Chicago, 1893). A free series of reports of the Exposition, with a sum-

mary of the proceedings of the various Congresses and Parliaments is now in course of preparation. It will be published by the United States Government, and will fill some twenty large volumes. No such official and complete statement has ever been published with regard to any other of the great expositions, and it is thought that this will be of great statistical and historical value. A fine series of articles by various writers of distinction, including Walter Besant, Paul Bourget, Samuel L. Clemens, H. H. Boyesen, John J. Ingalls, and Arthur S. Hardy appeared in the *Cosmopolitan Magazine* for December, 1893, with many fine illustrations from photographs.

WORM FEVER is a popular name for the affection more scientifically known as *infantile remittent fever*. Although it is a disease which presents great differences in its course and symptoms, according to the circumstances which have given rise to it, its characteristic symptoms will be found to point (as sir Henry Marsh, the eminent Dublin physician, long ago observed) to the mucous membrane as the original seat of morbid action. The disease seldom occurs during the first year of life; but from the second to the twelfth year, it is an affection often met with. Premonitory symptoms usually occur, and may last for some days. These symptoms are thus described by Dr. Evanson: The child looks ill, and loses his color; he is languid or fretful; complains of pain in the head or belly, is drowsy, but rests badly, starting in his sleep, or grinding his teeth. The appetite fails, the tongue becomes loaded, and the breath offensive. Fever now sets in; or the attack may commence with high febrile symptoms, and be ushered in by a cold fit. When once established the fever is remarkable for the distinctness of the exacerbations, the daily number of which varies in different cases. There is, however, usually one well-marked exacerbation, occurring in the evening and lasting till morning, and followed by a profuse sweat. Three is a common number—namely, one in the morning, one in the afternoon, and a third at night. However cool and lively the child may at other times be it becomes fretful, hot, and heavy, as the exacerbation approaches. During the febrile period all the symptoms become aggravated. As the period of remission approaches these symptoms gradually become less severe, and more or less perspiration appears. As the general disease declines the intermissions become lengthened, while the exacerbations diminish in duration and in intensity. Worms are often present in remittent fever, and give rise to many of the above-named symptoms; but as the symptoms often remain after worms have ceased to be expelled, the latter cannot be regarded as being always the sole cause of this disease.

With regard to the treatment of remittent fever, the first point is to improve the condition of the intestinal canal, and to correct the morbid secretions poured into it. "From the deranged state of the secretions," says Dr. Evanson, "the occasional use of a mercurial is often very beneficial; and it may be given combined with an aperient or a diaphoretic, according to the circumstances. The powder of jalap, simple or compound, is that which we prefer, and the addition of some ipecacuanha increases the effect." He recommends the following formula: Powdered jalap, 30 grains; powdered ipecacuanha, 5 grains; calomel, 5 grains; white sugar, 10 grains. From 2 to 5 grains of this powder may be given every three hours, till the bowels are freely moved. He adds that, to give cold drinks and keep the body cool by light clothing, and the use of an airy apartment (while we enjoin quietness, and occasionally exclude the light), is essential to recovery. When the bowels are not irritable a solution of crystals of tartar (bitartrate of potash) given cold, in the form of *imperial* (see TARTARIC ACID), possesses many advantages, as it acts on the kidneys, while it allays thirst, and tends to keep the bowels open. In the more advanced stages, when debility sets in, we have found the mineral acids useful. They can be employed much sooner than quinine; but the latter may occasionally be prescribed at the close of the complaint. If there are decided signs of intestinal inflammation leeches must be applied to the abdomen; when there is mere intestinal irritability, Dover's powder and the warm bath will give relief. If diarrhea cannot be checked by other means, turpentine, in doses of one or two drops, rubbed up with gum-water, may be tried. In relation to diet, the great point is to avoid giving such food as leaves a bulky, indigestible residue. When convalescence begins change of air often affords remarkable benefit.

WORM-GRASS. See SPIGELIA.

WORMS, an island with an area of about 36 sq.m., belonging to the Russian government of Esthonia, and lying to the e. of Dagö. It is flat and generally well-wooded in the interior, and throws out numerous steep promontories, round which strong currents run, so that, often for months together, it is cut off from all intercourse with the neighboring islands of Oesel, Dagö, Runö, etc., as well as with the mainland; and thus the inhabitants, who are of Swedish origin, have remained unmixed with foreign elements. A stranger is a rare and astonishing phenomenon on this island; and he, in his turn, is not less surprised at the peculiar old Swedish dialect, the architecture, and the manners and customs of this small, poor, but happy insular people. There are churches, schools, and about 2000 inhabitants.

WORMS, an ancient and interesting, but decayed t. of Hesse-Darmstadt, in a highly fruitful district on the left bank of the Rhine, 20 m. n.e. of Heidelberg, and communicating with Mainz and Mannheim by railway. Pop. '95, 28,629. Among its

churches, the chief is the cathedral, a massive building 478 feet long and 114 feet wide, in the Byzantine style, with four towers, founded in the 11th and completed in the 12th century. The gothic south portal with its rich plastic decoration belongs to the 15th century. The church of St. Paul, R.C., contains prehistoric, Roman and Frankish antiquities, and many belong to mediæval times. On a hill near the church called the Liebfrauenkirche, a highly esteemed wine, called *Liebfrauenmilch*, is grown. There is a Luther library. The manufacture of polished leather is important; tobacco is also manufactured, and a trade in the wines and the agricultural produce of the vicinity is carried on. Worms is one of the oldest cities of Germany, and is the scene of the *Nibelungen-Lied* (q.v.). It was occupied by the Romans, destroyed by Attila, and afterward rebuilt by Clovis. It was frequently the residence of Charlemagne and his Carlovingian successors, was the place of convocation of many German diets, and was erected into a free imperial city by the emperor Henry V. The most famous diet held here was that at which Luther defended himself before Charles V. and the princes of the empire (commemorated by an imposing monument to Luther erected at Worms in 1868). The industry and commerce of Worms were great during the middle ages, and its pop., as far back as the time of the Hohenstaufens, averaged 60,000, and even amounted to 30,000 at the close of the thirty years' war, but it was almost wholly destroyed by the French in the destructive war of 1689; and though soon after it was rebuilt on a smaller scale, it has never recovered its former prosperity. The site of the old town is only partially occupied by the present one, the rest being laid out in gardens. Here, in 1743, an offensive and defensive alliance was entered into by Great Britain and Austria with Sardinia. See illus., CATHEDRALS, vol. III.

WORMS, AS A DISEASE OF INFANCY. As we have elsewhere (see ASCARIS, ENTOZOA, TAPEWORM, and VERMIFUGES) treated of the natural history of the worms infesting the human subject, and of the remedies to be employed for their expulsion, we shall mainly confine ourselves in this article to the symptoms which are usually considered to be indicative of the presence of worms in children. These symptoms are, however, in reality, only evidence of irritation of the mucous membrane of the intestinal canal, which may be due to other causes than worms, as, for instance, the presence of indigestible matter, unhealthy secretions, or the existence of a morbid condition of the membrane itself. "Indeed, the latter," says Dr. Evanson, "would seem necessary, in many instances, for the production of any symptoms, although worms were present; as they have been passed by children in perfect health, who experienced no inconvenience on their account. Even the evacuation of worms does not prove that the symptoms present were caused by them, though doubtless they are likely to have been aggravated thereby. The worm *may* have been but an accidental accompaniment—a morbid condition of the mucous membrane being the true source of the symptoms."—*On the Diseases of Children*, 4th ed., p. 345. Although all the symptoms commonly referred to the presence of worms may exist without them, yet there is a group of symptoms which pretty certainly indicate their presence, and which, when occurring together, should, at all events, excite our suspicions. These symptoms are divisible into (1) those dependent directly on the presence of worms in the intestines; and (2) those connected with the sympathetic relations of the digestive organs, and due to some form of reflex nervous action.

(1.) "Worms," says Dr. Evanson, "may be suspected to be present when a child looks pale and grows emaciated, while his belly swells and becomes hard—a gnawing, pungent, or twisting pain being felt in the stomach or about the navel. The appetite is usually precarious, at times voracious; the breath is fetid; and the bowels often deranged, being alternately purged or costive, and much mucus passed in the stools. There is commonly picking of the nose, or irritation (often excessive itching) is felt in the lower part of the bowels; and when a child is old enough, he may complain of a sense of sinking or fainting, which seems to attend particularly on the irritation caused by worms. When symptoms are present, and cannot be accounted for by the existence of disease of the mucous membrane or of the mesenteric glands, we have good reason for believing that worms are their cause."—*Op. cit.*, p. 347.

(2.) Among the most marked sympathetic symptoms are those of the head. The sleep becomes unquiet, and the little patient is liable to start up suddenly from slumber; grinding of the teeth is common; the pupils are often dilated, and there may be headache, and sometimes convulsions—symptoms painfully like those of hydrocephalus (q.v.), but often disappearing on the expulsion of worms. A dry cough, unaccompanied by any signs of disease of the thoracic organs, is regarded as a sympathetic or reflex symptom of worms; and vomiting, hiccough, diarrhea, tenesmus, and bloody stools often accompany their presence. The round-worm (*ascaris lumbricoides*) may be present in the small intestine (its ordinary seat) in large numbers without occasioning any disturbance; but when it does give rise to symptoms, the most prominent are sharp colicky pains about the navel, faintness, great emaciation, and voracious appetite. The thread-worm (*ascaris* or *oxyuris vermicularis*) chiefly occurs in the rectum, where it often exists in large numbers, looking like bits of cut thread. In a recently voided stool they are seen to be in rapid motion; hence they are called *ascarides* (from the Greek *askaridzein*, to jump), and hence also, in all probability, the great distress which they occasion as compared with the quiet round-worms. The characteristic sign of the presence of these thread-worms is the itching and irritation felt in the rectum.

WORMS, or VERMES (COMPARATIVE ANATOMY). Most zoologists regard the worms as constituting a subdivision of the ARTICULATA; but one of our latest and best writers on classification—prof. Huxley—confines the synonymous terms ARTICULATA and ARTHROPODA to the insects, myriapods, arachnidans, and crustaceans; and places the higher worms, or *annelids*, with the above classes, in a primary division, or subkingdom, of ANNULOSA; and the less highly organized worms, *scolecids* (in which he includes the *rotifera* or wheel-animalcules, the *trematoda* or flukes, the *tæniadæ* or tapeworms, the *nematoidea* or thread-worms, the *acanthocephala* and the *gordiacea*), in a subkingdom, to which he applies the term ANNULOIDA. The main reasons of his placing the worms under two great subdivisions are—(1) that the annelids resemble the arthropoda in the arrangement of the nervous system, which constitutes a ganglionated double chain, traversed at one point by the œsophagus; (2) none of the scolecids possess any characters in common with the arthropoda generally, or the annelids, other than those which they have in common with all animals. No scolecid has a definitely segmented body, or bilaterally disposed successive pairs of appendages, nor has it a longitudinal chain of ganglia. These grounds of difference outweigh, in his opinion, the many points of resemblance between the annelids and the scolecids—as (1) the resemblance between the ciliated larvæ in many cases; (2) the resemblance between the forms of the mature bodies of many scolecids with that of one of the most familiar of annelids, which is so close as to have acquired for the scolecids the popular name of "worms;" and (3) the fact that in the annelids we see the representatives of that singular system of vessels which attains a perfect development in the "water-vascular" apparatus of many scolecids. The final settlement of the classification of these animals must be decided by further investigation.

With regard to the general characters of worms, it is well known that they are usually of a very elongated form. In the higher groups the division of the body into a number of segments is very distinct; while in some of the lower forms no segmentation can be detected. The segments, when present, are usually homonomous, or, in other words, are mere repetitions of one another. The soft and contractile body may be cylindrical or slightly compressed, or it may be flat and broad, and usually presents a distinct dorsal and abdominal surface. The lateral region is often provided, in the higher forms, with special appendages, resembling minute stumps, which take part in the respiratory process. Among the cuticular appendages must be mentioned the bristles (*setæ*), hairs, hooks, etc., which are often seen. The nervous system of the highest worms—the annelids—has been already sufficiently described in our notice of prof. Huxley's views. From this condition it appears in the scolecids to become more and more rudimentary, till in the parasitic worms it totally disappears. The mouth is absent in the lower forms, but in the higher lies in the mesial line of the abdominal surface, in close approximation to the chief nervous (pre-oral) ganglion, from which most of the organs of the senses derive their nerves, as the eye, the auditory apparatus, and the organs of touch (especially the lips). Some of the parasitic worms, as the tapeworms, etc., are totally devoid of an intestinal canal; others, as the turbellaria (with few exceptions), and the trematoda, have an intestine, but no anal aperture; while the rest have an intestine provided with both mouth and anus. The latter, when present, lies on the posterior part of the body, and sometimes (as in many turbellaria) on the dorsal surface. Except in the gephyrea or sipunculacea, the intestine, when present, is simple, and devoid of convolutions; but is often, as in the leech, provided with lateral blind sacs. The vascular system in the most highly organized worms consists of a closed system of arteries and veins, presenting modifications in different genera. A large vessel which runs beneath the dorsal integument may be seen under a microscope to contract and propel the blood forward, thus fulfilling the functions of a heart, and being the homologue of the dorsal vasiform heart of insects; while a corresponding venous trunk conveys the blood in an opposite direction, and runs along the under surface of the body. These great trunks are united at each segment by transverse vessels, which carry the blood from the ventral vein to the dorsal artery. In the nematelmia, or parasitic round-worms, the system is much simpler; and in the lowest worms no trace of true blood-vessels is discernible. None but the annelida (q.v.), or highest worms, possess special respiratory organs. These occur in various forms. Thus, in the leech and earthworm, a series of pores on each side of the body lead to as many simple sacculi formed by an inward folding of the integument. In the tubicolous annelids, such as the *serpula* (a common inhabitant in the aquarium), the respiratory organs are in the form of long flattened branchiæ, radiating from the head, and generally disposed in a spiral form. When not filled by the red circulating fluid which the annelids generally possess, they are often beautifully tinted with purple, green, and yellow colors, and form a gorgeous crown. In the *arenicola piscatorum*, popularly known as the sand worm, the respiratory organs are seen lying as lateral tufts in the middle part of the body (14 or 16 in number on each side). In the lower worms, there are no definite respiratory organs, the process being carried on partly by the surface of the skin generally, and partly by the water-canals noticed in the article TAPEWORM. As a general rule the worms are hermaphrodites, only one of the five classes into which they are divided—viz., the *nematelmia*, having the sexes separate. A large number of the lower kinds are parasitical; the others are inhabitants of sea and fresh water, mud, earth, etc.

The worms are arranged by V. Carus into the five following classes: (1.) ***Annulata***,

corresponding to the *annelids* of Owen, and described in the article ANNELIDA. (2.) *Gephyrea*, including the sipunculus and its allies. (The term is derived from the Greek *gephyra*, a bridge, because the animals included in it form a connecting link or *bridge* between the echinoderms and the true articulate animals.) In the article Sipunculus (q.v.), in which, according to the old view, that animal is regarded as an echinoderm, there is a figure of a British species, the *sipunculus Bernhardus*. (3.) *Chætognatha* (signifying *shaggy-jawed*, from the Greek *chaitēeis*, shaggy, and *gnathon*, a jaw), including the single genus *sagitta*, which was formerly erroneously placed among the nucleobranchiated mollusks. As the sagitta is not elsewhere described in this work, we may notice that it is a little fish-like animal with a distinct head, the mouth armed with several pairs of lateral hook-like jaws, with an elongated body furnished with one or two pairs of fin-like organs, and with a broad and usually bilobed caudal fin. The sagitta (so called from its arrow-like appearance) is of small size, swims with great rapidity, and is common in the Mediterranean and in the North sea. (4.)*Nematelmia* (from the Greek *nēma*, a thread, and *helmins*, a worm), which are described in a special article. (5.) *Platyelmia* (from the Greek *platys*, flat, and *helmins*, a worm), or *flat-worms*, which are divisible into the three orders: (1) *Turbellaria*, including the planarias, etc.; (2) *Trematoda*, including the flukes; and (3) *Cestoidea*, including the tapeworms. These orders are described in special articles.

For further information on the subject of this article the reader is referred to the various works and memoirs of Milne-Edwards, Grube, De Quatrefages (especially his *Rambles of a Naturalist*), Schmarda, Blanchard, Leuckart, Williams of Swansea (in the reports of the British association), etc. The British worms were not till quite recently described by any competent naturalist, although the labors of Williams of Swansea and Johnston of Berwick (both too early lost to science), are excellent as far as they go. Dr. Johnston's *Catalogue of the British Non-parasitical Worms in the Collection of the British Museum* (Lond. 1865, p. 366), with 20 plates, must be consulted by all who take an interest in this subject, although much of it is now out of date. The most complete work is the *Monograph of British Annelides*, published under the auspices of the Ray society by Dr. Mackintosh of Murthly, one of the most distinguished of the younger generation of Scottish naturalists.

WORM-SEED is the popular name for santonica, from which santonine (q.v.) is extracted.

WORMWOOD is the popular name for *artemisia absinthium*. It not only acts as an anthelmintic, as its name implies, but it likewise possesses tonic and stimulant properties, which prevent the reproduction of worms after their expulsion. An *infusion of wormwood*, made by pouring a pint of boiling water over an ounce and a half of the dried plant, letting it stand for an hour, and straining, taken in doses of a couple of ounces once or twice a day, is a very good domestic tonic, and may be prescribed with advantage even in cases where worms are not suspected.

WORSAAE, JENS JACOB ASMUSSEN, a distinguished Danish archæologist, was b. in 1821 at Veile, in Jutland, where his father held the post of *justitsraad*, or councilor of justice. Worsaae received the rudiments of his education at the gymnasium of Horsens, from whence he proceeded, in 1833, to Copenhagen, with the intention of studying theology. Having, however, soon exchanged his theological studies for law, and again as speeedily relinquished the latter, he turned his whole attention to the history and archæology of the north, which had from an early age presented special attractions to his mind; and in 1838 he obtained the place of assistant in the Royal museum of northern antiquities at Copenhagen, which was then under the direction of the able Danish archæologist, C. J. Thomson, to whom this most valuable collection owes its origin and its present state of excellence. In 1844 appeared Worsaae's important work, entitled *Runamo og Bravalla Slaget*, in which he, with consummate skill and profound erudition, definitely settled the long-pending doubts as to the authenticity and character of the Bleking rock inscriptions, and satisfactorily showed that the supposed runes were no runes at all, but the mere weatherings of the rock; and consequently that the interpretation given by the great Icelandic scholar, Finn Magnussen (q.v.), had no existence but in the mind of its author. This bold but conclusive solution of a long-pending problem, which, from the days of the great Danish historian, Saxo Grammaticus, had occupied the attention of the most learned men of the north, at once placed Worsaae, in the foremost rank of northern archæologists; and the numerous works and monographs which appeared from his pen in after years fully justified the high promise given by his early labors. During the ten years intervening between this period and his nomination in 1854 to the honorary rank of professor in the university of Copenhagen, Worsaae made repeated visits to the other Scandinavian lands, to Great Britain, Germany, France, and other parts of central Europe, which retained traces of the former presence of the Northmen. The Danish government defrayed the expenses of several of these journeys, the results of which have been the publication of numerous works and papers of interest, among which we may instance his *Minder om de Danske og Nordmænderne i England, Scotland og Irland* (Copenhagen, 1851); or Memorials of the Danes and Norwegians in England, etc., of which an English translation appeared the following yeai; and his treatise *Om en forhistorisk saakaldet tysk Befolkning i Danmark* (Copen

1849); etc. Some of the most important of his works on the archæology of his native country are his *Danmarks Oldtid oplyst ved Oldsager* (Copen. 1843); *Blekingske Mindesmärker fra Hedenold* (1846); *Danevirke* (1848); *Den Danske Erobring af England og Normandiet* (1863); *Om Slesvigs Oldtidsminder* (1865). Worsaae always showed himself a warm patriot, and a strenuous opponent of the spread of German tendencies in the duchies, and his views in this direction were forcibly enounced in his *Jylland's Danskhed*, a treatise published in 1850, and especially directed against Jacob Grimm's exposition of the question of German national law. Worsaae's merits have been fully recognized by his countrymen; and the Danish government constantly showed its sense of the estimation in which he was held, by placing him at the head of all important commissions connected with the archæology of the country, appointing him to important posts in connection with the university and antiquarian museums, and bestowing upon him various other marks of confidence and respect. He d. 1885.

WORSTED. Besides the application of this term, explained under Wool and Woolen Manufactures (q.v.), it is also applied to the thick loose woolen yarn used for knitting stockings, etc., known in trade as fingering-yarn.

WORT. See Beer.

WORTH, a co. in s.w. Georgia, partly bounded on the w. by Flint river, drained by Little river; 750 sq.m.; pop. '90, 10,048, chiefly of American birth, with colored. Co. seat, Isabella.

WORTH, a co. in n. Iowa, having the state line of Minnesota for its n. border, drained by Shell Rock river and Lime creek; 408 sq.m.; pop. '90, 9247. Co. seat, Northwood.

WORTH, a co. in n. Missouri, having the state line of Iowa for its n. boundary, 270 sq.m.; pop. '90, 8,738. Co. seat, Grant City.

WÖRTH, a village of Alsace-Lorraine, situated at the confluence of the Sauer and the Salzbach, about 10 m. s.w. of Weissenburg. Here, on Aug. 6, 1870, the French, under MacMahon, were outflanked and defeated with great loss by the Germans, commanded by the crown prince, who took 4,000 prisoners. Wörth suffered considerably during the battle, hand-to-hand fighting taking place in its streets. Pop. over 1000, mostly Protestants.

WORTH, William Jenkins, 1794–1849, b. Texas, entered the U. S. army as a private in 1812; distinguished himself at Chippewa and Lundy's Lane; was promoted, and from 1820–28 was instructor in tactics and commandant of cadets at West Point. He served with rank of col. in the Seminole war, and at its end was brevetted brig.gen. In the Mexican war he commanded a brigade, and later a division, and took part in the battles of Cerro Gordo, Churubusco, Molino del Rey, Chapultepec, and at the capture of Monterey, Vera Cruz, and the city of Mexico. He was brevetted maj.gen. and presented with swords of honor by congress and by the states of New York and Louisiana. A monument was erected over his remains by the city of New York, on the w. side of Madison square.

WORTHING, a fashionable and rapidly-rising watering-place on the Sussex coast, 10 m. w. of Brighton. Pop. '81, 10,976; '91, 16,606. Its importance began with the century, as, prior to that date, it was merely a small unvisited fishing-village. The climate is much milder than that of Brighton, the town and its immediate neighborhood being encircled on the n. and n.e. by almost an amphitheater of hills, which greatly shelter it from northerly winds, and render it one of the best places for a winter resort on the s. coast. The town has no noxious trades or manufactures, but is essentially a place of resort for pleasure-seekers and invalids. The growing of early fruits under glass is carried on.

WORTHINGTON, George, d. d., b. Mass., 1848; graduated from Hobart coll., N. Y., 1860; and from the Gen. theol. sem., 1863. His diaconate in the Prot. Epis. church was spent at Troy, and his subsequent ministerial work was at Balston Spa, N. Y. and at Detroit. He was consecrated bp. of the Prot. Epis. diocese of Nebraska, 1885.

WOTTON, Sir Henry, 1568–1639; b. England; educated at Winchester and Oxford. After a prolonged tour on the continent he returned to England, and became secretary to the earl of Essex. He went with him to Spain and Ireland, but upon Essex's arrest upon a charge of treason escaped to France. He went to Scotland in 1602, charged by the grand duke of Tuscany to warn James of a plot to take his life. He returned to England after the death of Elizabeth, was knighted, and in 1604 made ambassador to Venice where he remained till recalled in 1610. He resumed the Venetian embassy in 1616, having previously gone on a diplomatic mission to the Netherlands. In 1625 he took deacon's orders, to make him eligible for the provostship of Eton college, which he held till his death. He wrote several works which are forgotten, with the exception of his poems.

WOTTON, William, d.d., 1666–1726; b. England; was educated at Cambridge, and ordained to the English church. Among his works is a *History of Rome* (1701). He is best remembered, however, by his *Reflections upon Ancient and Modern Learning* (1694), which began the famous dispute about the authenticity of the *Epistles of Phalares*, and drew out Swift's *Battle of the Books*.

WOUNDS. All injuries attended with a division of tissue, inflicted by weapons of any description, sharp, blunt, or pointed, are classified as wounds. A wound then may be defined as a division of parts produced by external mechanical force. The solution of continuity may be apparent or concealed. It may be merely a scratch on the skin, or the deep-seated structures may be involved. Again the wound may be strictly subcutaneous, the integrity of the skin being retained.

On this account, wounds are generally, from a clinical point of view, divided into the "open" and the "subcutaneous." Wounds are constantly made by surgeons in the exercise of their professional duties, as in the removal of limbs, tumors, etc., and in the restoration of lost or mutilated parts. In general, wounds are inflicted accidentally, and may occur in a great variety of ways. Wounds may be also recognized as infecting or poisonous, such as those received while making dissections, those inflicted by the stings of insects, bites of rabid animals, snakes, etc., and the wounds which afford entrance to the poison of malignant pustule, glanders, and syphilis.

Bryant defines "open" wounds as injuries caused by external violence, the result either of accident or design, in which there is a solution of continuity in the soft tissues, and in which the deeper parts are exposed to the influence of the air through a more or less gaping orifice. The term "subcutaneous" he applies to such injuries as follow external violence, and in which the deeper tissues, bones or viscera, are broken, ruptured, lacerated, or crushed without any breach in the continuity of the soft parts covering them. In such wounds there is no exposure to the influence of the external air. Under this head are classed wounds inflicted in the operations incident to tenotomy, myotomy, and osteotomy. As a rule, "open" wounds are of a more serious character than the "subcutaneous," though when the viscera and important vessels are implicated, the latter are among the gravest the surgeon has to deal with. "Open" wounds heal by a more complicated process than the "subcutaneous," being exposed to risks from which the latter are free. Incised wounds, caused either by accident or in an operation, result from a sharp-edged instrument. Those inflicted by blunt instruments, where more or less tearing results, are known as lacerated. When bruising occurs in the parts wounded, the term "contused" is used. A "punctured" wound is one caused by the thrust of some sharp-pointed instrument, such as a knife, sword, or bayonet, the tissues being pierced and cut deeply. A "punctured" wound may approach in character that of the "incised" or "contused" form of injury. But, generally speaking, in "punctured" wounds, the soft parts are more or less "contused." A "simple" wound is one which has been made by a clean, sharp-edged instrument in a healthy subject, where there is nothing in the condition of the patient or in the nature of the wound to retard repair. Complicated wounds are those where, from the lodgment of foreign matter, or from hemorrhage which has not been controlled, or from more or less contusion or laceration of tissue, repair is interfered with. Local inflammation, constitutional disturbances, the drinking habit, old age, and general poor health, also complicate wounds. In a clean cut, whether the result of a surgical operation or an accident, there are three things which are chiefly to be observed: the hemorrhage, the pain, and the separation of the tissues, more commonly known as "gaping." Ordinarily the capillary bleeding, which results from a clean cut wound, ceases naturally. This depends upon the character and size of the vessels, the position of the part injured, and the general physical condition of the patient. We recognize a condition known as the "hemorrhagic diathesis," whereupon the most trivial cuts result in an unreasonable amount of bleeding. Aside from these irregularities, a wound in a healthy subject ceases to bleed soon after the completion of the injury. Where a hemorrhage takes place from large vessels, a fatal result is rapidly reached, unless promptly interfered with surgically. The pain varies in its nature and degree according to the portion of the body wounded. The skin of the face is much more sensitive than that of the back, buttocks or thighs. Patients vary as to sensibility. Where the physical powers are in normal health, the ability to resist pain is greater, but we have also to estimate the amount of "will-power" in the patient. Dr. Bryant calls attention to the evil influence of anticipation aggravating the suffering of patients. On the other hand, the excitement of battle or the condition of preoccupation, as when one is at work, numbs, as it were, the sensibility to pain. The gaping of a wound is caused by the retraction of its edges, and varies according to the tissues divided. The skin is the most elastic tissue in the body, and retracts rapidly when wounded. Where the part is in a state of tension, the gaping is more decided. In addition to the immediate gaping of fresh wounds, many wounds, unless prevented, will continue to retract for a long time.

The constitutional effects of a wound are in some subjects followed by a severe shock, which varies from mere fainting to a fatal syncope. Sometimes even the simplest operation may be followed by a fatal shock. The central nervous influence puts a sudden stop upon the action of the heart. The degree of shock which follows upon an operation or injury depends upon the importance of the organ injured, the amount of blood which has been lost, the violence exhibited in the injury of the tissues, and the location of the injury in proximity to great nervous centres. Generally speaking, a patient in good health will sustain a severe wound or operation successfully, while those who are suffering from kidney or visceral disease are more liable to succumb. This

condition of "shock and reaction" will be found more fully described under their respective headings.

The local consequences of an incised wound are to be studied in a deep cut which has passed through skin, subcutaneous fat, and fascia. Gaping continues, until, in a brief interval of time, the subcutaneous fat appears, and the divided edge of the true skin seems to be retracting from it and becoming everted. Within an hour or more, the edges of the wound and the adjacent parts become swollen and sensitive. There is a sensation of heat and pain, which may be described as dull, aching, or burning. The sutures become tighter, the parts are much swollen and œdematous, there is a tension upon the wound and a disposition to separate and gape. Gradually, in the course of a few days, where repair goes on normally, these local manifestations will subside, the skin becoming soft and cool, the pulse and respiration normal. But should these conditions be more persistent, increasing in severity, and spreading beyond the margins of the wound into the surrounding parts, or alter in character for the worse, what has been a physiological reparative process will pass into a pathological or diseased one, and the parts will then be said to be in a state of inflammation. The duration of this feverish reaction or traumatic fever does not seem to bear any fixed relation to the severity of the injury.

The fever may appear within twenty-four hours after the receipt of the injury, or this condition may be in abeyance until the second day, and it may continue for twenty-four, forty-eight, or even seventy-two hours. The beginning of suppuration often coincides with the subsidence of the fever, which, when the prognosis is favorable, seldom lasts beyond this period. When the fever runs into the fifth or sixth day, some complication is certain to be present, and a continuance of it beyond this point prognosticates very unfavorably.

The process of repair in wounds is accomplished either by immediate union, or what is known in surgical language as "union by the first intention;" by primary adhesion, or union by the adhesive inflammation; by granulation, or what is known as the "second intention;" by secondary adhesion, or the third intention—that is, by the union of granulations; and lastly, by scarring under a scab, the so-called subcutaneous cicatrization. Repair is identical in all tissues, soft or hard parts, bone or muscle, integument or tendon. The highly vascular tissues more rapidly accomplish this repair than the tendoness or bony structures. The process of healing is analogous to that of ordinary growth. In both there must be "pabulum" for nourishment, and this we naturally expect to find in the blood. But where, from any reason, the blood supply is deficient, either in quantity or quality, or if its elements have become perverted by constitutional disease, such as malaria, syphilis, or where the blood standard has been lowered and injured, as in the case of drunkards, growth, development, and repair must necessarily be interfered with. "The healing process is physiological, and is just equal to its purposes; when it is excessive it becomes pathological, and is known as inflammation." In this condition the process of repair is checked and subsequently undone. A healing by immediate union takes place when the wounded parts, being placed and maintained in contact, stick together. The capillary circulation is restored, and such perfect union is the result that in some instances neither scar nor cicatrix is to be found.

Where healing takes place by primary adhesion, we find, between the edges of the wound, a vast accumulation of cells. This multiplication of cells is the fact which is now recognized by all. It explains the purpose of the exudation of lymph, how this becomes organized, and how, gradually connecting the cut surfaces, it at length forms between them a firm layer of connective tissue, covered with a thin shining cuticle. According to Virchow Billroth, the cell elements take the leading part in this reparative process; while Cohnheim attributes the chief action of this repair to the capillaries. We must also bear in mind the important influence which the nerves exert on the reparative process, and their influence upon nutrition or secretion.

Granulation, or the "second intention" of Hunter, is that process which takes place in a wound where union by immediate repair is impossible. The edges gape and cannot unite; the surfaces, within a few hours, appear to be covered with a peculiar, gelatinous, grayish-white film known as plastic lymph; the structure is more vascular, and the surface appears more even. The wound is said to be cleaning. Now, if these surfaces are brought and kept together, union may result, this film becoming organized; but if the wound be left open, the film increases and takes part in the formation of granulations.

The epidermis gradually extends to the centre of the sore, and cicatrization proceeds. A cicatrix in the skin in time resembles closely true skin; cicatrix in the bone, true bone, and cicatrix in the tendon becomes tough and hard. "It is corpuscular in its origin and clearly fibrinous in its nature, and through it and by it all repair takes place. The result is a scar of fibro-cellular or connective tissue, with a superficial layer of epidermis. Gradually the development of the scar continues, and the connective tissue becomes organized, and the cuticle thicker and more opaque; perfect union by granulation as resultant.

When healing by secondary adhesion takes place, the granulating surfaces are brought together and adhering to each other, as when two divided surfaces are repaired. Here

the embryo cells and capillaries undergo the same changes, provided, of course, that the granulations are normal. By some authorities, that process which is known as healing by scabbing, or beneath the scab, is supposed to be most normal. The serum of the blood which has been effused on the surface of the wound, by reason of its plastic character, quickly coagulates, forming a protective film, beneath which the repair may steadily proceed. The medium of repair is known as "Hunter's plastic lymph."

This is more particularly observable in animals, when, if a wound is left wide open, the blood and other exudations dry upon the surface, forming an air-tight covering, under which repair goes on until complete, when the scab is cast off. In man such a process is less frequent, because, in the first place, exudations seem to be more often produced under the scab, which detach it and prevent the healing.

Every wound is followed by more or less tendency to an inflammatory process. In healing by granulation a very low degree of inflammation is best; while for healing by secondary adhesion or by scabbing, inflammation must be altogether absent. Everything must be done to avoid inflammation. Generally speaking, however, the inflammation ordinarily present in a wound does not require special attention, except when it exists in the large joints, the peritoneum, lungs, the eye, etc. Here serious mischief may be rapidly induced by inflammation.

In the treatment of wounds we must understand the natural processes, and make use of this knowledge as aids in our surgical art. When we have a "simple incised wound," in which the hemorrhage has been arrested by elevation of the parts, moderate pressure, or the application of a cold or hot sponge, the surgeon is called upon merely to protect the wound from outside infection, suitable cleansing and coaptation of the edges having been attended to. But in more severe wounds there are surgical rules which must be considered. First, as to position: "When comfort has, as far as possible, been secured, the next object should be that the wounded part be relaxed, so that the edges of the wound may come near or together; that no part, and especially no muscle, should be on the stretch, and that the direction of the wound may be such as to allow fluid to flow away from some parts of it. Provision must be made for the protection of the part injured; not only to secure it against the inroad of microbic poison existing in the atmosphere, but also against any internal injury. The cleansing of a wound is the first process after diagnosis has been arrived at. The first rule is summed up in the word "gentleness." Water which has been rendered antiseptic should be brought to bear upon the injured part by using either the irrigating bottle or the tube. Such foreign substances remaining in the wound as may be capable of hindering union by first intention must be removed by the forceps. (See Antiseptics.) The next process is to arrest the bleeding. Even capillary oozing must be stopped. A quantity of blood beyond that which is required in the process of repair acts as a foreign substance, and hinders union by first intention. Dr. Bryant recommends the use of a lotion composed of hot water and iodine to check the oozing of blood and to excite repair. The wound having been cleansed and the bleeding arrested, the coaptation of the divided surfaces must be effected. This is to be accomplished by the use of sutures, by suitable bandaging, and, in some instances, by the application of plaster. The interrupted and continued sutures are more commonly employed. The twisted, quilled, and buttoned sutures are also frequently made use of. The materials used for sutures are silk, catgut, horse-hair, and silver wire. In the interrupted suture, strips of adhesive plaster reinforce the sutures, whether of silk or wire. Another agent in the treatment of wounds is pressure; well-applied pads of lint, medicated absorbent cotton wool, and antiseptic gauze or sponge are carefully adjusted for this purpose. These pads are retained in position by means of strapping, by adhesive plaster, or by splints. Next to position, it is of the utmost importance that the wounded part be placed so as to avoid the least possible motion. Drainage is another important consideration in the treatment of wounds. "Pent-up fluids not only tend to separate tissue which are intended to unite, giving rise to pain by producing tension, but they are prone to excite inflammation, and undergo septic changes which may give rise to blood poisoning, septicæmia, or pyæmia. No general rules can be given regarding the time at which any or the whole of the dressing should be removed. Time varies from two days to even a week longer, according to the nature of the wound, situation, etc. Generally speaking, the union of small wounds may be considered safe at the end of a week, and that of larger ones at the end of ten days or a fortnight.

WOUVERMANS, Philip, a Dutch painter of note, was born in 1619 at Haarlem. From his father, Paul Wouvermans, an historical painter, he inherited a taste for art. He studied first with his father, and afterward with John Wynants. He passed his entire life at Haarlem in the assiduous practice of his art, and died in the year 1668. Though his pictures are now highly valued, he is said to have had little immediate success, and to have lived in poverty, pretty much in the hands of the picture-dealers. His pictures are, for the most part, landscapes of small size, with figures profusely introduced, commonly in energetic action. His battle-pieces, in particular, are greatly admired for their spirit and vigor. He had two brothers, also painters, John and Peter, who executed subjects somewhat similar, and whose works have not unfrequently been attributed to him; but they are plainly inferior to Philip.

WRACK, or **SEA-WRACK**, a name sometimes applied indiscriminately to many of the larger *algæ* of the sea-shores, but also employed to designate the species of the genus *fucus* (see FUCACEÆ), some of the most abundant of which are employed on the British shores for the manufacture of kelp (q.v.), and are also much used as a manure. The genus *fucus* has a leathery, dichotomous, generally flat, linear frond, usually furnished with large air-cells, which are included in the substance of the frond; the spores arranged in tubercles, imbedded in mucus, and collected in *receptacles*, through the pores of which they are finally discharged. *F. vesiculosus*, popularly know as *sea-ware*, *kelp-ware*, and in Scotland as *black tang*, is extremely abundant on all the rocky shores of Britain, growing between high and low water mark, and most plentifully near high-water mark, often struggling for existence on the very upper line, and even found among grass and moss in marshy ground occasionally overflowed by the tide. It is the species chiefly employed in the kelp manufacture, because it is more easily collected than any other. It is of a dark olive-green color, sometimes 2 or 3 ft. in length; the frond flat, entire on the margin, with a central rib; the air-cells spherical, in pairs, sometimes as large as hazel-nuts; the receptacles solitary, terminal, turgid, compressed, mostly elliptical Oxen, sheep, and deer eat it, and seek it on the sea-shore in winter when other food is scarce. In Gothland it is boiled and mixed with a little coarse flour as food for hogs. It has been used medicinally in glandular affections, probably owing its value to the iodine which it contains.—*F. nodosus* is another very common British species, sometimes called KNOBBED WRACK, growing nearer to low-water mark than the last, and therefore not so often and easily accessible, but esteemed the very best species for the manufacture of kelp. It has veinless fronds, branched in a somewhat pinnated manner, with large solitary egg-shaped air-cells in the central line of the frond. It sometimes attains a length of 6 feet.—*F. serratus* is also very common, and is easily distinguished by its serrated fronds, and the want of air-cells. It is sometimes called BLACK WRACK. It is less useful for kelp than the other species. In Norway it is used as food for cattle, generally sprinkled with a little meal. It is preferred to other species for packing crabs and lobsters to be sent to market, as it keeps them moist, while, having less mucus than the other species, it is less apt to ferment and putrefy.

Some of the *fuci*, as *F. vesiculosus* and *F. serratus*, on receiving injury by which any part of the frond is broken, throw out a cluster of young sprouts from the injured part.

WRANGEL, FRIEDRICH HEINRICH ERNST, Count VON: 1784–1877, b. and d. Prussia. He entered the Prussian army, 1796; fought the campaigns against Napoleon, rising to the rank of col.; was made maj.-gen., 1823, and lieut. gen., 1838. He was given command of the allied troops against Denmark, 1848, but shortly afterwards went to Berlin and quelled the revolution there, for which service he was made gen. of cavalry, 1849. He was created a field-marshal, 1856, upon the 60th anniversary of his service. He took part in the war of 1866, but held no command on account of his great age. He was connected with the army for over 80 years.

WRANGELL, FERDINAND, Baron von, 1796–1870; b. Russia; entered the navy; in 1820 led a sledge expedition to the polar regions, co-operating with Anjou, reaching 72° 2′ n. lat., discovering but not reaching the open polar sea, and also failing to reach the large tract discovered and called Wrangell's Land by Long in 1867. From 1829 to 1834 Wrangell was governor of Russian America, and in 1847 was made vice-admiral. Accounts of his expedition have been published in German and English.

WRANGLER, the name given at the university of Cambridge to those who have attained the first class in the public mathematical honor examinations. The word wrangler is derived from the public disputations in which candidates for degrees were in former times required to exhibit their powers. The examination is confined to mathematics, pure and mixed; it is conducted by two moderators and two examiners, with an additional examiner. The honor men who compose the mathematical *tripos* number usually about 100, and are divided into three classes—*wranglers*, *senior optimes*, and *junior optimes*, each candidate being placed in order of merit. The head of the tripos is called the *senior wrangler*. Heretofore this was the final result of the tripos, and this still holds for the first two parts of the examination; but it has been decreed that, from 1882 onwards, the third part of the examination coming six months afterward is to have the effect of sub-dividing the *wranglers* into three classes, the members of each class being arranged alphabetically. The number of wranglers varies from year to year. It has rarely been under 35, and has often been 45 or upward, the number not being limited, otherwise than through the application of a certain high standard of excellence. See **CAMBRIDGE, UNIVERSITY OF.**

WRASSE, or ROCK-FISH, *Labrus*, a genus of fishes of the family *labridæ* (q.v.), of the section having cycloid scales, *cyclolabridæ* of Müller. They have spiny fins, large thin scales, and an uninterrupted lateral line The mouth is protrusible, with thick fleshy lips, folded so as to appear double. The teeth on the jaws are simple, in one or more rows; the lower pharyngeal bones are completely fused together, and have broad grinding teeth. The form is somewhat perch-like, with the back more straight. There is a single long dorsal fin, the spines of the anterior portion of which are surmounted by short membranous filaments, the posterior portion having short and split rays. The

ventral fins are under the pectorals. The colors are generally very brilliant. The species are numerous, abounding in tropical seas, but several of them are found on the coasts of Britain. They chiefly frequent rocky shores, and are generally seen in small shoals, often hiding under sea-weeds. They feed on crustaceans, mollusks, and marine worms. They are often caught by bait intended for other fish, but their flesh is not much esteemed. The BALLAN WRASSE (*L. bergylta*, or *maculatus*) is one of the most common British species. It attains a length of about 18 in., and a weight of more than 3 pounds. It is bluish-green, paler on the belly, all the scales margined more or less broadly with orange-red, the blue prevailing in some specimens, and the orange in others. The COOK WRASSE (*L. mixtus*, or *variegatus*) is not unfrequent on the southern shores of England. Its prevailing color is orange, striped transversely with blue, particularly in the male, the colors of the sexes differing so much that the female has often been described as a distinct species, and is generally known as the RED WRASSE. There are several other British species of this and closely allied genera, as the CORKWING (*crenilabrus melops*, or *tinea*), about 6 in. long, and of a greenish-blue color, varied with yellow. The colors quickly fade after the fish is taken out of the water.

WRAXALL, Sir FREDERICK CHARLES LASCELLES, 1828–65; b. Boulogne; educated at Oxford. He served as assistant commissary in the Crimean war, and published *Camp Life* (1860). Others of his books are: *Handbook to the Armies of Europe; Armies of the Great Powers; Military Sketches; Memoirs of Queen Hortense;* and several novels. Sir Frederick was grandson of Sir NATHANIEL WILLIAM, 1751–1831, a traveler and author who wrote several books of a historical and biographical character, such as *Historical Memoirs of my own Time* (1836).

WREATH, WREATHED, in heraldry. A wreath is a twisted garland of silk of different colors, otherwise called a torce, on which it has, since the 14th c., been usual to place the crest. The side-view of a wreath thus dawn exhibits six divisions, which are generally tinctured with the livery colors—that is, the principal metal and color of the shield. Every crest is now understood to be placed upon a wreath, except when it is expressly stated to issue out of a chapeau or coronet. A wreath, when represented alone, shows its circular form. A Moor's head is sometimes encircled with a heraldic wreath. A wreath is always understood to be the twisted garland of silk above explained, unless otherwise specified; but wreaths of laurel, oak, ivy, etc., sometimes occur, and savages used as supporters are often wreathed about the head and middle with laurel. Ordinaries are occasionally *wreathed*, otherwise called *tortillé*, in which case they are represented as if composed of two colors, twisted as in the heraldic wreath; as in the coat of Carmichael, argent, a fess wreathed azure and gules.

WRECK, in maritime law, all goods cast upon land by the sea, and so left as to belong not to the jurisdiction of admiralty, but of the common law. By an ancient English statute, long since repealed, if any, either man or animal, escaped alive, there was, legally speaking, no wreck. Wreck belonged to the crown, but the rule is now, both in England and the United States, that it may be claimed by the owner within a year and a day, and afterward may be sold and the proceeds held by the government. For the compensation paid sailors, see SALVAGE.

WREDE, KARL PHILIPP, Prince of, a Bavarian field-marshal, was born at Heidelberg, April 29, 1767. Belonging to a noble family, he early obtained official employment, and in 1792 was assessor to the high court of Heidelberg; in 1793, was elected "civil commissary" in the palatinate, and in this latter capacity accompanied for five years the armies of Wurmser, duke Albert, and the archduke Charles, in Italy and Germany; and frequently took a direct share in military operations. In 1799 his military career may be said to have commenced by his leading a body of Bavarian volunteers to join the archduke Charles, and for his distinguished conduct in that campaign he obtained, May 15, 1800, the grade of maj.gen. After the peace of 1800, he devoted much time and labor to the organization of the Bavarian army; and, when war was renewed, found himself at the head of the Bavarian contingent, well disciplined and thoroughly equipped, fighting side by side with his former foes the French, and took a prominent part in most of the campaigns against the Austrians, Prussians, and Russians till 1813. But after the retreat from Russia, offended at some real or fancied insults which had been offered to him, he returned to Munich, joined the anti-French party, which was headed by the queen and crown-prince; and, though his intrigues were put a stop to by the victories of Lützen and Bautzen, he soon after succeeded in bringing about the treaty of Oct. 8, 1813, by which Bavaria joined the coalition against France, and, before the end of the same month, was at the head of 70,000 men. Attacked by Napoleon with an inferior force, he was, after a bloody and protracted contest, defeated at Hanau. He was chosen soon after to command the fourth corps of Schwarzenberg's army, and though unsuccessful in most of his petty conflicts, contributed considerably to the successful advance on Paris. His services were rewarded by the dignities of field-marshal (March 7) and prince (June 9, 1814), and by the gift of the domain of Ellingen. On the brief renewal of the contest during the "hundred days," Wrede was preparing to invade Lorraine, when the battle of Waterloo put an end to the strife. After this period, Wrede was employed on many important missions,

and was charged with the pacification of Rhenish Bavaria during the revolution of 1830. He died at Ellingen, Dec. 12, 1838.

WREN, Sir CHRISTOPHER, a renowned English architect, was born at East Knoyle, in Wiltshire, on Oct. 20, 1632. His father, Dr. C. Wren, was dean of Windsor, and his uncle, Dr. M. Wren, was bishop successively of Hereford, Norwich, and Ely. At an early age, young Wren was placed at Westminster school, under the celebrated Dr. Busby, and while yet only in his fourteenth year, was entered a gentleman-commoner of Wadham college, Oxford. Here he made considerable progress in mathematical studies, and attracted the notice of the cultivators of physical science—whether resident at the university or visitors—by his inventions of certain mathematical instruments, and his general zeal, and enthusiasm in the pursuit of experimental philosophy. In 1650 he took his degree of B.A., and in 1653, that of M.A., having been previously made fellow of All Souls. He now also became a member of a society established at Oxford for the improvement of natural and experimental philosophy; and in 1654 is spoken of by Evelyn, in his *Diary*, as "that miracle of a youth;" also, in his *Sculptura*, as "that rare and early prodigy of universal science." The acquaintance thus begun, ripened into a firm friendship between Wren and Evelyn.

In 1655 Wren greatly assisted in perfecting the barometer, then only recently invented. In 1657 he left Oxford for London, where he became Gresham professor of astronomy. In May, 1661, however, he returned to Oxford, as Savilian professor of astronomy. The same year he received the degree of D.C.L. Before leaving London, Wren had in conjunction with lord Brouncker, the Hon. Robert Boyle, Mr. Bruce, Dr. Wilkins, sir Robert Moray, and others, who used to meet together at Gresham college, laid the foundation of the future Royal Society. Before the society was formally incorporated, the members felt much the absence of Wren from their meetings, and one of their first proceedings was to get the king to lay his commands upon him to perfect a design he had in hand of a globe of the moon, and to "proceed in drawing the shapes of little animals as they appear in the microscope." The lunar globe was finished, much to the satisfaction of his majesty, who placed it in his cabinet of rarities. He also summoned Wren from Oxford to assist sir John Denham with his advice on architectural subjects; the poet Denham having been appointed surveyor-general of his majesty's buildings, but possessing little or no knowledge of the subject.

The study of architecture was one to which Wren had given great attention, while still a very young man, notwithstanding his devotion to mathematics, astronomy, chemistry, and even anatomy. In 1663, in his capacity of assistant surveyor-general, he was offered a large salary to go to Tangier, to survey and direct the works at the mole, harbor, and fortifications; but this commission he declined. In the same year Wren was engaged by the dean and chapter of St. Paul's to make a survey of the cathedral, with a view to certain projected repairs in that vast fabric. He accordingly drew up a very careful and elaborate account of the state of the building, with suggestions for its improvement and accompanying drawings and designs. All of these were laid before the king; but before any further steps were taken for the restoration of St. Paul's, that building was leveled to the ground by the memorable fire of 1666, and Wren was destined to be the architect of the new cathedral, instead of the restorer of the old. The first work actually built from a design by Wren was the chapel at Pembroke college, Cambridge, in 1663. But in the same year he designed the Sheldonian theater at Oxford, which was commenced in 1664, and finished in 1669. In 1664 Wren also designed some valuable additions to the buildings at Trinity college, Cambridge; particularly the beautiful western quadrangle known as Nevile's court. To this he added, in 1666, the library of Trinity college, said by Gwilt to be "one of his finest productions, and one with which he himself was well satisfied. It consists of two orders; a Doric arcade below, open to a basement supported by columns, which has a flat ceiling. . . . The principal story is decorated with three quarter columns of the Ionic order, well proportioned."

In 1665 Wren visited Paris, where he made the acquaintance of Bernini, architect of the Louvre, and of other distinguished men. In the following year he returned to find the royal society earnestly engaged in searching out the causes of the great plague, so soon to be succeeded by the great fire which laid London in ashes. This disaster at once opened a wide field for the exertion of Wren's genius. He formed a plan, and drew designs for the entire rebuilding of the metropolis, embracing wide streets, magnificent quays along the banks of the river, and other well-considered improvements. In rebuilding London, however, few of Wren's recommendations were adopted. He was certainly chosen to be the architect of new St. Paul's, one of the finest non-Gothic cathedrals in the world; besides which, he designed more than 50 other churches in place of those destroyed by the fire. The great church of St. Paul, built on the model of St. Peter's at Rome, was begun in 1675, and completed in 1710, when the last stone was laid upon the lantern by the architect's son, Christopher. Besides the numerous churches mentioned, Wren built the royal exchange, London, in 1667; custom-house, London, in 1668; Temple Bar in 1670; the monument, in 1671–77; the college of physicians in 1674–98; the royal observatory, Greenwich, in 1675; the gateway tower, Christ church, Oxford, in 1681–82; Chelsea hospital, 1682–90; Ashmolean museum,

Oxford, 1683; Hampton court, 1690; Morden college, Blackheath, 1692; Greenwich hospital, 1696; Buckingham house, 1703; Marlborough house, 1709; the towers at the w. front of Westminster abbey in 1713; besides the unfinished palace of Winchester, in 1683.

In 1672 Wren received the honor of knighthood. In 1674 he married Faith, daughter of sir John Coghill, by whom he had a son, Christopher, who survived him; and his wife dying, he married, in 1679, Jane, daughter of viscount Fitzwilliam, by whom he had issue, a son and daughter. In 1680, Wren was elected president of the royal society. In 1684 he was made controller of the works at Windsor castle; and in 1685 he was elected grand master of the order of freemasons. He was also elected a member of the house of commons for New Windsor in 1689, and being unseated on petition, was immediately re-elected for the same place. In 1698 he was appointed surveyor-general of the works and repairs at the abbey of St. Peter, Westminster; and in the same year, was again elected grand master of the freemasons. Wren died in his chair after dinner, Feb. 25, 1723, aged 90 years, and was buried in St. Paul's cathedral, where the appropriate inscription of "*Si monumentum requiris, circumspice,*" marks his tomb. During his declining years, he was treated with neglect, and even injustice, by the court of England; "one Benson" was appointed by George I. to supersede him in the office of surveyor-general; and some private individuals carped at his works in a most malevolent spirit. Steele, however, vindicated the fame of his friend in the *Tatler*, in which Wren is introduced in the character of Nestor; and few have been found since that time hardy enough to call in question the well-merited reputation of sir Christopher Wren as a distinguished architect, mathematician, and scientific observer.

WREN, *Troglodytes*, a genus of birds of the creeper family *certhiadæ*, having a slender, slightly curved, and pointed bill, the edge of the mandibles entire; the wings very short and rounded; the tail short, and carried erect; the legs slender, and rather long. Their plumage is generally dull. They are natives chiefly of the northern hemisphere, and most of them are American. They live on or near the ground, seeking for insects and worms among low bushes, and in other similar situations. The COMMON or EUROPEAN WREN (*T. vulgaris*) is found in all parts of Europe, and in the n. of Asia. It is more abundant in the northern than in the central and southern parts of Europe, and is found even in the Arctic regions. It is a very small bird, only about 4 in. long, reddish-brown above, with narrow transverse streaks of dark brown, yellowish-white below, the greater wing-coverts with three or four small bead-like spots of white. From its peculiarity of form, and its active, lively habits, it is one of the most familiarly known of British birds. It frequents gardens, hedges, and thickets. Its flight is not long sustained; it merely flits from bush to bush, or from one stone to another, with very rapid motion of the wings. It sometimes ascends trees, nearly in the manner of creepers. The male has a loud sweet song. The nest is large for the size of the bird, oval, domed above, with an opening on the side, and is composed of hay or moss, lined with feathers, and generally of materials such that it resembles in color the objects beside it, and is not easily discovered. It is often placed under the thatch of a building, under the turf of a turf-topped wall, against the side of a moss-covered tree, or under an impending bank, always so as to be sheltered from rain. The eggs are usually from 7 to 10 in number, and the male is assiduous in his attentions to the female in supplying her with food during incubation, and afterward assists her in the care of the young. Two broods are produced in the season. In severe winter weather, a number of wrens often take shelter together in an old nest or in a hole of a wall; sometimes they roost in byres, to enjoy the warmth proceeding from the cattle. When driven from bushes, the wren is easily run down; and the hunting of wrens on St. Stephen's day is an old custom in the s. of Ireland. In general, however, the wren is almost as much a popular favorite in Britain as the redbreast. The name *Kitty Wren* is popularly given to it in many parts of the country.—The North American species of wren are numerous; some of them, however, have recently been placed in new genera.—The HOUSE WREN (*T. ædon*) is larger than the European wren, being about 5 in. long. It is reddish-brown above, barred with dusky, and pale fulvous white below, with a light brownish tinge across the breast. It is abundant in the eastern parts of the United States. It is less shy than the European wren, and often builds its nest near houses, and in boxes prepared for it. The nests are made to fill the boxes; and to effect this, a large mass of heterogeneous materials is sometimes collected. The song of the house wren is very sweet. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself, as the blue-bird and swallows, and taking possession of the boxes which they have appropriated for their nests. It even attacks cats when they approach its nest.—The WINTER WREN (*T. hyemalis*), is so similar to the European wren, that it is not easy to state a specific difference. It is common throughout North America, from Labrador to Louisiana, and partially migratory. Several other species are common in North America, as the CAROLINA WREN (*Troglodytes* or *thryophorus ludovicanus*) and the MARSH WREN (*Troglodytes* or *cistophorus palustris*), both of which are found chiefly in the vicinity of water. All of them agree very nearly in their habits with the common wren. See illus., BIRDS, fig. 1; LARKS, ETC., fig. 25.

WREX'HAM, a municipal and parliamentary borough in Denbighshire, and one of the most important towns in North Wales, 12 m. s.w. of Chester, on an affluent of the Dee. The town is handsome and lively, and the church, a handsome edifice in perpendicular, was built about the year 1470, though its tower, 135 ft. in height, was not completed till 1500. In the vicinity are several collieries, which, together with lead-mines, iron-works, paper-mills, and breweries, give employment to the inhabitants. It is also of very considerable importance on account of its markets and fairs. Pop. '81, 10,928; '91, 12,552.

WRIGHT, a co. in central Iowa; 576 sq. m.; pop. '90, 12,057, chiefly of American birth. Co. seat, Clarion.

WRIGHT, a co. in central Minn., bounded on the n.e. by the Mississippi river, and on the s.e. by the Crow river; about 684 sq. m.; pop. '90, 24,164, chiefly of American birth. Co. seat, Buffalo.

WRIGHT, a co. in s. Mo.; about 700 sq. m.; pop. '90, 14,484, chiefly of American birth. Copper and lead are found. Co. seat, Hartville.

WRIGHT, CARROLL DAVIDSON, economist and statistician, b. in New Hampshire, 1840, began to study law in 1860 but his course was interrupted by the war in which he served first as a private and finally as a colonel. Resuming his studies in Boston in 1865, he was soon admitted to the New Hampshire bar. After serving two terms in the Massachusetts senate, to which he was elected in 1871, he was chief of the bureau of labor statistics of Massachusetts from 1873 to 1888, and in the meanwhile superintended the state censuses of 1875 and 1885. In 1885 he was appointed U. S. commissioner of labor and, while in this office, has superintended the publication of a large number of very valuable documents relating to all phases of the labor question. In 1895 he was appointed to the chair of political science in the Catholic University of America, at Washington. Besides the official publications of the department of labor, including the reports and the bulletins, he has written, *The Industrial Evolution of the United States* (1895).

WRIGHT, ELIZUR, b. Conn., 1804; graduated at Yale in 1826. He was professor of mathematics and natural philosophy at Western Reserve college, 1829–33, when he settled in New York, where he was for 5 years secretary of the anti-slavery society, editing within that time 2 anti-slavery periodicals, *Human Rights* and the *Quarterly Anti-Slavery Magazine*. He went to Boston, 1839, and edited the *Massachusetts Abolitionist*, the *Chronotype*, and its successor, the *Commonwealth*. He was state insurance commissioner of Massachusetts, 1858–66. He took a very active part in the discussions on life insurance. He published a translation of La Fontaine's *Fables* in 1841. He was a prominent member of the liberal league. He d. 1885.

WRIGHT, FANNY. See D'ARUSMONT, FRANCES.

WRIGHT, HORATIO GOVERNEUR, b. Conn., 1820; graduated at West Point, and was appointed to the engineers. He was assistant professor of engineering at West Point, 1842–44, and was commissioned maj. in 1861. At the first battle of Bull Run he was Heintzelman's chief engineer; commanded the 2d brigade in the expedition to Port Royal, and was head of the expedition to which Fernandina, Fla., surrendered in 1862. The next year he led a division of the army of the Potomac at Gettysburg. He commanded the 6th corps during the Richmond campaign; went through the Shenandoah campaign, and was wounded at Spottsylvania and Cedar creek. He served through the war, attaining the rank of maj.-gen.; chief U. S. corps engineers, 1879; retired, 1884.

WRIGHT, JOSEPH, 1756–93; b. N. J. In 1772 he went to England; studied art there and had some success as a portrait painter. Among his sitters was the prince of Wales. After his return to this country he painted three portraits of Washington, was the designer of the first national coins, and the first draughtsman of the U. S. mint.

WRIGHT, SILAS, 1795–1847; b. Mass.; educated at Middlebury college, and called to the bar. He began practice in Canton, N. Y., in 1819. The next year he was elected surrogate, and in 1823 he became a democratic member of the state senate, where he opposed the policy of DeWitt Clinton. He sat in congress, 1827–29, and approved the protective tariff of 1828, though at a later period he favored a tariff for revenue only. A motion to appoint a committee to investigate the expediency of abolishing slavery in the District of Columbia received his vote. He was comptroller of New York, 1829–33, when he was elected to the U. S. senate, where he remained till 1844, when he was elected governor of New York. During his service in the senate he supported Henry Clay's compromise bill, and Jackson's removal of the deposits from the U. S. bank, the re-charter of which he opposed. He voted against Calhoun's motion not to receive a petition for the abolition of slavery in the District of Columbia, and against the Rives resolution in 1838, denying the right of the states to meddle with slavery in the territories. He favored the annexation of Texas, and voted for the tariff of 1842. He declined several offices from Tyler, and the secretaryship of the treasury from Polk. He failed of a re-election as governor in 1846.

WRIGHT, THOMAS, an English antiquary and historian, was b. near Ludlow, in 1810, and was educated in the grammar-school of that town. From school he proceeded to Trinity college, Cambridge, where he took his degree of B.A. in 1834, and subse-

quently that of M.A. At an early age Wright showed considerable literary talent, and while still at the university, contributed to *Fraser's Magazine*, the *Gentleman's Magazine*, the *Literary Gazette*, and other periodicals. In 1835 he came to London, and at once commenced the career of a man of letters; and from that time till his death he was continually before the public in the capacity of author, editor, or translator. In 1837 he was elected a fellow of the society of antiquaries; and in the following year published his first considerable work, entitled *Queen Elizabeth and her Times* (2 vols. 8vo). In this year also he was one of the two founders of the Camden society, for which he edited various works at different times, such as the *Latin Poems of Walter Mapes*, *Letters on the Dissolution of the Monasteries*, etc. He was also for some years honorary secretary of the Camden society. In 1843 Wright, in conjunction with his friend, Mr. Roach Smith, founded the British archæological association. He also took an active part in the formation of the Percy and Shakespeare societies, and for each of these, from time to time, edited volumes. Upon the death of the earl of Munster, in 1842, Wright was elected to succeed him as corresponding member of the institute of France, an honor never before attained by one so young. There were several candidates; but Wright was chosen by a large majority, among whom were two ministers of state, MM. Guizot and Villemain. Wright was also a member of the society of antiquaries of France, of the ethnological society of Paris, of the Royal society of northern antiquaries of Copenhagen, and of other learned societies on the continent and in America.

Of Wright's various works—said to exceed 100 volumes in number, including, of course, translations and works edited for societies—the following may be regarded as the principal: *Biographia Britannica Literaria*, 2 vols., of which the Anglo-Saxon period appeared in 1842, and the Anglo-Norman in 1846; *Essays on Subjects connected with the Literature, Popular Superstitions, and History of England in the Middle Ages* (2 vols. 1846); *The Archæological Album, or Museum of National Antiquities, the Illustrations by F. W. Fairholt* (1845); *England under the House of Hanover, Illustrated from the Caricatures of the Day* (2 vols., 1848); *Narratives of Sorcery and Magic* (2 vols. 1851); *History of Ludlow* (1852); *The Celt, the Roman, and the Saxon: a History of the Early Inhabitants of Britain down to the Conversion of the Anglo-Saxons to Christianity* (1852; 2d ed. 1861); *History of Ireland* (3 vols. 1854); *Wanderings of an Antiquary* (1854); *Cambridge University Transactions* (2 vols. 1854); *Dictionary of Obsolete and Provincial English* (2 vols 1857); *History of France* (3 vols. 1856–1862); *Guide to the Ruins of the Roman City of Uriconium, at Wroxeter, near Shrewsbury* (1859); *Political Poems and Songs relating to English History, composed during the Period from the Accession of Edward III. to that of Richard III.* (2 vols. 1859–61). These volumes form part of the series of works published, under the direction of the master of the rolls, in illustration of the mediæval history of England; *Les Cent Nouvelles Nouvelles* (2 vols. 1858), being a collection of mediæval tales from the only known manuscript of the same, discovered by Wright in the library of the Hunterian museum, Glasgow; *Essays on Archæological Subjects* (2 vols. 1861); *History of Domestic Manners and Sentiments in England during the Middle Ages, with Illustrations by F. W. Fairholt* (1861); *A History of Caricature and Grotesque in Literature and Art, with Illustrations by F. W. Fairholt* (1865). To these may be added his *Womankind in Western Europe* (1869); *Uriconium: a Historical Account of the Ancient Roman City* (1872); and his translations of Pauli's *King Alfred*, and of Napoleon's *Julius Cæsar*. He died Dec. 23, 1877.

WRIGHT, William, ph.d., ll.d., b. Bengal, India, 1830; educated at St. Andrew's and Halle universities; became deeply learned in the oriental languages, and was made professor of Arabic in University college, London, 1855; in Trinity college, Dublin, 1856; and in Cambridge, 1870. From 1860 to 1870 he was employed as assistant in the manuscript department of the British Museum. He received the degree of ll.d. from Cambridge, Dublin, Edinburgh, and St. Andrew's, and ph.d. from Leyden. He published several translations from the Arabic and Syriac; among others the *Apocryaphal Acts of the Apostles*, and the *Book of Jonas in four Oriental Versions;* also a grammar and text-books of the Arabic. He died in 1889.

WRIGHT, William Aldis, b. England, 1836; educated at Cambridge and became librarian of Trinity college. He contributed many articles to Smith's *Dictionary of the Bible*, and has edited Bacon's *Essays*, *The Bible Word-Book*, Chaucer's *Clerke's Tale*, and Robert of Gloucester's *Metrical Chronical*. He was also co-editor with W. G. Clark of the Cambridge and Globe editions of Shakespeare. He was vice master of Trinity college (1888).

WRIGHT'IA, a genus of plants of the natural order *apocynaceæ*, containing some of the greatest twining shrubs of the East Indies, such as, attaching themselves in the first instance to trees for support, become themselves at last of tree-like thickness, as well as height, and kill the supporting trees by their choking embrace. The corolla is salver-shaped, with scales in its throat; the fruit consists of two erect follicles. The leaves are simple, generally ovate, or nearly so. The timber of some species, as *W. mollissima* and *W. coccinea*, is valuable. *W. antidysenterica*, a native of Ceylon, yields Conessi Bark, a valuable astringent and febrifuge; *W. tinctoria*, common in many parts of India, yields excellent indigo, and was strongly recommended for cultivation on this account by Dr. Roxburgh, the produce being large, and the plant less dependent on rain than the species of *indigofera*.

WRIT is a general term much used in the law to denote a formal document proceeding in the queen's name, or the name of a judge or other officer of the law. Such is a writ of summons commencing an action at law. In nearly all actions and proceedings, writs of various kinds are issued, which are named from the nature of the particular act to be done.

A writ is issued by a court or some other competent authority, sealed and signed by the clerk of the court or other proper officer, and directed to the sheriff or other person authorized to execute it. It may issue at the beginning of or during an action. Writs are *original*, beginning proceedings; or of *mesne process*, during proceedings; or of *execution*, making operative the judgment of the court. Many of the old common-law writs have been abolished. Most important are the writs of *habeas corpus*, of *certiorari*, and of *error*.

WRITER, a term vaguely applied in Scotland to a law practitioner or his clerk; in provincial towns more definitely to a law agent practicing before the sheriff, and acting as factor in the management of private affairs.

WRITER TO THE SIGNET, or CLERK TO THE SIGNET, the name of an important body of legal practitioners in Edinburgh, who derive this designation from having been originally clerks in the office of the secretary of state, where the different writs that passed under the king's signet were prepared. Act 1537, c. 39, establishing the college of justice, mentions the clerks to the signet as a previously existing body; and though no charter of incorporation is extant, the society is considered entitled to all the privileges of a corporation. The keeper of the signet, an officer appointed by the crown, appoints one of the members of the society of writers to the signet his deputy, who is in use to preside at meetings of the society, and along with certain other members named by him as commissioners to manage its affairs. Admission to the society must be preceded (1) by attendance during two different sessions, or two full winter courses of lectures on the faculty of arts of a Scottish university; (2) by a five years' apprenticeship; (3) by attendance on four courses of law in the university. Previous to admission the candidate is examined in scholarship and in law. The whole expense of admission to the society, including the apprentice fee of £200, is £410, 15s. 6d. The writers to the signet have long been the principal body of law agents practicing before the supreme courts of Scotland; and the individual members of the body are also entitled to practice before the sheriff court in all matters which have been transferred by statute from the supreme courts to the sheriff court, as proceedings in bankruptcy. They possess the exclusive right of preparing the warrants of charters of land flowing from the crown, of signing summonses citing parties to appear in the court of session, and all other writs that pass the signet, as diligences for affecting the person or estate of the debtor. A very considerable proportion of the conveyancing business of Scotland is in their hands, and they are largely employed as factors in the management of private affairs. Most of them are notaries public. They possess a large and valuable library.

Act 36 and 37 Vict. c. 63 has transferred to a newly-created body, called "law agents," the exclusive right of practicing before both the supreme and the inferior courts of Scotland. Admittance to this body must be preceded by a five years' apprenticeship, which if entered on after 1873 must be under an indenture duly recorded and intimated to an officer, called the registrar of law agents, within six months from its commencement. A three years' apprenticeship is to be held sufficient in the cases of a person who has been five years clerk to a law agent, is a graduate in law or arts, an advocate in Scotland or barrister in England, or an enrolled attorney or solicitor in England. The applicant is admitted by the court of session after an examination by examiners appointed by the court. Persons who prior to Feb., 1874, were members of the society of writers to the signet, or of the society of solicitors before the supreme courts, or procurators before the inferior courts, are entitled on application to be enrolled as law agents. For three years, from Aug., 1873, the qualifications for admission are relaxed in favor of persons in course of qualifying as procurators, under the procurators act, 1865. Before being allowed to practice before the court of session or any inferior court, a law agent must subscribe the roll of that court. Any law agent may on application to the court of session be admitted a notary public.

WRITERS' CRAMP, or SCRIVENERS' PALSY, is a peculiar kind of local spasm, in which every attempt to write instantly calls forth uncontrollable movements in the thumb, the index and middle finger, so that the pen starts up and down on the paper, and instead of a legible handwriting a mere scrawl results. "The more," says Romberg, "the patient persists in his attempt, the more the difficulty of using his pen increases; and to the visible and sensible contractions of the muscles of the thumb, contractions of the fore-arm, and even of the upper-arm, are often superadded. Abnormal sensations, especially of a sense of weight and constriction of the hand or of pain extending from the upper arm to the back, are occasionally present. It is diagnostic of these attacks that they are instantly arrested when the individual ceases writing, and that the hand is capable of every other combination of movements and exertions."—*The Nervous Diseases of Man*, vol. i. p. 320. The disease is chiefly confined to middle age, and scarcely ever occurs in women; and there can be no doubt that an occupation entailing much writing predisposes to it, the quality of the paper or of the pen having nothing to do with

it. The treatment hitherto pursued, both local and general, has, according to Romberg, been "invariably ineffectual." This is, however, too strong a term, since he mentions a case in which Stromeyer applied the principle of division of the muscles to the cure of writers' cramp, and in one case a brilliant result justified the antispasmodic reputation of tenotomy; the patient being perfectly able to write as early as the fourteenth day after the subcutaneous division of the tendon of the long flexor of the thumb." The same operation was, however, several times performed by Diffenbach without success. In some cases, judicious treatment, combined with entire cessation of writing for a considerable time, has led to satisfactory results. Galvanism and the use of strychnia, iron, or conium, have also proved useful.

WRITING is the art of fixing thoughts in a palpable and lasting shape, so as to make them known to others. There are two principles employed in this process, either separately or jointly—viz., ideographism and phonetism. An ideograph is either a picture of the object the idea of which is to be conveyed, or, at a later stage, some symbol which stands, by common consent, for the object, in which case it is called symbolism. Phonetism, on the other hand, is either syllabism—i.e., a combination of consonants and vowels which form a word, or component parts of it—or alphabetism, a system that further breaks up the syllables into their single component parts of vowels and consonants. All systems of writing seem to have originated in ideographism, and to have gradually arrived at phonetism. The pictorial mode of ideography gradually led, as indicated, to the symbolical mode. The former, also called kyriological (Gr. *kyrios*, principal, proper, the opposite of metaphorical or symbolical) writing, contents itself with representing only bodily things, either by fully or partly depicting them, or by merely indicating them by some special characteristic. The latter—the symbolical mode—represents abstract things in accordance with their similarity to corporeal subjects, as in the hieroglyphs of later Egyptian times. Examples of the real delineations of the subjects, or parts of them, which have been replaced by conventional signs, we find at an early period in Egypt, as well as with the Aztecs, with the primitive Assyrians, in ancient China, and in Guiana. Phonetism here no longer aims at a delineation of subjects or symbols, but of the sounds by which these objects are conveyed to the mind. The first step in phonetic writing is, as we said, the syllabic, which by degrees becomes alphabetical. Difficult though it be in many instances to fix accurately the original ideographic meaning of many of the letters now in use, there is yet absolutely no doubt as to their having once been mere pictures of certain things to which a meaning was attached, the sound of which was in some shape connected with the present value of the letter. Our knowledge of Phenician, whence our alphabet is directly derived, and of its cognate dialects, enables us, in many instances, to trace them back to their primitive source. Thus, our *A* was originally depicted as the head of an *ox*, a likeness to which may still be traced in its Phenician form, and its name (aleph = ox) has still survived in Hebrew and Greek (aleph or alpha). This process of the gradual change of a picture into a character is most clearly traceable in the various stages of Egyptian hieroglyphics, which, when written more cursively, assumed such different shapes (in hieratic and demotic respectively), that often there remains scarcely a likeness between different forms of the same characters. Among the ideographic methods there are some, however, which scarcely seem to deserve the name of writing, in the ordinary sense. Such are the Peruvian quippos, or knots, which, by changes in color, size, arrangement, and the rest, indicate a certain special sequence of ideas; further, the "khernus," or sticks, which, before the introduction of their present alphabet, the Tartars used to circulate among their tribes, to indicate the number of men and horses to be used for some special expedition. Similar to the Peruvian quippos was (according to the celebrated Chinese work, *I-king*) also the primitive Chinese mode of writing; while the Scandinavian and Germanic runes rather remind of the Tartar staves. Of a more advanced stage appears the Mexican pichne-writing, a system by which single syllables or words were expressed by phonograms. The Chinese system appears to combine both the ideographic and phonetic characters; but there is scarcely a doubt that even the phonetic signs are derived from ideographic ones. The step to the alphabetic system, however, was never taken by the Chinese.

When and how our present alphabet was invented has been matter of speculation from the earliest times. The myths of antiquity ascribed it to Thoth (q.v.) or to Cadmus, which only denotes their belief in its being brought from the east (Kedem), or being perhaps primeval. The Talmud ascribes it to a special revelation. It has been a question whether there were several original alphabetical systems, or whether one is to be assumed as having given rise to the various modes of writing now in use. Thus, three principal sources—Semitic, Chinese, Indian—are given by Klaproth. It is, however, now agreed on all hands that it is the Phenician character, as we now know it, to which we directly owe our own. See PHENICIA. From it many streams have flowed out. The principal of these appear to have been—first, the Semitic, in which the values of the letters have remained almost identical with those of the original Phenician, with exception, perhaps, of a few sounds added to them in Persian, for the purpose of expressing certain Indo-Germanic sounds not existing in Phenician. This class has further been subdivided into Hebræo-Samaritan and Aramaic, the latter embracing the

square or modern Hebrew, which is closely allied to the Palmyrene, the Estranghelo or Syriac, the Sabian, the Arabic in its different forms, the Mongol, the Pehlvi, Armenian, etc. The second or central division embraces the writing of Greece, Asia Minor, and Italy, from the Æolo-Doric, Etruscan, Umbrian, Oscan, and other but little known kinds, to the late Pompeian Graffiti. A further group would include the "Indo-Homerite" characters, and seems to have originated in central Arabia, whence it appears to have spread to Africa and India, where the Magadhi—the oldest variation the Phenician assumed here—gave rise to the five families of Devanaghari, Pali, Dravidian, Oceanian, and Thibetan. See PALEOGRAPHY.

Yet, when we speak of the Phenician as being the mother of all our known alphabets, we must not be understood finally to ascribe to the Phenicians the original invention of it in the first instance. We shall only indicate here that the theory to that effect, held by Gesenius and others, will probably, sooner or later, have to give way to the more recent results of De Rougé's investigations, who, with great show of probability, believes it to have been borrowed, or rather adapted from certain archaic hieroglyphics of Egypt. It would appear as if at some very archaic period the Phenicians had borrowed the hieratic signs then in use; as, indeed, the *prisse papyrus*, the oldest in existence, exhibits striking similarities with the Phenician characters. Instead, however, of simultaneously taking the Egyptian names for these characters, they invented new ones according to their own fancy, and to the supposed similarity of the characters to some particular thing. The Egyptian origin of the Phenician character, as confirmed by further researches, (see Taylor, *The Alphabet*, 1883), was affirmed of old by Tacitus (*Annal* xi, 14)—a curious case of old tradition verified.

We have in the course of this work treated at full length several points of this subject. See HIEROGLYPHICS, CUNEIFORM, ALPHABET, etc. We may therefore, for a fuller elucidation of the details, refer to those articles. We shall only add in this place that the manner of writing is very different with many nations. The Mexican picture-writing begins at the bottom; the Chinese and Japanese, as well as the Mongols, write in columns beginning from the top, and going from right to left. The Egyptian hieroglyphics have no fixed direction; but the hieratic and demotic, though the single letters are formed from right to left, always run from left to right; as is also the case in Ethiopic, cuneiform, and Indo-Germanic languages generally. The Semitic languages have retained the Phenician mode of writing from right to left—all but the numerals—a mode still retained in archaic Hellenic and Etruscan. By degrees, however, the writer not wishing to return to the beginning of the line, and continuing right underneath the last word penned, a double mode was introduced, called the boustrophedon—as the ox plows. Finally, this too was abandoned, and the direction from left to right was followed. About the many various styles of modification our characters have undergone in the course of time, the punctuation of the words, and the rest, we refer to ALPHABET. The materials and the instruments (see PAPYRUS, PEN, etc.) differed much at various times. Consult Steinthal, *Die Entwickelung der Schrift* (1852); Wuttke, *Geschichte der Schrift* (1872).

WRITING FLUIDS. See INK.

WRITING MACHINES. See TYPEWRITERS.

WRY'NECK, *Yunx*, a genus of birds of the woodpecker family (*picidæ*), having a short, straight, conical beak; a long extensile tongue, with a horny point; wings of moderate size; a rather short and rounded tail; the feet with two toes in front, and two behind. One species, the COMMON WRYNECK (*Y. torquilla*), is a summer visitant of Britain and the n. of Europe. From its appearing at the same time with the cuckoo, it has acquired the name of *cuckoo's mate*. It is common in the s. of England, but very rare in the northern parts of Britain. It is about 7 in. long, of a rusty ash color, irregularly spotted with brown and black. It feeds on caterpillars and insects, and is often seen on the ground near ant-hills, feeding on the ants and their "eggs." The construction of its tongue resembles that of woodpeckers, and enables it to seize its insect prey with wonderful celerity; the tongue is darted out, and retracted, so that the eye can scarcely follow it; the two posterior branches of the bones of the tongue being much elongated, and muscles for its extension attached to them. There is also a long gland on each side of the lower jaw, which secretes a glutinous mucus, so that insects adhere to the horny tip of the tongue. The wryneck generally makes almost no nest, but deposits its eggs on fragments of decayed wood in the hole of a tree. The young birds are easily tamed, and are great favorites with boys. In France, it is common for boys to tie a string to one of the legs of the bird, and to allow it to climb trees in search of insects. It climbs readily on their clothes. The name wryneck is derived from the habit which the bird has of writhing its head and neck quickly in various directions, with an undulating snake-like motion, which it does particularly if found in its hole in a tree, making at the same time a hissing noise, so as to alarm the intruder; but on his drawing back, it suddenly escapes. See illus., LARKS, ETC.

WULSTAN, or WULFSTAN, and sometimes WOLSTAN, a name of interest in connection with Anglo-Saxon history and literature. There are three individuals of the name

especially noticeable. — 1. A monk of Winchester in the 9th c., author of a poem, in Latin hexameters, on the miracles of St. Swithin, which is reputed the best Latin poem of that age produced in England. — 2. An archbishop of York, in 1003, author of two pastoral letters and several sermons in Anglo-Saxon, the most remarkable of which is printed in Hickes's *Thesaurus*, vol. iii. — 3. The well-known bishop of Worcester, and a saint of the English calendar. He was born at Icentum, in Warwickshire, about 1007, and educated at Evesham and Peterborough. He became a priest, afterward a monk, and prior of the monastery of Worcester, and ultimately, in 1062, bishop of that see. He lived through the troubles of the Norman conquest, and enjoyed the favor not only of the conqueror, but of William Rufus, and died in 1095, at the age of 87. He is by some reputed the author of the portion of the Anglo-Saxon Chronicle which extends from 1034 to the death of the conqueror.

WUNDT, William Max, b. Baden, 1832; studied medicine at Tübingen, Heidelberg, and Berlin; was a privat-docent at Heidelberg, 1857, and a prof., 1864. He was called to the chair of physiology at Zurich, 1874, and passed the following year at Leipsic. Among his works are *Die Lehre von der Muskelbewegung* (Studies on the Movement of Muscles), 1858; *Beiträge zur Theorie der Sinneswahrnemung* (Theory of the Perception of the Senses), 1862; *Vorlesungen über die Menschen und Thierseele* (Lessons on the Intellect of Men and Animals), 1863; *Lehrbuch der Physiologie des Menschen* (1865, 4th ed., 1878); *Untersuchungen zur Mechanik der Nerven und Nervencentren* (1871–76); *Grundzüge der Physiologische Psychologie* (1874); *Logik* (1880–83); *Essays* (1885); *Ethik* (1886); *System der Philosophie* (1889); *Hypnotismus und Suggestion* (1892). In 1883 he founded the *Philosophische Studien*.

WUPPERTHAL, a celebrated valley of Rhenish Prussia (q.v.), derives its name from the river Wupper, or Wipper, a small affluent of the Rhine, which rises between the towns of Wipperfürth and Hückeswagen, 26 m. n.e. of Cologne. Its course is first n., then n.w., past Barmen (q.v.) and Elberfeld (q.v.) — the chief town on its banks — then s.w. to its junction with the Rhine between Wiesdorf and Rheindorf, 7 m. below Cologne, after a course of 50 miles. The waters of the Wupper are very abundant, and for the length of its course it supplies motive-power to an extraordinary number (about 400) of mills, of various kinds. It is navigable for small craft below Solingen (q.v.).

WÜRTEMBERG, The Kingdom of, lies in 8° 15′ to 10° 30′ e. long., and 47° 35′ to 49° 35′ n. lat., is bounded on the w., s.w., and n.w. by the Grand Duchy of Baden; e., s.e., and n.e. by Bavaria; and s., for a few leagues, by the lake of Constance and Vorarlberg. Hohenzollern makes a deep indentation into the land from the s., and the entire boundary is very irregular. Detached pieces of territory belonging to Würtemberg also lie in the adjacent countries. Its greatest length, from the village of Simmringen in the n. to the lake of Constance in the s., is 139 m.; and greatest breadth, from the Katzenkopf, in the Black forest, eastward to the castle of Duttenstein in Nerestein, 105 miles. The following table gives the area and the population according to the census in 1895:

Circles (Kreise).	Area in Square Miles.	Population (1895).
Neckar	1,285	697,373
Black Forest	1,845	488,431
Jagst	1,985	398,887
Danube	2,418	496,460
Total	7,533	2,081,151

At the census of 1890 the population was 2,036,522. Würtemberg is fourth in population of the states of the empire, after Saxony and before Baden; but is third in point of size, having a greater area than Saxony.

The capital of Würtemberg is Stuttgart (q.v.). Ulm had (1895) 39,304 inhabitants; Esslingen, 24,031; and Heilbronn, 33,461; but Stuttgart has no rival as to population or importance.

Physical Aspect. — The surface of Würtemberg is composed of terraces of hill and dale, the lowest point being 437 ft. above the sea. In the Black forest circle the mountains attain the highest elevation, the Hornisgrinde rising to 3820 feet. One point of the Swabian Alps is 3327 ft. high. The valleys and plains average 500 ft. above the sea. Rich pastures, cultivated fields, orchards, gardens, hills covered with vines, and mountains with forests, give the most diversified scenery. In the s.e. are extensive peat-lands.

Rivers, Lakes, etc. — The most important rivers are: the Neckar (q.v.), with its affluents; the Danube, which receives the Iller; and the Tauber, a tributary of the Maine. The Neckar and its streams drain 4200 sq. m.; the Danube, 2037; the rivers which fall into the lake of Constance, 714; the Tauber, 315; and other water-courses, 168 sq. miles. The only lake in the interior is the Federsee, near Buchau, in the Danube circle. There is much traffic both by steam and sailing ships on the Neckar, and from Friedrichshaven, on the lake of Constance.

Railways have been constructed to the extent of (1895) 990 English m. from Bruchsal to Ulm, Ulm to Friedrichshaven, Bietigheim to Hall, Canstatt to the Bavarian lines, and from Plochingen by Tübingen and Rottweil into Baden and on to Schaffhausen. There are more than 511 post-offices, which forward 20,000,000 letters, 4,000,000 post-cards, and 22,000,000 newspapers annually. The postal expenditure in 1896–97 was 450,000 marks. Of telegraphs, there were 1500 miles in operation.

Geology, Mineralogy, etc. — The prevailing rocks are granite, gneiss, limestone, and various sandstones. Tourmaline, cobalt, bismuth, silver, malachite, chalcedony, gypsum, copper, rock-crystal, and iron occur. A great variety of fossils have been found. The peat-lands are extensive. Fire-clay of excellent quality, earths for dyeing, and native sulphate of lime, are worked. Building materials, from the granite of the Black forest to the tufa of the Alb valley, abound. Clay-band ironstone, yielding from 30 to 36 per cent. of iron, is worked in eleven different districts, and salt in five. The value of minerals raised in the kingdom in 1894 amounted to 1,088,537 marks. There are many springs of mineral water, those of Canstatt and Stuttgart being much frequented.

The climate is mild and healthy, but in the highlands the winters are long and cold. When w. winds prevail, the cold of winter and summer heat are less than in some countries in the same latitude. The greatest quantity of rain falls in summer. Of the total area about 25 per cent. is occupied by plains or level ground, 46 per cent. is hilly, and 29 per cent. mountain land. The soil is for the most part very fertile and well tilled. The vineyards are chiefly in the Neckar circle and that of the Jagst. The forests, grain, and pasture lands are nearly equally distributed throughout all the circles. Wheat, oats, barley, rye, potatoes, beans, maize, turnips, mangold-wurzel, lucerne, etc., are the principal agricultural products. There are extensive orchards in all parts of the land. Cherries, damsons, walnuts, peaches, apricots, and the more common fruits, are largely grown. Timber is largely grown and exported, especially from the Black Forest regions. Large and small cattle are plentifully reared. Large cattle, which in Würtemberg are generally fed in the stall, constitute the principal export of Würtemberg to Switzerland and neighboring lands. Forestry and the various branches of agricultural science are diligently promoted by numerous technical institutes. The acreage of the state forests, according to a report of 1897, was 418,904. The forests extend over the entire kingdom, and a considerable area is annually sown and planted with trees. At the head of the department of forests is the president and a board of four technical and four administrative officers, and one commander of the guards. The service is on an equal footing with the other branches of the civil service. The private forests of W. cover a somewhat wider area,—namely 528,794 acres. Wine-producing is an important occupation in W., and in 1896 the crop amounted to 11,287,984 gallons from vines covering an acreage of 42,002. During the preceding period of 69 years, from 1827 to 1895, the average product per acre was 570.6 gallons, or 16.3% less than the average product of 1896. In the latter year the import of wine and grapes from foreign countries amounted to only $\frac{1}{14}$ part of the home production.

Manufactures, Industries, etc. — The manufactures are chiefly linen, woolen, cotton, and silk fabrics. Wool and cotton spinning, bleaching, dyeing, printing, iron-founding, making machinery, cutlery, gold and silver articles, glass, porcelain, earthenware, tile, cabinet-work, sawing wood, carriage-building, grinding corn, book-printing, and the cognate trades are principal industries. There are many oil- mills, beer-breweries, and brandy distilleries. Water is to a large extent the motive-power employed in the manufactories and mills. In Würtemberg 3,493,151 hectoliters of beer were produced in 1894–95. The exports are chiefly grain, cattle, wood, salt, oil, leather, woolen, cotton, and linen goods, beer, etc.

Religion, Language, Education, etc. — The population of Old Würtemberg is almost entirely Lutheran. The numbers of each denomination in 1890 will be seen in the subjoined table:

Circles.	Evangelical Lutherans.	Roman Catholics.	Other Christians.	Jews.
The Neckar	595,212	59,607	4,633	5,463
" Black Forest	357,227	121,015	1,631	1,432
" Jagst	275,073	123,696	722	3,494
" Danube	179,136	305,276	465	2,250
Total	1,406,648	619,594	7,451	12,639

In 1895 there were 1,441,240 Evangelical Lutherans; 620,474 Roman Catholics; 7451 other Christians; and 11,887 Jews.

Several dialects of German are spoken, of which the Swabian and Franconian are the most general. Wurtemberg has been the native country of many distinguished men, of whom a few may be mentioned. In poetry, Schiller, Uhland, Wieland, Kerner; in theology and philosophy: Brentz, Œcolampadius, Bengel, Schelling, Hegel, Baur, Strauss, etc.; in science and art: Kepler, Stiefel, Tobias Mayer; the botanists Joseph and Karl Friedrich Gärtner; the chemist Schönbein, the painters Eberhard Wächter, Hetsch, and the famed sculptor Dannecker.

Education is compulsory and there must be at least one public school in every commune. In 1895 there were 2303 elementary public schools, having 4729 teachers and attended by 301,082 persons, 80 *realschulen* with 9120 students, 68 grammar schools, 18 gymnasia, 7 lyceums, and there is a university at Tübingen. In 1892–93, 6,100,000 marks were appropriated by the state to educational purposes. At Hohenheim is an agricultural and botanical institution, in which farming, management of forests, and gardening are scientifically taught. Stuttgart has a polytechnic school which is one of the best institutions of the kind in Germany. There is not in Wurtemberg a person above ten years of age who cannot both read and write.

Revenue, Expenditure, etc.—In 1896–97 the revenue was estimated at 70,900,447 marks, and the expenditure at 71,744,325. The public debt on April 1, 1896, was 468,051,000 marks. Of the revenue, 14,310,840 marks came from commercial revenues, 15,910,050 marks from direct taxes, 15,400,630 marks from customs, etc., and 14,600,130 marks from other indirect taxes. Of the expenditure, 18,334,562 marks went as matricular contribution to the German empire, 20,836,542 marks towards the national debt, and 10,712,022 to purposes of religion and education. The troops of Würtemberg form the 13th corps d'armée of the German empire.

Government, etc.—The crown is hereditary in the male line, and failing that, in the female. Freedom of the press and religion are enjoyed. The privy council consists of a president, the six ministers of state, and members named by the king. The legislative body is composed of two chambers—the first being formed of princes of the royal family, nobles, and members appointed by the king, the last named not exceeding a third part of the whole; the second chamber is composed of 13 representatives of the knighthood, 6 Protestant general superintendents, the bishop and 3 others of the Catholic clergy, the chancellor of the university, 7 representatives from the cities Stuttgart, Tübingen, Ludwigsburg, Ellwangen, Ulm, Heilbronn, and Reutlingen, with a representative from each of the 63 bailiwicks. Members of the second chamber are not eligible as such before reaching their 30th year. The king has the power of proroguing or dissolving the chambers; but in the latter case a new election must take place within six months. As a member of the reconstituted German empire (1871), Würtemberg has 4 votes in the federal council, and 17 representatives in the diet of the empire.

History.—The earliest inhabitants of Würtemberg were probably Celts; but when the Romans came first to know the country, it was held by the Suevi, who were succeeded by the Alemanni and the Franks. In 1090, Conrad, count of Würtemberg, possessed a castle near Cannstatt, and limited territories, which were largely added to by Ulric I. from 1246 to 1265. Other extensions were gained by Eberhard I. between 1279–1325; by Ulric II., who, though a man of peace, added Tübingen; Eberhard II., who secured Teck, Gutenberg, Kirchheim, Herrenberg, and other places. By the marriage of Eberhard IV. with the countess of Montbéliard, that county became connected with Würtemberg. At his death, the possessions were divided between his two sons, each of whom enlarged his portion; and a few years after their death, Eberhard V. secured a reunion, and the land advanced rapidly in power and importance. In 1495, the emperor Maximilian raised Eberhard to the rank of duke, with the title of Eberhard I. In 1519, duke Ulrich, having offended the Swabian league by some arbitrary acts of oppression exercised upon the imperial free city of Reutlingen, was forcibly ejected from Würtemberg, and did not reconquer his estates till 1534. While Eberhard III. was duke (1628–74), Würtemberg suffered much in consequence of the thirty years' war. Ludwig Eugene (1793–1795) having taken part in the war against the French republic, a French army attacked and compelled him to resign Montbéliard, and pay 8,000,000 francs.

With duke Frederick II., who succeeded his father in 1797, the most important period in the history of Würtemberg begins. In 1800, compelled by the French to flee from his dukedom, he got back, by the peace of Lunéville, all his territories except Montbéliard, and instead, had others granted, with the rank of elector. Having aided Napoleon in the war against Austria, at the peace of Presburg (Dec. 26, 1805), Würtemberg was further enlarged, and made a kingdom. After the battle of Leipsic, Frederick abandoned the cause of Napoleon, and concluded a treaty with Austria, in which his lands were guaranteed. His reign was arbitrary; and internal troubles were thickening around him, when he died (Oct. 30, 1816), and was succeeded by his son, William I., who was born at Lubin, in Silesia, Sept. 27, 1781. He was cordially welcomed to the throne, and the expectations of his subjects were realized. His first acts were to reduce the expenditure, and introduce other reforms, prominent among which was the liberal constitution of 1819. In 1848–50, a strong agitation was kept up with the view of obtaining some permanent modifications in this constitution, but without success. For nearly fifty years he reigned over a people steadily increasing in prosperity, and died June 25, 1864, at Rosenstein castle. His son, Charles I., succeeded him, and dying in October, 1891, gave way to William II. See Germany. See illus., Heraldry, vol. VII.

Würzburg, a former sovereign bishopric or ecclesiastical principality of the German empire, was founded in 741 (according to other accounts, 742 or 746), and received

endowments from the Frankish kings, which were afterward increased by the German emperors. The first bishop was Burkhardt, who was consecrated by Boniface. The patron saint was Kilian (q.v.), who is said to have preached the gospel here as early as 688. By good management and economy, the bishops were able to acquire numerous possessions of the neighboring Frankish proprietors; and out of these was gradually formed the extensive sovereign bishopric of Würzburg, ruled over by the prince-bishop as duke of Franconia. The ducal title and authority were first conceded about 1120. In spiritual matters, the bishops were under the archbishop of Mainz. The area of the bishopric was as much as 1827 sq.m., with a pop. of 250,000, and a yearly revenue of 500,000 guldens. At the peace of Lunéville (1801), the bishopric of Würzburg, like the other spiritual principalities of Germany, was secularized; and in 1803, the greater part of it was conferred on the elector of Bavaria as a secular principality. The last prince-bishop received a pension, and died at Bamberg in 1808. At the peace of Presburg (1805), Bavaria gave up Würzburg to the grand duke Ferdinand of Tuscany, and the principality was raised to the dignity of an electorate. In 1806, the elector Ferdinand joined the confederation of the Rhine, and from that time took the title of grand duke of Würzburg. By a decree of the Vienna congress, the grand duke received his hereditary state of Tuscany, and Würzburg reverted to Bavaria (1815). At present the greater part of the bishopric belongs to the circle of Lower Franconia.

WÜRZBURG, capital of the former principality of Würzburg, now of the Bavarian circle of Lower Franconia, is situated in a beautiful valley on both sides of the Main, 60 m. s.e. of the city of Frankfort. The number of inhabitants amounted (1895) to 68,714, of whom 11,000 are Protestants. Among the public buildings, the most distinguished are the episcopal palace or residence, rebuilt 1720–44, one of the most magnificent royal residences in the world; and the spacious and excellently fitted-up Julius hospital, established in 1576. Of the numerous churches, the most worthy of notice are the richly decorated cathedral, which was rebuilt in the 11th and following centuries; the Marien-kapelle, one of the most beautiful monuments of old German art, with 14 statues of the 15th c. by Tilmann Riemenschneider; and the Neumünster church, containing the bones of St. Kilian. The streets adjoining the palace square are wide and straight, but most of the others are narrow and crooked. In front of the Julius hospital there is a bronze statue of the founder, bishop Julius, by Wiedemann, founded in bronze by Miller; a monument of Walther von der Vogelweide (q. v.) stands in a niche outside the Neumünster kirche.

The university of Würzburg was founded in 1582 by bishop Julius, who also founded the hospital above mentioned. The endowments for both institutions were taken from the possessions of the convents that were destroyed during the peasant war (q. v.). In order to promote the study of medicine, the hospital was put in connection with the university, the professors of medicine being made physicians and surgeons to the hospital; this connection has all along kept the medical faculty in high reputation, and promoted the prosperity of the university as a whole. The present medical staff includes several names of European reputation, among others Kölliker (q. v.). All the professors of the theological faculty are thoroughgoing Infallibilists. There is also a faculty of political economy. In 1896–97 there were 82 professors and teachers, and 1365 students. The library contains above 200,000 vols. In the musical institute, any one can receive instruction gratis in singing or in playing on any instrument; and twice a week there are great musical pieces performed. In Würzburg, besides the university, there is a gymnasium, a Latin school, a district agricultural and trade school, a seminary for Catholic priests, and a seminary for training teachers, an orthopedic institution, a veterinary school, a school for midwifery, a swimming school, a society for the improvement of the arts and manufactures, and a female society for the encouragement of skill in arts and handicrafts among women. Besides the Julius hospital, there are asylums for the deaf and dumb and for the blind, and other charitable institutions. The manufactures are woolen stuffs and cloth, mirror-glass, leather, tobacco, railway carriages, and sparkling wines. The fortress of Marienberg, built on the site where Drusus founded a castle, is situated on a hill 400 ft. high, on the left bank of the Main, outside the town. The campaign of the Prussian army of the Main ended with an action fought before Würzburg, July 27, 1866. The fortifications have been demolished. The industry of Würzburg has greatly prospered during the last ten years.

WÜRZEN, a small walled t. of Saxony, 15½ m. n.e. of Leipsic, picturesquely situated and surrounded by romantic valleys, on the Mulde, here crossed by two bridges. Pop. '90, 14,635, employed in brewing, bleaching, weaving, and hosiery-work. It is a station on the Leipsic and Dresden railway.

WY'ANDOT, a co. in n.w. central Ohio ; 404 sq.m. ; pop. '90, 21,722, chiefly of American birth. Co. seat, Upper Sandusky.

WYANDOTS', a tribe of North American Indians, of the Iroquois family, the Hurons of the French writers, who called themselves Wendats or Yendats, first known at Montreal, where, in the middle of the 17th c., they became Roman Catholics under the instructions of the French missionaries. Having, as allies of other tribes, become involved in a war with the Iroquois, they were nearly exterminated, and the remnant emigrated to the country around lake Superior; then gathered at Mackinaw, 1670, under

the care of father Marquette; thence came to Detroit, where they furnished 400 warriors to the English in 1812. In 1829 they were settled, to the number of 600, on the head-waters of the Sandusky river in Ohio; and in 1832, by a treaty with the United States government, removed to Kansas, where the few remaining have acquired the rights of citizenship, each having of their divided lands a farm of 40 acres.

WYANDOTTE, a co. in n.e. Kansas, adjoining Missouri, and bounded on the n. by the Missouri river; 160 sq.m.; pop. '90, 54,407, chiefly of American birth. Co. seat, Kansas City.

WYANDOTTE, formerly the co. seat of Wyandotte co., Kan., but now included in Kansas City (q.v.).

WYANDOTTE, a city in Wayne co., Mich.; on the Detroit river, and the Lake shore and Michigan Southern and the Michigan Central railroads; 12 miles s.w. of Detroit. It is a manufacturing city, with iron furnaces, rolling and flour mills, and iron and steel works, and has a public library, high school, state banks, and weekly newspapers. Pop. '90, 3817.

WYANDOTTE CAVE, in Crawford co., Ind., is over 20 m. long. Its greatest height is about 250 ft., and its greatest width about 300 ft. It is remarkable for the number and beauty of its crystals, exceeding, it is said, even the Mammoth cave in that respect. Among the remarkable features are the "pillared palace," with clusters of stalactites, "monument mountain," 175 ft. high, with 3 massive stalagmites at its top; and the "mammoth hall," 350 by 245 ft.

WYANT, A. H., b. Ohio, 1836; began his career as a landscape painter in Cincinnati. He studied for some years under Hans Gude in Düsseldorf, and afterwards in London, returned to America and settled in New York, 1864. He was one of the early members of the American Soc. of painters in water-colors, was elected an associate of the National acad., 1868, and an academician, 1869. Among his pictures are, "Scenes on the Upper Susquehanna," 1869; "A View on Lake George," 1875; "Gathering Shells," 1876; "New England Landscape," 1878. He excelled as a painter of wild scenery. D. 1892.

WYATT, Richard John, an English sculptor of great eminence, was b. in Oxford street, London, on May 3, 1795. He belonged to a collateral branch of the family which made the name of Wyatt famous during two centuries in connection with architecture and sculpture, sharing their descent from a stock of yeomen long settled at Weeford in Staffordshire. Having the bias of his family towards art he became an articled pupil of Charles Rossi, R.A., sculptor, and afterwards a student of the Royal academy, whose medal was twice awarded to him during his pupilage. He afterwards passed some time in Paris, studying under Bosio; and from Paris, in 1821, he went to Rome, and entered the studio of Canova, where he had Gibson for a fellow-pupil. The remainder of his life was spent in Rome, in complete devotion to the prosecution of his art; and he died at Rome on May 29, 1850. His youth had shown great promise in the estimation of painters like Lawrence and sculptors like Canova; and the works which he produced in rapid succession early placed him in the front rank of English sculptors.

WYATT, Sir Francis, about 1575–1644; b. England; gov. of the colony of Virginia, 1621–26 and 1639–41. He established the first courts of justice.

WYATT, Sir Matthew Digby, an eminent English architect and writer on art, was b. in 1820 at Rowde, near Devizes, Wilts. After his apprenticeship and studying for some time at the Royal academy, he, in 1844, went to the continent and made a diligent study of the architecture of Italy, France, and Germany. He returned to England in 1846, and in 1848 published *Geometrical Mosaics of the Middle Ages.* He not only studied decorative art in his own profession, but also in its various applications. In 1849 he made a report to the society of arts on the Paris exposition of industry; and soon after, as secretary to the royal commissioners, took an important part in the arrangements of the 1851 exhibition. He took a similar interest in the Sydenham Crystal Palace. In 1856 he was appointed architect to the East India company, for whom he designed several important public works—bridges, barracks, and hospitals. In 1865 he was made honorary member of several foreign academies, and in 1866 received the royal gold medal of the Royal institute of British architects. He was knighted in 1869, and in the same year was chosen Slade prof. of fine arts at Cambridge. His chief art publications are, *Metal Work and its Artistic Design* (1852); *Industrial Arts of the Nineteenth Century* (1853); *Art Treasures of the United Kingdom* (1857); *Fine Art* (1870); *Architect's Handbook in Spain* (1872). He died in May, 1877.

WYATT, Sir Thomas, was born in 1503, at Allington castle in Kent. His father, sir Henry Wyatt, of a family originally of Yorkshire, stood high in favor with Henry VII.; and not less so with Henry VIII., who succeeded him. In 1515 the young Wyatt was entered at St. John's college, Cambridge, where in due time he took his degrees of bachelor and master of arts. While still very young, he was married to Elizabeth Brooks, daughter of lord Cobham. Through his father's influence, a career at court was open to him. In this sphere he was thoroughly well qualified to succeed; he was one

of the most accomplished men of his day; of a noble presence and fine manners, and withal dexterous and subtle in the management of affairs, though of unimpeached honor and integrity. In 1536 he received at the hands of the king the honor of knighthood, and the next year he was made high sheriff of Kent. Though necessarily involved in much perilous court intrigue, he continued—though once or twice in some hazard of losing it—to retain the favor of the king, and was frequently employed by him in positions of trust and importance. His chief service was rendered as English ambassador at the court of Charles V., in which capacity he acquitted himself with much diplomatic tact and skill. In 1542, in token of the king's appreciation of his services, he received a grant of lands at Lambeth; and the year after, he was named high steward of the king's manor at Maidstone. He had now very much withdrawn himself from public life, and lived for the most part retired at Allington. On Oct. 11, 1542, he died at Sherborne, of a fever contracted, it is said, on an over-hasty journey caused by a sudden summons to attend the king.

Among the other accomplishments of Wyatt was that of verse, which he seems to have begun to cultivate early, and continued through life to practice. During his life he had acquired considerable reputation as a poet; and in 1557 his poems, along with those of the celebrated Surrey, were published in London. As marking a stage in the progress of our early literature, they hold a permanent place. His love poetry is somewhat overrun with conceits derived from the study of Italian models; but some of the shorter pieces are models of grace and elegance. His satires also possess very considerable merit. More lately, in 1815, an edition of his works, in two volumes, was published in London.

WYATT, Sir Thomas, surnamed "the younger," to distinguish him from the preceding, of whom he was the only son, was born about 1520. After a wild and riotous youth, he raised a body of men at his own expense, and did good service at the siege of Landrecies (1544), displaying considerable military talent; and continued in honorable service on the continent till 1550. In 1554, when the Spanish match was in agitation, Wyatt joined the insurrection, and led the Kentish men to Southwark, after gaining considerable successes over the royalists; but failing to capture Ludgate, he became separated from the main body of his followers, and was taken prisoner, and soon after executed, April 11, 1554.

WYCHERLEY, William, a comic dramatist of the period of the restoration, was born at Clive, near Shrewsbury, in 1640. His father, a cavalier squire of £600 a year, sent his son to France at the age of 15; and during his residence on the banks of the Charente, the youth was a favorite at the court of the governor of Angoulême, whose accomplished wife, the Mme. Rambouillet of Voiture, converted him to the creed of the church of Rome. On his return to England in 1660 Wycherley studied a short time at Oxford, where he was reconciled to the Anglican church, and he was entered of the middle temple. His first comedy, *Love in a Wood*, was acted with great applause, and published in 1672, and it was followed by three other successful comedies, *The Gentleman Dancing-master* (1673); *The Country Wife* (1675); and *The Plain Dealer* (his best work, 1677). About 1680 the dramatist was married to a young and rich widow, the countess of Drogheda, whom he had met at Tunbridge. The lady was distractedly jealous of him, kept him from frequenting the court, which lost him the favor of the king, and watched him closely wherever he went. She did not live long, and she left him the whole of her fortune; but his succession to the estate was disputed, and an expensive lawsuit ensued, the costs of which, added to personal debts, fairly broke down the unlucky dramatist. He was committed to the Fleet, and suffered to languish there neglected for seven years. He was partly relieved by the bounty of James II.—probably because he returned to the communion of the church of Rome—and he succeeded to the patrimonial estate in Shropshire by the death of his father. This did not, however, much relieve him, as the estate was heavily mortgaged, and strictly entailed. He was on bad terms with the heir-at-law, his nephew; and on purpose to injure this relative, Wycherley, at the age of 75, married a young girl, on whom he settled a jointure; and eleven days after this transaction—the last and perhaps the most scandalous act of his life, as Macaulay describes it—the old dramatist died. His death took place in Dec., 1715, and he was interred in St. Paul's church, Covent garden. Besides his comedies, Wycherley published a volume of wretched *Miscellany Poems* (1704), and another volume, partly consisting of "moral reflections," was published after his death. The comedies of Wycherley, on which his fame rests, reflect the literary taste, the manners, and vices of the times in which he lived. They are, in truth, grossly immoral and profligate. They have, however, some literary excellence. The language is clear and forcible, the dialogues often witty and lively, some of the characters vigorously drawn, and the observations and maxims scattered throughout the different scenes are shrewd and sensible, and expressed in a terse, sententious style. Wycherley was the founder of that school of artificial comedy which Congreve, Farquhar, and Sheridan carried to its highest perfection, imparting to it an airy grace and brilliancy far above the reach of its first master.

WYCLIFFE, John de, the greatest of all the "reformers before the reformation," was born in 1324, and is supposed to have been a native of the parish of the same name, near

the town of Richmond in Yorkshire. He studied at Oxford; but of his early university career nothing is known.

Wycliffe first emerges into public notice in 1361, when his name appears as master of Balliol hall—as Balliol college was then called. In May of the same year he was instituted to the rectory of Fylingham in Lincolnshire, and shortly after resigned his mastership and went to reside at his rectory. About 1363 he took his degree, and began to read lectures on divinity at Oxford, in which his anti-Romish views were first expounded. In 1368 he exchanged the rectory of Fylingham for the living of Ludgershall, in Bucks; and in 1374 was presented to the parish of Lutterworth, of which he remained priest till his death.

In the great struggle maintained by Edward III. and his parliament against the pretensions of the papacy, regarding the exaction of certain tribute-money which had been granted by king John in acknowledgment of the fealty of the kingdom to the Roman see, Wycliffe, who had been advanced to be one of the king's chaplains, was called upon to reply to a defense of the papal claim, which had been anonymously sent abroad. This he did publicly at Oxford in an ingenious and powerful manner, and thus early showed his antipathy to the pretensions of Rome. A clear evidence of his growing reputation is furnished by his appointment in 1374, as second in a commission sent to Bruges to confer with the papal legate as to certain abuses on the part of the papacy complained of by the English parliament. It was probably on his return from this mission, that Wycliffe was promoted to a prebend in the diocese of Worcester, and at the same time presented to the rectory of Lutterworth in Leicestershire. Here he labored with great zeal, preaching not only on Sundays, but on the several festivals of the church, and showing himself "a most exemplary and unwearied pastor." Here also he began at length to speak his mind as to the papacy. The insight into papal doings which he had received at Bruges seems to have confirmed suspicions previously forming in his mind, and he is said, soon after his return to England, to have styled the pope "antichrist," "the proud worldly priest of Rome, the most cursed of clippers and purse-kervers" (cutpurses). Then began in real earnest his troubles with the hierarchy. In the beginning of 1378, he was summoned to a meeting of convocation, to be examined for his opinions. He obeyed the summons, but he appeared attended by his friend John of Gaunt and others. A great tumult ensued, the London citizens bursting into the chapel, and frightening the synod of clergy, who were ordered to sist proceedings. The papal authority was then invoked against him, and Gregory VI. issued several bulls, three addressed to the archbishop of Canterbury and other bishops, one to the king, and one to the university of Oxford, commanding an inquest into the erroneous doctrines attributed to the reformer. Wycliffe was accordingly again summoned before the prelates at Lambeth; but on this occasion also he was favored by circumstances, and escaped merely with an injunction to refrain from preaching the obnoxious doctrines.

These proceedings only served to make Wycliffe a more thorough reformer. He now entered upon his great work of translating the scriptures, and circulating them among the common people. He had a great retinue of poor preachers, to aid him. He also challenged the doctrine of transubstantiation; though he always believed in some kind of real presence. Many of the people, the burghers and the middle class, heard him gladly, and matters seemed tending to an open rupture with the papacy. But the times were not as yet ripe for this. Many who otherwise sympathized with the reformer were afraid of his views about transubstantiation. He was especially summoned to answer on this head, first, before a synod at the Greyfriars, London, and finally before convocation in 1382. He appeared, and defended himself with great subtlety and power. His defense was unavailing. Twenty-four "erroneous" statements were picked out of his works, which were in consequence condemned and ordered to be burned. He was banished from Oxford, but was allowed to retire to his parish of Lutterworth. His health was already shattered by hard work and many anxieties, and on the last Sunday of the year 1384, he was struck down by paralysis while conducting public worship, and two days afterward expired. Wycliffe appears to have been a man of simple faith and of earnest and manly courage. He made a strong impression upon his age; an impression there is reason to think not entirely effaced even to the time of the reformation. The Lollards, as his disciples were called, were to be found not only among the poor, but in the church, the castle, and even on the throne. Political mischances, however, overtook the party in the following century, and only a few traces of it survived here and there when the movement of the 16th c. began. See Huss.—T. Arnold published 3 vols. of Wycliffe's select works in 1871, and F. D. Matthew his hitherto unprinted *English Works* in 1881. See Lechler's *Johann von W.*, trans. by Lorimer; and *W.'s Place in History*, by Montague Burrows (1882).

WY'COMBE, Chipping or High, a municipal and parliamentary borough in Bucks, surrounded by beech-clad hills, 28 m. w.n.w. of London, on the Wye, a small affluent of the Thames. The church of All Saints is a large and handsome building, erected in 1273; it is in the Norman and early English style of architecture, and consists of a body and two aisles, and, with the chancel, is 180 ft. long. The tower is 96 ft. high, and was built in 1522. There are corn and paper mills on the Wye; beech-wood chairs are made here, and lace-making is carried on. At two miles' distance is the village of West Wycombe. Since 1867 the borough returns one member to parliament. It is connected

with the Great Western Railway. Pop. '81, of municipal borough, 10,618; '91, 13,435.

WYE, a river of Wales and England, of picturesque beauty and considerable importance, an affluent of the Severn, has its origin in two copious springs which issue from the s.e. side of Plinlimmon, not two miles from the head-water of the Severn (q.v.). It flows in a s.e. direction through Montgomeryshire and Radnorshire, forming the s.w. and s. boundary of the latter, e.s.e. to the middle of Herefordshire, and then s., dividing in its lower course the county of Monmouth from that of Gloucester, and entering the estuary of the Severn below Chepstow. Length of course, 130 m., for 70 m. of which to Hereford it is navigable for barges, though large vessels cannot ascend above Chepstow bridge. At Chepstow (q.v.) the tide rises higher than at almost any other place in Great Britain. The chief affluents of the Wye are the Lug and Ithon on the left, and the Monnow, the Caerwen, and Irfron on the right. The part of the river which separates Monmouth from Gloucester is that chiefly visited for its singular beauty.

WYKEHAM, William de, was b. at Wickham, in Hampshire, in 1324. He was educated at Winchester. On Oct. 8, 1366, by the king's recommendation, he was elected bishop of Winchester. He was consecrated Oct. 10 of the year following. Meanwhile, he had been appointed lord high chancellor of England; in which office he was confirmed Sept. 17, 1367. He resigned on Mar. 14, 1371, on a petition being presented to the king against the government remaining too long in the hands of men connected with the church. He now devoted himself to various objects of lasting usefulness. His preparatory college or school at Winchester was opened for teaching in 1373; but the building of the college was not begun till 1387. It was finished in 1393. In the college which he instituted at Oxford, teaching had also begun in 1373; but the building of "St. Mary's college of Winchester in Oxford" was not begun till 1380; it was finished in 1393. He began the rebuilding of Winchester cathedral in 1395, and just lived to see it finished. Meanwhile, he had become the object of resentment to the duke of Lancaster and party, at whose instance he was indicted for pecuniary defalcation, and other crimes alleged to have been committed by him as keeper of the privy seal and lord chancellor. He was heard in 1376 before a commission of peers, bishops, and privy councilors, declared guilty, and a severe sentence was passed upon him. It was, however, ultimately commuted into a fine, which was remitted on the accession of Richard II. in 1377. He was one of the council of 14 appointed to the king in 1386, and in May, 1389, he was again made lord chancellor. He continued in office till Sept. 27, 1391, when he resigned; and from this date he appears to have taken little active part in public affairs. He was present in the parliament held on Sept. 30, 1399, when Richard II. was deposed. He was also present in the first parliament of Henry IV. He died at South Waltham, Sept. 27, 1404.—See *Life* by Dr. (afterward bishop) Lowth (Lond. 1754). Wykeham of Wykeham was one of the most munificent benefactors of the English church; but he was not a fanatic. He loved learning, order, civilization, and purity of manners; and as bishop of Winchester, signalized himself by his rigorous reformation of ecclesiastical abuses; but he had not the slightest tendency toward *Protestantism*, affording, in this respect, a most striking contrast to his great contemporary Wycliffe (q.v.). Wykeham of Wykeham may be taken as the type of a class of English churchmen both before and after the reformation—men who are destitute of zeal on questions of doctrine, but zealous for the dignity, culture, and practical efficiency of the church.

WYLIE, Samuel Brown, d.d., 1773–1852; b. Ireland; graduated at the university of Glasgow, and removed to Philadelphia in 1797; tutor in the university of Pennsylvania, 1798; pastor of First Reformed Presbyterian church, Philadelphia, 1801–52; professor in the theological seminary of his denomination, 1809–51; conducted also a classical school with success for many years; professor of ancient languages in the university of Pennsylvania, 1828–45, and vice-provost thereof, 1838–45; and was an author of numerous works.

WYLLYS, George, 1570–1645; b. England; settled at Hartford, Conn., 1638; and was successively, assistant, deputy-governor, and governor of the colony, being elected to the last office in 1642, and commissioner of the united colonies.

WYLLYS, Samuel, 1739–1823; b. Conn.; graduated at Yale college in 1758. He commanded a regiment at the siege of Boston in 1775, and for the rest of the war was col. of a Connecticut regiment. He was secretary of state of Connecticut, 1796–1809. This post was occupied by members of the Wyllys family for 98 years.

WYMAN, Jeffries, 1814–74; b. Mass.; educated at Harvard, where he took the degree of m.d. in 1833. He was for a time demonstrator of anatomy at the Harvard medical school, and afterward curator of the Lowell Institute, Boston. After studying in Europe, he was elected in 1843 professor of anatomy and physiology at Hampden-Sidney college, Richmond, Va. Four years later he became professor of anatomy at Harvard university, where he remained till his death. He at once began making collections in comparative anatomy and archæology, and he succeeded in forming extensive and valuable collections. His rank as a comparative anatomist was high. He published nearly 70 scientific papers. He became curator of the Peabody museum of archæology at Cambridge, Mass., on its foundation in 1866.

WYMAN, R. H., b. N. H., 1822; entered the navy, and served in the Mexican War, being present at the capture of Vera Cruz. In the civil war he commanded the *Pawnee* at Port Royal, and was subsequently placed at the head of the Potomac flotilla. He rose to the rank of capt., 1866, and in 1872 was made commodore. After the war he was in charge of the hydrographic office, Washington. He d. 1882.

WYNTOUN, Andrew, an old rhyming Scottish chronicler, lived in the beginning of the 15th century. Except that he was prior of the monastery of St. Serf on loch Leven, and wrote *The Orygynale Cronykil of Scotland*, well known and valued by students of that kind of curious literature, almost no information regarding him has been preserved. Though with the usual proportion of extravagant fable, his work is not without considerable historical importance; while philologically it has very distinct value, as a specimen of the old Scotch, then as nearly as might be identical with the contemporary dialect of England. The *Orygynale Cronykil* consists of nine books or cantos, of which only the last four are devoted to Scottish history; the first five giving a fragmentary outline of the history and geography of the ancient world. From his quotations, Wyntoun seems to have been a well-read scholar for his time. His style is not essentially different from Barbour's, and his versification is the same—the pleasant octosyllabic. In 1795 a splendid edition of this work was published by Mr. D. Macpherson; and this edition has been revised and enlarged by D. Laing, LL.D. (vols. i. and ii. 1872; vol. iii. 1879).

WYOMING, a n. western state, lies between lat. 41° and 45° n.; long. 104° and 111° w.; is bounded on the n. by Montana; on the e. by South Dakota and Nebraska; on the s. by Colorado and Utah; on the w. by Utah and Idaho; length from e. to w., about 355 m.; breadth, about 275 m.; gross area, 97,890 sq. m., or 62,649,600 acres.

Wyoming was organized as a territory in 1868, July 25, from areas previously in Dakota, Idaho, and Utah, but derived more remotely from the original territories of Nebraska, Utah, and Oregon, a portion having at one time belonged also to Washington. The advent of the Union Pacific railroad was followed by the settlement of Cheyenne in the summer of 1867 and of Laramie City in the spring of 1868. The growth of Wyoming was slow for many years, the Indians having been troublesome. In 1889, at a convention held Sept. 3–30, a constitution was framed which was adopted Nov. 5 by a vote of 6272 to 1923. Admission to the union was denied until the following year, when a bill passed Congress by a strictly party vote and was signed by the President, July 10. The main chain of the Rocky Mts. extends across W., entering from Colorado at the s.e. corner and passing out at the n.w. corner. Its principal divisions are the Shoshone Mts. in the n.w.; the Teton and Gros Ventre ranges in the w.; the Wind River and Sweetwater ranges in the w. central part; the Big Horn Mts. in the n.; the Black Hills in the n.e., and the Laramie Mts. in the s.e. There are many peaks of great altitude, among them Mt. Hayden, 13,691 ft., and Fremont Peak, 13,790 ft. The Laramie mts. form the eastern boundary of the Laramie plains, a plateau with an elevation of about 7000 ft., comprising meadow expanses and rolling and hilly ground. The most notable topographical feature of W. is the Yellowstone valley in the northwest corner, in which an area of over 3300 sq. miles has been reserved as a National park. Here are the largest and most numerous geysers (or intermittent thermal springs) in the world; numbering about 4000. About 50 of them throw columns of water 200 ft. high and they deposit chiefly lime and silica. The temperature of the calcareous springs is from 160° to 170°, that of the others rising to 200° or more. Other objects of interest are the cañons of the Yellowstone river and the surrounding ranges, always snow-covered. The Yellowstone and its tributaries, the Big Horn, Tongue, Powder, Little Missouri, and Cheyenne, drain north and northeastern Wyoming; the Snake or Shoshone and Green river and its tributaries, the west and southwest; and the north fork of the Platte, with its tributaries, nearly all the rest. The geology embraces in the mountain ranges Devonian, carboniferous, triassic, Jurassic, and cretaceous rocks, succeeding each other in regular order; while the elevated plains are mostly cretaceous, overlaid with tertiary sands, gravel, and drift, with occasional extensive deposits of lignite. In 1895 the output of coal exceeded 2,246,911 short tons, valued at nearly $3,000,000. Gold is mined in the Black hills, the Wind river, and the Big Horn mts. In the Medicine Bow Mts., west of Laramie City, placer mining is successfully carried on. Silver is found in all these sections and native copper, especially in the vicinity of Laramie City. There are immense deposits of nearly pure iron in several places; also red oxide of iron, hematite, and chrome iron. Granite, marble, mica, kaoline, graphite, mineral paint, corundum, pyrites for making acids, bismuth, gypsum, silica sand, sulphur, asphalt, ozokerite, gilsonite, brick and potters' clays, salt, soda, and petroleum are found in the Laramie region and elsewhere.

The mountains are covered with a thick growth of pine, spruce, and hemlock trees of great size; on the foot-hills grow pine, spruce, aspen, walnut, elm, ash, box elder and red cedar; along the river bottoms are found two species of cottonwood and several species of willow. The principal wild animals are the grizzly bear, black bear, wolf, prairie wolf, badger, wolverine, otter, porcupine, mink, skunk, little ermine, elk, antelope, deer, prairie dog, and jack rabbit.

The climate varies with the altitude, being very severe on the higher mountains, and comparatively mild in the sheltered valleys. The average mean temperature of the year is, for Wyoming as a whole, about 44°. In the mountains it falls in some years as low

as 36°, while on the plains in the east it averages 45°. The summers are usually cool, though sometimes the temperature for a day or two rises to 100°. On the Laramie plains very little snow falls. The rainfall is small, varying from 8 to 13 in.; but in all the arable portions there are streams flowing at such an elevation that irrigation is not difficult. The soil of the foot-hills and river bottoms is very fertile, but many sections require irrigation to make them productive. One canal, fed by the Big Sandy river, an affluent of Green river, irrigates 270,000 acres. The soil in general is better suited to turnips, potatoes, pease, beans, etc., than to cereals. The director of the United States geological survey has estimated the amount of land in Wyoming that may be reclaimed by irrigation at 15,000,000 acres. In 1891 the number of acres under irrigation was given at 2,172,000, with over 3000 separate ditches. The state is noted for the abundance and excellence of its grasses, on which a great stock-raising industry has been created. The farm and ranch animals exceed $17,000,000 in value, sheep predominating—over 1,500,000 head—and the wool clip (1896) aggregated 10,369,130 pounds; of agricultural crops the most valuable is hay, averaging over $3,000,000 per annum.

Manufactures in Wyoming are of minor importance. The U. S. census of 1890 reported for Wyoming, 190 manufacturing establishments, employing $1,411,184 capital and 1144 persons, paying $878,646 for wages and $1,084,432 for material, and having a combined output valued at $2,367,601. The principal manufactures are flour and grist mill products, lumber and saw-mill products, cigars, and brick and tile. Mining has become one of the chief interests, although a large part of the state is still undeveloped in this respect.

Banking and Insurance. — On Oct. 31, 1896, there were 11 national banks in operation, with capital, $860,000; deposits, $1,858,595; reserve, $582,854; and outstanding circulation, $212,227; 5 state banks, with capital, $72,000; deposits, $161,771; and resources, $274,246; 8 private banks, with capital, $164,349; deposits, $633,325; and resources, $841,712; and over 50 life and fire insurance companies licensed to carry on business in the state.

Railroads. — The state has nearly 1500 miles of railroad, which represent a total investment of over $80,000,000, and an expenditure for construction and equipment of over $61,000,000.

Churches and Schools. — The strongest denominations numerically are the Roman Catholic, Mormon, Methodist Episcopal, Lutheran, Protestant Episcopal, Presbyterian, Congregational, and Baptist. The public school population exceeds 21,000; enrollment, 11,500; value of school property, $429,000; and annual expenditure, $210,000. There are a state university at Laramie, a normal and scientific college at Rawlins, a collegiate institute (Cong.) at Big Horn, the academy of the Holy Child Jesus (R. C.) at Cheyenne, and public, law, and school libraries at Cheyenne and Laramie.

Government. — The capital is Cheyenne. The governor, secretary of state, auditor, treasurer, and superintendent of public instruction are elected for terms of four years each; appointive officers serve from two to six years each. The legislature, holding sessions biennially, must comprise at least one senator and one representative from each county. The right to vote and hold office shall not be denied or abridged on account of sex. This confirms a right acquired by the women of Wyoming as early as 1868. Perpetuities and monopolies are forbidden. All laws of a general nature have a uniform operation. The judicial power is vested in a supreme court of three justices, district courts, probate courts, and justices of the peace. The legal rate of interest is 8 per cent., but 12 per cent. is allowed by contract. The territorial institutions not educational are: an asylum for the insane at Evanston, a state hospital at Rock Springs, a soldiers' and sailors' home at Cheyenne, and state penitentiaries at Laramie and Rawlins. In 1892 the state cast three electoral votes for Harrison and Reid; in 1896 the same number for Bryan and Sewall.

In 1896 the assessed property valuations exceeded $30,000,000, and in 1897 the total debt, all bonded, was $320,000. The population in 1880, with seven cos., was 20,789; in 1890, with one unorganized and 12 organized cos., it was 60,705, of whom 59,275 were white, and 1430 colored (922 negroes, 465 Chinese, 43 civilized Indians), 45,792 natives and 14,913 foreign born. Most of the Americans were born in the territory, or in New York, Pennsylvania, and Ohio; and the foreigners were from Great Britain and Germany. There are 13 cos. The largest cities and towns in 1890 were, Cheyenne, 11,690; Laramie, 6388; Rock Springs, 3406; Rawlins, 2235; Evanston, 1995; Newcastle, 1715; and Carbon, 1140.

WYOMING, a co. in w. New York, bounded on the s.e. by the Genesee river; 606 sq. m.; pop. '90, 31,193. Co. seat, Warsaw.

WYOMING, a co. in n.e. Pennsylvania; about 396 sq. m.; pop. '90, 15,891. Coal and iron are found. Co. seat, Tunkhannock.

WYOMING, a co. in s. West Virginia, drained by the Guyandotte river; about 660 sq. m.; pop. '90, 6247. Co. seat, Oceana.

WYOMING VALLEY, a beautiful fertile valley on the Susquehanna river, in Pennsylvania, 21 m. long by 3 wide, surrounded by mountains 1000 ft. high, its name supposed to be a corruption of the Indian *Maughwauwame*—large plains. It was purchased about 1765 by a Connecticut company from the Delaware Indians; but the settlers were soon dispersed by hostile savages. In 1769, 40 families came from Connecticut,

but found a party of Pennsylvanians in possession, and for several years there were continual contests of the settlers with the Indians, and with each other. The Connecticut colony finally succeeded, and their town of Westmoreland had 2,000 inhabitants. In 1776 they armed for their own defense against the English and their Indian allies; but in 1778, most of their troops were called to join the army under Washington. June 30, a force of 400 British provincials, or Tories, and 700 Seneca Indians, led by col. John Butler, entered the valley, and were opposed by 300 men, under col. Zebulon Butler. On July 3, the settlers were driven to the shelter of fort Forty, with the loss of two-thirds of their number, many soldiers and inhabitants being murdered; a half-breed Indian woman, called queen Esther, having, in revenge for her son's death, tomahawked fourteen with her own hand. On the 5th, the remnant of the troops surrendered, and they and the inhabitants were either massacred or driven from the valley, which was left a smoking solitude. Campbell's *Gertrude of Wyoming*, founded upon the stories of this disaster, contains exaggerations and misstatements, notably that of attributing the leadership to Brandt who was not in the expedition. The disputes between the Connecticut and Pennsylvanian settlers were not finally settled till 1788. The valley is now one of the most flourishing districts in the state.

WYTHE (pronounced With), a co. in s.w. Virginia, about 496 sq.m.; pop. '90, 18,019, chiefly of American birth. Iron and coal are found. Co. seat, Wytheville.

WYTHE, George, 1726–1806; b. Va.; educated at William and Mary College. He came into the possession of a large fortune by the death of his parents during his minority, and fell into dissipated habits; but when about 30 years of age, changed his course, and began to study law. He was admitted to the bar in 1757, and soon rose to eminence. He represented William and Mary college in the house of burgesses for several years, and in 1764 framed a remonstrance against the stamp act. In 1776 he was a commissioner with Jefferson and others to revise the Virginia statutes. He was a delegate to congress, 1775–77, when he was elected speaker of the house of delegates, and appointed judge of the high court of chancery; and in 1786 he was made chancellor, an office which he held for about 20 years. He was law professor at William and Mary college, 1779–89, and a member of the Virginia convention which ratified the federal constitution in 1787. He died by poison. He emancipated his slaves. He published *Decisions by the High Court of Chancery* (1795).

WYTTENBACH, Daniel, 1746–1820; b. Bern, Switzerland; educated at the universities of Marburg, Göttingen, and Leyden. He became professor of Greek and of philosophy at Amsterdam, 1771; and in 1799 was made professor of elocution at Leyden. He edited Plato's *Phædo*, and the *Moralia*, and *Animadversions of Plutarch*, and published a number of philosophical and critical works in the Latin language.

WY'VERN, a fictitious monster of the middle ages, frequently occurring in heraldry. It resembles a dragon, but has only two legs and feet, which are like those of the eagle.

X

X, THE last letter of the proper Latin alphabet, and the last but two of the English. It is in reality a superfluous character, being equivalent in English, as it was in Latin, to *ks* or *gs*. In form, it corresponds to the Greek χ, but in power to Greek ξ. It was a later addition to the Latin alphabet, having been introduced, according to Corssen, between the time of the decemvirate and the fall of Veii. Some Roman scholars did not acknowledge the character, but wrote *cs*, *gs* instead; and this substitution frequently occurs in inscriptions (e.g., *ucsori*, for *uxori*). At one period of Roman literature, *xs* was often written for *x*; e.g., *saxsum*, *lexs*. In the popular pronunciation, the guttural element of the character gradually disappeared, until, in the later period of the empire, *x* was undistinguishable from *ss* or *s*; thus, inscriptions show *visit* for *vixit*, *milex* for *miles*. This change survives in modern Italian, which substitutes *ss* or *s* for the Latin *x*, as *sasso* = *saxum*; *straneo* = *extraneum*; and uses *x* only in foreign words. In Spanish, in the beginning of words, *x* has a guttural sound, something between *ch* and *y*. In German, the use of *x* is mostly confined to foreign words; in native words the sound is usually represented by *chs*, as *wachsen*, to wax or grow, though some write, e.g., *axe* for *achse*.—In algebra, *x* is the usual symbol for the unknown quantity which is to be determined.

XANTHEINE and **XANTHINE OF FLOWERS.** The coloring matters of various flowers have been carefully examined by Fremy and Cloez, who believe that the various tints may be referred to three distinct substances, of which one is of a blue or rose color, while the other two are yellow. These pigments have received the names of *cyanine*, *xanthine*, and *xantheine*; the first being derived from the Greek *kyanos*, sky-blue; and

the last two from *xanthos*, yellow. None of these substances have, however, been extracted in a pure condition, and hence nothing definite can be stated regarding their composition or properties.

XANTHINE, $C_5H_4N_4O_2$, was first described by Dr. Marcet, the able chemist, who regarded it as a very rare constituent of urinary calculi, and from its composition he gave it the name of *uric oxide*. During the last ten years it has been proved to be a normal ingredient (although to a very small amount) of human urine, and has been found in the brain, the spleen, the pancreas, and the liver of the ox; in the thymus gland of the calf; and in the muscular tissue of the horse, the ox, and of fishes; as well as in the liver of various animals. Calculi composed of this substance are extremely rare, the total known number obtained from the human subject being less than half a dozen. They are of a light-brown cinnamon color, assume a waxy appearance when rubbed, and consist of concentric layers easily separable from one another. *Xanthine* occurs in such very minute quantities in the various tissues, and is so rare an ingredient of calculi, that it is unnecessary for us to enter into any description of its properties, further than to state that, when dried, it exists as a yellowish-white powder, which assumes a glistening appearance when rubbed, and exhibits no signs of crystallization under the microscope; moreover, the chemical difficulties of detecting traces of this substance are so great that we shall not attempt to describe its tests. It seems to be intermediate to uric acid and hypoxanthine, both in a chemical and a physiological point of view. The composition of uric acid is represented by the formula $C_5H_4N_4O_3$, that of xanthine by $C_5H_4N_4O_2$, and that of hypoxanthine, now called sarcine, by $C_5H_4N_4O$. The former two occur simultaneously, not only in the urine, but in the spleen, the liver, and the brain; while xanthine is not only invariably accompanied by larger or smaller quantities of hypoxanthine, but the latter can be made by the oxidizing action of nitric acid to yield a product from which xanthine (in place of hypoxanthine) may be obtained by a process of reduction. Xanthine must be regarded as a higher stage of oxidation of hypoxanthine, and a product of the regressive metamorphosis of the tissues, which, in the ordinary condition of the system, is excreted in a more highly oxidized form of urea, uric acid, etc.

This substance is stated to have been found by Göbel in some oriental bezoars extracted from the intestines of certain ruminating animals. It is most probable that the supposed bezoars were in reality urinary calculi.

XANTHIPPÉ, the wife of Socrates, has acquired the reputation of having been an arch termagant, doubtless not without some foundation. It ought, however, to be remembered that her naturally infirm temper must have been not a little tried by the small concern manifested by Socrates in the regulation of his domestic affairs, which appears occasionally to have made it difficult for Xanthippe to "make both ends meet." Socrates himself, it is known, had completely mastered his naturally strong appetites and passions, and had acquired a temper of perfect serenity. It is quite natural, then, that contrast-lovers and story-mongers should, as a foil, match so great a practical philosopher with a woman of such an ungovernable temper as Xanthippe is said to have been. She herself, if we can trust Plato, appears to have really loved her husband, and he at his death committed her tenderly to the care of his friends. Many stories are told of her, as of every other notable character in history, to illustrate her peculiar tendency, but it is difficult to say how much credit ought to be given them.

XANTHORRHÆ'A. See Grass Tree.

XANTHOXYLUM, a genus of trees and shrubs, the type of the natural order *xanthoxylaceæ*. an order closely allied to *rutaceæ*, and chiefly distinguished from it by unisexual flowers. including more than 100 known species of trees and shrubs, having opposite simple or pinnate leaves with pellucid dots, and no stipules, chiefly natives of warm climates, and more particularly of the warm parts of America. The order is generally characterized by pungent and aromatic qualities, which are strongly developed in the genus xanthoxylum itself, *X. fraxineum*, a North American species, a very low, deciduous tree, with leaves somewhat like those of the ash, common from Canada to Virginia, is called Toothache Tree, from the use made of the hot acrid bark and capsules for the relief of toothache. It is also in high repute in the United States as a remedy for chronic rheumatism, for which it is administered in the form of a powder, in doses of from 10 grains to half a dram three times a day. Some of the species are popularly called Peppers in their native countries, as in India and Japan, where they are used as a substitute for pepper. The bark of *X. fraxineum* is a powerful sudorific and diuretic, and other species possess similar qualities; some are febrifugal, and the seeds and unripe capsules of some are gratefully aromatic.—To the order *xanthoxylaceæ* belong the ailanthus (q.v.) and the White Iron-wood (*vepris undulata*) of the cape of Good Hope, the wood of which is very hard and tough, and is much used for agricultural implements.

XANTHUS, the name of the capital of the ancient Lycia, anciently called Arina, a city of the Tramilæ, or Solymi, the primitive inhabitants. It lies at the s.w. corner of Asia Minor, and near the village of Kounik. From the earliest historic times to that of Crœsus, the Lycians appear to have been independent under native rulers; but after the fall of Sardis and the capture of Crœsus, the Persian conqueror Cyrus sent an army for

the conquest of Lycia, led by Harpagus, in 546 B.C. The most desperate resistance was made by the Lycians, and the people of Xanthus burned themselves in their citadel, rather than surrender to the conqueror, only 80 families surviving the catastrophe. Reduced to a Persian satrapy, they sent 50 ships to the expedition of Xerxes against Greece, and contributed to the revenues of Persia. Little is known of the history of this town till the days of Alexander the Great. Alexander took Xanthus, which is said to have made as determined a resistance as it did on the former occasion. In the war which ensued among the successors of Alexander, Ptolemy took Xanthus from the garrison of Antigonus; and the city subsequently passed into the possession of the Ptolemies and Seleucids. After the defeat of Antiochus it was ceded by the Romans to Rhodes, but subsequently had its liberties restored. In the civil war between Brutus and the Triumvirs (43 B.C.), Xanthus was taken by Brutus. The inhabitants a third time destroyed themselves and their families, and few survived the capture. From that time Xanthus belonged to the Roman empire, and suffered in the earthquake in the reign of Tiberius; but Lycia did not lose all its freedom till the time of Claudius, who reduced it to a province. Xanthus was situated 70 stadia, or 9 m., from the sea, on the left bank of the Sibres or Sibrus, the Greek Xanthus, or Yellow river, on a plateau of elevated ground, of nearly rectangular shape, the elevated parts close to the river rising 200 feet. The most remarkable edifices in the city and its vicinity, according to ancient authors, were the Sarpedonion, or temple of Sarpedon; that of the Lycian Apollo; and Letôon, or temple of Leto. On the elevated ground, or acropolis, stood the so called Harpy Tomb, and an ancient theater of Greek workmanship; while in the other part of the city which lay to the e. was a mixture of Greek and Roman buildings. The whole city and its environs contained numerous temples and tombs. The discoveries of sir C. Fellows in 1838 revealed the city of Xanthus, its temples and its monuments, and they appear to fall into the following classes: 1. The sepulchers of the early inhabitants, placed inside the wall in shape of square columns, with step-shaped bases, and sepulchral chamber on the summit. The most remarkable of these is the Harpy Tomb, so called from the subject of the bas-reliefs being the Harpies bearing off the daughters of Pandarus, king of Lycia—executed in a style resembling the earliest efforts of oriental Greek art. Another, with a frieze of lions and hunters in Persian style, and the inscribed obelisk, with long Lycian inscription and some Greek verses, apparently of the time of Artaxerxes Longimanus, and made about 466 B.C. 2. The tombs of the age of the Persian subjection, with roof-shaped tops and ridges, and imitation of wood-work, the sepulchral chamber for the principal dead being at the summit, the others in the middle and base, the sides ornamented with reliefs of a later style of art. Of a later style, but of more beautiful art, was the Ionic peristyle temple or monument of 14 columns, with a solid cella, placed on a base or pedestal, both temple and base ornamented with friezes, supposed to represent the conquest of Lycia by Harpagus, and with figures between the columns. The friezes represent hunts and feasts, the combats of Lycians and Persians, and taking of the city of Xanthus by the latter—the whole treated in a style not unlike the school of Phidias and his successors. These sculptures have been supposed to represent the exploits of Harpagus, or the suppression of the revolt of the Cilicians by a Lycian satrap, and to have been made between 450 and 387 B.C. This temple was discovered by sir C. Fellows in 1840–44. See illus., SCULPTURE, vol. XIII.

The language found on the monuments of Lycia, written in an alphabet of 25 letters, is an Aryan dialect, distinguished by a prevalence of vowels. The letters, with two exceptions, are archaic Greek, and borrowed from by no means the oldest form of that language. The syntax and inflections are Aryan or Indo-European, but many of the roots are different from the languages of that family, although certain words may be referred to well-known equivalents—as *goda*, "lord," to the Persian; *tedeeme*, "son," to the Slavonic; and *ladé*, "wife," to the Anglo-Saxon. Some words, too, resemble the Zend. The presence of many Greek words barbarously transcribed can also be well recognized in the different inscriptions, and some few derived from their Persian conquerors—as *gssatrape*, or "satrap." The inscriptions are generally short and sepulchral, and follow the well-known formula commonly used under the Roman empire, and are sometimes accompanied by Greek versions or translations, helping to explain the Lycian. One inscription alone, recording the exploits of one of the family of the Harpagi after the battle of Eurymedon (466 B.C.), on the so-called obelisk of Xanthus, is of any length. The language seems to have lasted from about the 5th c. B.C. to the 1st c. A.D.—Rawlinson, *Herodotus*, vol. i. pp. 311, 673; *Synopsis of the Contents of the British Museum*, 1855, p. 105; Fellows, *Asia Minor* (Lond. 1839); *Discoveries in Lycia* (1841); Birch in the *Archæologia*, vol. xxx. pp. 176–204.

XAVIER, ST. FRANCIS, a celebrated missionary of the Roman Catholic church, was born of a noble family at Xavier, in Navarre, April 7, 1506. Having received his early education at home, he was sent, when in his 18th year, to the college of Sainte Barbe, at Paris, where he formed the acquaintance of Ignatius de Loyola (q.v.), with whom he ultimately became associated in the foundation of the Jesuit society. Under that head will be found detailed so much of his history as regards the first establishment of the order, and the early labors of its founders in Rome. It was while he was engaged in these early labors of the society in Rome, that

Xavier attracted the notice of the representative of John III. of Portugal at Rome Govea, who suggested to the king the idea of sending out members of the new order as missionaries to the Portuguese colonies in the east. Xavier was chosen for this purpose in the place of Bobadilla, who had been originally appointed, but was prevented by sickness from going on the expedition. Having sailed from Lisbon, April 7, 1541, and wintered at Mozambique, he arrived at Goa, May 6, 1542, and presented to the bishop his letters of authorization from pope Paul III. Xavier's first proceeding, on finding the excessively depraved condition of the European Christians settled in India, was to endeavor, by stirring up among them a spirit of penance and religious fervor, to remove the great obstacle to the efficacy of his preaching to the native population, which was presented by the evil example of the professing Christians of the colony. His efforts in this preliminary reformation were eminently successful, and he was equally blessed in his labors among the pearl-fishing population of the coast, from cape Comorin to the island of Manaar. After a stay of more than a year in this region he returned to Goa, and with a fresh staff of assistants visited the kingdom of Travancore, where, in the space of a single month, he baptized 10,000 natives. Passing thence to Malacca, where he was re-enforced by three other Jesuit missionaries, sent by Ignatius de Loyola in compliance with Xavier's earnest solicitations, and having achieved great success among the residents of the coast, he proceeded, in 1546, to the Banda islands, to Amboyna, and the Moluccas. In all these places his success was extraordinary. Having thus effected a first establishment of the Gospel in many places, he resolved to retrace his steps, and revisit the several scenes of his preaching. He arrived at Malacca in 1547, and thence by Manassar, near cape Comorin, where he stayed for some time, he passed to the island of Ceylon, where he converted the king of Kandy, with many of his people. In May, 1548, he returned a second time to Goa. His great object now was to carry out a project for the conversion of the Japanese empire, which had been suggested to him by a Japanese of high rank, whom he had attached to himself at Malacca, and who accompanied him to Goa. This Japanese, whom, with two of his domestics, he converted and baptized, became a most valuable auxiliary. Through his aid, Xavier was enabled during the voyage to acquire so much of the Japanese language as enabled him to translate into Japanese and explain the Apostles' creed; and although his success in the first island which he visited was very insignificant, yet at Firando, and afterward at Miako, his preaching was attended with extraordinary fruits. At the latter place he had failed signally upon his first visit, which was made in a very poor and humble guise; but having returned with a more imposing train, and under circumstances of greater outward distinction, he obtained a ready and favorable hearing, and made so lasting an impression that the mission he founded continued to flourish for above 100 years, until the final expulsion of Christianity from the Japanese empire. His mission to Japan occupied about two and a half years; and in Nov., 1551, he sailed from Amanguchi for the purpose of returning to Goa to organize a mission to China. Touching at Malacca upon his voyage, he endeavored to concert with the governor an embassy, in the name of the king of Portugal, to China, under cover of which he hoped to effect an entrance for his missionary enterprise, but on his return from Goa to Malacca, he found a new governor, who was opposed to any such attempt; and he was obliged to adopt the expedient of sailing in a merchant-ship to the island of Sancian, near Macao, which was at that time the trading depot of the Chinese with the merchants of Portugal. From Sancian, Xavier, having procured a Chinese interpreter, hoped to induce one of the native merchants to land him secretly on the coast; but in this hope also he was baffled by the fears of the Portuguese, who dreaded for themselves the vengeance of the Chinese authorities upon this infraction of the law. This disappointment, coupled with the privations and labors to which he had been exposed, brought on a violent fever, and under the combined weight of mental depression and physical sickness, this Christian hero sunk upon the very threshold of what he had looked to as the great enterprise of his life, in the island of Sancian, Dec. 22, 1552. His remains were conveyed to Malacca, and thence with great solemnity to Goa, Mar. 15, 1554. Many miracles, attested by numerous witnesses, were reported of Xavier in almost all the stages of his career. Among these there have been some who reckoned the miraculous gift of tongues. The evidence of these miracles was submitted to the usual process of inquiry at Rome; and many miracles having been established by the ordinary canonical process, Xavier was "beatified" by Paul V. in 1619, and "canonized" by Gregory XV. in 1622, his festival being fixed upon Dec. 3. His only literary remains are a collection of letters, in 5 books, 8vo (Paris, 1631), and a Catechism, with some short ascetic treatises. His Life, by Père Bouhours, was translated into English by James Dryden. There is a Latin Life by Tursellino (Rome, 1594); in Italian by Bartoli and Maffei; in German by De Vos (1877); and in English by Venn (1862) and Coleridge (1873).

XEBEC, an armed vessel of great speed, formerly used by the Algerine corsairs. It carried three masts, on which square or lateen sails could be set. The bow and stern were remarkable for the small angle they made with the water. The sides were low, and the upper deck of great convexity, that the water might readily flow off through the scuppers. As this rendered them inconvenient for walking on, gratings were laid at

the sides of the deck, to avoid the convexity. The crew walked dry on these gratings, while the water flowed out underneath. Xebecs carried from 16 to 24 guns.

XENIA, city and co. seat of Greene co., O.; on Shawnee creek, and the Cincinnati, Hamilton, and Dayton, and the Pittsburg, Cincinnati, Chicago, and St. Louis railroads; 55 miles s.w. of Columbus. It is the seat of Wilberforce university for colored students (Amer. Meth. Epis.), the theological seminary of the United Presbyterian church, and the State soldiers' and sailors' orphans' home, and has a court-house in a park in the center of the city, city hall, co. jail, city workhouse, numerous churches, national banks, several hotels, electric lights, university, seminary, and public libraries, and daily, weekly, and monthly periodicals. The city is widely known for its manufactures of twine and cordage, and has also saw and planing mills, marble and granite works, and paper, shoe, pump, and carriage factories. Xenia was settled in 1804 and incorporated in 1808; is in the beautiful Miami valley, 3 miles from the Little Miami and 12 miles from the Big Miami rivers; and is surrounded by a fertile agricultural country, abounding in water and limestone. Pop. '90, 7301.

XENIA, in ancient Greece and Rome the gifts given by the host to his guests. Martial calls the 13th book of his epigrams, which deals with subjects connected with this exercise of hospitality, *Xenia*. In 1797 Goethe and Schiller, borrowing this title, published in the *Musenalmanach* some 400 epigrams, in criticism of literary men and affairs. The work excited great interest at the time. Goethe's later-published *Zahme Xenien* contains criticism of a much milder character.

XENOCRATES, an ancient philosopher, was b. at Chalcedon 396 B.C., and died 314. At an early age, he attached himself to Plato, and in course of time, was so much esteemed for his proficiency in philosophy and high moral character, that he was thought worthy of succeeding Speusippus, Plato's successor, in the presidency of the academy. This post he filled most creditably for 25 years. He wrote numerous treatises upon dialectics, physics, and ethics, and drew with unusual precision the boundaries between these three departments of philosophy. Of these works merely the titles have been preserved; and what is known of his doctrines is gathered only from notices of them contained in various authors. He introduced into the academy, to a greater degree than before, the mystic Pythagorean doctrine of numbers, in connection with the *ideas* of Plato. Zeus, the father, ruling in heaven, he called Unity, as being uneven number and spirit; the world-soul, which operates through all things liable to motion and change, he styled Duality. This divine world-soul dwells in the heavenly bodies, the Olympic gods, the elements of nature, and also in terrestrial demons, whom he regarded as intermediate between gods and men. In his ethical teaching, he aimed at making the Platonic doctrines more directly applicable to ordinary life in individual cases, and pitched his standard of excellence very high. He held that virtue is in itself valuable, while other things are only so conditionally, and that it extended to thoughts as well as actions. He was himself of irreproachable character, of a well-balanced mind, and temperate in his habits without cynicism. His conversion of the youthful debauchee Polemo into an earnest, virtuous man, and his disregard for wealth, as shown by his refusal of the offers of Philip and Alexander, are the best-known incidents in his long, useful, and virtuous career.

XENOPHANES, founder of the Eleatic school of philosophy, was b. at Colophon, in Asia Minor, about 580 B.C., or, according to others, about 40 years earlier. He spent the greater part of a life which was prolonged beyond his 90th year, in banishment. He passed many years in Sicily, and resided for some time at Elea (whence adj. *Eleatic*), in Lucania. He composed many poems, historical, didactic, and elegiac, which have all perished, except a few fragments. He employed his poetry as the instrument for disseminating his philosophical tenets. He was the first to maintain the Eleatic doctrine of the oneness of the universe; and recognizing clearly the unity and perfection of the Deity, he attacked the prevalent mythology and the practice of attributing to the godhead a human form and human weaknesses. He was thoroughly in earnest, but his logic was confused and contradictory. While he held the existent to be identical with the Deity, and regarded it as the basis of phenomena, he also maintained that the divine essence was neither finite nor infinite, neither moved nor unmoved: not finite, for then it must be limited by another, whereas God is one; nor, on the other hand, infinite, for only non-being is infinite, as having neither beginning, middle, nor end. The distinguishing tenet of Xenophanes is his monotheism; and as a philosophical rhapsodist, he sought to inculcate it, though he failed to express it in a clear and systematic manner. His speculations are skeptical in their tendency, and appear to have had great influence upon succeeding philosophers. His explanations of physical phenomena were crude; but one is recorded in which he has anticipated modern geology. From the shells and marine petrifactions found on mountains and in quarries, he inferred that the surface of the earth had risen gradually out of the sea. In the 18th c., Voltaire could give no better explanation of the fact of sea-shells being found on the mountains of Spain, than the supposition that they were the scallop-shells dropped by pilgrims journeying to and from the shrine of St. James. See ELEATIC SCHOOL.

XENOPHON, celebrated as a general, historian, and philosopher, was b. at Athens 435 B.C. At an early age, he became a pupil of Socrates, and is said to have been saved from death by that philosopher at the battle of Delium. At the age of 40 or thereabouts, he joined the expedition of the younger Cyrus against his elder brother, Artaxerxes Mnemon, king of Persia. After the battle of Cunaxa, and the treacherous massacre of the Greek generals, Xenophon played an important part in the adventurous retreat known in history as the retreat of the ten thousand; and it was his courage and conduct that contributed mainly to its success. After having returned to Asia Minor, Xenophon led a portion of his forces upon a pillaging expedition, and amassed wealth enough to enable him to live the life of a country gentleman. Before retiring, he served under Agesilaus, the Spartan general, against the Persians; and at Coronea fought against his own countrymen. Sentence of banishment had been previously passed upon him at Athens, probably for his share in the Cyrean expedition. His sympathies were entirely Spartan. He soon afterwards settled at Scillus, a small town near Olympia, in Elis, under Spartan protection, where he lived upwards of twenty years, occupying himself with hunting, agriculture, and writing. He is not mentioned as having ever returned to Athens, though his sentence of banishment was repealed, and his two sons were in the Athenian division which aided the Spartans at Mantinea. At last, Xenophon was driven from his retreat at Scillus by the Eleans, and took refuge in Corinth, where he probably died, 359 B.C. His works are numerous, and to judge by their titles and number, all extant. His style is simple, elegant, but rather monotonous and deficient in vigor. As a philosopher, he holds no very high rank. He possessed excellent practical talents, was a humane, sensible, religious man, but seems to have had neither genius nor taste for speculative philosophy. His principal works are the *Anabasis*, or narrative of Cyrus's expedition and the retreat of the ten thousand; a history of Greece in continuation of Thucydides; the *Cyropædia*, or education of Cyrus the elder —a sort of political romance, in which Cyrus is drawn as the model of a wise and good ruler. In the latter work, Xenophon clearly shows his preference of a well-regulated monarchy to the democracy of his native country. He wrote besides the reminiscences (*Memorabilia*) of Socrates, a series of dialogues intended to refute the charges upon which that philosopher was executed; also treatises on hunting, on the horse, the revenues of Athens, and domestic economy. Standard editions of Xenophon as a whole or in part are those of Krüger, L. Dindorf, Schenkl, Cobet, Zurborg, and Hug. There is a lexicon to Xenophon by Sturz. The best English version is that of Dakyns (1893). See the monograph by A. Croiset (1873).

XERES-DE-LA-FRONTE'RA, or **JEREZ-DE-LA-FRONTERA**, an important town of Spain, in the province of Cadiz, and 14 m. directly n.e. from Cadiz, near the right bank of the Guadalete, and on the railway between Cadiz and Seville. The houses are generally well built, and the streets and squares clean, spacious, well paved, and well lighted. The wealthy wine-merchants mostly reside in the suburbs. Xeres-de-la-Frontera is an ancient town supposed by many to be the *Asta Regia Cæsariana* of the Romans. Xeres-de-la-Frontera has manufactures of woolen cloth and leather, and a considerable trade in corn; but all these are of little consequence in comparison with its wine trade. *Sherry* derives its name from Xeres-de-la-Frontera. Some of its *bodegas*, or wine-stores, are of vast dimensions. They are not wine vaults, but stores erected above ground. The greater part of the wine is exported to England. Pop. '87, 61,708.

XEROTINE SICCATIVE, a compound of boiled linseed oil and certain metallic oxides or salts, and, like similar compounds bearing the common name of "driers," is largely used for mixing with oil colors, that they may readily dry. Salts forming very unstable compounds when mixed with oil, have come into use and constitute highly explosive substances.

XERXES I. (the name is perhaps akin to Sanskrit *kshatra*, king), king of Persia, was the eldest son of Darius and his second wife Atossa, and was appointed successor by his father, in preference to Artabazanes, his eldest son by his first wife, whose children were all born before Darius became king. Darius died in the beginning of the year 485 B.C., in the midst of his preparations for a third expedition against Greece. Xerxes, after having subdued the rebellious Egyptians, and appointed his brother Achæmenes governor, gave his whole attention to the completion of the preparations begun by his father, which occupied nearly four years. Immense hordes of men were gathered together from all parts of the vast Persian empire, from the steppes of Central Asia, from the banks of the Indus and its tributaries, and from the interior of Africa; an enormous fleet was furnished by the Phenicians and other maritime nations subject to Persia; stores of provisions sufficient to support the immense army were collected at different points along the intended route of march. A bridge of boats, an English mile in length, under the superintendence of Egyptians and Phenicians, was built across the Hellespont. The bridge, however, was destroyed by a storm, on which (according to the Greek historians), Xerxes ordered the heads of the engineers to be cut off, and was so enraged at the rebellious and disrespectful sea, that he ordered 300 lashes to be administered to it, and a set of fetters to be cast into it. Another bridge, consisting of a double line of boats, was built; and a canal was cut through mount Athos, at the point of the peninsula of Acte in Macedonia, on which the fleet of Mardonius had been

wrecked in 492 B.C. The preparations were completed in 481 B.C., and in the autumn of that year, Xerxes arrived at Sardis, where he wintered. In the spring of the following year, the vast assemblage began to march toward the Hellespont; and, according to Herodotus, it took seven days and nights to march across the bridge. After crossing the Hellespont, the march was continued along the Thracian coast toward Doriscus on the Hebrus, where a halt was made on a large plain, and the army numbered. The fleet drew up near to Doriscus. According to Herodotus, the whole number of fighting-men, military and naval, amounted to nearly 2,500,000, and the fleet consisted of 1207 ships of war, besides 3,000 smaller vessels. These numbers were considerably increased during the march between Doriscus and Thermopylæ by the Thracians, Macedonians, Magnesians, and other nations through whose territories Xerxes passed on his way to Greece. Herodotus supposes that the number of camp-followers, exclusive of eunuchs and women, would amount to more than that of the fighting-men; so that, according to him, the whole number of people assembled on this occasion would be considerably over 6,000,000, a number greater than the entire population of Ireland. This number is doubtless greatly exaggerated; still, it cannot be doubted that this was one of the greatest multitudes ever brought together for any purpose under the sun. Grote, who discredits the immense numbers given by Herodotus, nevertheless says: "We may well believe that the numbers of Xerxes were greater than were ever assembled in ancient times, or perhaps at any known epoch of history." This immense force moved on without resistance through submissive nations till it reached Thermopylæ (q.v.), where it was brought to a stand by the army of Leonidas (q.v.). Although the Greeks were entirely defeated and slain, it was not without heavy loss to the Persians. On the same day, and on the third day after, the Persian fleet, which had previously suffered severely from a storm, was defeated with heavy loss by the Greeks off Cape Artemisium in Eubœa. Xerxes continued his march on to Athens through Phocis, which he laid waste, and Beotia, whose inhabitants joined him, with the exception of those of Platæa and Thespia, which cities he burned. A detachment which he sent to attack Delphi met with a signal defeat. When Xerxes arrived at Athens (in the summer of 480, three months after crossing the Hellespont), he found the city deserted, the Athenians having sent their families to Trœzen, Ægina, and Salamis. Athens was destroyed. Meantime the two fleets had sailed round from Eubœa and taken up their positions in the narrow strait between Salamis and the Attic coast, where the famous naval battle of Salamis took place (Sept., 480 B.C.). See SALAMIS. Xerxes witnessed the fight from a lofty throne which he had caused to be erected on one of the slopes of mount Ægaleus,

> "The rocky brow
> Which looks o'er sea-born Salamis."

Xerxes was apparently confounded at the unexpected and inglorious result of all his mighty preparations for the overwhelming of Greece, and, becoming alarmed for his personal safety, fled, under an escort of 60,000 men, with all haste toward the Hellespont, which he reached in 45 days. The bridge of boats having been again destroyed by a storm, he crossed over to the Asiatic coast in a vessel. Mardonius was left with 300,000 men to carry on operations in Greece. In 479 B.C., the Greeks defeated Mardonius in the famous battle of Platæa (q.v.), and on the same day gained another victory over the Persians at Mycale in Ionia. Next year (478 B.C.), the Persians lost their last possession in Europe by the capture of Sestos on the Hellespont. The war was continued for a few years longer, though the struggle was now virtually at an end. Little more is known of the personal history of Xerxes, except that, in 465 B.C., he was murdered by Artabanus, who aspired to the throne, and was succeeded by his son Artaxerxes. From all that is known of Xerxes, he appears to have been utterly ignoble in character, vain-glorious, licentious, cruel, cowardly—the very *beau-ideal*, in short, of the worst kind of eastern potentate. His history would be scarcely worth recording were it not for his connection with Greek history. His famous invasion was undertaken apparently for no other purpose than to gratify a weak-minded vanity, which was delighted with the idea of being able to assemble at one time "ships by thousands" and "men in nations," who were at the mercy of his unprincipled caprice.

XIME'NES DE QUESA'DA, GONZALO, about 1500–79; b. Spain; came to South America, was a judge in Santa Marta in 1635. Soon afterward he led an expedition against the Chibcha Indians, and at the head of 800 men, after great hardships, captured the cities of Iraca and Tunja in New Granada, found a large amount of treasure, and broke the power of the Chibchas. He founded the city of Bogota in 1538, visited Spain the next year, and received the title of marshal, and on his return to South America went in search of El Dorado. In 1572 he founded Santa Agueda.

XIMENES, FRANCIS DE CISNEROS, by which latter name he is commonly called in Spain, the well-known statesman, archbishop, and cardinal, was born of a humble family at Torrelaguna, in Castile, in 1436. He was educated at Alcalá de Henares, Salamanca, and finally Rome, where he obtained from the pope a provisional or prospective nomination to a prebend in the cathedral of Toledo. The archbishop, resisting the papal claim of "provisor," refused to admit Ximenes; and on his persisting in his claim,

put him in prison, where he was detained for a long period. On his release, he was named vicar-general of cardinal Mendoza at Siguença; but he gave up this preferment, and entered the Franciscan order in 1482. His reputation for piety and learning, led the queen, Isabella, to choose him, in 1492, for her confessor; and three years afterward, to name him archbishop of Toledo—a dignity which he refused to accept until he received an express command from the pope. Having yielded in the end, he continued as archbishop the life of mortification and austerity which he had practised in his monastery; and he applied to purposes of religion, charity, and public utility the whole of the princely revenues of his see. As confessor and confidential adviser of the queen, Ximenes, during the lifetime of Isabella, was the guiding spirit of Spanish affairs; and on her death in 1504 he held the balance between the parties of Ferdinand and Philip of Burgundy, husband of Joanna, the heiress of the crown. On the death of Philip in 1506, Ximenes was appointed regent, in consequence of the incapacity of Joanna and the absence of Ferdinand, and conducted the affairs of the kingdom through a most critical time with consummate skill and success. In 1507 he was created cardinal; and in the following year he organized, at his own expense, and himself accompanied as commander, the celebrated expedition, consisting of 10,000 foot and 4,000 horse, for the conquest of Oran, on the African coast. Ferdinand died in Jan., 1516, and on his deathbed named Ximenes regent of Spain till the arrival of his grandson Charles; and although the grandees had organized an opposition as well to himself as to the royal authority, Ximenes, by his prompt and able dispositions, overawed them into submission; and subsequently, by the same exercise of vigor and determination, quelled the incipient revolt of Navarre. In order to the better consolidation of the royal authority in Spain, Ximenes urged very strongly the speedy visit of Charles, who still lingered in his Flemish principality; but it was not till after the lapse of a year and a half that the king decided on his journey; and meanwhile the enemies of Ximenes had so worked upon his jealousy and pride, that he took the ungracious and ungrateful course of dismissing his faithful, but, as he feared, too powerful servant. Ximenes had set out to meet the king, and although laboring under great infirmities, continued to prosecute his journey, when he was seized with a mortal illness at Branguillas, near Aranda de Duero, where he died, Nov. 6, 1517.

As a statesman and administrator, the reputation of cardinal Ximenes is deservedly of the very highest. The social and political revolution which he effected in breaking down the feudal power of the nobles has often been compared with the analogous change wrought in France by Richelieu. But the revolution of Ximenes was, at least in its results, rather in the interest of the people than, like that of cardinal Richelieu, of the crown; and while it freed the sovereign from the unworthy position of dependence on the nobility, it established the municipalities and the communal representatives in the enjoyment of certain well-defined and undoubtedly substantial privileges and immunities. His munificence as a patron of religion, of letters, and of art, has been the theme of praise in every history of his time. The university of Alcalá de Henares, which he planned, organized, erected, and endowed, was a marvel of enlightened munificence in such an age, and may compare advantageously with even the most princely foundations of the most enlightened times. His Complutensian Polyglot (q.v.), besides being the first of its class, was, considering the resources of the period, perhaps the grandest in conception among the projects of its own order; and the perseverance with which, during the long period of fifteen years devoted to its preparation, he watched and directed its progress, is an evidence that it originated from a genuine love of sacred learning, rather than a passing impulse of literary enthusiasm. The cost of this gigantic undertaking amounted, on the whole, to 80,000 ducats. His expenditure on churches, hospitals, schools, convents, and other works of religion and benevolence, was on a scale of corresponding munificence. He maintained thirty poor persons daily at his own cost, and he regularly set apart one half of his income to the uses of charity.—See Hefele's *Der Cardinal Ximenes und die kirchlichen Zustände Spaniens* (Tübingen, 1851); Prescott's *Ferdinand and Isabella.*

XORULLO. See Jorullo.

XYLOGRAPHY. See Wood Engraving.

XYLOI'DIN is a substance which is precipitated in the form of a white powder, insoluble in water, alcohol, and ether, when water is freely added to a solution of starch in cold nitric acid. Its composition is not determined with positive certainty, but it is probably starch, $C_6H_{10}O_5$, in which either one or two atoms of hydrogen are replaced by a corresponding number of nitric acid radicals, NO_2. According to prof. Miller, there is a substitution of two atoms, so that the formula representing xyloidin is $C_{12}H_{18}(NO_2)_2O_{10}$. It explodes when sharply struck, and burns with violence at 356° F. (180° C.). By the action of reducing agents, it is again converted into starch.

XYLOL (Gr. *xylon*, wood) is an oily aromatic fluid with a strong refractive power, and boiling at about 284° F. (140° C.). Its composition is represented by the formula C_8H_{10}, and it is regarded as the hydride of a non-isolated radical, C_8H_9, to which the name *xylyl* is given. Xylol, mixed with toluol, cumol, and cymol, is found among the oils which are separated from coal-tar by fractional distillation.

XYLOPHAGA (Gr. wood-eaters), a family of *coleoptera*, of the section *tetramera*, nearly resembling weevils, but differing from them in the want of a beak. They have short antennæ, thickened toward the tips, and sometimes leafy from the base. The species are numerous, and are arranged in many genera. They mostly live in wood, on which they feed, both in their perfect and larval states. Some of them are very destructive to trees and timber. See BARK BEETLE and SCOLYTUS. Some of the xylophaga live in fungi and feed on them.

XYLOPHONE, a musical instrument composed of wooden keys arranged in the order of their notes upon a body of wood. It is played by two little mallets held in the musician's hands, the principle being the same as that of the musical glasses.

XYRIS. See YELLOW-EYED GRASS.

XYSYTHRUS, according to the Chaldæan historian Berosus, was king of Babylon at the time of the deluge. In the fragments of the history which have been preserved by Eusebius, it is said that many people of different tribes dwelt together on the plain of Shinar, without laws and in a barbarous manner; that a god appeared among them from the Persian gulf and taught them the arts of civilization; that thus Babylon was built and reigned over by 10 kings, the last of whom was Xysythrus; that he, warned of a coming deluge, built a ship in which he was saved; that when the waters retired the ship stranded on the mountains of Koordistan, and the king, going out of it, built an altar, offered sacrifices, and disappeared in the clouds. There is said to be a striking resemblance in many important features between this narrative of Berosus and that of Moses.

Y

Y, THE last letter but one of the English alphabet, is derived from the Greek γ (*v*). It had no place in the earlier Latin alphabet, and only came into use by Roman writers in the time of Cicero in spelling words borrowed from the Greek. In the Greek of the classical age, υ (γ) no longer retained its pristine power (Ital. *u* or Eng. *oo*), but had degenerated into a sound like the French *u*, or even nearer to *i* (*ee*); it could not therefore be represented by the Roman *u* or *v*, which had remained (and remains yet in modern Italian) undegenerated, and thus was appended to the Roman alphabet as a new character. Its use in native Latin words, as *sylva* for *silva*, *satyra* for *satira*, is an error of modern editors. Italian has no *y*, but uses *i* instead, as *sinfonia*, symphony. The other modern languages of Europe have not only retained it in spelling words of Greek origin, but some of them substitute it for *i* in native words, generally in a very capricious manner. German orthography has recently been purged of this abuse; and in Dutch, where it had always the sound of English *i* (*ai*), the double character *ij* is now written. In English it is used to represent the semi-consonantal power of *i* or *j* (see I and J) in the beginning of a word and before another vowel, as *yoke* = Lat. *iugum* or *jugum* = Ang.-Sax. *iuc.; young* = Ang.-Sax. *iong* = Ger. *jung*. It has been suggested that the practice of writing *y* at the end of a word instead of *i*, while we replace it by *i* on adding a syllable (e.g., *lovely, lovelier*), may have arisen like the habit of giving a tail to the last unit of the Roman numerals (e.g., ij, iiij), in the wish to give a kind of finish to the word and please the eye. The would-be antique spelling *yᵉ*, *yᵗ*, for *the, that*, is a blunder, arising from mistaking the Ang.-Sax. þ (= *th*) for a *y*.

YACHT is a small vessel constructed so as best to insure strength, elegance, and speed, and exclusively employed for pleasure-sailing. Vessels of this sort were first constructed in this country in 1604, at which date a yacht was built by the king's master-shipwright for Henry, eldest son of James I. of England; the idea of such a vessel being taken from the Dutch, among whom they had been employed for some time previous. From this time yachting, steadily patronized by royalty, became a favorite pastime of the nobility and gentry, and there are now about 50 yacht clubs in the United Kingdom, possessing, according to the *Yacht List* of 1880, 3,700 yachts. This amusement is encouraged by government, mainly because it supplies an excellent training for seamen, who in time of war become available for the royal navy, while in time of peace they are no burden on the national treasury; and accordingly yachts are allowed to bear the ensign of the royal navy, supplemented by the special flag granted by the admiralty to each club, and to refit and revictual in the royal dockyards. The oldest yacht club in the United Kingdom is the *Royal Cork*, which, under the title of the "Water club of Cork," is known to have existed as early as 1720; and the next in order of seniority is the *Royal Yacht Squadron*, founded in June, 1815, and having its headquarters at Cowes, isle of Wight. The club which stands first as to the number of its members and yachts is the *Royal Thames Yacht Club*, which was founded in 1823, and has its headquarters in London. Of the other clubs, 6 are Scotch (4 on the Clyde and 2 on the Forth), 8 Irish (2 at Queenstown, 2 at Kingstown, 1 at Dublin, 1 at Belfast, 1 at Carlingford loch, and 1 at loch Erne), and the rest English, being mostly located on the Thames, the channels between Southampton and the isle of Wight, or the n. coast of Wales, from Liverpool to

Holyhead. More than half of these clubs have been founded since 1840. Yachting is gaining ground in foreign countries and in the British possessions, the United States ranking next to Great Britain and Ireland in the number and importance of her yacht clubs (the chief of which is the New York yacht club); and Holland, Belgium, France, Australia, Bermuda, Canada, and Russia have similar associations.

The principles adopted in the construction of yachts have fluctuated greatly, from the simple unpretending rig, small tonnage, and clumsy build of the early yachts of the royal Cork club, to the immense canvas area, larger size, and long narrow build of the yacht of the present time. The yacht of the early part of the century was built with a fine run aft, and a bluff bow; but about 20 years ago this style was supplanted by increased sharpness of bows and stern, a raking (slanting upward and backward) stern-post, more depth, the draught aft double of that forward, great fineness of the water-lines, narrow beam, and immense sails. The effect of these changes was a great increase of speed, attended, however, with certain defects: one of which was that the diminished breadth of beam injuriously affected buoyancy, and the yachts consequently were more liable to be wetted in a heavy sea. In 1851 the hollow manner in which the crack yachts of the principal clubs in England were beaten by the yacht *America* of the New York yachting club, showed their owners and builders that they had still much to learn in the way of improvement; and, with few exceptions, they wisely took the lesson. The *America* had great breadth of beam, comparatively little depth inside, an upright stern-post, extremely sharp entrance, and fine water-lines, and (the most remarkable feature) her maximum breath considerably abaft the center. With the exception of the great breadth of beam, and little depth inside, all the other characteristic points of the American yacht were adopted by the builders of yachts in this country; the difference between the draught aft and forward was diminished; and the result of these changes has shown that they were great improvements.

The materials used in the building of yachts are wood, iron, and steel; wood alone, wood and iron together, iron alone, and steel alone, being the various ways in which the materials are employed. Yachts built of wood, or of wood and iron, are generally coppered, to protect the planking, and secure the smoothness of surface essential to speed. The considerations which determine the relative length, breadth, depth, etc., are treated of under SHIPBUILDING. Considerable stimulus is given to improvements in construction by the numerous prizes which are offered for competition by the various yacht clubs, and which amounted in 1875 to $70,000, besides cups. These small, but powerfully built and thoroughly sea-worthy vessels have traversed every sea on the globe; numbers make trips to Norway and the Mediterranean; some visit America and the Indian and Southern oceans; and one or two have circumnavigated the globe. Some of the most remarkable performances of yachts are the voyage from New York to Liverpool of the *Charter Oak*, 23 tons, in 36 days; that of the *Sylvie*, 205 tons, from Halifax to Havre, in 16½ days; those of the *Inca*, *Katinka*, and *Vivid*, 25 tons each, from England to Australia; and the great Atlantic yacht-race from New York to Cowes, in Dec., 1866, which was won by the *Henrietta*, 205 tons, after a voyage of 14 days. Yachts may be divided, according to the style of their rig, into cutters (q.v.), fore-and-aft and square topsail schooners (q.v.), and yawls (q.v.). The tonnage of these vessels is very variable, ranging from 3 to 420 tons in Britain, the average tonnage being 30 to 50 tons. Steam-yachts (screws) are now exceedingly common, their independence of wind making them very popular. The *Victoria and Albert* and the *Osborne*, both belonging to the queen, are specimens of this class.

The first regular club in the United States was founded in New York in 1844; in 1845 a club house was built on the Hudson near Hoboken; and in the same year the first regatta was held in New York bay. In 1846 the first race was contested between the sloop *Maria*, 154 tons, owned by John C. Stevens, the commodore of the club, and the schooner *Coquette*, 74 tons, owned by J. H. Perkins; the course being 25 m. to the windward and return, from the light-ship off Sandy Hook. The race was won by the *Coquette*. In 1851 the victory of the *America*, belonging to the New York yacht club, gave a great impetus to yachting in this country, and changed English views as to the scientific principles of ship building. (See the preceding article). In 1866 the *Henrietta*, *Fleetwing*, and *Vesta* raced from Sandy Hook to Cowes for a purse of $90,000. The *Henrietta* won in 13 days 21 hours and 55 minutes. In 1870 Mr. James Ashbury, a prominent English yachtsman, brought the *Cambria* to this country. In the voyage over she defeated Mr. James Gordon Bennett's *Dauntless* by one hour only. In the race for the queen's cup (brought here by the *America*) the *Cambria* was beaten by the sloop *Magic*, which won in 4 hours 7 minutes 54 seconds, actual time, the course being from Stapleton, Staten island, around the s.w. spit to the Sandy Hook light-ship and return, about 43 miles. In 1876 the Canadian yachtsmen sent the *Countess of Dufferin* to New York to contend for the queen's cup, but she also proved unsuccessful. There are now nearly 40 different clubs in this country. Among the largest, besides the New York club, may be mentioned the Brooklyn, the Eastern, and the Hudson River clubs. In 1880 the National yacht association held its first meeting in New York harbor. There were 40 yachts entered from 13 clubs. The winners in the different classes were the *Silence*, 3 h. 52 m. 37 sec.; the *Isonomy*, 4 h. 01 m. 16 sec.; the *G. B. Deane*, 4 h. 26 m.

02 sec.; and the *F. L. Sheppard*, 2 h. 52 m. 45 sec.; all actual sailing time. Racing yachts use a large triangular sail called a spinaker, which is set from the topmast head to the deck and boomed out on the windward side when the wind is abaft the beam By special acts of congress yachts are given the privilege of coming into and leaving ports without entering or clearing at the custom-house or paying tonnage tax.

A fair estimate of the speed of modern American yachts may be had by averaging the times made at the various regattas of any season. The following were among the contests of 1884, in the waters surrounding New York: Knickerbocker club, May 31st, from Port Norris to and around Ft. Schuyler buoy for the eighth class; for other classes around Gangway buoy, off Sands point; winners, class A, *Sara*, 4 h., 46 min., 01 sec. (elapsed time); class B, *Reckless*, 4 h., 58 min., 46 sec.; class C, *Gracie*, 4 h., 18 min., 43 sec.; class D, *Daisy*, 4 h., 44 min., 27 sec.; class E, *Nellie R.*, 4 h., 35 min., 54 sec.; class F, *Adele*, 4 h., 34 min., 46½ sec.; class G, *Rex*, 4 h., 50 min., 01 sec.; class H, *Foam*, 4 h., 41 min., 20 sec. Eclipse club, June 2d: from East 104th st. around Throgg's Neck, and return, 15 m.; winner, *Jessie*, 3 h., 31 min., 04 sec. Williamsburg club, June 3d: from club house on Pottery beach through Hell Gate to the Gangway buoy, returning to Hunt's dock; winners, class A, *Van Voorhis*, 4 h., 44 min., 42 sec.; class B, *Mary Keegan*, 5 h., 36 min., 30 sec.; class C, *Tidal Wave*, 6 h., 52 min., 05 sec.; class D, *A. J. Foster*, 6 h., 30 min., 21 sec. Atlantic club, June 10th: from Bay Ridge through the Narrows round the buoy on the s. w. spit, thence around the Scotland and Sandy Hook lightships, returning s. and w. of the Romer beacon; winners, class A, *Grayling*, 6 h., 16 min., 04 sec.; class B, *Triton*, 6 h, 40 min., 27 sec.: class C, *Mischief*, 6 h., 11 min., 10 sec.; class D, *Fanita*, 6 h., 26 min., 22 sec. (corrected times). New York club, Aug. 11, handicap race from Martha's Vineyard to Newport: winners; schooners, *Clio*, handicap corrected time, 4 h., 55 min., 41 sec., actual corrected time, 4 h., 48 min., 53 sec.; sloops, *Mischief*, actual handicap time, 5 h., 19 min., 16 sec.; actual corrected time, 5 h., 22 min., 45 sec.; *Vixen*, 5 h., 13 min., 53 sec.; and 5 h., 09 min., 07 sec.; and *Athlon*, 5 h., 04 min., 11 sec., and 5 h., 18 min., 05 sec. 1885, Aug. 5, during the annual cruise of the New York club, in a race from Newport to New Bedford—over 30 m.—the *Priscilla* made the run in 3 h., 05 min., 51 sec., and the *Gracie* (a smaller boat) in 3 h. 15 min., 05 sec., beating the *Puritan* (3 h., 17 min., 07 sec.) and the English yacht *Genesta*. A few days afterward, however, in a race of 38 m., the *Puritan* beat the *Priscilla* by 1 min., 52 sec., completing the course in 3 h., 51 min., 26 sec. In 1886, the *Mayflower* beat the English *Galatea* by 12 min., 8 sec.; and in 1887 the American yacht *Volunteer* beat the English *Thistle* by 19 min. 23¾ sec. In 1893, the Earl of Dunraven challenged the defenders of the cup with his 85 ft. cutter, *Valkyrie*. To meet him the 86 foot centre-board yacht *Vigilant*, built by Herreshoff, was selected. Two races, which took place in October, resulted in the *Vigilant's* favor,—the first being won by 5 m. 48 s. corrected time, and the second by only 40 seconds. In 1894, Mr. George Gould purchased the *Vigilant* from the syndicate that had built her, and took her to England, where she met with poor success against the Prince of Wales's cutter *Britannia*, with which she raced 16 times, winning only 5 of the contests.

Steam yachting has much increased of late. It has been proved by experiment that for the perfect working of steam yachts, in ocean voyages, the chief necessity is due protection against cylinder condensation. For this reason it is found advisable to use non-conducting material in the manufacture of the interior surfaces of cylinders. Under these conditions alone can high speed be attended with comparative economy. A brief description of some of the essential features of the fine English steam yacht *Lady Forfrida* (built by Elder & Co., 1883) will cover many of the improvements of late years in this branch of the art of shipbuilding. The engines have a steam pressure of 110 lbs. to the sq. in., with a vacuum of 28½ in. With this pressure, they are of 1,020 horse-power. There are two low-pressure inverted cylinders, and one high-pressure, also inverted—the former with a diameter of 24 in., and the latter with one of 34 in. The high-pressure cylinder (steam-jacketed, like the other two) differs from the low-pressure cylinders in the construction of its valve, which is like the equilibrium pistons, and not "slide." One of the low-pressure engines works the various pumps, while the other causes a reciprocating circulating pump to supply the surface condenser with water. The single-acting air-pump has a 17 in. stroke, and is 20 in. in diameter. The propeller is formed of solid manganese bronze. The American Yacht club was organized in New York, 1883, to encourage steam yachting; it now has a large membership. In 1885, June, the *Stiletto*, from the docks of the blind ship-builder Herreshof, Bristol, Penn., surprised yachtsmen by beating the *Mary Powell* (which had been known as "Queen of the Hudson") in a race of 29 m., performing the feat in 1 h., 17 min. In July of the same year, she won the regatta of the American Yacht Club, running from Larchmont through Long Island sound to New London, a distance of 92 m., in 4 h., 13 min. This boat is 95 ft. long, with a water-line length of 90 ft., and a beam width of 11 ft. The stern is nearly as narrow as the bow. The boiler is a beehive coil, with the fire directly under it, and never containing more than a gallon of water at a time, though having a capacity of 200 lbs. of steam. Steam-yachts are usually built of "mild" steel. As this metal rusts in some waters, however, it has been proposed to use "delta" metal (an alloy of iron, copper, and zinc) in their manufacture. A yacht was built of this metal for the African exploring co., 1884. See Kunhardt's *Small Yachts* (N. Y., 1885).

YADKIN, a co. in n.w. N. C., bounded on the n. and e. by the Yadkin river; about 320 sq.m.; pop. '90, 13,790. Iron is found. Co. seat, Yadkinville.

YAHOOS. See HOUHNYMNS.

YÂJNAVALKYA is the reputed author of the S'atapatha-Brâhman'a (See *Yajurveda,* under VEDA), and of a Dharmas'âstra, or law-book (see SANSKRIT LITERATURE, sec. *law*). His name points to his being a descendant of Yajnavalka, and, according to tradition, he was also a descendant of *V'iswámitra* (q.v.), and belonged to a branch of the *Kus'ikas.* He seems to have occupied an influential position at the court of king Janaka of Videha. Nothing certain, however, is as yet known regarding the age at which he lived.

YAK, *Bos grunniens,* a species of ox found in Thibet, and domesticated there. It is ranked by col. Hamilton Smith in the genus *bison,* along with the bison, gaur, and gayal, and by Mr. Gray in the new genus *poephagus.* The wild yak of central Asia is the largest native animal of Thibet, and is found only near the limits of perpetual snow, descending into the higher wooded valleys in winter, and ascending in summer to the pastures of short grass and *carices,* some of which are at an elevation of 17,000 ft. above the sea. It is hunted by large dogs, and is very fierce, falling upon an adversary not only with its horns but with its chest, and crushing him by its weight. It is generally black. The yak has been domesticated from time immemorial, and forms great part of the wealth of the inhabitants of the highest and coldest regions of central Asia. The domesticated yak is about the height of an English ox, which it much resembles also in figure of body, head, and legs. It is covered all over, however, with a thick coat of long silky hair, hanging down like the fleece of a sheep. The head is rather short; the eyes large and beautiful; the horns not very large, spreading, tapering from the base, a little turned back at the tips, a space between them on the forehead covered with a mass of curling hair; the nose is smooth and convex, the nostrils small. The neck is short; the withers high and arched; the rump is low; the legs are short. Over the shoulders there appears a bunch somewhat like that of the zebu, but it consists only of long hair. The hair of the whole ridge of the back is long and erect, but not harsh. The tail is covered with a prodigious quantity of long flowing hair, descending to the hock, and has much the appearance of a large bunch of hair artificially attached. Not a joint of it is visible. From the chest, between the fore-legs, issues a large pointed tuft of long hair. The hair of the shoulders, rump, and upper parts of the body, is comparatively thick and short; but that of the lower parts is long and straight, hanging below the knee, and sometimes even to the ground. Yaks exhibit great variety of colors; but black and white are the most prevalent. It is not uncommon to see the long hair on the ridge of the back, the tail, the tuft on the chest, and the legs below the knee white, while all the rest is jet black. The great quantity of hair, evidently a protection against the cold of the climate for which it is destined, gives the yak an apparent size far beyond the reality.

The yak does not low like an ox, but utters a short grunting sound like a pig, as the expression either of uneasiness or of satisfaction.

The milk of the yak is very rich, and the curd made of it is much used by the Thibetans, both fresh and dried, often powdered into a kind of meal. The butter made from yak-milk is excellent, and is preserved for a long time in the dry and cold climate of Thibet in bladders. It is an important article of Thibetan commerce. The flesh of the yak is of the finest quality; that of the calves is much superior to ordinary veal. Yak flesh is often dried in the sun by the Thibetans, and eaten raw. The yak is never used for tillage or draught, but is very much employed as a beast of burden, and travels at a slow pace 20 m. a day, where no other beast of burden could well be employed. The lazy and luxurious lamas of Thibet often ride upon it, an attendant leading the animal. The hair is spun into ropes, and made into coverings for tents. The soft fur on the hump and shoulders is made into a fine and strong cloth. Caps, jackets, cloaks, and blankets are made of the skin with the hair on. The tails are the *chowries,* or fly-flappers, used in all parts of India, and which are to be seen particularly on all occasions of state and parade, and sometimes in the hands of the meanest of grooms, sometimes of the highest officers of state. See illus., Ox, vol. XI.

YAKI'MA, a co. situated in s. Washington; about 5760 sq.m.; pop. '90, 4429. Co. seat, North Yakima.

YAKOOB BEY, d. Kashgar, 1877. By some accounts he was a native of Khokand, by others an Arab. Little is known of his history until he distinguished himself in the defense of Khokand against the Russians, 1853. Though finally defeated, he fought with great valor, and was given the title of Bey by the Khan of Khokand, who sent him to aid an insurrection against the Chinese in Kashgar, 1863. He succeeded in driving out the Chinese, and having himself proclaimed Ameer of Kashgar. He conquered several other cities of the Tarim basin; expelled the Chinese completely from east Turkistan, and formed a powerful dynasty, over which he ruled until 1877, when he died while in the midst of a campaign against the Chinese, who for some years had been preparing to recapture the country. After his death the Chinese reconquered his territory. The Turks had hoped that he would become a great Mussulman power, and he was allowed by the sultan Abdul Aziz to assume the honored title of Commander of the Faithful.

YAKSHA is, in later Hindu mythology, the name of a kind of demigods, who especially attend on Kuvera, the god of riches, and are employed in the care of his garden and treasures. According to the Vishn'u-Purân'a, they were produced by the god Brahman, as beings emaciate with hunger, of hideous aspect, and with long beards; but Brahmanic poetry generally represents them as inoffensive. The Buddhists, however, describe them in some of their legends as cruel demons, who feast on serpents and human corpses.

YAKUTSK. See JAKUTSK.

YALE, a town, the head of navigation on the Fraser river, in British Columbia, 103 miles from Vancouver. Near it are the gold-washings, across the river is the mining town of Hope Station. Chinese and Indians form a part of the population, which in 1891 numbered 1382.

YALE, ELIHU, the early patron of Yale college, from whom it received its name, was the son of Thomas Yale, who came to America in 1638 with the colonists who settled New Haven, but soon after removed to Boston, where Elihu was born, April 5, 1648. In 1658 the son accompanied his father to England, and never returned to America. After completing his education in England, he went to the East Indies, where he resided for about twenty years, and acquired a great estate. From 1687–92 he was governor of Fort St. George, Madras, and after his return to London was governor of the East India Company. He was also a fellow of the Royal society. His gifts in money and books to the college in New Haven, between 1714 and 1721, amounted to about £400. He died at London, July 8, 1721, and was buried in the churchyard at Wrexham, Wales. His epitaph contains the following lines :

> Born in America, in Europe bred.
> In Africa travel'd, and in Asia wed,
> Where long he liv'd and thriv'd ; at London dead.
> Much Good, some Ill he did : so hope all's even,
> And that his soul thro' Mercy's gone to Heaven.

YALE UNIVERSITY, at New Haven, Conn., is one of the oldest and best endowed universities in the United States.

The plans of the first settlers of New Haven in 1638, included the establishment of a college, but Massachusetts objected because there was not then population enough in the colonies to support the college already founded at Cambridge, and for sixty years the people of Connecticut sent their sons to Harvard. In 1700 ten of the principal ministers of the colony, all but one of whom were graduates of Harvard, at a meeting at Branford, formally founded a college by a gift of books for a library, and the next year the Colonial Assembly granted a charter making the ten ministers and their successors trustees of the "collegiate school of Connecticut." The trustees elected Abraham Pierson, of Killingworth, one of their own number, rector of the school, and, in order to insure the support of the towns on the river, voted to locate it at Saybrook, "as the most convenient place for the present." Until the death of Rector Pierson, however, the students and the one tutor lived at Killingworth, probably in the house of the rector. Under the second rector, Samuel Andrew, the senior class was instructed by him at Milford, and the other classes by two tutors at Saybrook. In 1717, amid much opposition, the school was removed to New Haven, and located permanently there. A wooden building was erected, where Osborn Hall now stands, which at commencement in 1718 was formally opened, when the name of Yale College was adopted, in honor of Gov. Elihu Yale, who had aided the institution by generous contributions. This building, besides chambers for students, and a library, was furnished with a kitchen and dining-hall, and from this time, for more than one hundred and twenty years, all students were required to board together in commons. Timothy Cutler was rector from 1719 to 1722, when, on account of a change in his religious views, he was excused by the trustees from further service. Elisha Williams served from 1726 to 1739, and was succeeded by Thomas Clap, who had more business qualifications than any of his predecessors. He drew up and published in Latin the first code of laws, catalogued the library, and drafted a new charter which was approved by the General Assembly in 1745, by which the former trustees were incorporated under the name of The President and Fellows of Yale College in New Haven. He erected Connecticut Hall (South Middle), then, "the best building in the colony," and a chapel (the Atheneum). President Clap also successfully defended the college against the attempted interference of the legislature in its management. Naphtali Dagget, Professor of Divinity, served as president from 1766 till 1777, when he was followed by Ezra Stiles. About this time, on account of the scarcity of provisions at New Haven, caused by the revolutionary war, the students were removed into the interior, the freshmen to Farmington, the sophomores and juniors to Glastonbury, and the seniors to Wethersfield. President Stiles succeeded in overcoming the opposition to the college which had long existed in the legislature, and in 1792, by joint action of the legislature and corporation, certain state funds valued at $30,000 were applied to the improvement of the college, and the Governor, Lieutenant Governor, and six senior senators became members of the corporation. The administration of Timothy

Dwight (1795–1817), begins a new era in the history of the college. At his accession there were about one hundred students, and the instructors consisted of the president, one professor, and three tutors, one tutor instructing each of the three lower classes in all of its studies. He established permanent professorships, and filled them with recent graduates of unusual ability and promise. Three young men, appointed at this time served the college together for more than half a century, and brought it great honor, Jeremiah Day in mathematics, Benjamin Silliman in chemistry, and James L. Kingsley in language. President Dwight, anticipating the growth of the college, extended, by purchase, the college green so as to include the whole front of the present campus, and continued the brick row to Berkeley Hall (North Middle). He also planned the organization of professional schools under district faculties, but the medical school only was established before his death. Jeremiah Day, who became President in 1817, had been selected by Dr. Dwight as his successor, and continued to carry out his plans. The divinity and law schools were organized and the brick row completed. Under President Day the responsibility for the government of the students was placed upon the faculty, and out of the stricter discipline now enforced, grew two unsuccessful rebellions known as the "Conic Sections Rebellion" and the "Bread and Butter Rebellion." In 1831 a fund of $100,000 was raised to meet the general expenses of the college, the total productive funds before this time having been less than $20,000. When President Day resigned in 1846, there were 587 students in the college, about one fifth of whom were from the southern states. Under President Theodore D. Woolsey (1846–1872), the corps of instructors was greatly enlarged, and the standard of scholarship raised; the scientific school was established, and the foundation laid for the school for graduate instruction; the professional schools were reorganized, and the school of the fine arts founded. During his twenty-five years of service the number of students increased to 809. Dr. Woolsey proposed the plan by which six graduates of the college took the place of the state senators in the corporation in 1871. In the same year Noah Porter became President. His administration was one of great material prosperity. At this time a most important change was made in the course of instruction, and the present system of elective studies was adopted. At his resignation the student body numbered 1079. He was succeeded in 1886 by Timothy Dwight, grandson of the elder President Dwight, under whose management the growth of the institution has been unprecedented. In five years the number of students increased more than fifty per cent. The name Yale University was authorized by the legislature in January, 1887. Under the last three Presidents the productive funds have been greatly augmented, and more than twenty buildings have been erected at a cost of above $2,000,000.

The Corporation as now constituted is composed of the President and eighteen Fellows, viz.: Ten Congregational clergymen, the successors of the ten original founders who by the charter of 1701 were made trustees of the "collegiate school," the Governor and Lieutenant-Governor of Connecticut, who were made members *ex-officio* in 1792, and six representatives elected by the graduates from their own number, one every year for a term of six years. The corporation, only, has power to confer degrees. The University includes four departments each under the administration of a distinct faculty.

In the department of philosophy and the arts are included the two undergraduate departments, the art school, and the school for graduate instruction. The academical department is the original college, and has existed since 1701. The course of instruction covers four years, and leads to the degree of bachelor of arts. During the first two years the following studies are prescribed: Greek, Latin, mathematics, German, French, and English. The work in junior and senior years is mostly elective. The charitable funds of the college yield an income of over $18,000, which is applied to the abatement of tuition of students of good character and standing who need aid. There are several scholarships and fellowships, yielding annually from $60 to $800 each, given to undergraduates and graduates of this department. Of the prizes to be won by competition, the chief are the De Forest, Townsend, Ten Eyck, and Betts prizes in English. The Winthrop, Robinson, Woolsey, Hurlbut, Berkeley, and Chamberlain prizes for excellence in classical scholarship, and the De Forest mathematical prizes. The college campus borders on the New Haven green, and occupies half of one of the original nine squares in which the city was laid out. It is bounded by College, Chapel, High, and Elm streets. The modern buildings are arranged so as to form a quadrangle 850 feet long and 400 feet wide. At the north corner of the campus is Alumni hall (1853), used for meetings of the graduates and examinations, at the west, the art school (1866), at the east, Battell chapel (1875), and at the south, Osborn Hall (1889), containing recitation and lecture rooms. On the High street side are situated the old library (1844), Dwight hall (1886), devoted to the uses of the Yale Y. M. C. A., and the Chittenden library (1890). The space on Elm and College streets is filled by the dormitories Durfee (1871), Farnam (1870), Lawrence (1886), and Welch (1892) halls. On the Chapel street side are Vanderbilt hall, the Art School and Osborn hall. The Sloane physical laboratory (1883) and the Kent chemical laboratory (1887) are west of the campus, on Library street.—The Sheffield scientific school furnishes both graduate and undergraduate instruction, but the larger part of its students are undergraduates. It was established in 1847 as a school of applied chemistry, and began with two professors and eight students in the president's house, where Farnam hall now stands. The degree of bachelor of philosophy was first given in 1852. Two years later, having enlarged its field, it was called the Yale scientific school. Mr.

Joseph E. Sheffield, in 1860, provided it with a building and a permanent fund, and the next year the school was reorganized and called the Sheffield scientific school. In 1863 it received from the legislature of Connecticut $135,000, being the proceeds of the congressional land grant of July, 1862, for the promotion of "such branches of learning as are related to agriculture and the mechanic arts." The school is under the control of a governing board, consisting of the president, the director of the school, and its permanent officers. Professor George J. Brush has been director since 1872. The course of study occupies three years. The work of freshman year is prescribed, including German, English, mathematics, physics, chemistry, and drawing. The instruction of the last two years is arranged in the following special courses: Chemistry, civil engineering, mechanical engineering, agriculture, natural history, biology, mining and metallurgy, and select studies. There are about seventy state scholarships open to students from Connecticut who expect to engage in agriculture, manufacturing, or engineering. The Sheffield campus borders on Hillhouse avenue, Grove, and Prospect streets, and contains Sheffield hall (1860), North Sheffield hall (1870), and the Sheffield biological laboratory (1889). The campus and buildings were all presented by Mr. Sheffield, whose gifts to the school have amounted to not less than $1,000,000.—The school of the fine arts was established in 1864. It is open to students of both sexes, and furnishes instruction in drawing, painting, sculpture, architecture, and copper-plate etching. Its collections include the "Jarves gallery of Italian art," the "Ehrich gallery of Dutch and Flemish art," and the "Trumbull gallery" of historical paintings, besides many casts, marbles, porcelains, bronzes, and wood-carvings.—The graduate department is under the direction of the philosophical faculty, which comprises the faculties of the three departments already described. It provides advanced instruction in studies not professional for graduates of colleges or universities. The number of courses offered in the graduate department of the university in 1896–7 was as follows: philosophy, etc., 25; political science and history, 44; oriental languages, 42; classical philology, 47; modern languages, 40; natural sciences, 54; pure and applied mathematics, 27; fine arts, 4; music, 7; and physical education, 1; total, 291. At the commencement in 1896, degrees were given to 30 doctors of philosophy, 11 masters of arts, and 4 civil engineers.

Each professional school forms a separate department of the university. The divinity school is north of the college campus, on the corner of College and Elm streets. East Divinity hall (1870) and West Divinity hall (1874) together accommodate about 150 students. The school was organized in 1822, but instruction in theology had been given at Yale since its foundation, and the first professor in the college was a professor of Divinity, in 1755. The school is Congregational in doctrine, but it has ever been characterized by a liberal spirit, and students of nearly every denomination avail themselves of its advantages. It possesses a very complete reference library and a valuable library of church music which formerly belonged to Dr. Lowell Mason.—The earliest professional school organized at Yale was the medical school. Four professors in medicine were appointed in 1813, and degrees were given the following year. The school was aided in the beginning by a grant of $30,000 from the state, and for seventy years was under the joint control of the college and the state medical society. It is closely connected with the New Haven hospital and the New Haven dispensary, which furnish good opportunities for instruction in surgery and the treatment of disease. The school building, at 150 York street, was erected in 1859.—The law school became a part of the college in 1824, though no degrees were given till 1843. It is located at present in the county court-house, but a new building for this department is soon to be provided. Its course of instruction is designed to fit for the practice of law in any state. An examination for admission is required of those who have not received a collegiate education. The law library is one of the most complete in the country. Three years of study are required for the degrees of bachelor of divinity and doctor of medicine, and two for the degree of bachelor of laws, but each school offers opportunity for one or two years of advanced work.

The university library contained (1896) about 200,000 volumes, and the Linonian and Brothers library about 20,000, all of which are accessible to students in any department. The additions to both libraries amount to about 6000 volumes annually. The Peabody museum of natural history was founded in 1866 by a gift of $150,000 from George Peabody, the London banker, and in 1876 the first wing of the museum, on the corner of High and Elm streets, was completed. It contains the collections in mineralogy, geology, paleontology, and zoology, with several laboratories and work-rooms. The buildings of the observatory are located on Prospect street, about a mile from the college campus. The late professor Elias Loomis bequeathed to the observatory a fund of more than $300,000, the income of which is to be used for the promotion of astronomical observations. The new gymnasium, completed in 1891 at a cost of more than $200,000, stands on Elm street, nearly opposite Peabody museum. The faculty and instructors in the university now (1897) number 238, and the students 2495, viz.: undergraduates, 1790 (academic, 1237; scientific, 553); art students, 53; music, 76; graduates, 281; students in theology, 104; medicine, 138; law, 213.

YALOBUSHA, a co. in n. Mississippi; about 472 sq. m.; pop. '90, 16,629. Co. seat, Coffeeville.

YAM, *Dioscorea*, a genus of plants of the natural order *dioscoreaceæ*, distinguished by an inferior ovary and membranous winged fruit. The species are mostly tropical,

natives of the East and West Indies, etc. They have tuberous roots and herbaceous twining stems. The great fleshy roots of some of them are very much used as an article of food, in the same way that potatoes are in more temperate climates. They contain much starch, and generally become somewhat mealy and pleasant to the taste when boiled. This, however, is not the case with all; the roots of *D. triphylla*, *D. dæmonum*, *D. virosa*, and several other species with ternate leaves are very nauseous even when boiled, and are poisonous. The tubers of all the yams contain an acrid substance, which, however, is dissipated by boiling, except in the species with compound leaves. The WINGED YAM (*D. alata*) is an article of food in daily use in the South Sea islands. The roots are 1½ to 3 ft. long, and often 30 lbs. in weight, with a brownish or black skin, juicy and reddish within. They vary exceedingly in form. The stem, which is winged, twines up tall poles which are provided for it by the cultivator; the leaves are between heart-shaped and arrow-shaped. Two or three small tubers are generally found in the axils of the leaves. It is supposed that this species may be the original of most, or perhaps all, of the yams cultivated in the tropical parts of Asia, Africa, and America—as the common yam of the West Indies (*D. sativa*), which has a round stem and heart-shaped leaves; *D. bulbifera*, in which the tubers in the axils of the leaves attain the size of apples; the prickly yam (*D. aculeata*), which has a prickly stem, and a fasciculated, tuberous root; *D. globosa*, the most esteemed yam of India, which has very fragrant flowers, and roots white internally; *D. rubella*, another Indian kind, with tubers sometimes 3 ft. long, tinged with red below the skin; etc.

YAMA, the Hindu god, who, at the epic and Purân'ic period of Hinduism (see INDIA, sec. *religion*), is the sovereign of the manes, and the judge of the dead, is, in the hymns of the R'igveda, a son of *Vivas'wat* and *Saran'yû*, and a twin-brother of *Yamî*, whose desire to become his wife he resists. His father is sometimes also called the *Gandharva*; and he is further represented there as possessing two four-eyed dogs, which guard the road to his abode (see J. Muir, "Yama and the Doctrine of a Future Life, according to the R'ig-, Yajur-, and Atharva-vedas," in the *Journal of the Royal Asiatic Society*, New Series, 1865, vol. i. p. 287, *ff.*). The idea represented by these mysterious deities has been differently understood. Prof. Roth takes Vivas'wat for the light of heaven, Saran'yû for the dark storming cloud, and Yama and Yamî as representing the first human pair—the originators of the race, or the Vedic Adam and Eve produced by the union of the damp vapor of the cloud and the heavenly light. The Vedic hymns, however, do not afford the slightest ground for such a fantastical interpretation of these names; and as regards that of Yama and Yamî, they discountenance it even distinctly by describing Yama as resisting the sexual alliance with his sister. Prof. Max Müller understands *Vivas'wat* to represent the sky; *Saran'yû*, the dawn; *Yama*, the day; and *Yamî*, the night (*Lectures on the Science of Language*, 2d Series, Lond. 1864, p. 509, *ff.*). But this interpretation, too, is open to the strongest doubts, inasmuch as there is no valid ground for identifying the luminous deity Vivas'wat with the sky, or *Saran'yû* (from *saran'a*, going, moving) with the dawn. It seems more probable that the phenomena symbolized by this myth are not of a luminous, but of an aerial character; the kindred myth of a luminous character being that of the *As'wins*, who are likewise the twin progeny of Vivas'wat and Saran'yû, or rather of Vivas'wat and "a form similar to that of Saran'yû," and who represent the transition from darkness to light, and the inseparable duality produced by the intermingling of both (see J. Muir, "Contributions to a Knowledge of the Vedic Theogony and Mythology, No. 2," in the *Journal of the Royal Asiatic Society*, vol. ii. 1866). For as *Vivas'wat*, "the expanding," probably implies the firmament "expanding" to the sight through the approaching light, *Gandharva*, as usual, the solar fire, and *Saran'yû*, the dark and cool "air" (the moving element), Yama and *Yamî* seem to represent the current of air produced by the effect of the solar heat emanating from the firmament on the cool air of the night, when the antagonism between the warm and cold air of which this current consists would be Yama repelling the union with his sister Yamî, though, at the same time, they are "husband and wife while yet in the womb" (of the night-air). And since this phenomenon extends over the whole atmosphere, the two four-eyed watch-dogs of Yama are probably the eight or twice-four regions of the compass, either each couple of them taken together with their intermediate regions—whence both dogs are called spotted—or the four regions and the intermediate four taken separately—whence one dog is also called *dark*, and the other *spotted*. Yama being produced by the solar heat, it becomes then intelligible why it is said of Agni, the (solar) fire, that he is born as Yama, and Yama being a phenomenon of the air, why he is also identified with Vâyu, the wind, and why the intermediate space between heaven and earth is assigned to him as his domicile. It is probably a later conception of the Vedic period which describes this abode as having been made for him by the spirits or *manes*, and Yama as having been the first who found his way to it; and a still later one, which represents him as the first of *mortals* who went to that world, for in passages where these ideas are expressed, there is an association between the moving air and departed life which is foreign to the oldest notions of the Vedas. It led to the position which subsequently Yama assumed as a luminous king who dwells together with the manes, and as the lord of death—death then becoming his messenger. Yet in the R'igveda, he has not yet the office of judge of the dead which is assigned to him in the later mythology

of the epic poems and Purân'as, and probably already in some of the Upanishads. At the epic and Purân'ic period, Yama entirely loses his cosmical character, though he is still called the son of Vivas'wat. He then marries 13 daughters of the patriarch Daksha, is installed as the king of the manes, becomes the regent of the south, and resides in Yamapura, a town of the infernal regions, where he sits in judgment over the souls of the departed which are brought before him. They are generally fetched by his messengers, who draw them with nooses out of the bodies which they animated; but in the case of very pious persons he assumes himself the function of separating the soul from the body. After the soul has been brought before him he orders his recorder, *Chitragupta* or *Chandragupta*, to read to him an account of all the good and bad actions it had done during its life, and which are kept registered in a book called *Agrasandhânî;* and according to their merit or demerit, it is sent to heaven or the infernal regions. The precise knowledge which the Purân'as pretend to possess of all these proceedings also extends to the description they give of this recorder, and to their enumeration of the assessors who co-operate with Yama at his court.—Yama's sister is *Yamunâ* (q.v.). Among his other names, *Dharma* ("justice"), *Dharmarâja* ("king of justice"), *Antaka* ("the ender"), *Kâla* ("time"), and *S'râddhadeva* ("the god of the S'râddha," q.v.), are of usual occurrence.

YAMASKA, a co. in central Quebec, Canada, bounded on the n.w. by lake St. Peter and the St. Lawrence river; about 250 sq.m.; pop. '91, 16,058. Capital, St. François du Lac.

YAMBU, or YEMBO (*Iambia* of Ptolemy), a maritime t. of Arabia, on the coast of the Red sea, about 130 m. s.w. of Medina; stands on the edge of a barren plain that extends between the mountains and the sea, fronting the northern extremity of a narrow winding creek. It shares with other places the title of "Gate of the Holy City," and is the third quarter of the caravan road from Cairo to Mecca, and is thus a place of considerable importance. Yambu being the port of Medina, is supported by a considerable transport trade and extensive imports from the western coasts of the Red sea. The harbor is good and well sheltered. It is surrounded by walls with turrets, outside of which are a few domes and tombs. The streets are wide, the houses stand at a considerable distance from each other, are built of limestone and coralline, and have huge hanging windows. There is a large market-place, a custom-house, some white-washed mosques of a very simple form, and a few caravanserais. According to Burton, "there is an independent bearing about the people, strange in the east; they are proud without insolence, and look manly without blustering. Moreover, the population has a healthy appearance." Pop. between 6,000 and 7,000. See Burton's *Pilgrimage to El-Medinah and Meccah* (1855).

YAMHILL, a co. in n.w. Oregon, bordering on the Coast Range mountains; 640 sq. m.; pop. '90, 10,692. Co. seat, McMinnville.

YAMUNÂ, the modern Jumna, is one of the sacred rivers of the Hindus, mentioned as such as early as in the hymns of the *R'igveda*. Bathing in it, especially where it falls into the Ganges, at Allahabad, was at a later period, and is now, supposed to have the efficacy of removing sin, because at Allahabad the god Brahman is said to have performed a great horse-sacrifice—whence this place is termed *Prayâga*, literally "sacrifice," or *Bhat't'aprayâga*, literally "the best sacrifice." (Though Allahabad, which is a celebrated place of pilgrimage, is *the* Prayâga, this term is also applied to other places where two sacred rivers meet, four of which, situated at the confluence of the Ganges with the Alakanandâ, Pindar, Mandâkinî, and Bhâgîrathî, are, besides Allahabad, held in especial sanctity, and severally called *Nanda-*, *Karn'a-*, *Rudra-*, and *Dera-Prayâga*.) In the Purân'ic mythology, the Yamunâ—in Sanskrit, a word in the feminine gender—is called a sister of the god *Yama* (q.v.); and a legend is also told in regard to her, according to which Balarâma, the brother of Kr'ishn'a (see VISHN'U, the 8th Avatâra), once ordered the river to come to him, and as she disobeyed his bidding, plunged his ploughshare into her banks, and dragged her to him. Yamunâ, the legend continues, was thus compelled to quit her ordinary course, and to follow Balarâma whithersoever he went. At last, however, appeased by her entreaties, he let her go, after she had watered all the country. Prof. Wilson appends to this legend, where occurring in his translation of the *Vishn'u Purân'a*, the following remark: "The legend probably alludes to the construction of canals from the Jumna, for the purposes of irrigation; and the works of the Mohammedans in this way, which are well known, were no doubt preceded by similar canals dug by order of the Hindu princes."—*Vishn'u-Purân'a* (Lond. 1840, p. 572).

YANCEY, a co. in n.w. North Carolina, bordering on Tennessee; about 298 sq.m.; pop. '90, 9490, chiefly of American birth. Mount Mitchell, in the s.e. part, is 6500 ft. high. Co. seat, Burnsville.

YANCEY, WILLIAM LOWNDES, 1814–63; b. Georgia; son of Benj. C. of S. C., educated at the north; studied law, and was admitted to the South Carolina bar. In 1836 he settled in Alabama, was a newspaper editor and politician, and in 1844 was elected to congress. He was an extreme democrat, and one of the foremost advocates of secession. In 1859 he favored the election of Breckenridge. In 1861 he introduced the ordi-

nance of secession into the Alabama legislature. During the war he was a member of the confederate congress, and an agent of the government in Europe.

YANG-TZE-KIANG, "son of the great river" or "sea," the principal river of Asia, the "girdle of China," connecting together all the central provinces of that empire, situated between Tibet and Kokonor on the w. and the Pacific ocean on the east. Its entire length through all its numerous windings, under various names, has been estimated at 3200 miles. If regard be had to its tributaries and to the cities to which its waters give access, to the richness of the soil, and the variety of the products along its banks, and above all to the vast population scattered far and wide over the valleys, and plains, and hill-sides drained by it and its confluents, the Yang-tze-kiang has no equal on the globe. It takes its rise in the same elevated regions of central Asia which give birth to the Brahmaputra, Makiang or Mekong, Salween, and Hwang-ho or Yellow river. Its course at first is southward, winding its way through an apparently level country, and bearing the name *Mura Ussu*, or Tortuous Waters. The magnitude of the stream must be considerable even in these upper regions, for it was here, beyond the Bayen Khara mountains, that the missionary traveler, M. Huc, in the winter of 1845, saw a herd of wild oxen that had perished, having got frozen up in the ice while attempting to cross the river. Leaving these upper regions, after traversing the wide territory of Kokonor, the Tortuous Waters run southward, and enter the province of Yun-nan at about 28° n. lat. The river then flows in a south-east direction through this province, and at about 26° n. lat. and 103° e. long., it turns north, forming part of the boundary between the provinces of Yun-nan and Sze-chuen. After entering the latter province, it flows in a n.e. direction under the name of *Kin-sha-kiang* (river of golden sands), receiving at this part of its course many tributaries. On the s., the tributaries of the provinces of Yun-nan and Kwei-chow are numerous, but not large; the principal one, the Oo or Woo, flows through the latter. On the n., the tributaries are numerous and large, the principal being the Ya-loong, the Min or Wen, and the Kia-ling, which force their way through narrow passes, rolling over lofty precipices, and carrying with them large masses of ice. Two of these rivers are each more than 1000 m. in length. It enters the province of Hu-pe at about 110° e. long., shortly before which it receives the name of *Ta-kiang* (Great river). The Great river next runs east-by-north through the entire length of the province of Hu-pe, receiving in its progress the waters of many lakes and rivers, the principal being the *Han-kiang*, from which the most illustrious dynasty takes its name, which in turn gave to Chinamen the name of which they are most proud —sons of Han. The two provinces Hu-pe and Hu-nan—i.e., "north of the lakes" and "south of the lakes"—contribute, by natural or artificial channels, to augment the main stream. One of these lakes, the Tung-ting-hu, is the largest in China, having an area of 300 sq. miles. After receiving the waters of these lakes, the river proceeds in a north-eastern course through the province of Ngan-hwui, in which part are situated the cities forming the great mart Han-kow. Skirting the n. of the province of Keang-se, it receives the waters of the Po-yang lake, which receives nearly the whole of the waters of the province of Keang-se, and, like the Tung-ting-hu, pours all its contents into the Great river. Thence moving in a n.e. direction, it becomes broader and deeper as it traverses the province of Ngan-hwui, receiving tributaries from both banks. Entering Keang-su, and passing Nankin, it travels southward, intersecting the "Transport river," or Yun-ho—i.e., the Grand canal. Through the whole of this province it receives tributaries, helping to swell the flood of waters, till in one broad expanse, several miles in extent from n. to s., they disembogue into the Yellow sea. To name the cities on the banks and tributaries of this rival of the Mississippi, would be to enumerate a large portion of the cities of the empire. It is navigable by ships of the largest class to 900 m. from its mouth, and for smaller vessels to upward of 1500 miles. There is a large steam traffic on it up to Han-kow, nearly 700 m. from its mouth. By the treaty of Tien-tsin, the Y. was opened to foreign commerce as far as Han-kow; and in 1877, Ichang, 360 m. further up the river than Han-kow, became an open treaty port and the seat of a British consul.

YANINA. See JANINA.

YANKEE. Yankee has long been the popular name given to a New Englander in America, and in Great Britain often applied indiscriminately to the whole population of the United States, was in its origin a corruption of the word English as pronounced by the Indians (Yenghies, Yanghies, Yankees). It seems to have been first applied about 1775 by the British soldiers as a term of reproach to the New Englanders, who themselves afterward adopted it.—Since the war of secession, the southern population apply it to the northern people generally.

YANKEE DOODLE, a national air of the U. S., the origin of which is unknown. The words, which were in derision of the ill-assorted provincial troops, are said to have been written in 1755 by Dr. Schuckbrugh, who served as surgeon under Gen. Amherst during the French and Indian war. The original title was *The Yankee's Return from Camp*, and several versions are extant. The tune, always called *Yankee Doodle*, passed through various changes. Its historical association has prevented criticism of the melody, which is shallow and shrill. It has been ascribed to various countries, but is probably of English birth. It occurs in Samuel Arnold's opera of *Two to One* (London, 1784), under the

name of *Yankee Doodle*. See Grove's *Dictionary of Music* and Helen K. Johnson's *Our Familiar Songs* (New York, 1881).

YANKTON, a co. in e. S. Dakota, separated from Nebraska by the Missouri river; about 515 sq. m.; pop. '90, 10,444. Co. seat, Yankton.

YANKTON, city and co. seat of Yankton co., S. Dakota; on the Missouri river and the Chicago and Northwestern, the Chicago, Milwaukee and St. Paul, and the Great Northern railroads; 61 m. n.w. of Sioux City, Ia. It is the seat of Yankton college (Cong.), and of the state hospital for the insane, and has a high school, electric lights, waterworks supplied from the river and artesian wells, national, state, and savings banks, and daily, weekly, and monthly periodicals. There are extensive Portland cement works, several flour mills, and breweries, woolen mill, planing mills, foundry, and pork-packing house. The city is the supply depot of the military posts and Indian agencies on the upper Missouri river, and has a large general trade. Pop. '90, 3670.

YAPOCK, *Cheironectes palmatus*, a marsupial quadruped of the opossum family, *didelphidæ*, the only known species of its genus. It differs from the opossums in having only five molars on each side of each jaw, in its aquatic habits, and its incapacity for climbing trees. The muzzle is rather sharp; the ears naked and rounded; the tail long, scaly, and prehensile; the feet webbed; the hind-feet with an opposable thumb. The Yapock inhabits Brazil and Guiana. It is rather larger than a rat. It is of a brown color, with three transverse gray bands, white on the under parts. It feeds on crustaceans, fishes, etc. It has cheek-pouches, in which it stows away its food.

YAQUIS, or HIAQUIS, a tribe of Mexican Indians, living on the Yaqui river, and kin to the Pima tribes. From 1735 to 1841 they were constantly in revolt against the Spanish and Mexican government, and showed great courage and skill in warfare. They are better advanced in civilization than most Indian tribes, and are industrious and well behaved. Stock-breeding is their chief pursuit, with farming and mining.

YAR, or YARE, a river of the county of Norfolk, rises about the middle of the county, flows e. past Norwich, and, receiving the Waveney, widens into the estuary of Breydon Water, is joined by the river Bure at Great Yarmouth, 2½ m. below which it enters the North sea, after a course of about 30 miles.

YARD (A.-S. *geard*, *gyrd*, Ger. *gerte*, a rod or wand), the British standard measure of linear dimension (see WEIGHTS AND MEASURES), is subdivided into feet and inches. The yard contains 3 ft., and each foot 12 inches. The term "yard" and "ell" (the ell being, however, equivalent to 1¼ yards) are frequently (*commonly*, according to Recorde) used synonymously by old authors.

YARD, in the rigging of a ship, is a timber which, when in its normal position, is borne horizontally at right angles to the ship's length at one of several heights on a mast, for the purpose of sustaining and spreading a square sail. It is upheld by the "lifts," and trimmed out of its right angle to suit the wind by the "braces." The lower sails or courses are upheld by the main, fore, or mizzen yards. Above these are the topsail-yards, the topgallant-sail-yards, and the royal-yards.

YARKAND, a city of eastern Turkistan (pop. 35,000–60,000), is situated in 38° 25′ n. lat., and 77° 15′ e. long., near a river of the same name. Until Yarkand was visited by Mr. Shaw, in 1868, we had little reliable information concerning it. He found it to contain long streets, covered in against the rays of the sun, with rows of fine shops, in which goods of every sort, and from every country, were exhibited. He found the bread excellent; the supply of vegetables varied and abundant; the butchers' shops well provided with horse-flesh, camel beef, and mutton. The population seemed industrious, orderly, and well skilled in many of the arts of civilized life. In 1877, eastern Turkistan (q.v.) was retaken by the Chinese, and Chinese rule was re-established at Yarkand. —See Shaw's *High Tartary, Yarkand, and Cashgar* (1871); Boulger's *Life of Yakoob Beg* (1878).

YARMOUTH, a co. in s.w. Nova Scotia, bordering on the Atlantic ocean; 736 sq. m.; pop. '91, 22,216, a third of French descent. Fishing is the chief occupation. Co. seat, Yarmouth.

YARMOUTH, town, port of entry, and co. seat of Yarmouth co., Nova Scotia; on a small bay of the Atlantic and the Dominion and Atlantic railroad, 205 miles s.w. of Halifax. It is the chief shipbuilding place in the province, and has electric lights, electric street railroads, seminary, banks, and large fishery interests. Pop. '91, 6089.

YARMOUTH, a town in Barnstable co., Mass. It is on Cape Cod extending from Nantucket sound to Cape Cod bay, and is largely occupied with cranberry raising and agriculture. It has churches, public library and a national bank. Pop. '90, 1760.

YARMOUTH, GREAT, a municipal and parliamentary borough returning one member to parliament, an important seaport, and fishing and sea-bathing t. on the e. coast of Norfolk, 19 m. directly e. of Norwich, and 20½ by railway. It stands about 2½ m. above the mouth of the river Yare, on a slip of land about a mile and a half broad, washed on the w. by the Yare, and on the e. by the North sea. Between the town and the suburb of Southtown, or Little Yarmouth, on the right bank of the Yare, in Suffolk, communi-

cation is established by means of a bridge. Connected with Southtown is the village of Gorleston, near the mouth of the river. The principal streets of Yarmouth run parallel to the river, and are intersected by cross lanes or "rows," which, as a rule, are so narrow as to be impassable for ordinary wheel-carriages, being generally not more than from 5 to 8 ft. wide. The vehicles by means of which traffic is carried on in the rows are called "Yarmouth carts." They are low, narrow, and well suited for conveying heavy goods. A quay of nearly 2 m. runs along the river, and here are the town hall, the council chamber, and several other handsome buildings—the finest houses, however, being those built along the esplanade on the beach. There are many churches, schools, and other public buildings, including a sailors' home, fishermen's hospital, and military asylum, the principal church being that of St. Nicholas (230 ft. long and 112 ft. high), founded in the 12th c., a handsome cruciform building with a tower and spire 168 ft. high. The town also contains a monumental column, 144 ft. high, to the memory of Nelson. On the coast are several batteries, three piers, besides two at the harbor mouth, several public gardens, and a marine drive and promenade 2 m. long. Vessels of over 200 tons can enter the harbor, which is formed by the Yare. Yarmouth is the principal seat of the English herring-fishery; deep-sea fishing, the produce of which is forwarded daily to London, is also carried on, and employs many hands. The curing of fish, especially of herrings, is important, and the "Yarmouth bloater" is highly esteemed in London and throughout the country. A very extensive export trade in agricultural produce, herrings, and malt is maintained. Shipbuilding is carried on, and the manufacture of ropes, sails, nets, and silk goods; there are also foundries, tan-works, and flour-mills. A new town-hall has been erected at a cost of £50,000. The coast is dangerous, but in Yarmouth roads, inside a line of sandbanks, there is safe anchorage. Pop. '91, 49,318.

YARN. The name applied to the thread spun for the purpose of weaving cloths of various kinds. It varies not only in the materials of which it is made, but also in the fineness to which it is spun. This latter quality is of great importance, as upon it depends entirely the evenness and quality of the manufacture. In order that uniformity may be insured, a pound of the material is taken as the standard, and this is divided into *hanks* or *cuts*. Thus, with linen yarn, a hank or cut consists of 300 yards; and if it takes 25 of these hanks to make a pound, the yarn is called 25s; and if 40, 40s; and so on. A hank of wool or cotton consists of 840 yards. No material admits of such fine spinning as cotton.

YAROSLAV. See JAROSLAV.

YARROW. See ACHILLÆA.

YAR'ROW, a Scottish stream, rendered famous by song and ballad, rises a little over a mile e. of loch Skene, at the place where the counties of Dumfries, Peebles, and Selkirk meet. It flows in a general n.e. direction through Selkirkshire, and joins the Ettrick about 2 m. above the town of Selkirk, after a course of 25 miles. About 3¼ m. from its source it expands into the loch of the Lowes, which is a m. long, and a quarter of a m. broad. Leaving the loch of the Lowes, the small stream enters St. Mary's loch, separated by a narrow neck of land, on which stands St. Mary's cottage (Tibby Shiels'), from the other and smaller lake. St. Mary's loch is 3½ m. long, and nowhere broader than 7 furlongs.

YAR'ROW. See JARROW.

YASKA. See NIRUKTA.

YATES, a co. in w. New York, bounded e. by Seneca lake; about 342 sq.m.; pop. '90, 21,001. Iron ore is found. Co. seat, Penn Yan.

YATES, EDMUND HODGSON, b. London, 1831; son of Edmund, a well-known English actor. He was for many years chief of the missing letter dept. in the London post-office; was theatrical critic for the *Daily News;* was editor of *Temple Bar* magazine; and was the first editor of *Tinsley's* magazine. He resigned from the post-office, 1872, to give his whole time to literature; made a lecturing tour of the U. S., and was appointed London correspondent of the New York *Herald,* but resigned, 1874, and established *The World,* a London society journal which has met with great success. For publishing a libellous article in this journal he was sentenced to four months' imprisonment, 1885. Besides magazine articles, sketches, etc., he published a number of novels, among them *Land at Last, Pages in Waiting, Wrecked in Port, Nobody's Fortune, The Impending Sword.* He also wrote some dramas, and an autobiography, pub. 1885, entitled *Fifty Years of London Life, Memoirs of a Man of the World.* He died in 1894.

YATES, JOSEPH C., 1768–1837; b. N. Y.; admitted to the bar, and practised at Schenectady, of which he was mayor, 1798–1808. He served in the state senate, 1806–7, was a justice of the New York supreme court, 1808–22, and governor of New York, 1823–25. He was one of the founders of Union college. Yates co., N. Y., is named from him.

YATES, RICHARD, 1818–73; b. Ky.; graduated at Illinois college, and was called to the bar. He soon began to take an active part in public affairs, and after several terms in the Illinois legislature was elected to congress on the whig ticket and remained there,

1851–55. He was governor of the state of Illinois during the war of the secession, and rendered important service in raising troops. He was U. S. senator from Illinois, 1865–71. His natural abilities were recognized as great.

YATES, Robert, 1738–1801; b. N. Y.; studied law, was admitted to the bar, 1760, and practiced at Albany. He was a member of the provincial congress of 1776 and of the committee of public safety. In 1776 he was made a judge of the supreme court of New York and became chief-justice in 1790. He was a member of the convention which framed the U. S. constitution, and his notes on the proceedings of that body were published posthumously.

YATES, William, D.D., 1792–1845; b. England; studied at Bristol, became a missionary, and in 1815 was sent to India by the Baptist association. Here he remained until his death, with the exception of a trip to England and the United States in 1827. He translated the New Testament into Hindu, Bengalee, Hindustanee, and Sanskrit; the Old Testament in whole into Bengalee, and in part into the other tongues. He published a grammar of Sanskrit, 1820, and other philological works. Returning to England in 1845, he died on the Red sea.

YAVAPAI, a co. in n. Arizona, bounded n. by Utah and intersected by the Colorado river; 29,236 sq.m.; pop. '90, 8685, chiefly of American birth. The region is noted for its precipitous and picturesque cañons of the Colorado Chiquito. Gold and silver are found. Co. seat, Prescott.

YAW, in the motion of a ship or boat, is the term for describing an irregular deviation in the course steered. A very chopping wind or sea *may* produce this effect, but the helmsman would usually have the credit of bad steering.

YAWL, a decked boat having two masts, on the first of which is a lugsail and topsail; and on the aftermost, which rises almost from the stern-post, a driver or fore-and-aft sail. It is a very easily managed rig.

YAWNING may be either the simple result of deficient aëration, or may be brought on by the mere sight of the act in another person, and is a modification of the ordinary movements of respiration, in which the inspiration is deeper than usual, and is accompanied by a kind of spasmodic contraction of the muscles which depress the lower jaw, and by a great elevation of the ribs and to some degree of the shoulder-blades. "The purely involuntary character of the movement," says Dr. Carpenter, "is sometimes seen in a remarkable manner in cases of palsy, in which the patient cannot raise his shoulder by an effort of the will, but does so in the act of yawning. Nevertheless, this act may be performed by the will, though not completely; and it is one that is particularly excited by an involuntary tendency to imitation, as every one must have experienced who has ever been in company with a set of yawners."—*Principles of Human Physiology*, 8th ed., p. 280.

YAWS, known scientifically as *frambœsia*, is a cutaneous eruption of a very peculiar nature, which commonly attacks negroes, but has been noticed in Europeans. The disease is preceded by languor and pain in the limbs, and shivering, succeeded by heat and restlessness, and is more severe in children than in adults. After a few weeks, the pure glossy-black color of the skin gives place to a dirty dull tint; and the patients often not only loathe food, but take to eating coals, chalk, earth, etc. The skin is then covered for a few days with a white mealy scurf, as if it had been dusted with flour, after which pimples like pin-heads appear on the forehead, face, neck, groins, etc., which increase for a week or more, growing into crusted pustules, which enlarge until the base attains the size of a sixpence, or even a shilling. If the crust is removed, a foul sloughing sore is exposed. The pustules may, however, burst spontaneously, and discharge a thick viscid matter, which hardens to a scab on the surface. In the larger pustules this surface at length becomes elevated into a red granulated excrescence, not unlike a wild raspberry (*frambœsia*), which is the true and characteristic yaw. In size it may vary from that of a pea to that of a mulberry, and in color it varies with the general health of the patient from a red to a pale white tint. It has very slight sensibility, and never properly suppurates, but discharges a glutinous fluid, which communicates the disease by inoculation. When the yaw has remained for some time, it diminishes in size, and as the pustule heals, is finally covered with skin, leaving little or no mark. When the disease seems to have reached its height, one pustule becomes much larger than any of the others, and instead of being elevated, is depressed. This is termed the master or mother yaw, and requires much care. When the mulberry-like excrescences appear on the soles of the feet, the resistance of the thick epidermis excites great pain. They are then termed by the negroes *tubbœ*, or crab yaws. This disease is endemic among certain tribes of native Africans, and is common among the negroes of the West Indies and of North and South America. It is contagious, and cannot be communicated except by the actual contact of yaw-matter to the abraded skin, or by inoculation, which is sometimes effected by means of a large fly called the yaw-fly. The interval between the reception of the poison and the formation of the eruption varies from seven to ten weeks. The disease scarcely ever attacks the same individual more than once. "Yaws," says Dr. Craigie, in his learned work on *The Practice of Physic*, "are liable to be confounded with the secondary [tertiary?] or

cutaneous symptoms of syphilis, with sivvens,* with the Arabian leprosy, with radesyge, pellagra, and the red leprosy of Cayenne." Several writers of eminence regard yaws as the same with the disease described in Leviticus, chap xiii., as the Jewish leprosy, but the description of the symptoms there given is not sufficiently precise to furnish sufficient evidence regarding their identity. With regard to treatment, mercury does more harm than good, and all that can be done with advantage is to render the progress of the morbid processes as little painful as possible. The most important remedial agent is the warm bath; and blood-purifying drinks, such as decoction of sarsaparilla, etc., may be prescribed. The Africans have their own native remedies in the bark of trees called *yuffo* and *bullanta*, taken in infusion or decoction; and to destroy the mother-yaw they adopt the following barbarous process: Iron is boiled in lime-juice with a quantity of the common black ants and of Malaguetta pepper, and the liquid thus prepared is applied hot to the yaw.

YAZOO', a river of Mississippi, formed by the union of the Tallahatchie and Yalabusha, runs s. and s. by w. in a very serpentine course, in a deep, narrow, sluggish channel, between fertile cotton plantations, and empties into the Mississippi river, 12 m. above Vicksburg; it is 290 m. long, and navigable at all seasons.

YAZOO, a co. in w. Mississippi, bounded s. by Big Black river; 1020 sq. m.; pop. '90, 36,394. Co. seat, Yazoo City.

YAZOO FRAUD, a term commonly applied to the sale by the state of Georgia in 1795 of her western territory, now included in Alabama and Mississippi, to several land companies. The consideration was $500,000. In 1789 a similar sale had been made, but owing to defective Indian titles was inoperative. The territory was described as extending from the Alabama and Coosa rivers to the Mississippi, and from the 35th to the 31st parallels of latitude. It was believed that the legislature had acted from corrupt motives. President Washington referred to the matter in a message to congress. The people of the state were indignant and excited, and a party was formed, led by Senator James Jackson, which agitated for the repeal of the sale. This was brought about in 1796, and the records of the transaction were burned in the presence of the governor and legislature. The territory in question was ceded to the United States in 1802. In 1803 a commission was appointed by Jefferson under an act of congress to investigate the Yazoo claims. Madison, as chairman, recommended a compromise, but Georgia refused to compensate the claimants. Their claim was sustained in the U. S. supreme court, Marshall, C. J., holding that allegations of bribery of the legislature could not be entertained, and that purchasers from the land companies were innocent holders without notice. Accordingly in 1814 congress ordered the lands to be sold and $5,000,000 to be appropriated for extinguishing the Yazoo claims.

YEADON, a t. of the West Riding of Yorkshire, England, 8 m. n.w. from Leeds. It stands on a hill, on the left side of the valley of the Aire. It has considerable woolen manufactures. Pop. '91, 7396.

YEAR, a division of time containing a complete course of the seasons, and depending upon the revolution of the earth (q.v.) round the sun. Its duration was variously determined by the nations of antiquity; the earliest method being the conventional one of making it include a certain number of lunar months; the lunar month being, after the day, the first period of time which was fixed. Twelve lunar months, giving a year of 354 days, were first taken as a near approach to a course of the seasons. This, though a pretty close approximation to the true value of a year, was yet so incorrect (being defective by more than 11 days) that it was soon found to be necessary to intercalate these 11 days, in order to preserve the year in a constant relative position to the seasons. The intercalation was variously effected; thus, the Egyptians, who knew the year of 365 days previous to 1500 B.C., divided it into three seasons ("winter," "summer," and "the Nile," i.e., *the inundation of the Nile*) of four months each, made each month contain 30 days, and introduced five intercalary days at the end of the 12th month; the Greeks, who generally retained the lunar year of 354 days, added 3 months in the course of every eight years, giving an additional month to the third, fifth, and eighth year of each cycle; the Romans also added additional days, but their system of intercalation was continually changed, not always for the better, till Julius Cæsar caused the adoption of the solar year. The Romans likewise abolished, in Asia, Egypt, and all the other countries under their sway, the old method of reckoning by lunar years, and compelled the adoption of the Julian calendar, according to which the year was assumed to contain 365 days 6 hours. The substitution of the Gregorian calendar in the 16th c. introduced for the average length of the solar year, 365 days 5 hours 49 minutes, which differs only by a few seconds from its true value; and this small annual error, as well as the excess of

* As sivvens or sibbens, and radesyge, are diseases not much known to the general public, and not noticed in this work, we may mention that sibbens is a tubercular affection of the skin, often extending to the deeper tissues, very infectious, and said to be endemic in Dumfriesshire, Ayrshire, and Galloway, first described about a century ago by Dr. Ebenezer Gilchrist; while the radesyge, spedalskhed, spedalska, liktraa, northern leprosy, or marsh sickness, is endemic in various parts of Scandinavia, consisting in its fully developed form of "an eruption of pimples, scales, patches, and tubercular pustules on the skin, terminating in pusiform discharge, with or without ulceration."—Craigie, *op. cit.*, vol. i. p. 690.

the true year over the year of 365 days, is compensated for by means of a succession of *leap-years* (q.v.).

The time at which the year began varied much among different nations. The Carthaginians, Egyptians, Persians, Syrians, and other eastern peoples commenced their year at the autumnal equinox, at which time the civil year of the Jews also began, though their sacred year was reckoned from the vernal equinox. The commencement of the Greek year was at the winter solstice before Meton's time, and was then changed to the summer solstice. The Romans were the first to adopt the 1st day of January as the first of the year, but their example was not followed by subsequent European nations for some time. In France, the commencement was Mar. 1 under the Merovingians, Mar. 25 under the Carlovingians, Easter under the Capetians, and Jan. 1 from 1564. The ecclesiastical year in Europe generally commenced on Mar. 25 (see DATE). The ancient northern nations reckoned their year from the winter solstice; the Russians, till Peter the great's time, from Sept. 1, and the same reckoning, known as the Byzantine era, was in use in the eastern empire. Of necessity, the commencement of the year among Mohammedan nations has no fixed position in relation to the sun's course or the seasons, it being invariably a lunar year. In astronomy there are several kinds of years depending upon the various configurations of the earth in its orbit, and consequently varying in length. First, there is the *tropical*, or as it is sometimes incorrectly called) *solar* year, which, from its being recognized in legislation and history, and commonly applied in the measure of time, has also received the name of *civil* year. This year is defined as the time which elapses from the sun's appearance on one of the tropics to its return to the same, and has a mean length of 365.2422414 mean solar days, or 365 days 5 hours 48 minutes 49.7 seconds (see PRECESSION). Next is the *sidereal* year, which is the period required by the sun to move from a given star to the same star again, and this year, affected as it is by nutation (q.v.) only, is one of the most invariable quantities which nature presents us with, and has a mean value of 365.2563612 mean solar days, or 365 days 6 hours 9 minutes 9.6 seconds. The time which elapses between the earth's arrival at its perihelion (q.v.) and its return to the same position, is known as the *anomalistic* year, and is equivalent to 365.2595981 mean solar days, or 365 days 6 hours 13 minutes 49.3 seconds. The sidereal and anomalistic years have a merely astronomical importance.

YEAR AND A DAY, a period of time much used in law as a limit to privileges and perils. For example, if the owner of an estray challenged it within a year and a day he could recover it; if a wounded person die within that time his death may be accounted murder; when a judgment is reversed a new action may be commenced within the limit; if the execution of a judgment be delayed beyond the limit it cannot be issued without a renewal of legal process; so in case of prize, or of goods saved if no claim be entered within the limit the condemnation to the parties in possession follows as a matter of course. The same period was recognized in the civil law, book of feuds, and the laws of the Lombards. And the year was not always limited to a precise calendar year. With the Gothic nations it meant a year and six weeks.

YEAST. In the process of fermentation of saccharine fluids containing albuminous matter, as in brewing or wine-making, the originally clear fluid becomes turbid, carbonic acid is evolved, and the substance causing the turbidity gradually separates in a graying foaming mass of a bitter taste and an acid reaction. This is yeast; and on examining it under the microscope, it is found essentially to consist of aggregations of small oval cells of a vegetable nature, known as the yeast-cells, yeast-plant, or *torulà cerevisiæ* (q.v.). Yeast, as is well known, has the property of setting up fermentation in saccharine solutions; and beer-yeast, the kind with which we are specially acquainted, possesses, according to Prof. Miller, this power in the highest degree, as may be shown by dissolving 4 parts of pure cane-sugar in 20 parts of water, and adding 1 part of fresh yeast: if this mixture be exposed to a temperature of about 80°, in less than an hour fermentation will have commenced. The investigations of Mitscherlich have led chemists to distinguish two varieties of yeast—viz., the *ober-hefe*, or surface-yeast, and the *unter-hefe*, or sediment-yeast, the former collecting on the surface of the fermenting fluid, and the latter forming a sediment. Surface-yeast is propagated by buds (see TORULA CEREVISLÆ) and sediment-yeast by spores; and each variety produces specific results upon the fermenting fluid. The fermentation induced by the surface-yeast is rapid and irregular; while that produced by the sediment-yeast is slow and quiet. The surface-yeast is formed when the saccharine fluid ferments at a temperature of from 65° to 77°; while the sediment-yeast is chiefly produced when fermentation takes place at the lower temperature of from 32° to 45°. In their chemical relations, the two varieties present no apparent difference. On treating yeast with a solution of potash, a cellulose-like substance remains, while an albuminate is dissolved. The action of yeast is destroyed by exposing it to a temperature of 212°, by alcohol, by the strong mineral acids, chlorine, iodine, and bromine, oxide of manganese, creosote, etc.; on the other hand, it may be dried at a low temperature, or by pressure, and may be preserved in this state without losing its activity. The part which the globules of yeast play in exciting the conversion of sugar into alcohol and carbonic acid, is very obscure; but an experiment of Mitscherlich seems to show that the sugar ferments only in those points which are in actual contact with the globules. Pasteur's experiments render it probable

that the process of fermentation is connected with the assimilation of the sugar by the yeast-plant during the development of the yeast-globules, or, in other words, that "the essential condition of fermentation is the conversion of albuminoid matter into organized globules."

According to Mitscherlich's analysis, the cells of ordinary washed yeast in a condition to excite fermentation contain (the ashes being deducted): carbon, 47.0; hydrogen, 6.6; nitrogen, 10.0; sulphur, 0.6; oxygen, 35.8; while spent yeast (after fermentation had ceased) contained only 5 of nitrogen. The inorganic matter amounted to 7.3 per cent of the dried yeast, and consisted entirely of phosphates.

The economic uses of yeast in bread-making, brewing, etc., are noticed in other articles. Beer-yeast (*cerevisiæ fermentum*) is an article of the British Pharmacopœia. It is employed as a stimulant in the advanced stages of low fevers, and is especially serviceable in cases where, in consequence of inflammatory symptoms, wine is inadmissible. Neligan has found it of great service in intense tympanitis following parturition. The dose is two tablespoonfuls every three hours, and it may be given in camphor mixture or peppermint water. Yeast-poultice forms an excellent stimulating application to foul and irritable sores. It is composed as follows: Take of yeast, six fluid ounces; flour, fourteen ounces; water heated to 100°, six fluid ounces. Mix the yeast with the water, and stir in the flour. Place the mass near the fire till it rises. This poultice should be renewed every six or eight hours. Its special efficacy depends upon the carbonic acid gas which it evolves.

If surface-yeast or under-yeast be collected and placed on a cloth to drain, and then pressed until nearly dry, it can be kept with care for several months, and in that state is what is called GERMAN YEAST, for which a large trade has sprung up within the last few years; the imports to Britain from the continent having amounted, in the year ending Dec. 31, 1880, to 208,123 cwts., valued at £544,783. It is chiefly imported from Holland and Hamburg, and is obtained mostly from the great continental distilleries. Nearly the whole of this large quantity is consumed by the bakers. PATENT YEAST is exactly similar, but is raised from a wort made purposely from malt and hops. ARTIFICIAL YEAST is a dough of wheat or other flour, mixed with a small quantity of common yeast, and made into small cakes, which are dried. If kept free from damp, it long retains its fermentive power. See BAKING POWDERS.

YEDO, or YEDDO. See TOKIO.

YEISK. See JEISK.

YEKATERINBURG. See EKATERINBURG.

YEKATERINOSLAV. See EKATERINOSLAV.

YELATOM. See JELATOM.

YELETZ'. See JELETZ.

YELL, a co. in w. Arkansas, bounded n. by the Arkansas river; 936 sq.m.; pop. '90, 18,015. Co. seat, Danville.

YELL, one of the Shetland (q.v.) islands, and, after Unst, the farthest n. of that group, is separated from Mainland by Yell sound, and from Unst by Blue Mull sound. It is 17 m. in length, 5½ m. in average breadth. Area, 94 sq.m.; pop. '81, 2529. The w. coast is rocky and precipitous, but on the whole the surface is tame, and consists largely of moorlands—the greatest elevations being no more than 400 ft. above sea-level. Agriculture is in an unusually backward state, and, though the surrounding seas are generally stormy, fishing is the chief employment.

YELLOW BERRIES. See BUCKTHORN.

YELLOW-BIRDS, *Chrysomitris tristis,* a bird of the finch family (*fringillidæ*), a native of North America, where it is very widely distributed. It is rather more than 5 in. in entire length; the male in summer plumage of a bright yellow color, with black crown, wings, and tail, the upper and under tail-coverts white. The female is yellowish brown above, and ashy brown below, and the male assumes a very similar plumage in winter. Yellow-birds are often seen in large numbers, feeding on seeds of thistles and other plants, and seldom alighting on the ground. The nest is made of lichens fastened together with saliva, and lined with soft substances. The song of the yellow-bird is very pleasing; and it is a sprightly and attractive cage-bird, easily tamed, and capable of being taught tricks. Several allied species are found in the western parts of America.

YELLOW COLORS. The yellow pigments employed by painters are: 1. The varieties of chrome prepared from chromate of lead. See CHROMIUM. 2. Several colors technically called *pinks*—as *brown pink,* prepared as a lake from a decoction of French berries and fustic; and *English pink* and *Dutch pink,* both lakes, prepared by different processes from French or yellow berries and turmeric. 3. *Naples yellow,* a mixture of metallic antimony, red-lead, and oxide of zinc calcined, added to a small quantity of lime, then fused, and afterwards ground to powder. 4. *King's yellow* is a tersulphuret of arsenic. 5. *Patent yellow* consists of 28 parts of chloride of lead and 27 parts of carbonate of lead well mixed in powder, and then fused together. 6. *Weld yellow* is prepared from a decoction of weld (*reseda luteola*), or dyer's weed with alum, and is, in fact,

another yellow lake. It is much used in paper-staining. 7. *Gamooge*, which constitutes the chief yellow color used in water-color painting.

YELLOW-EYED GRASS, a genus of grasses, *xyris*, of the order *xyridaceæ*, or yellow-eyed grass family, the members of which are rush-like herbs with equitant leaves, sheathing the base of a naked scape, which is terminated by a head of triandrous flowers. The three-valved, and usually one-celled pod, contains several or many orthotropous seeds with a minute embryo at the apex. More than 50 species of *xyris* have been described, of which 15 are found in the northern United States.. *X. flexuosa* has a slender scape from 10 to 16 in. high, slightly flattened at the summit, smooth, and much longer than the narrow linear leaves. Grows on sandy bogs all along the Atlantic coast from Massachusetts to Virginia, and also in some of the central western states. *X. torta* grows on the New Jersey pine barrens and in the southern states in dry sand. Scape nearly round, with one sharp edge, and slender, from 9 to 20 in. high, springing from a bulbous base, and in time becoming spirally twisted with the linear-filiform rigid leaves; head ovoid, becoming spindle-shaped and acute, from one-half to three-quarters of an inch long; sepals longer than the bract, and lateral sepals winged on the keel and fringed above the middle. In the same localities is found *X. fimbriata*, having an angled scape, two-edged above, 2 ft. high, rather longer than the linear sword-shaped leaves, the base not bulbous; head oblong, from one-half to nearly an inch long. *X. Caroliniana* is found in sandy swamps from Rhode Island to Virginia and southward, along the coast; scape rather flat, from 1 to 2 ft. high.

YELLOW FEVER is a disease endemic in low districts near the sea, but under certain circumstances sporadic in other places, never appearing beyond 48° of n. lat., nor without a temperature of at least 72° F., nor above the elevation of 2,500 ft. above the level of the sea, depending in part on causes not yet known, but in circumstances favorable to its production, capable of being propagated by contagion. It usually commences suddenly (generally in the night or early morning) with a sense of coldness, a rigor, or actual shivering, followed by vascular reaction, as shown by the heat and dryness of the skin, headache, especially over the eyes, and pain of the eyeballs, which are suffused, and have a strange drunk-like aspect. The limbs and loins are painful; the tongue is loaded, and its edges are red. There is a peculiar and characteristic flush or suffusion of the face, occupying a zone of about an inch above and below the eyes. Nausea, gastric uneasiness, and a tendency to vomit soon supervene. These symptoms may gradually lessen, and the patient will then regain his ordinary health in 24 or 36 hours; but if the symptoms persist, they soon become more aggravated, and the stomach ejects at first a clear fluid, which soon becomes of a dirty-brown tint, and is finally succeeded by the true *black vomit*. A yellow tint on the conjunctiva is observed, which extends to the skin of the face; and as the disease advances, the whole body becomes of a yellow color, varying in intensity from a pale lemon to a deep orange tint. The anxious countenance indicates the distress of the patient, who appears to be agitated by fearful apprehensions or incipient delirium. The skin feels constricted, and is of a pungent heat. The bowels are constipated, and the red, clean, and tremulous state of the tongue indicates the presence of intestinal irritation, and consequently the increase of danger. The urine and other excretions are more or less suppressed. Eructations, hiccoughing, and vomiting increase the distress and weakness. The disease in fatal cases usually terminates on the second or third day. The above train of symptoms is by no means constant. Sometimes, when everything seems favorable, black vomit suddenly appears, and the patient immediately succumbs. In other cases, patients experience no symptoms except severe pains in the legs and suppression of urine, and die without taking to their beds. In all cases terminating fatally, albumen appears in the urine on the second or third day. In females, the catamenial discharge is sure to appear, whether due or not. The discharges from the bowels, toward the close of the disease, may be black or dark green, and these dark evacuations are succeeded by what is termed the "caddy-stool," resembling dark sandy mud. As yellow fever is not a disease of this country, we shall not enter more fully into its symptoms. According to Dr. Jackson, who has written an excellent treatise on this disease, the usual course of yellow fever in its most concentrated form consists of 12 hours of forming period, 36 or 38 of formed or proper fever, and 24 or 36 of declining or concluding period. When the symptoms are less intense, the patient may survive to the 14th day. In the milder modifications of this disease, the morbid symptoms are prolonged to a considerable extent. Death may occur at any period of the disease, and the mode in which it occurs is by syncope (fainting), uræmia (or poisoning of the blood by the accumulation of urea), apoplexy, or asphyxia or suffocation. When the black vomit is plentiful, and the urine free, the intelligence remains unaffected, but the skin becomes cold and damp, the pulse small, and finally imperceptible at the wrist, and death ensues from gradual exhaustion and syncope. When the black vomit is scanty, and the urine suppressed, the poisoned blood acts upon the brain, and the patient exhibits wild delirium, followed by coma, convulsions, and death. The ratio of deaths to cases in the disease is always very high. From Tulloch's statistical reports on the diseases of soldiers, it appears that in the windward and leeward command, the ratio was 1 to 2¼ (or 3 in every 7 cases died), in the

Jamaica command it was 1 to 1⅛ (or 3 in every 4 cases died), while in Gibraltar it was 1 to 1⅞ (or 3 in every 5 cases died).

There are great differences of opinion as to the proper treatment of this disease. Dr. Blair, one of the highest anthorities on yellow fever, holds that the disease may be cut short or aborted by prescribing "20 grains of calomel added to 24 grains of quinine, afterward followed by two drams of carbonate of magnesia, and two ounces of sulphate of magnesia in eight ounces of peppermint water." These aborting doses were repeated at intervals of four or six hours, one dose being generally efficient, but four have been given before the quinine induced its special symptoms of cinchonism. Many physicians who have had much experience of this disease, have no belief in the abortive treatment; and some treat their cases with antiphlogistic or lowering remedies, and others with stimulants. It is probable that there is no one mode of treatment suitable for all cases, and that each should be treated according to its special symptoms. The extreme heat of the surface (a temperature of 107° has been observed in the arm-pit) may be relieved by the frequent application of the wet sheet; cupping or leeches often relieve the head-symptoms; and a blister to the gastric region may relieve the irritation of the stomach. If there is no suppression of urine, and if that fluid is free from albumen, morphia is of great service, but it must be given with great caution. The food should be of the mildest form, such as chicken-tea, arrow-root, sago, and barley-water, and these should be taken frequently in very small doses, in consequence of the state of the stomach. Similarly, with regard to all drinks, which are most likely to be retained if sucked through a tube or given by teaspoonfuls. Tea usually disagrees, but cold infusion of oatmeal, and very dilute brandy and water, are usually relished. Our highest authority on tropical diseases, sir J. Ranald Martin, states that, whenever the disease breaks out, "the most speedy means of prevention [of its spreading] in respect to towns and garrisons, will always be found in the removal of both the sick and the healthy to a locality where the temperature is sufficiently low, such as a neighboring range, or dry ventilated ground." In all ships on service on the w. coast of Africa and other unhealthy stations, the following rules (which we borrow from Dr. Aitken's *Handbook of the Science and Practice of Medicine*) should be strictly attended to. A prophylactic dose of quinine (five grains) should be administered to the men daily (a precaution that should be taken in all malarious regions, independently of yellow fever). Whenever the fever appears on board, the ship should at once put out to sea, and should proceed to the coolest atmosphere within reach. The most immediate measures of prevention should be, to obviate direct solar exposure, to prevent fatigue, and to check any excesses in the use of spirits. Seamen should be kept as remote from unhealthy coasts as is consistent with duty, anchoring every evening a few miles from the shore if possible. Duties in boats should as much as possible be conducted during the mornings and evenings, the noon-day heats and the deadly nocturnal emanations being to be equally avoided. When men are landed, they should be encamped on high and dry ground. Meals should be regularly served and carefully cooked, and coffee should be given early in the morning, and after unusual fatigue or exposure, and no work should be commenced till the coffee has been taken. Holds of ships should not be cleansed on the spots where the fever has originated, or during its prevalence, but the process should be deferred till the vessel is in a colder latitude. Lastly, green wood should not be placed on board ship in hot climates, but the wood should be barked and partly charred.

Dr. Craigie, in his learned *Practice of Physic*, gives the following extensive list of synonyms of yellow fever: "*Febris flama, Typhus ecterodes*, Sauvages and Cullen, *La Maladie de Siam, La Fièvre Matelotte, Vomito Prieto, Chapetonada, Fiebre* Aramilla *Hispanorum et Hispano-Americanorum;* new distemper of 1691; Kendal's fever, pestilential fever, bilious fever of Gamble; endemial causus or burning fever of Moseley; malignant pestilential fever of Chisholm; remittent and bilious remittent of Hunter; concentrated endemic fever of Jackson; tropical continued fever of Lempriere." We shall conclude with a short notice of the history of this disorder. Long before the arrival of Cortez in Mexico, an extremely fatal epidemic disease used to prevail among the native Mexicans. Epidemics of special severity occurred in 1545, 1576, 1736–37, and 1761–62. Although Humboldt thinks that the elevation of the table-land of Mexico (7200 to 7800 ft. above the level of the sea) is sufficient to exclude any idea of the identity of this disease, known as *Matlazahuatl*, with yellow fever, there can be little doubt, from the similarity of the symptoms, that the two diseases are really the same. The Europeans visiting the shores of America soon became painfully familiar with the disease; and it is almost certain that "the plague" which so often destroyed the English and Spanish troops at the end of the 15th and the beginning of the 16th centuries was in reality yellow fever. A disease bearing the character of yellow fever appeared in 1618 among the Indians in certain parts of Massachusetts, and prevailed with much severity till 1622, and it committed great havoc among the emigrants to Virginia. When the expedition against Hispaniola in 1655, under Venables, returned to Jamaica, they met there "an enemy (the plague) more severe than the Spaniards, which in a little time reduced the army, originally 7000, to fewer than 2000 men." There can be little doubt that this plague was yellow fever. In 1691 it was very fatal in Barbadoes, where it was known as the *new distemper*. From about this date yellow fever has been endemic in the West

Indies. It was unknown at Carthagena and along the coast till 1729, when it committed dreadful havoc; the Spanish galleons never remaining any time without interring one-half or at least one-third of their men. In 1740 it first appeared at Guayaquil, since which time it has often occurred; and in all the towns on the coast of the American continent and islands between 45° n. lat. and 10° s. lat. it appeared in proportion as Europeans began to visit them. "In this manner," says Dr. Craigie, "Vera Cruz, Cumaná, Havana, Acapulco, and La Guayra have successively become its endemial abodes; and its appearance in these towns is as uniform and certain as the arrival of the sun at the tropic of Cancer. Of these places Vera Cruz and Havana may be regarded as the nursery of yellow fever; and from the month of March to that of September or October the disease rages like a pestilence among the recently arrived Europeans, and those natives who descend from the elevated table-lands of the interior." Until the year 1793 the disease was regarded as having a spontaneous origin, and being due to tropical peculiarities operating on European and unseasoned constitutions; but that year the doctrine of infection suddenly started. In that year the disease appeared with great virulence in the island of Grenada, and rapidly spread over the Antilles to Philadelphia and many parts of the state of Pennsylvania, to Massachusetts, New York, Caroline co., Md., Alexandria in Va., several counties in North Carolina, and Caracas in Venezuela. This outbreak was preceded by a few days by the arrival of a vessel from Bulam, on the w. African coast, at a harbor in St. Grenada, in which vessel, when stationed off Bulam, fever had prevailed about five months before to a great and fatal extent. This disease was at the time termed the Bulam fever, but soon turned out to be ordinary yellow fever. Since 1763 yellow fever has very often appeared as an epidemic in the West India islands and various parts of the American states, and has even been endemic in various parts of the s. of Europe, especially Gibraltar and Malaga. From the testimony of many medical writers it is certain that a disease essentially identical with yellow fever prevails endemically along the w. coast of Africa, at Senegal, Sierra Leone, Cape Coast Castle, and the island of Fernando Po. Fortunately for Great Britain, this fell disease, which has repeatedly been brought to the coasts (Swansea, Southampton, etc.), is at once nipped out by our climatic conditions. When, in 1866, it was imported into Swansea, Dr. Buchanan, who was at once sent down by the government to watch the disease, and take the necessary measures to prevent it from spreading, recorded 12 instances in which, with filth, bad ventilation, and every other condition favoring the fever, it failed in every case to spread beyond the original victim. Altogether there were 20 cases, of which 15 were fatal.

The most terrible recent visitation of yellow fever scourged portions of the lower Mississippi valley in the autumn of 1878. In New Orleans and Memphis alone the deaths exceeded 5000.

The recent investigations that have been chiefly carried on by the American public health association indicate that yellow fever is a highly infectious disease, but not contagious, in the sense that small-pox is—one person taking it from another by breathing the same atmosphere. If the person sick with the disease wears garments brought from the infected locality, such materials may communicate the disease. The following facts submitted in a paper by Dr. D. W. Hand, surgeon U. S. army, at the annual meeting of the American public health association at Richmond, Va., in Nov., 1878, furnish strong evidence in favor of this view. In Sept., 1864, a violent epidemic of yellow fever broke out at New Berne, N. C. An occasional case had been seen there before, but no epidemic since 1779, when a large number of citizens died of it. New Berne was under martial law in 1864, and an examination of records shows that no vessel arrived there from any port s. of Beaufort, N. C., nor from any infected port, during the summer of that year, and no case occurred at Wilmington till near the middle of October. New Berne is situated on a low, sandy plain at the junction of the Neuse and Trent rivers, and is almost surrounded by swamps and marshes. In 1864 tight board fences surrounded nearly all the gardens and back-yards, and the privies and outhouses had been neglected. The drainage of the town was entirely on the surface, which being but little above the level of the river, made it defective. The summer was hot and wet, and the whole town was damp and moldy. There is very little ebb and flow of tide, but a succession of strong s.w. winds in August drove the water out, and for many days the tide was extremely low, leaving extensive mud flats exposed to the rays of the sun. At the same time a new embankment was made by the military authorities across the Neuse river-front, and large quantities of filth-saturated soil were exposed. Previous to this several small docks on both river-fronts had been filled up, partly with stable manure and street cleanings, for the purpose of extending the wharves. Between two of these was a row of old frame buildings used as commissary warehouses, several being built on piles, and under them the water had flowed and formed a cavern for which no drainage was provided. Dead rats and other vermin and filth made the pool in this cavern exceedingly poisonous. The above conditions, in the opinion of surgeon Hand, produced the peculiar germs of yellow fever. Upon noticing that the first and worst cases came from this point, an investigation was made, during which many workmen were made sick by the overpowering effluvium. Gradually the disease spread through the town, and by Nov. 1, nearly every inhabitant had had

an attack. The negroes generally had the disease mildly, as well as the children, but among the aged and persons recently from the north it was generally fatal. Among the attending physicians the fatality was very great. Of 23 medical officers of all grades, 21 had the fever and 11 died. Many sick were sent to other places, as Moorhead City, Beaufort, Hatteras, and Roanoke island, and of these many died, *but the disease did not extend to others.* At Moorhead City the patients removed from the hospital at New Berne were placed indiscriminately in the wards of a large general hospital, and citizens of New Berne were received at the hotel. Among them 21 soldiers and 34 citizens died of yellow fever, but the disease extended to none except they had visited New Berne or Beaufort. At other points the same immunity of non-exposed persons was noticed. Other facts, such as that brought forward by Dr. Toner, of Washington, that yellow fever has never been propagated within the limits of the United States at a greater altitude than 500 ft., indicate that the generation of the disease germs from filth requires certain geographical and meteorological conditions which still demand study. There is diversity of opinion as to treatment, but all concur in removal to a pure atmosphere, and thorough cleanliness. See GERM THEORY.

YEL'LOW-HAMMER, or YELLOW BUNTING, *Emberiza citrinella*, a species of bunting (q.v.), which is one of the most common of small birds in Britain, distributed over all parts of the country, and is common also in most parts of the continent of Europe from Norway and Sweden to the Mediterranean. It is about seven inches in entire length, and the male is a bird of brilliant plumage, although there is something in the short thick form of the bird, and in the tints and distribution of its plumage, which prevents it from being greatly admired for beauty. It is, perhaps, also the less regarded because it is so common; and in many parts of Britain there is a prejudice against it, so that boys who would think it wrong to rob any other bird's nest, esteem it a kind of duty to rob that of the yellow-hammer. In summer the plumage of the male, the head, cheeks, ear-coverts, and nape of the neck are bright lemon yellow, with a few dusky black patches; the upper part of the back and wings are reddish brown, tinged with yellow; the wing-primaries are dusky black, with narrow external edges of bright yellow; the secondaries, tertials, and wing-coverts dusky black, broadly margined with rich chestnut brown; the upper tail-coverts reddish chestnut, edged with yellow; the tail-feathers dusky black; the central pair edged with chestnut, and tinged with yellow; the chin, throat, and whole under surface, bright lemon yellow, clouded on the breast and flanks with reddish brown. The tail is slightly forked, and is shorter than that of the common bunting. The knob in the palate is also less conspicuous. The female has much less yellow about the head than the male, and her plumage is altogether much less vivid. The yellow-hammer frequents hedges and low trees, and is often to be seen, especially in winter, in the vicinity of houses, in flocks, with sparrows, chaffinches, etc. It generally makes its nest on the ground, under shelter of a bush or a tuft of grass, forming it of moss, roots, and hair. The song of the male is very sweet, and consists of few notes, which have been jocularly set to music with the words "*A little bit of bread, but no-o cheese.*" He is remarkably attentive to his mate, and takes his turn in incubation. In Italy great numbers of yellow-hammers are caught, and fattened like ortolans for the table. It is a curious and noteworthy circumstance that this bird is rare in insular situations; in the islands of the Mediterranean, as well as the Orkneys. The name Yellow hammer is a corruption of yellow-ammer; *ammer*, in German, signifying bunting.

YELLOW-LEGS, the *gambetta flavipes* (Bonaparte), a North American snipe, inhabiting the Atlantic coast of the United States. It is about 10 in. long from the tip of the bill to the end of the tail, with wings about 6 in. long. It is a delicious game bird. *G. melanoleuca* (Bonap.) is larger, being 14 in. long, wing 8 in., but similar in appearance, with ashy color above, under parts whitish, with transverse spots and stripes on breast and sides.

YELLOW MEDICINE, a co. in s.w. Minnesota; 612 sq.m.; pop. '90, 9854. Co. seat, Granite Falls.

YELLOW RIVER. See WHANG-HO.

YELLOW SEA. See WHANG-HAI.

YELLOWSTONE, a co. in s.e. Montana; between the Yellowstone and Musselshell rivers; w. of Custer co.; 3105 sq.m. Pop. '90, 2065. Co. seat, Billings.

YELLOWSTONE, a river of the United States; rises in a beautiful lake of the same name high up in the Rocky mountains, and receiving numerous branches from the s., flows north-easterly through the state of Montana, and empties into the Missouri river, in the n.w. part of North Dakota, lat. 48° 5′ n., long. 104° west. It is 800 yds. wide at its mouth, 1000 m. long, and navigable 700 or 800 m.

The region of the Yellowstone and its source was for the first time explored by parties from the United States in 1870–71, and seems to be one of the most wonderful spots in the earth. Making their way up the river through the grand scenery of the Rocky mountains, the explorers came to a district of a square mile in area, filled with hot springs in active operation, which cover the hillsides with snowy white deposit like a frozen cascade. Three or four miles around were occupied by springs which have ceased to flow. They are about 6,000 ft. above the sea, and are already resorted to by invalids. This was but the beginning of the wonders. Next they came to a terrific rift,

2,000 ft. in depth, with a river rolling in its deeps, "a grand, gloomy, terrible place." At the head of this cañon are the Tower Falls, with a sheer descent of 400 ft. The Grand Cañon, however, throws this into the shade. This fearful abyss is 3,000 ft. in perpendicular height, and to one looking up from the bottom, stars are visible in broad daylight. The ravine is full of hot springs of sulphur, sulphate of copper, alum, steam jets in endless variety, some of most peculiar form. The grandeur of the cañon is at once heightened and diversified by the Upper and Lower Falls; the latter one unbroken, symmetrical expanse, 350 ft. in height. Between this fall and the lake lies a region full of boiling springs and craters, with two hills 300 ft. high, formed wholly of the sinter thrown from the springs. Further on is a valley containing about 1500 geysers, some throwing up immense columns of water to the height of more than 200 ft. The beautiful lake from which the river issues is about 300 sq.m. in area, and is situated 7,738 ft. above the level of the sea. In 1872 the region at the source of the Yellowstone, 65 m. long by 55 m. broad, including the Grand Cañon and the lake, was reserved by Congress from occupancy, and set apart as a "public park or pleasuring-ground for the benefit and enjoyment of the people."

YELLOWSTONE NATIONAL PARK. See NATIONAL PARKS.

YELLOW-THROAT, a species of insessorial birds, the *geothlypis trichas* of North America, more particularly called the Maryland yellow-throat. It belongs to the family *sylvicolidæ*. It is 5½ in. long, with a wing 2½ in.; the male has a black band on the forehead, cheeks, and ear-coverts; the female is without the band. Both have the throat and breast yellow. Its nest is made upon the ground, in which it lays from four to six white, light-brown-spotted eggs.

YEMEN, in a wide sense, includes the whole s. and s.w. of Arabia; but, more strictly, is the name of only the south-western corner of the peninsula, bounded on the n. by Hedjaz and Nedjed; and on the e. by Hadramaut and the desert. It was known to the ancients as *Arabia Felix* (*Felix* being a mistranslation on the part of Ptolemy of *Yemen*, which does not mean "happy," but the land to the "right" of Mecca), and they obtained from it much frankincense, myrrh, and other costly balsamic substances, in which it abounds more than any other part of the world; they obtained also from its ports the products of India, and other eastern regions, with which its inhabitants maintained a constant trade. The history of Yemen reaches back to the highest antiquity. The Joktanides, descendants of Joktan or Kahtan, are its first possessors of whom we have any record; and from them it seems to have passed, about 2400 B.C., into the hands of the Himyarites, or Homerites. The Himyarite states and cities of Saba, Thaphar, and Athana or Aden, attained at an early period a high degree of prosperity, carrying on a great commerce both by sea and land, and they extended their dominion over a large part of Asia and the n.w. of Africa. See SABÆANS and ADEN. The persecution of the Christians by the last Himyarite princes led to the overthrow of the Himyarite power by the Abyssinians, 529 A.D. From this date till 601 Yemen was ruled by Abyssinian governors; then for a short time by the Persians, under Khosru (*Chosroes*) II. The followers of Mohammed did not succeed in subduing Yemen till they had for a considerable time been masters of the rest of Arabia. Under all the califs, and even under Saladin, Himyarite princes retained a partial independence, which they reacquired when the Turks, who conquered the country in the 16th c., were expelled in the century following. For more than two centuries afterward, the country remained under the dominion of a number of Himyarite princes or sheiks, the most powerful of them being for a time the Imám of Sanáa (q.v.). In 1871–73 it was reconquered by Turkey.

Our geographical knowledge of Yemen has been much increased by recent explorations, and charts of its coasts have been laid down by officers in the service of the East India company. Throughout the whole length of the country, at a distance of from 10 to 30 m. from the coast, a chain of mountains extends, between which and the sea is a tract of low ground, the *Tehama*, generally sandy and desolate, but in some places very fertile, and clothed with tropical vegetation. Inland from the mountain chain is a fertile table-land, at a general elevation of about 4,000 ft., yielding the productions of warm temperate rather than of tropical regions. Some of the mountains rise to a height of about 8,000 feet. The slopes even of the more lofty mountains are covered with luxuriant forests, and the mountain valleys are of unsurpassed fertility. The principal exports are coffee, dates, senna, gums and gum-resins, wax, ivory, and goat-skin morocco. Some grain is also exported. There are no rivers; but good habors are formed in some places by natural openings in the coral reefs which line the coast. The principal ports are Mocha (q.v.), famous for the coffee which it exports; Aboo Arish, or Gasim; Hodeida; Shehr; and Aden (q.v.), which is now in the hands of the British. Sanaa, the capital, or nominal capital, is situated on the table-land. Damar, Taas, Loheia, Beit-el-Fakih, and Zebeed are among the other principal towns.

YEN, a Japanese coin minted in both gold and silver. The gold yen is worth (1896) $0.997; the silver yen $0.528. See FOREIGN MONEY.

YENIKA'LÉ STRAIT, sometimes also called STRAIT OF KERTCH connects the sea of Azov with the Black sea, forming a sea-passage between the Crimea on the w. and the Caucasus on the east. It is about 19 m. in length, and at its narrowest is about 3 m.,

and so shallow and interrupted by shoals, that cautious sailing and steering are necessary even for small steamers.

YENISEI', the longest river of Siberia, formed by the junction of the Oulou-Keme and the Bey-Keme, which rise in the mountains on the southern border of Siberia. It flows n. through the center of Siberia into the Arctic ocean, forming at its mouth a long estuary. In the earlier part of its course it is interrupted by falls and rapids; but afterward flows through a great plain or steppe, receiving many tributaries, of which the principal are the Upper Tunguska or Angara, from lake Baikal; the Middle and the Lower Tunguska. The Yenisei is over 3000 m. long, and is traversed by steamers. Repeated voyages since 1875 have proved that it is possible during part of the summer for vessels from Europe to sail direct to the mouth of the Yenisei, and to carry back the varied produce of the immense basin drained by it.

YENISEISK, a government of Siberia, extending from the Chinese frontier to the Arctic ocean on both sides of the Yenesei river; 987,186 sq. m.; pop. '92, 480,546. The northern part is a frozen swamp, and the plain which inclines from the mountains to the ocean is inhabited by a few tribes of hunters. The southern part is mountainous and abounds in forests and the precious metals. There are many salt lakes yielding 50,000 cwt. of salt annually. There is much fishing and hunting. Minusinsk supplies the province with grain and cattle. One of the most important towns, although not the capital, is Yeniseisk (q.v.). Capital, Krasnoyarsk.

YENISEISK, a t. in the government of the same name in Siberia, on the Yenisei. Pop. '88, 7382. Yeniseisk is an important trading center, and has a great annual fair, the chief articles of trade being grain, fish, salt, spirits, and furs. It is 3 m. in circumference, and has a custom-house and arsenal.

YEO'MAN (Ang.-Sax. *gemen*, common), a term which seems, in early English history, to have been applied to a common menial servant, but after the 15th c. came to denote a class of small freeholders, forming the next grade below gentlemen. The term yeoman is sometimes considered identical with the forty-shillings freeholder, possessed of the elective franchise.

YEO'MANRY, a volunteer force of cavalry in Great Britain, numbering in 1880, 14,511 of all ranks, and costing the country annually about £80,000. It was formed during the wars of the French revolution, and then comprised infantry as well as cavalry; but the whole of the infantry corps, and many of the cavalry, were disbanded after the peace of 1814. The organization of the corps is by counties, under the lords-lieutenant. The men provide their own horses and uniform; in consideration of which they receive annually a clothing and contingent allowance of £2 a man, are exempt from taxation in respect to the horses employed on yeomanry duty, and draw during the annual training 2s. a day for forage, besides a subsistence allowance of 7s. a day. If called out for permanent duty, they receive cavalry pay, with forage allowance. The yeomanry are available in aid of the civil power; and in time of invasion, or apprehended invasion, the sovereign may embody them for service in any part of Great Britain, under the provisions of the mutiny act and articles of war.

YEOMEN OF THE GUARD, an English company, consisting of 100 old soldiers of stately presence, employed on grand occasions, in conjunction with the gentlemen-at-arms, as the body-guard of the sovereign. These yeomen were constituted a corps in 1485 by king Henry VII., and they still wear the costume of that period. Armed with partisans, and in the quaint uniform, the men present a curious sight in the 19th century. The officers of the corps are a capt. (ordinarily a peer), a lieut. and an ensign. There is also a "clerk of the cheque and adjutant." All these appointments are held by old officers, and are considered as important prizes. The whole charge is borne by the sovereign's civil list. The head-quarters of the corps is at the tower of London, where the men are popularly known as *beef-eaters* (q.v.).

YEO'VIL, a small municipal borough of Somersetshire, 33 m. s.w. of Bath, on the borders of Dorsetshire, a busy, handsome place, built of red brick and yellow Hamhill (a neighboring quarry) stone, and situated in a pleasing district on a hill-side sloping to the Yeo. The church of St. John, a structure of the 15th c., is much admired. The height of the side aisles, and large size of the windows, give it grace and lightness, and hence it has been called the "lantern of the west." There are several other churches, besides schools, alms-houses, and other charities. Kid and other gloves are here more extensively manufactured than in any other town in England. Woolen manufactures and leather-dressing are also carried on. Pop. '81, 8480; '91, 9648.

YER'CUM, another East Indian name of the plants called mudar (q.v.) and their fiber.

YESSO, or Jesso. See Yezo.

YETH'OLM, a parish of Scotland, in the n.e. of Roxburghshire, bordering on England, 15 m. e.n.e. of Jedburgh. The Beaumont water runs through the parish, and on either side of this stream are the villages of Kirk-Yetholm and Town-Yetholm, the former being the head-quarters of the gypsies in Scotland. According to the census of Scotland for 1880 the village of Yetholm contained 746 inhabitants.

YEW, *Taxus*, a genus of trees of the natural order *taxaceæ*, which is very generally regarded as a sub-order of *coniferæ*, and is characterized by solitary and terminal fertile flowers, with a solitary ovule sessile in the center of a fleshy disk, forming a sort of drupe when in fruit, and by dicotyledonous seeds. The genus *taxus* is distinguished by a solitary terminal seed, surrounded by a succulent cup. The species are diffused over the whole northern parts of the world, and are large and beautiful evergreen trees, with narrow lanceolate or linear leaves. The COMMON YEW (*T. baccata*), a tree of 30 to 40 ft., and a trunk sometimes of great thickness, branching a few feet above the ground, and forming a large and dense head, is a native of the middle and s. of Europe and of Siberia. Noble specimens of it are to be seen in many parts of Britain. It attains a great age, at least 300 or 400 years. Its wood has been much used from very early times for making bows, for which it is preferred to every other kind of wood. It is very hard, and reckoned almost equal to boxwood for fine work. The heart-wood is of an orange-red or deep-brown color. The fruit is red, and was long reputed poisonous, but the pulpy part is not so; the seed, however, is a dangerous poison. The leaves also are a powerful narcotic; and although they are sometimes given as a vermifuge, their use is attended with danger.—The IRISH YEW (*T. fastigiata* of Lindley; *T. Hibernica* of Hooker), originally discovered in Ireland, and now very common in pleasure-grounds, is by many supposed to be a mere variety of the common species, with upright fastigiate habit, but it differs also in having the leaves scattered, while those of the common yew are in two rows.—The NORTH AMERICAN YEW (*T. Canadensis*) is of humbler growth.—The name JAPAN YEW is sometimes given to *podocarpus macrophyllus*, a tree of a genus nearly allied to *taxus*, and recently separated from it. It is a large and stout tree, a native of Japan; its wood much valued for cabinet work. See illus., TREES, ETC., vol. XIV.

YEZD, a considerable city of Central Persia, situated on the s.w. of the great desert of Khorassan, in lat. 32° 10′ n., long. 54° 50′ east. It is the great emporium of the internal commerce of the empire. Manufactures of silk stuffs, velvets, cotton and woolen fabrics, arms, and loaf sugar are carried on, and the bazaars are spacious and well supplied. Pop. 40,000.

YEZO, or JESSO, the most northerly of the four principal islands which compose the empire of Japan, lies n. of the central island of Nipon. Till lately, the interior was almost wholly unknown. Under the new *régime*, Yezo has been thoroughly explored, and extensive measures have been taken to colonize the island and develop its natural resources. The area is 30,276 sq. m., and the pop. (1894) 339,455, chiefly resident in the s.; the Ainos, a docile aboriginal race, thinly occupy the north. The surface of Yezo is mountainous, with volcanoes; it is rich in fine timber; valuable minerals, especially coal, are found; the rivers and coasts abound in fish. Bears, deer, and wolves exist in large numbers. The chief towns are Matsumai (q. v.) and Hakodadi (q. v.).

YGG'DRASIL, the name given in Scandinavian mythology to a tree, the greatest and most sacred of all trees, which was conceived as binding together heaven, earth, and hell. It is an ash, whose branches spread over all the world, and reach above the heavens. It sends out three roots in three different directions: one to the asa-gods in heaven, another to the frost-giants, the third to the under-world. Under each root springs a wonderful fountain, endowed with marvelous virtues. From the tree itself drops a honey-dew. Among its branches and roots, several animals sit or run about: an eagle, a squirrel, four stags, a serpent, all having their own proper names. The serpent, Nithhöggr, lies at the under-world fountain and gnaws the root of Yggdrasil; the squirrel, Ratatöskr, runs up and down, and tries to breed strife between the serpent and the eagle, which sits aloft.

Of this old-world myth too imperfect an account has survived to enable us to read its meaning. Some writers in the middle ages bring it into connection with the cross. It is striking to find Virgil (*Georg.* ii. 291) describing the ash as sending its branches as high into the air as it sends its roots into the earth.

Jacob Grimm sees an intimate connection between the world-tree Yggdrasil and the *Irmenseule*, of which numerous traces are to be found in the records of German antiquity. This is described by Rudolf of Fuld as a great trunk of a tree set upright, and worshiped in the open air; the name *Irminsul*, he explains as meaning the universal or all-sustaining pillar (Ger. *Säule*, pillar). Such a tree-idol was destroyed by Charles the great in his conquest of the Saxons in 772, at a place called Heresburg, in Westphalia, which was a chief seat of the pagan religion of the Saxons. The word *irmin*, Ang.-Sax. *eormen*, was frequently compounded with other words in the earlier stages of the Teutonic languages, in the sense of universal, greatest of all. As the primitive nature-worship tended more and more to the personification of particular powers, these trunk-idols were associated with particular divinities, and perhaps had an image set upon them, or were cut into some rude resemblance, as in the case of the Greek pillar-images called *herma* (see HERMES). The coincidence of the names *irmin* and *hermæ*, which may, however, be casual, has not failed to be remarked. The Christmas tree of modern Germany may be some kind of offshoot of the old notion of Yggdrasil.

YIDDISH (YIDDISH-DEUTSCH, or JÜDISCHE-DEUTSCH). The Judeo-German dialect, spoken by large numbers of Russian, Polish and German Hebrews both in Europe and America, is called by this name. It is founded mainly on pre-Lutheran German, with a liberal infusion of Slavic terms, and was originally spoken in a primitive form by the

Jews who emigrated to Poland. The dialect is written in Hebrew characters. Pure Yiddish is even more classical than modern German, as it contains many features of old German which have been lost altogether in the language spoken since Luther's time. Take the word *Verlieren*, to lose, for example. The Hebrew makes a distinction between losing from the pocket and losing in trade or speculation, and to express the latter he has preserved the ancient German *Ohne-werden*, to become without. The philological student who undertakes to master Yiddish will be sadly puzzled over the numerous inconsistencies and disadvantages peculiar to this tongue, chief among which are the irregular use of the auxiliary verbs, and the confusion of vowels and diphthongs. For instance, in using the German word *gehen*, to walk, the Polish or Russian Jew will pronounce it *gine;* and *haben*, to begin, he will pronounce *hoiben*. Very frequently whole letters are swallowed, or an adjective is made to take the form of a verb, as in the case of the word *achpern*, a verb, which is usually substituted for the German adjective *achtbar*, noteworthy or honorable. Slavic or Hebrew endings are affixed to words of German origin, so that they become practically unrecognizable, especially when a diminutive is to be expressed; *Vögelchen*, little bird, for example, becomes *Vogele*, with the Russian ending, and *Carlchen* is rendered *Carle* as a term of endearment, and *Carlke* to express contempt. A wide variety of foreign words, according to locality and environment, which relate to business or to intercommunication with Gentiles have become gradually incorporated into Yiddish, and are used sometimes in a German, again in a Russian guise, and more frequently still as the result of a mixture of both grammars. In New York City, Yiddish is almost the only language of upwards of 30,000 Hebrews, and it is also probably understood in a greater or less degree by many whose affiliations are largely with Christians. Six or seven newspapers are published in the language, and there are three theatres where Yiddish plays are given. As spoken in this country, with the interpolation of countless English phrases, it has become a jargon that the European Jew would comprehend with difficulty. Yiddish literature can boast of a poet not unworthy of the title in Michael Gordon, a Russian Jew of Scotch descent, and on this side of the water. Isaac Myerdick has written stories, etc., of considerable merit.

Y'LANG Y'LANG. See IHLANG IHLANG.

Y-MOTH, *Plusia gamma*, a beautiful species of moth (q.v.) common in Britain and throughout great part of Europe, about an inch in entire length, without reckoning the antennæ, which are not quite half an inch. The color is lilac, variegated with brown, the upper wings beautifully marbled, with a shining mark nearly in the form of the letter Y, or of the Greek γ (gamma), whence the names.

YOAKUM, a co. in n.w. Texas, New Mexico, being its w. boundary; formed 1876; 840 sq.m.; unorganized. Pop. '90, 4.

YOGA (from the Sanskrit *yuj*, join; kindred to the Lat. *jung-*, Gr. *zeug-*, Gothic, *jiuk;* hence *junction*, and figuratively, "concentration, religious or abstract contemplation") is the name of one of the two divisions of the Sânkhya philosophy of the Hindus. See SÂNKHYA. While the first of these divisions, the Sânkhya proper, is chiefly concerned in teaching the *tattwas*, or principles of creation, and the successive development of the latter, the main object of the Yoga is to establish the doctrine of a Supreme Being, and to teach the means by which the human soul may become permanently united with it; and since the Sânkhya proper is silent on the creation of the world by a Supreme Being—whence it was charged, though unjustly, by its opponents, with being atheistical—the Yoga, which is called theistical, is considered to be its complement. According to *Patanjali*, the reputed author of this system, the term *Yoga* means "the hindering of the modifications of thinking;" and by such modifications, which, he says, may be accompanied with afflictions, or be free from them, he understands "the three kinds of evidence—viz., perception, inference, and testimony—misconception or incorrect ascertainment, fancy, sleep, and recollection." The "hindering of these modifications" is, according to him, "effected either by a repeated effort to keep the mind in its unmodified state, or by dispassion, which is the consciousness of having overcome all desires for objects that are seen (on earth) or are heard of (in Scripture)." Dispassion is conducive to meditation; this, again, is of different kinds, and is attained either "impetuously"—in adopting various transcendent methods—or "by a devoted reliance on *Is'wara*, the Lord." This Lord, or Supreme Being, Patanjali then defines as "a particular *Purusha*, or spirit, who is untouched by afflictions, works, the result of works, or deserts; in whom the germ of omniscience reaches its extreme limit; who is the preceptor of even the first, because he is not limited by time; and whose appellation is Om, the term of glory." This word is to be muttered, and its sense is to be reflected upon, for "from it comes the knowledge of Is'wara, and the prevention of "the obstacles" which impede Yoga. These obstacles, Patanjali says, are "illness, apathy, doubt, listlessness about the accomplishment of meditation, want of exertion, attachment to worldly objects, erroneous perception, failure to attain any stage of meditation, or inability to continue in the state of meditation when it has been reached." There are several other methods to prevent these obstacles from distracting the mind, and impeding its steadiness. One, for instance, consists in pondering over one single accepted truth; another in "practicing benevolence, tenderness, complacency, and disregard toward all objects in possession of happiness or grief, virtue or vice;" another, "in forcibly expelling or retaining the breath;" another, in "dwelling on knowledge that presents itself in dream or sleep;" etc. When all these modifications have disappeared, the mind becomes free from "the tingeing" of the exterior world, as the pure crystal is free from the color that seems to belong to it, when a

colored substance is seen athwart it. After having described the various modes in which the mind may appear changed into the likeness of what it ponders, the author of this system then proceeds to explain the practical Yoga, by which "concentration" may be attained. It comprises, according to him, mortification, the muttering of certain hymns, and a devoted reliance on the Lord. Through it meditation is established, and *afflictions* are got rid of. By afflictions, again, he understands ignorance, egotism, affection, aversion, and tenacity of life; which terms are then the subject of an especial investigation into the nature of what is to be got rid of, of what is not desired to be got rid of, of what is constituted by the cause, and of what is the constitutive cause.—There are eight means or stages subservient to the attainment of concentration—viz., forbearance (*yama*), religious observance (*niyama*), postures (*ásana*), regulation of the breath (*prán'áyáma*), restraint of the senses (*pratyáhára*), steadying of the mind (*dháran'á*), contemplation (*dhyána*), and profound meditation (*samádhi*).—The first stage, *forbearance* (*yama*), consists in not doing injury to living beings, veracity, avoidance of theft, chastity, and non-acceptance of gifts; they are the universal great duty.—The second stage, *religious observance* (*nyama*), comprises purity—external as well as internal—contentment, austerity, muttering of the Vedic hymns, and devoted reliance on the Lord.—The third stage of Yoga *postures* (*ásana*), is defined by Patanjali, as "that which is steady and comfortable" at the same time. The commentators mention several varieties of such postures. According to an interesting treatise on the Yoga philosophy by Navînachandrapâla, one of these, called *Siddhásana*, is practiced by placing the left heel under the anus, and the right heel in front of the genitals, by fixing the sight upon the space between the eyebrows, and, while in this motionless attitude, meditating upon the mysterious syllable *Om* (q.v.). Of the posture called *Padmásana* the same treatise says, that it consists in placing the left foot upon the right thigh, and the right foot upon the left thigh, in holding with the right hand the right great toe, and with the left hand the left great toe, the hands coming from behind the back and crossing each other; while the chin rests on the interclavicular space, and the sight is fixed on the tip of the nose. When the command of such postures is attained, Patanjali says, the Yogin does not suffer either from cold or heat, hunger or thirst, or similar afflictions. The fourth stage, *regulation of the breath* (*prán'áyáma*), is threefold, according as it concerns exhalation or inhalation, or becomes tantamount to suspension of the breath, the latter also being termed *kumbhaka* (from *kumbha*, a jar), because "the vital spirits then are as motionless as water is in a jar." Through such a regulation of the breath, the obscuration of the pure quality of the mind is removed, and the latter becomes fit for acts of attention. Navînachandrapâla describes different processes of the Prânâyâma as selected from different authorities. One, for instance, consists, according to him, in the act of inhaling through the left nostril for 7.6788 seconds, suspending the breath for 30.7152 seconds, and exhaling through the right nostril for 15.3576 seconds; then inhaling through the right nostril for 30.7152 seconds, and exhaling through the right nostril for 7.6788 seconds, suspending the breath for 30.7152 seconds, and exhaling through the left nostril for 15.3576 seconds; lastly, inhaling through the left nostril for 7.6788 seconds, suspending the breath for 30.7152 seconds, and exhaling through the right nostril for 15.3576 seconds. To the *kumbhaka*, of which there are eight varieties, the same author observes, two processes are indispensable: sitting in one of the postures described, and, by means of an incision in the frænum linguæ, and milking, as it were, the tongue, causing it gradually to become so lengthened as to allow the rima glottidis to be shut by pressing back the epiglottis with the point of the retroverted tongue. Such *kumbhakas*, it is supposed, produce the most wonderful effects: some of them cure diseases of the head and lungs, dropsy, etc.; others make proof against all sorts of inflammation and fever; the eighth or last variety of the *kumbhaka*, especially, cures all diseases, purges from all sins, promotes longevity, enlightens the mind, and awakens the soul.—The fifth stage of Yoga, the *restraint of the senses* (*pratyáhára*), means the withholding of the senses from their respective objects, and the accommodating them entirely to the nature of the mind. According to an authority quoted by Navînachandrapâla, a Yogin's senses are suspended when he can suspend the respiratory movements for 10 minutes and 48 seconds.—This stage is preparatory to the sixth, or *the steadying of the mind* (*dháraná*), which means the freeing of the mind from any sensual disturbance, by fixing the thoughts on some part of the body, for instance, on the naval or the tip of the nose. This stage, it is supposed, can be accomplished when the Yogin is able to suspend his respiratory movements for 21 minutes and 36 seconds; and, according to Navînachandrapâla, it is effected by different processes—muttering the syllable *om* 144,000 times, fixing the eyes upon the tip of the nose, or the space between the eyebrows, for two hours, swallowing the tongue for two hours, etc. *Contemplation* (*dhyána*), the seventh stage of Yoga, is the fixing of the mind on the one object of knowledge, the Supreme Spirit, so as to exclude all other thoughts. It is practiced in consequence of the "steadying of the mind," as defined before; and, according to the authority quoted by Navînachandrapâla, a man can accomplish it when he is able to suspend his respiratory movements for 43 minutes and 12 seconds.—The eighth and last stage of Yoga, *profound meditation* (*samádhi*), is the perfect absorption of thought into the one object of meditation, the Supreme Spirit; it is devoid, as it were, of any definite character, which would suggest a term as applicable to it. In such a state, Navînachandrapâla says, "a Yogin is insen-

sible to heat and cold, to pleasure and pain; he is insensible to blows and wounds, to the effects of fire; he is the same in prosperity and adversity; he enjoys an ecstatic condition. He is free from lust, fear, and anger; he is disengaged from all works. He is not affected by honor and dishonor. He looks upon gold, iron, and stones with the same unconcerned eyes. He is the same in love and in hatred; he is the same among friends and enemies." And, according to the authority he quotes, such a state may be attained by a man who can suspend his respiratory movements for 1 hour 26 minutes and 24 seconds. The last three stages are also comprised under one distinctive name, *samyam'a*, or "restraining," because it is chiefly on the perfection attained in these three collectively that depend the wonderful results which are promised to a Yogin when he applies them to the contemplation of special objects. Such results are, for instance, a knowledge of the past and future, a knowledge of the sounds of all animals, of all that happened in one's former births, of the thoughts of others, of the time of one's own death, a knowledge of all that exists in the different worlds, of stars and planets, of the structure of one's own body, etc. There are especially, however, eight great powers which a Yogin will acquire when properly regulating and applying the *sam'yama*—viz., the power of shrinking into the form of the minutest atom; that of assuming a gigantic body; that of becoming extremely light; that of becoming extremely heavy; that of unlimited reach of the organs (as touching the moon with the tip of a finger); that of irresistible will; that of obtaining perfect dominion over the inner organs of the body; and that of acquiring mastery over everything. If the Yogin applies *sam'yama* to the contemplation of the smallest divisions of time, and the successive order in which such divisions occur, he obtains a discrimination which enables him to understand the subtle elements, and to see all objects at once. When his intellect has become free from all considerations of self, and his spirit is no longer subject to the result of acts performed, and when both have thus obtained the same degree of purity, the Yogin obtains eternal liberation.—In the last chapter of his work, Patanjali then shows that these perfections are not always obtained by Yogins in one birth, but that *Prakr'iti*, or nature (see SÂNKHYA), generally in a succession of births, brings to maturity the result obtained in a prior birth. He thus makes nature, not actions, the cause of each effect; meritorious actions merely serving, according to him, to remove the obstructions which, from bad actions, would arise to its regular progress, just as water would take its natural course after the husbandman, who would want to lead it from field to field, had removed the obstructions that lay in its path. After having then taught that the result of actions, in successive births, consists in the recollection of a prior state, and in the obtainment of a special (existence, a special duration of life, and special enjoyments); and after having discussed the different influences to which the mind may become subject in its union to different objects, Patanjali winds up with describing the mode in which final liberation gradually takes place. First, he says, when a person has obtained the discrimination conveyed by the Yoga doctrine, all ideas of self—such as, I am different from another—cease. In consequence, thought is turned inward, and this is the commencement of liberation. But, as still recollections, derived from former existences, sometimes prevail in his mind, they must be abandoned by him in the same way as he has to overcome the afflictions, above specified. When he has succeeded in this, his knowledge will have become so infinite, that but little will remain for him to be known. Then the cosmical *gun'as*, or qualities, too (see SÂNKHYA), having accomplished the main object of spirit, will have gradually arrived at the end of their functions, and, as a consequence, matter will become separated from spirit. This is *kaivalya*, or true liberation, for the mere power of the mind to retain its nature after dissolution has taken place, is not yet true liberation.—The practical part of the Yoga was admitted into the later vedânta (q.v.). Its ethical portion is especially dwelt upon in the celebrated episode of the Mahâbhârata (q.v.), the *Bhagavadgîtâ*. But the great power it has at all periods exercised on the Hindu mind, is less derived from its philosophical speculations or its moral injunctions, than from the wonderful effects which the Yoga practices are supposed to produce, and from the countenance they give to the favorite tendency of orthodox Hinduism, the performance of austerities. It is needless, however, to say that frequently these practices were and are merely a cloak for imposture and hypocrisy, and that the professional Yogins (q.v.), numbers of whom are met with throughout India, are often nothing but lazy mendicants or jugglers, who, by impressing the vulgar with a belief in their supernatural powers, convert it into a source of an easy livelihood. Such followers of the Yoga pretend, for instance, to foretell future events; they deal in palmistry, and profess to cure diseases. There are instances, too, where, for a handsome consideration, they allow themselves to be buried for a certain time, so as to exhibit the power of the Yoga. Two such cases are related as authentic in the treatise of Navînachandrapâla; and it would appear from them, that a human being, after having undergone certain preparations, such as the Yoga prescribes them, may be shut up in a box without either food or drink, for the space of a month, or even forty days and nights, and yet remain alive. The author of the treatise endeavors, indeed, to show that the rules laid down by the Yoga regarding the mode of respiration, the postures, and the diet of a Yogin, may have been founded on a careful observation of the nature and habits of hibernating animals; and in support of this view, he enters into a detailed investigation of the effect of the Yoga

practices on animal life. If, as it seems, his statements are correct, much of what otherwise would be incredible in the accounts given of the performances of Yogins, could be received as true, because admitting of explanation. The system *patanjali* was taught by him in a little work called *yogasûtra*, which consists of four pâdas, or chapters, each comprising a number of sûtras (q.v.). The oldest commentary on it is ascribed to a *rydsa* (q.v.); and this was commented on by *Vachaspati-Mis'ra*. Of other commentaries, those by *Vijnânabhikshu*, *Bhojadeva*, and *Nâgojibhat't'a*, are the most approved of.—For a fuller enumeration of works on the Yoga, see *A Contribution toward an Index to the Bibliography of the Indian Philosophical Systems*, by Fitzedward Hall (Calcutta, 1859). The first two chapters of the sûtras have been translated, with annotations, founded on the commentary of Bhojadeva, by the late J. R. Ballantyne (Allahabad, 1853); and a paraphrase, but somewhat too free, of the same commentary is contained in the 4th vol. of William Ward's *View of the History, Literature, and Religion of the Hindus, etc.*, 4 vols. (London, 1817–20). For a brief account of the system, see also the 1st vol. of H. T. Colebrooke's *Miscellaneous Essays*, 2 vols. (London, 1837); and for the practice of the Yoga, *A Treatise on the Yoga Philosophy*—that referred to above—by N. C. Paul (i.e., Navînachandrapâla), (Benares, 1851).

YOGIN, a follower of the Yoga system of Hindu philosophy (see Yoga), but in popular acceptation a term generally denoting a Hindu ascetic or devotee, a man who has entered the fourth stage of religious life as described in the s'astras. A large class of such persons forms a division of the votaries of S'iva. See S'aivas.

YOICKS', supposed to be a corruption of the French *oyez*, "listen," "hear," is a hunter's cry of encouragement to his hounds when following the fox. See Tally Ho. Dame Juliana Berners (q.v.) gives in her *Book of Hunting* of the fifteenth century the cry "*Oyez, oyez, à Bemounde!* the last word being the name of a hound.

YOKOHAMA (Japanese for "cross shore"), a t. of Japan, in the island of Nipon, and the port for the foreign trade of Tokio. It is situated on the s. side of a bight of the bay of Yedo, about 18 m. from Tokio, and opposite to Kanagawa. In 1854, it was only a small fishing village, but after it supplanted Kanagawa as the treaty port of Tokio in 1859, it rapidly increased. The Japanese government built at a great outlay solid granite piers and landing-places, a large custom-house, official residences, and shops for Japanese traders; besides houses and godowns for the foreign community and merchants. It now extends along the sea-shore for about 1½ m., and is two or three streets deep. The custom-house is nearly in the center of the town; and e. and w. of it, lie respectively the foreign and native quarters. The shops are filled with goods to suit the foreign taste —such as lacquered ware of rare quality and bronze-work, baskets and porcelain, fancy silks and embroidery, curiosities and articles of *vertu*. Since the recent changes in the policy of the Japanese government, great improvements have taken place in the native quarter. Broad and cleanly streets are rapidly superseding the former dirty and narrow thoroughfares. A canal is drawn as a cordon around the settlement on the land-side, and in 1871 the Japanese government widened and deepened it very considerably. Other important undertakings have recently been carried out, the chief of which is a railway from Yokohama to Tokio. Pop. '94, natives 160,439; foreigners, about 3400.

YOLO, a co. in n. central California, bounded on the e. by the Sacramento river, and on the s. by Putah creek; about 972 sq.m.; population, 1890, 12,684, chiefly of American birth. Co. seat, Woodland.

YONGE, Charlotte Mary, a novelist of considerable merit and popularity, was born in the year 1823. She is a daughter of the late William Crawley Yonge, esq., of Otterbourne, Hampshire, sometime an officer in the 52d regiment. The work by which she is best known is *The Heir of Redcliffe*, which had great success, and has gone through several editions. Besides this, she is the author of *Heart's Ease; Dynevor Terrace; The Daisy Chain; The Lances of Lynwood; The Little Duke*, etc. These works exhibit much literary accomplishment, and have secured for Miss Yonge a public of her own. The spirit which pervades them is pure, amiable, and pious; and commonly the stories are more or less contrived as vehicles of the high church opinions to which the writer is warmly attached. Considerable sums accruing from the sale of her writings she is said to have devoted to the aid of religious missions in New Zealand. In addition to the fictions by which she is chiefly known, Miss Yonge has published a work *On Christian Names, their History and Derivation*, in which much curious erudition is displayed; *Life of Bishop Patteson* (1873); and several historical works.

YONKERS, a city in Westchester co., N. Y.; on the Hudson river, and the New York Central and Hudson River railroad; adjoining New York city on the n. It contains high, Halsted, and Lowden schools, public library, St. John's Riverside hospital, St. Joseph's hospital, Homœopathic home, Hollywood Inn for workingmen, a historical manor hall, gas and electric light and electric street railroad plants, and waterworks supplied from Grossy Sprain lake. There are about 30 churches, Y. M. C. A. and W. C. T. U. halls, Leake and Watts orphan home, Hebrew home for the aged and infirm, and Greylock, the suburban residence of Samuel J. Tilden. The U. S. census of 1890 reported for Yonkers, 628 manufacturing establishments, employing $10,989,789 capital and 11,303 persons, paying $5,877,145 for wages and $10,995,699 for materials,

and having a combined output valued at $21,319,017. The principal manufactures are carpets and rugs, hats, silk and silk goods, foundry and machine shop products, elevators; refined sugar, chemicals, and rubber and gutta-percha goods. The city was incorporated as a village in 1855, and chartered as a city in 1872. It has several national and savings banks, and daily, and weekly newspapers. Pop. '90, 33,033.

YONNE, a department in the n.e. of France, bounded on the n. by the department of Seine-et-Marne, on the e. by Aube and Côte-d'Or, on the s. by the Nièvre, and on the w. by Loiret. Area, 2868 sq. m.; pop. '96, 332,651. The department is watered by the river Yonne, which flows across it in a n.e. direction. The surface is hilly, many of the hills being covered with fruitful vineyards, the intervening valleys being beautiful and fertile. There are some fine forests in the department. The climate is generally healthy, except in the s.w., where the marshes often give rise to fever. The soil produces abundance of grain, but the cultivation of the vine is of the greatest importance, the best wines produced here being those of Chablis, Joigny, Auxerre, and Tonnerre. The chief mineral products are red granite, marble, lithographic stones, pavement, red and yellow ocher, iron. There are manufactures of cottons, woolens, beet-root sugar, bricks, tiles, etc. The chief exports are timber, corn, and wine. It is divided into five arrondissements—viz., Auxerre, Avallon, Joigny, Sens, Tonnerre. The capital is Auxerre.

YORITOMO, 1146–99; b. Japan; son of Yoshitomono Minamoto. He was the first of the mikado's subjects upon whom was conferred the title *Sei-i tai shogun* (great general who tranquilized the barbarians), the same office which in the American treaty of 1854 is ascribed to the "tycoon." He founded the city of Kamakura, near the modern Yokohama, in 1181; annihilated his rivals, the Taira family, after many bloody battles; and in 1192 received from the mikado the title and office by which Japan henceforth, until 1868, had two capitals or centers of power; two kinds of government, civil and military, or "the throne and the camp;" and two rulers, mikado and shogun (or tycoon), at Kioto and Kamakura (or later, Yedo). His life came to an end by the death of his grandson Sanctomo, by assassination.

YORK, a co. in s.w. Maine, bounded on the n. by the Ossipee river, on the e. by the Atlantic ocean, and on the s.w. by the Piscataquis and Salmon Falls rivers, which separate it from New Hampshire; about 920 sq.m.; pop. '90, 62,829, chiefly of American birth. Co. seat, Alfred.

YORK, a co. in s.e. Nebraska; 576 sq.m.; pop. '90, 17,279, chiefly of American birth. Co. seat, York.

YORK, a co. in s. Pennsylvania, adjoining Maryland, bounded on the n.e. by the Susequehanna river; about 910 sq.m.; pop. '90, 99,489, chiefly of American birth. Iron is found. Co. seat, York.

YORK, a co. in n. South Carolina, bordering on North Carolina; about 750 sq.m.; pop. '90, 38,831, chiefly of American birth, inclu. colored. Iron ore, gold, manganese, and limestone are found. Co. seat, Yorkville.

YORK, a co. in s e. Virginia, bounded by York river and Chesapeake bay; 75 sq.m.; pop. '90, 7596. Co. seat, Yorktown.

YORK, a co. in s.w. New Brunswick, separated from Maine by the St. Croix river; 3472 sq.m.; pop. '91, 30,979, many of Irish and of Scotch descent. Co. seat, Fredericton.

YORK, a co. of Ontario, Canada, bordering on lake Ontario; 913 sq.m.; pop. '91, 241,382. Co. seat, Toronto.

YORK, a river of Virginia, formed by the union of the Pamunkey and Mattapony, flowing s.e. to the Chesapeake bay, nearly opposite Cape Charles. It is 40 m. long, and from 1 to 3 wide. Yorktown, an ancient but decayed port, on the right bank, 11 m. from its mouth, was the scene of Lord Cornwallis's surrender, Oct. 19, 1781.

YORK, a town in York co., Me.; on York harbor, and the York Harbor and Beach railroad; 7 miles n.e. of Portsmouth, N. H. It is a popular summer resort, with a public library, large brick works, national bank, several churches, and weekly newspaper. Pop. '90, 2444.

YORK, city and co. seat of York co., Neb.; on the Burlington route, the Fremont, Elkhorn, and Missouri Valley, and the Kansas City and Omaha railroads; 50 miles w. of Lincoln. It contains York college (Unit. Breth.), Ursuline hospital, public library, electric light plant, several national banks, and daily, weekly, and monthly periodicals. Pop. '90, 3405.

YORK, city and co. seat of York co., Pa.; on the Northern Central, the Pennsylvania, the Western Maryland, and the York Southern railroads; 27 miles s. of Harrisburg. It contains a collegiate institute, young ladies' seminary, co. academy, public schools of all grades, business colleges, hospital and dispensary, Cassat, United, and co. law libraries, Highland and Penn parks, electric light and street railroad plants, nearly a dozen banks, and about 50 churches. The U. S. census of 1890 reported for York, 350 manufacturing establishments, employing $3,842,453 capital and 4120 persons, paying $1,609,456 for wages and $3,170,840 for materials, and having a combined output valued at $5,968,223. The principal manufactures are iron and steel, agricultural implements, wall-paper, cars, organs and pianos, soap, cigars, wire-cloth, underwear, and carriages and wagons. The continental congress held its sessions here in 1777–8. Pop. '90, 20,793.

YORK, the capital of Yorkshire, is situated at the junction of the rivers Ouse and Foss, the three ridings of the county meeting at the same place, and is nearly equidistant from London and Edinburgh. It is the seat of an archbishopric, a county in itself, and a municipal and parliamentary borough. The government is vested in 12 aldermen and 36 councilors, of whom one, as in the case of London, is lord mayor. It returns two members to parliament. The population in '71 was 43,796, being an increase from '61 of 3,363 persons, and 904 inhabited houses. In the registration district of which York is the center, there are 83 parishes, with an area of 82,545 statute acres, and a population in '71 of 64,909. Pop. of municipal bor. '81, 54,198; '91, 66,984.

York is among the most ancient of British cities. Before the Roman invasion it was one of the chief towns of the Brigantes, the most numerous and powerful of the British tribes. It was constituted a Roman station, under the name of *Eboracum*, by Agricola about 79 A.D., and was very soon the principal seat of Roman power in the n., perhaps in Britain. While the Roman dominion existed in the island York was a city of the first importance. Here Hadrian lived and Severus died. Here, too, died Constantine Chlorus, the father of Constantine the Great, and here, as many believe, his greater son was born. When the emperors visited the province York was their chosen residence, and it was the abode of the imperial legates when the emperors were absent. Little is known of the city for a century after the departure of the Romans, about 409 A.D., but it certainly suffered much during the long conflict between the Britons and the Picts, against whose incursions York was a material defense. It afterward became the capital of Northumbria. The first metropolitan church in England was built here by Edwin, the Northumbrian king whom Paulinus baptized; and here also Edgar, the first sole monarch of England, held, in the year 966, the witenagemot. William the Conqueror was long unable to overcome this stronghold of the n., notwithstanding his coronation by its archbishop, Aldred. One Norman garrison, numbering 3,000 men, was put to the sword in 1069, but William exacted a terrible vengeance in the following year, when he laid waste the whole country between York and Durham.

The first English parliament was held at York in 1160 by Henry II., and for 500 years afterward parliaments continued to be summoned occasionally to the ancient city. Under Henry III., the courts of king's bench and exchequer sat at York for seven years; and for a few months Richard II. removed thither the courts of king's bench and chancery. During the insurrections consequent upon the dissolution of the monasteries by Henry VIII., York was seized by the insurgents of the "pilgrimage of grace;" and in its immediate neighborhood, Fairfax, in 1644, conquered prince Rupert on Marston Moor. The city and castle, already besieged, surrendered to the parliamentarians a few weeks after. The British association was organized at Y. in 1831, and here the jubilee meeting was held, 1881.

A city so ancient necessarily presents many interesting memorials of antiquity. There are remains or memorials of Roman towers and temples, and of the earliest British churches. One of the most magnificent of the Anglo-Saxon churches was erected at York in the 8th c., and this, destroyed by fire, rebuilt, enlarged, and changed from time to time, is now known as York minster. A portion of the original church was disinterred during the excavations which followed the latest burning of the minster, in 1829. The present structure takes rank with the finest specimens of Gothic architecture in the world. It was mainly built in the 13th and 14th centuries. Its length, from base to base of the buttresses, is 525 ft., and its extreme breadth 250 ft., being 25 ft. longer than St. Paul's cathedral, and 150 ft. longer than Westminster abbey. The magnificent east window is 78 ft. high and 31 ft. broad, and contains about 200 compartments, each a yard square, representing scriptural subjects. War and fire have conspired to deform or destroy this splendid cathedral. Twice it has been burned down, once in 1069, and again in 1137, each time to rise more beautiful than before. During the times of the commonwealth much damage was done by war and wantonness, and several of its older monuments were mutilated or broken up. In 1829 it was set on fire by Jonathan Martin, a maniac; and the roof of the choir, 222 ft. long, with all the wood-work on each side, was destroyed. While this disaster was being repaired, a workman's candle was carelessly left burning, one night in 1840, and again a terrible fire broke out, destroying the south-western tower, with its splendid peal of bells, and the roof of the nave. The cost of the repairs exceeded £100,000.

A monastery of Benedictine monks was built, or rather completed, at York in the time of William Rufus, which was in great part reconstructed about the end of the 13th century. Its abbot had a miter and a seat in parliament. Some portions of the original building yet remain. Thirteen seceders from this monastery established, in 1131, the neighboring abbey of Fountains, near Ripon, under Cistercian rule. On the site of the Benedictine monastery now stand the museum and gardens of the Yorkshire philosophical society. The same order had a priory dedicated to the holy trinity in Micklegate, and a nunnery outside the walls at Clementhorp. Besides these the Dominicans, Franciscans, Augustinians, and Carmelites had each a monastery, and the Gilbertines a priory, within the city. In the immediate neighborhood were 16 hospitals. At the reformation, York contained 41 parish churches, 17 chapels, 16 hospitals, and 10 religious houses. Twenty-two of the churches yet remain, and several new churches have been built. The Roman Catholics have a fine pro-cathedral. There are numerous dissenting places of worship.

The educational institutions of York are numerous and useful. Notable among them are St. Peter's school, founded in 1557; archbishop Holgate's free school, dating from Henry VIII.; the blue coat school for boys, and the gray coat for girls, supported chiefly by annual subscriptions; and the Yorkshire school for the blind, conducted in a palace originally built for the lord president of the council of the north.

A fine art exhibition was held at York in 1879; the building erected for it contains a concert-hall and picture galleries. The Yorkshire philosophical society was formed in 1822, and possesses a handsome building and gardens on the site of St. Mary's abbey, with a museum, rich in antiquarian relics and specimens illustrative of natural history. Among other public institutions are the county hospital, the first established in England n. of the Trent; the lunatic asylum; the dispensary; the Friends' retreat; and many charitable foundations for the benefit of poor persons. The ancient castle, with the exception of its imposing Clifford's tower, is superseded by the modern and commodious assize courts. The Guildhall, a fine Gothic building, was erected in 1446. There are also convenient assembly and concert rooms, and a creditable theater.

Whatever the trade of York may have been in ancient times—and old writers speak of it in glowing terms—it counts for little now. The making of leathern gloves, combs, glass, etc., supplies employment to many; some find employment in iron-foundries, in flax-spinning, and the manufacture of linen; and of late, the construction of railway carriages has become part of the city industry.—See Drake's *Eboracum;* Browne's *History of the Metropolitan Church of St. Peter's, York;* Britton's *Cathedral Antiquities—York;* Hargrave's *History of York;* Gent's *York;* Wellbeloved's *Eburacum, or York under the Romans.*

YORK, George Frederick Ernest Albert, Duke of, the second son of the Prince of Wales, was born in 1865 and received his training in the navy, but at the death of his elder brother in January, 1892, which made him the heir presumptive to the throne, he gave up active service. In 1893 he married Princess May of Teck and a son was born to them in 1894.

YORK, Henry Benedict Mary, Duke of, cardinal and bishop of Frascati, the last male descendant of the royal house of Stuart, was the second son of James (III. of England), commonly known as the pretender. He was born at Rome, Mar. 26, 1725; and after the failure of the attempt of his elder brother, Charles Edward, in 1745, resolved to enter the church. He was admitted to tonsure and minor orders by Benedict XIV., and created cardinal in 1747. Clement XIII. consecrated him bishop of Corinth *in partibus infidelium,* and afterward of the suburban see of Frascati, where he took up his residence. He also enjoyed, through the favor of the crown of France, the revenues of two abbeys, which he held *in commendam,* as well as a pension from the Spanish court; and the liberal charity with which he dispensed his income among the poor, and for the other charitable and religious necessities of his diocese, endeared him to his flock. These resources were lost at the revolution; but, nevertheless, in the distresses of the holy see which ensued, Cardinal York sold his family jewels for the purpose of relieving Pius VI. in his necessities. On the occupation of Rome he withdrew to Venice; but he returned in 1801, on the restoration of the papal authority under Pius VII. George III., having become aware of the failure of his former means of income, granted him a pension of £4,000 a year, which he accepted, and enjoyed till his death. Those to whom a printed record of the "Last of the Stuarts" may be interesting, will find a small collection of his "pastoral letters," in a 4to volume published in Rome, and entitled *Appendix ad Tusculanam Synodum a Celsitudine Regia Emmentissimi Henrici Episcopi Tusculani* (Rome, 1764). He was appointed by Pius VII. dean of the sacred college, and held several other dignities, and was much respected, as well by the Italians as by foreigners visiting Rome. He died at Frascati, July 17, 1817, at the advanced age of 92. His last will, which is a very interesting document, is printed by Artaud in his *Vie de Pie VII.* His monument, by Canova, in St. Peter's, was erected by order of the prince regent, afterward George IV.

YORK, House of. See Plantagenet.

YORKSHIRE, which is larger in territorial extent than any other two counties in England, is situated nearly in the center of Great Britain, about midway between London and Edinburgh. "Its extreme points," says Allen, in his history of the county, "lie between the parallels of 53° 18′ to 54° 40′ n. lat., and between 2° 40′ of w. to 0° 10′ of e. long. from Greenwich. On the n. side, it is separated, in its whole extent, from the county palatine of Durham by the river Tees; from the mouth of the same river to the entrance of the Humber, the whole e. side is bounded by the German ocean; on the s. side it is divided from Lincolnshire by the rivers Humber and Trent. The boundaries between Yorkshire and the counties of Nottingham, Derby, Cheshire, Lancashire, and Westmoreland are merely conventional, being indicated by no natural feature of the country." The longest diagonal of the county, n.w. to s.e., extends about 130 m.; the shortest, s.w. to n.e., about 90. It contains about 6067 sq. m., or 3,888,351 statute acres. It is divided into three Ridings, North, East, and West, and a small district not included in any of the three, comprising the city of York. The Ridings have areas and

populations, respectively, of 2122 sq. m., 284,827; 1159 sq. m., 141,516; 2658 sq. m., 1,351,570; and the city of York, a co. borough, has an area of 3591 acres, and a pop. of 67,004. In the whole country, besides the archiepiscopal city, there are 59 market-towns, and 1639 townships and places. The North Riding (including for parliamentary purposes the Ainsty and city of York) returns eight members; the East Riding, six members; the West Riding, twenty-two members. According to the census of 1891, the population was 1,844,927.

The history of the county in early times may be mainly read in that of its chief city. Apart from the events which transpired at, and in connection with York, there is little to be recorded. It was originally occupied by the Brigantes, and was subjected by the Romans under Agricola about 71 A.D. When the Roman occupation ceased, it was long and greatly troubled, first by Pictish, and then by Saxon incursions. Under Saxon rule, the traces of Brigantian occupancy were soon obliterated, only the rivers, mountains, and a few remarkable natural curiosities retaining their British names, while all things else received Saxon designations. The county formed part of the kingdom of Northumbria, taking the name of Deira (the country of Deer), when that kingdom was divided. In the troublous times which preceded the conquest, many battles were fought against invading Danes, and generally with success. At Stamford Brig, a few miles from York, Harold, the last of the Anglo-Saxon kings, defeated the united Danish and Norwegian armies, three weeks before he fell before the Normans on the fatal field of Hastings. Among the more notable events of later history, may be named the battle of Wakefield, where the duke of York was defeated by queen Margaret in 1460; the battle of Towton field, near Tadcaster, fought on Palm Sunday in 1461, the most sanguinary conflict of the bitter war between the rival roses; and that of Marston Moor, which gave the final blow to the falling fortunes of Charles I. Since that time, with slight exceptions, the history of Yorkshire has been one of peace and prosperity.

The surface of the county is greatly diversified. On its north-western border runs a range of lofty hills, many of them containing extensive caverns, and giving birth to wild and romantic streams. Here is Ingleborough, 2,373 ft. above the sea-level, with its marvelous cave, half a mile long, full of beautiful stalactites; Whernside, 2,414 ft. high, with its subterranean cataract of 75 ft. in Weathercote cavern; and the vast mass of Mickle Fell, 2,600 ft., which overlooks the waters of the Tees and Lune. Eastward, far away, rise the Hambleton and Cleveland hills. Lower down are the wolds, a line of chalk hills stretching from Flamborough Head to Ferriby on the Humber. The hills and dales of Craven, which cover a large tract of country in the w., abound in natural beauty Right down the center of the county, from the Tees to the Humber, runs the great vale of York. Across its northern border flows the Tees. Coming southward, we find the dales of the Swale, Ure, the Nidd, the Wharfe, the Aire, the Calder, and the Don, all on the western side of the county, each sending a river to the central vale, where the united waters, with the Derwent and a few smaller tributaries from the e., form the Ouse; while the Ouse, after uniting with the Trent, becomes the Humber estuary, which rolls eight-tenths of the Yorkshire waters to the sea. The Ribble, rising in Craven, passes by Preston, and falls into the Irish channel, and is the only Yorkshire river which finds a western outlet. The Esk joins the German Ocean at Whitby, and the Tees between Redcar and Hartlepool.

Geologically, Yorkshire is too large a subject for us to do more than touch The vale of Yorkshire, rarely more than 100 ft. above the sea, has on its western side the long slow elevations which culminate in the Pennine chain, while on the e. rise the lower but more sudden eminences of the wolds and the high grounds of Hambleton and Cleveland. On the w. are the millstone grit and mountain limestone, the two coming together in lofty opposing eminences in many parts of Craven, where, along the line of what is called by geologists the "Craven fault," the limestone rises into magnificent cliffs many hundreds of feet in height, and nearly 2,000 above the level of the sea. The limestone is in many places very rich in lead ore. On the e. lie the chalk wolds. In the southwestern district is a splendid coal-field, intermixed with ironstone, extending over 600 sq. miles.

In the n.w., the lower parts of the North Riding, Craven, and the East Riding, the land mainly supplies occupation to the inhabitants. Craven is almost purely a grazing district, and so are most of the upper lands and dales in the county. Excellent corn is grown in the vales of York and Cleveland, and the East Riding has many large and excellent farms. The horses of Yorkshire, both for the race-course and for use, are too well known to need eulogy. The manufactures of the county are immense. Leeds is the center of the woolen, as Bradford is of the worsted trade. Sheffield is the principal seat of the cutlery manufacture; while the Cleveland district is rapidly rising into importance for mineral wealth and enterprise. The large iron-works of Low Moor, Bowling, and Rotherham, and the flax and linen manufactures of Leeds and Barnsley, merit a passing notice, with the blankets and cloths of the Huddersfield district, and the new llama and alpaca industry introduced at Saltaire near Bingley, by Sir Titus Salt. Harrogate, Ilkley, Askern, and Croft are the principal inland health-resorts of the county; Scarborough, Filey, Bridlington, and Whitby take the lead on the coast.

The public works of Yorkshire rank with the finest in the kingdom. Among them are the Aire and Calder navigation, 15 m. long; the Calder and Hebble navigation; the navigation of the Don and Sheffield region, 40 m.; and the Huddersfield canal, one of the most surprising engineering works in England. This canal is 20 m. in length, and rises between Huddersfield and Marsden by 42 locks to the height of 656 feet. At this elevation, the highest canal-level in the country, it passes by a tunnel more than 3 m. long under Standedge, a range of hills between Marsden and Saddleworth. The canal terminates near Dukinfield. Add to these the Leeds and Liverpool canal—which cost 46 years of labor, and is 129 m. long—besides many smaller but very costly undertakings, and some idea may be formed of the activity of Yorkshire in this direction. Its railway communications are excellent, and grow in number and completeness every year. On these lines, in consequence of the mountainous districts through which many of them pass, are to be found some of the longest and most difficult tunnels, viaducts, bridges, embankments, and cuttings which have yet been attempted by engineers in England.

A very brief reference to the antiquities and natural curiosities of the county must suffice. Traces of great Roman roads are found in many places, as well as of Roman, Saxon, and Danish encampments. In the wolds are many tumuli; and it is supposed by some that the singular and imposing mass of rocks called Brimham crags, which overlook Nidderdale, about 4 m. from Pateley bridge, was once a Druidical temple. The ruins of ancient abbeys and priories are numerous and beautiful. Few can rival the glories of fountains and rievaulx, and the scenery which encompasses Bolton priory is delightful. Besides these there are the ruins of Kirkstall, Roche, and Selby in the West Riding; St. Mary's at York; Jervaux, Byland, and Whitby in the North Riding; and many others. Of castles we may name, in the West Riding, Conisborough castle, near Doncaster, one of the oldest and most interesting ruins known to antiquaries; Knaresborough, Pontefract, and Skipton, the last still used as a residence: in the North Riding, Richmond, with it unrivaled Norman keep ; Middleham Castle, where the king-maker, Warwick, lived, and where Edward IV. was immured ; and Bolton Castle, the prison for a time of Mary Queen of Scots ; in the East Riding, Wressle Castle, once the home of the Percies. Of York castle nothing remains but its massive Clifford's tower.

The lover of the picturesque will find the Yorkshire scenery full of charms. The rapid of Caldron Snout, on the Tees, 200 ft. in descent; High Force, on the same river, a perpendicular fall of 69 ft. over a cliff of greenstone marble; Aysgarth Force and Hardraw Force, on the Ure; the Strid, immortalized by Wordsworth, in Bolton woods on Warfe; the magnificent Gordale Scar and Malham Cove, each nearly 300 ft. in height, on the upper waters of the Aire; and the uncounted glens and streams among its myriad hills are sufficient to indicate the attractions of its river and mountain aspects. It would require a volume to do them justice.—See Allen's *History of the County of York ;* Whitaker's *Histories of Richmondshire, Craven, and Leeds ;* Hunter's *Hallamshire ;* Gent's *York, Ripon, etc. ;* Phillips's *Geology of Yorkshire*, and *Rivers, Mountains, and Sea-coasts of Yorkshire.*

YORKTOWN, town and co. seat of York co., Va.; on the York river, 7 miles from Chesapeake bay. It contains the oldest custom-house in the United States, a monument commemorating the surrender of Lord Cornwallis, and several public schools and churches. The town is chiefly noted for its two sieges, 1781 and 1862. Cornwallis having established himself here Aug. 1, 1781, fortified the town with 7 redoubts and 6 batteries on the land side, and a line of batteries along the river. Gloucester Point, on the opposite side of the river, was also strongly fortified. He had an army of 8000 supported by several vessels anchored in York river. Washington, with the combined French and American army, suddenly leaving New York, reached Williamsburg, and, Sept. 28, marched to the investment of Yorktown with a force of 16,000, of whom 7000 were Frenchmen. A French fleet under Col. de Grasse had one hour before entered the Chesapeake, and, by blocking the James and York rivers, cut off communication between the British at Yorktown and New York. In the siege the French were posted in front. Oct. 9 the batteries opened, dismounting many of the guns and destroying several vessels. On the 11th they began their second parallel, only 300 yards from the fort. On the 14th two redoubts were carried by assault, one by American, the other by French troops. On the 16th the walls and fortifications of the British works were broken down and almost every gun dismounted. The British general attempted now to escape by night by way of Gloucester Point, but the attempt was frustrated by a furious storm, which scattered his boats. On the 19th he capitulated to the allies, the land army with its munitions to the Americans, the marine to the French. The prisoners, exclusive of seamen, amounted to more than 7000, of whom 2000 were sick or wounded. Among the spoils the Americans obtained 235 pieces of cannon, 8000 stand of small arms, 28 regimental colors; the French 2 frigates and 20 transports. The total loss of the British was about 550, and of the allies 300. This victory virtually ended the war. The second siege was begun by McClellan, April 5, 1862. Magruder, with 15,000 men, had erected formidable works around the town, and strong works on Gloucester Point. They were soon re-enforced by Gen. Johnston, the total force numbering 50,000, and that of McClellan about 90,000. In the night of May 3 the confederates left their works and retreated to Richmond. They were pursued, and on the 5th was fought the battle of Williamsburg. Pop. '90, 221.

YORK VON WARTENBURG, Hans David Ludwig, Count, 1759–1830; b. Prussia; entered the army in 1772; was cashiered for insubordination and imprisoned 1780–81, but reinstated in 1786. In the Russian campaign of 1812 he commanded the Prussian contingent in Napoleon's army, and made a convention with the Russians to be neutral. The convention was disavowed by the king of Prussia till he declared war against Napoleon. York distinguished himself in the campaign of 1813–14, and was made field-marshal in 1821.

YORUBA, or Yarriba, a country of Guinea, w. Africa, lying to the e. and n.e. of Dahomey, in n. lat. 6° to 9°, and e. long. 2° to 6°. Its area is about 19,000 sq. m.; and the pop. is estimated at 3,000,000. Palm-oil, cotton, and ivory are the principal articles of export. Lagos (q.v.) is the port through which trade with foreign countries is chiefly carried on. It was a most powerful native kingdom until 1825, when wars broke it up into the smaller divisions which still exist.

YO-SEM'ITE, Yo-Hamité, or Ahwahné, a valley and water-fall of California, in the center of the state, about 57 m. from Coulterville, on a large feeder of the San Joaquin, and on the western side of the Sierra Nevada. The scenery of California is remarkable for its combination of loveliness with sublimity; and in no part of the country yet explored are these characters so strikingly displayed as in the Yosemite valley—a valley about 6 miles in length, and a little more than a mile wide; in some places filled with noble oaks, in others opening out into broad, grassy fields; with a river rushing through it about 40 yards in breadth. Of the pine-covered mountains towering on either side, Cathedral rock is 2,660 ft. high; Sentinel rock, 3,043; Sentinel dome, 4,160; El Capitan presents a squarely-cut and imposing face of rock, rising to 3,300 ft.; the Three Brothers, 3,830; North dome, 3,633; and Half dome, 4,737. Between the latter two lies Mirror lake, the reflections of which are wonderful. The main valley branches at its end into three distinct, but narrow cañons. Little Y. V., about 4 m. long, and from a half to one m. wide, is a continuation of the larger valley. The Yosemite fall has a first vertical leap of 1,500 ft.; the Virgin's Tears fall, a sheer descent of 1,000 ft.; the Pohono, or Bridal Veil waterfall, is remarked for its beauty as well as for its height, which is 930 ft., and almost unbroken. The Yosemite valley was first entered by white men in 1851. See National Parks.

YOUATT, William, 1777–1847; b. England; founded *The Veterinarian* in 1828. He was a veterinary surgeon, among whose works are *The Horse* (1831); *Sheep* (1832); *The Dog* (1842), and *The Pig* (1847).

YOU'GHAL, a seaport, parliamentary, and municipal borough of the barony of Innakilly, county of Cork, Munster, Ireland, situated in lat. 51° 57′ n., long. 7° 52′ w., on the estuary of the Blackwater, 22 m. e. from Cork. The population in 1851 was 7410; in 1861, 6328; in 1871, 6081; in 1881 was 5826, and in 1891 was 4317. The town has some structures of interest—the parish church, which is formed of the nave and aisles of the ancient collegiate church, built by the earl of Desmond in 1464; the "clock-gate;" and Sir Walter Raleigh's house, which remains nearly in its original state. There is a handsome Roman Catholic church, as also churches of the several other denominations; two convents; several schools; a fever hospital, a lying-in hospital, and several other benevolent institutions. The trade of Youghal is considerable, but lies chiefly in the export of agricultural produce. The harbor, which is obstructed by a bar, does not admit vessels of more than 400 or 500 tons burden; the fisheries are extensive and valuable, and employ a considerable number of hands. There are several remains of buildings, civil, ecclesiastical, and military; and according to the local tradition, the potato was first planted at Youghal, by Sir Walter Raleigh.

YOUMANS, Edward Livingstone, b. N. Y., 1821. On account of blindness, from which he only partially recovered in later years, his education was acquired by the aid of his sister (a writer on botany, etc.), who assisted him in his scientific studies. He received a medical degree from the univ. of Vermont, and in 1866 took the chair of chemistry at Antioch coll. He published a *Class-Book of Chemistry*, *The Correlation and Conservation of Forces*, and other books, and was well known as a public lecturer on scientific subjects. He originated the plan of the *International Scientific Series*, of which a large number of volumes has been published, and in 1872 founded the *Popular Science Monthly*, of which he became editor. He d. 1887.

YOUMANS, William Jay, scientist, b. 1838, at Milton, N. Y. He is the brother of Edward Livingstone Youmans. He studied chemistry at Columbia college for a year, spent another in special study at the Sheffield scientific school, and graduated in 1865 from the medical school of the University of the City of New York. After studying physiology and anatomy under Professor Huxley in London and devoting three years to medical practice in Minnesota, he became assistant editor of the *Popular Science Monthly*, and in 1887 was appointed its sole editor. Besides his editorial work on this periodical, he revised his brother's *Class-Book of Chemistry*, and wrote the latter part of an elementary work on physiology and hygiene, published conjointly by himself and Professor Huxley. In 1895 he published *Pioneers of Science in America*.

YOUNG, a co. in n. Texas, about 900 sq. m.; pop. '90, 5049, chiefly of American birth. Co. seat, Graham.

YOUNG, ARTHUR, an eminent writer on agriculture, was born Sept. 7, 1741, and educated at Lavenham in Suffolk. In 1758 he was apprenticed by his father, a doctor of divinity and clergyman of the Church of England, to a mercantile house in Lynn. But Young had no liking for business, and devoted much of his attention to literature. On his father's death, in 1759, he undertook the management of a small farm of which his mother had a lease. Six years afterward he became a farmer on his own account in Essex. He seems, at the same time, to have acted as a parliamentary reporter; and as he only saw his farm from Saturday till Monday, it need not be wondered that he found it unprofitable. At the end of five years he gave £100 to a practical farmer to take the lease off his hands. In the mean time, however, he had made notes of the results of numerous experiments on his farm, which he afterward published, under the title of *A Course of Experimental Agriculture.* His first successful book was *A Tour through the Southern Counties* of England, which was followed by other works describing the state of agriculture in various parts of England and in Ireland. The enthusiasm of Young and his lively style made his writings popular, and by them the knowledge of many judicious practices, confined to one locality, was spread throughout the whole empire. In 1784 Young began the publication of the *Annals of Agriculture,* of which 45 vols. 8vo were published. Three years later he was invited by count de la Rochefoucauld to make a tour in the south of France. What he saw induced him to undertake a series of tours in France, through a great part of which he traveled leisurely on horseback. The result was his most important work, *The Agricultural Survey of France.* The author did not confine his attention to agriculture, but described the social and political condition of the people in a lively and truthful manner, and his work has become, in consequence, the most reliable source of information regarding the state of France just before the revolution. In 1801 the French directory showed the value attached to the writings of Young by ordering the whole of his agricultural works to be translated into French. They were published at Paris, in 20 vols. 8vo, under the title of *Le Cultivateur Anglais.* In 1808 Young received a gold medal from the English board of agriculture, "for long and faithful services in agriculture." He died April 12, 1820.

YOUNG, BRIGHAM, American Mormon leader, was born at Whittingham, Vermont, June 1, 1801, and was the son of a small farmer proprietor. In 1832, having become converted to Mormonism, he was made an elder of the church of the Latter-day Saints, and began to preach at the Mormon settlement at Kirtland, Ohio. In 1835 he was appointed one of the twelve apostles of the church, and sent as a missionary to the New England states, where he was very successful in making converts. After the Mormons had been driven from Kirtland to Missouri, and from the latter to Illinois, and the murder of Joseph Smith by a mob (1844), Young was chosen president in his place. The year following the charter of Nauvoo was repealed by the legislature of Illinois; and after a cannonade of three days the Mormons were driven from their capital and temple, and led by President Young to Utah, where they arrived, after a toilsome journey, July 24, 1847. Next year the great body of Mormons arrived and founded Salt Lake City; and in 1850 President Fillmore appointed Brigham Young governor of the territory for four years. In 1854, in consequence of the Mormons setting the federal laws at defiance by having in 1852 proclaimed polygamy as the "celestial law of marriage," Col. Steptoe was appointed governor in Young's place, but on visiting Utah he thought it an unsafe residence, and resigned. The Mormon president exercised supreme authority, and said, "I am and will be governor, and no power can hinder it until the Lord Almighty says, 'Brigham, you need not be governor any longer.'" In 1857 a new governor, Cumming, was appointed, and sent with a force of 2,500 U.S. troops to protect him and the federal officers; but Young forbade them to enter the territory, and cut off the supply-trains. A compromise was, however, effected, the Mormons pardoned, and the troops remained until 1860. The determination of the United States to abolish polygamy, and the appointment, in 1869, of a new U.S. governor, contributed somewhat to reduce Young's authority. In 1874 his fifteenth wife petitioned the U.S. courts for a divorce, and separated from him. Young died Aug. 29, 1877, leaving a fortune of two million dollars to 17 wives and 56 children. See MORMONS, SALT LAKE CITY, and UTAH.

YOUNG, CHARLES AUGUSTUS, PH.D., LL.D., b. N. H., 1834; graduated at Dartmouth, 1853; till 1856 taught at Phillips academy, Andover, and from 1856 to 1866 was professor of natural philosophy and mathematics in the Western Reserve college, Ohio. In 1865 he was made professor of astronomy and natural philosophy in Dartmouth. In 1877 he was appointed to fill a similar position in the College of New Jersey at Princeton. Prof. Young has made astronomical observations and discoveries of the highest scientific value. In observing the total eclipse of August, 1869, he discovered evidence that the corona is of solar origin, as proved by the bright line of the spectrum. He was a member of Winlock's party of 1870, and observed the total eclipse at Jerez, Spain. In 1872 he was sent out with a coast-survey party by the government, and demonstrated, by observations on the peaks of the Rocky mountains, the superiority of a great altitude for purposes of astronomical observation. He was assistant astronomer in Watson's expedition to Pekin, China, to observe the transit of Venus, 1874. Prof.

Young has published many scientific papers, *The Sun* (1882), and *A Text-book of General Astronomy* (1888).

YOUNG, Edward, the author of the well-known *Night Thoughts*, was born in the year 1684, at Upham, in Hampshire, of which parish his father was at that time rector. He was educated at Winchester school, and afterward, in 1703, went to Oxford. In 1708 a law fellowship in All Souls' college was conferred on him by archbishop Tenison. With law, however, he seems pretty much to have declined to meddle, occupying himself, by preference, with poetry and religious studies. In 1714 he obtained his degree of B.C.L.; and that of D.C.L. followed in 1719. Meantime he had come before the world as a poet, by publishing, in 1713, an *Epistle to George, Lord Lansdowne*, on his being created a peer. For Young, who continued through life one of the most persevering and audacious toadies that ever flattered a patron, this was a characteristic beginning. In the same year he also published two other poems of some length, entitled respectively *The Last Day* and *The Force of Religion, or Vanquished Love;* the year following he again flowed forth in *A Poem on the Death of Queen Anne.* These performances procured him some amount of immediate reputation. In 1719 he ventured on the more ambitious effort of a tragedy, which, under the title of *Busiris*, was brought out at Drury Lane. The piece had a fair success, through which means it probably was that he attracted the notice of the strange and eccentric duke of Wharton, with whom, in the end of that year, he was induced to go for a short time abroad. The duke seems to have entertained for him a real kindness, and to have treated him with much liberality. At the duke's death, Young set forth certain claims against his estates, which he succeeded in making good to the extent of an annuity of £200. The details of the case are perplexed, and need not here be entered into. They involve nothing dishonorable to Young, yet convey a somewhat unpleasing impression that the pious author of the *Night Thoughts*, in his extreme solicitude about the next world, contrived to keep a pretty sharp eye to his little pocket-interests in the present one. In 1721 was produced his tragedy, *The Revenge*, which, though unsuccessful at the time, has since had greater acceptance, and is the only one of his pieces still occasionally acted. His third and last attempt is this field, *The Brothers*, was produced in 1753. Between 1725 and 1728 appeared in succession his satires, under the title of *The Love of Fame, the Universal Passion.* These had a great success, and brought to their fortunate author money as well as fame. They abound with wit and vivacious observation, and even now will very well repay perusal. Of *The Instalment*, a poem, issued in 1726, and addressed to sir Robert Walpole on his being made a knight of the garter, it seems enough to say that, inasmuch as we incidentally hear from Swift of a pension granted him, we may surmise that this was the service to the public by which he had contrived to earn it. In 1727 Young, having taken holy orders for the purpose, was appointed one of the royal chaplains; and in 1730 he became rector of Welwyn, in Hertfordshire. The year after he married lady Elizabeth Lee, daughter of the earl of Lichfield and widow of Col. Lee, He is supposed to have been very happy with her, as he exhibited great grief on her death in 1741. It is believed that from his solemn meditations on the event he got the suggestion of the *Night Thoughts*, begun shortly after, and published 1742–46. By this work almost solely it is that he has continued to be remembered. His mind retained its activity to the last. He published various other works, now so entirely forgotten that it would be waste of time to enumerate them; and in 1762 superintended a collected edition of his works, in 4 vols. 12mo, from which he had the grace to exclude certain of the most fulsome of his dedications, probably as having served their turn and not likely to be of further use. His death took place on April 12, 1765. Since that time his *Night Thoughts* has passed through editions innumerable, and is more or less familiar to every reader. It displays much gloomy force of pious reflection; and has passages of fine imagination, frequently somewhat marred by an epigrammatic mannerism of expression. Certain of its sententious lines have passed into common use and become in a manner proverbial. Though now somewhat declined from the estimation in which he was long held, Young must continue, on the strength of it, to hold a distinct and even high place in that interval in our literature which divides the artificial and so-called classical school of Pope from the return to a simpler and more natural manner, heralded some time afterward by Cowper. If we except his one great weakness of character—an inordinate appetite for preferment and worldly honors, which sought its gratification in ways somewhat servile and unworthy—there seems every reason to believe that Young was, on the whole, a very excellent and worthy man, and sincerely devout Christian.

YOUNG, James, b. Scotland, 1811; for some time assistant in chemistry to Thomas Graham. About 1847 he began a series of analyses of petroleum, and succeeded in producing a lubricating oil for machinery and a lighter oil for lamps. He afterward took out a patent for a process of slow distillation of oil from coal. His discoveries showed the value of coal-oil and petroleum, and contributed to the development of the American oil-wells. He fitted out an expedition in search of Dr. Livingstone in 1872. He d. 1883.

YOUNG, James Hamilton, b. Scotland, 1793; emigrated to the United States in 1801, and settled in Philadelphia. He was an authority on statistical matters as well as an expert engraver, and the Mitchell geographies were his work both in text and maps.

YOUNG, JOHN FREEMAN, S.T.D., b. 1820; graduated at the theol. sem. of Virginia, 1845; was ordained priest in the Prot. Epis. church, Jacksonville, Fla.; engaged in missionary work in Texas; held other charges in the South, and was an asst. minister in Trinity parish, New York. He was consecrated bp. of Fla., 1867. Bp. Young was well known as a liturgical scholar, and in 1864 visited Russia in behalf of the plan to establish intercommunion between the Eastern and the English-speaking Episcopal churches. He d. 1885.

YOUNG, JOHN RUSSELL, b. Chester, Penn., 1841; educated at Philadelphia and New Orleans; began his journalistic career in the former city in connection with the Philadelphia *Press;* became the war correspondent, afterwards the managing editor, of the paper. He also founded the Philadelphia *Evening Star*, a successful penny paper. He was managing editor of the New York *Tribune*, and was for a number of years connected with the *Herald*, accompanying Gen. Grant around the world, as its correspondent. He wrote letters from Europe during the Franco-Prussian war, and has held other journalistic posts of importance. He was appointed by Pres. Arthur, minister plenipotentiary to China, 1882, serving till 1885.

YOUNG, THOMAS, M.D., one of the most ingenious and original philosophers of this century, and almost as eminent for his scholarship and his linguistic discoveries as for his contributions to science, was born at Milverton, in Somersetshire, on June 13, 1773. His parents, Thomas and Sarah Young, were Quakers of the strictest sect; and Young had the impression that the peculiar doctrines of the Quakers had a favorable influence upon his character and career. In particular, he connected with the Quaker doctrine of divine suggestion the perseverance with which he followed up any pursuit in which he engaged, to which he, like Buffon, was disposed to attribute all the discoveries which his genius enabled him to make. Wonderful stories of his youthful precocity have been recorded, and they seem to have more truth in them than such stories usually have. In 1780 he was sent to a boarding-school at Stapleton, near Bristol, where he remained two years; he was afterward put to school at Compton, in Dorsetshire, kept by a Mr. Thompson, who appears to have been an able and judicious teacher. When he left Compton, in his 14th year, besides having a great knowledge, for his age, of Greek and Latin and of mathematics, he had learned French and Italian, and, without any tuition, had made considerable progress in Hebrew, Persic, and Arabic. In 1787 he went to live with Mr. David Barclay, of Youngsbury, near Ware, in Hertfordshire, an eminent member of the society of Friends, partly as the fellow-pupil, partly as the tutor, of that gentleman's grandson, Hudson Gurney. A Mr. Hodgkin was called in to assist the studies of the two lads, but Young soon proved to be superior in acquirements to his instructor, and virtually the three became fellow-students. Mr. Hodgkin published in 1793 a work entitled *Calligraphia Græca*, which he dedicated to Young. Young continued to live with Mr. Barclay till 1792, spending the summer months in Hertfordshire and the winter in London, studying Greek and Latin, the modern languages, the oriental as well as the European, the higher mathematics, and natural philosophy, and, by way of amusement, botany and zoology. He taught himself to write Latin with fluency and elegance, and to write Greek verses, which received the commendation of some of the best judges of the time.

Toward the end of 1792, under the advice of Dr. Brocklesby, an eminent London physician, his mother's uncle, who had been greatly impressed by his abilities and attainments, he began to study medicine, and he attended medical lectures for two years in the schools of London, and afterward for a year at the university of Edinburgh. After going to Edinburgh, Young gave up the Quaker dress and the more inconvenient of the Quaker customs; he took lessons in music and dancing, mixed freely in society, and occasionally went to the theater. These changes, though not intended to go further, eventually led to his complete estrangement from the society of Friends. From Edinburgh he went to the German university of Göttingen, from which, after nine months' residence, he got the degree of doctor of medicine. He continued upward of a year longer in Germany, and visited various medical schools, returning to England in Feb., 1797. At that time the membership of the college of physicians was restricted to graduates of Oxford and Cambridge, and to qualify himself for it Young, on his return, entered as a fellow-commoner at Emmanuel college, Cambridge, at which he remained until he took his degree in 1799. In the year 1800, having become a member of the college of physicians, he took up his residence in London, and began to practice as a physician. He took the degree of M.B. at Cambridge, in 1803, and that of M.D. in 1807.

In 1801 he was appointed professor of natural philosophy, in the Royal Institution, then newly established, and he began to deliver lectures early in the following year. As a lecturer he was not popular, his style being too condensed, and the matter of his lectures unsuited to the miscellaneous audiences of the Royal Institution. He published in 1802 a *Syllabus of a Course of Lectures on Natural and Experimental Philosophy*, in which, among other things, he first announced his great discovery of the law of the interference of light (see INTERFERENCE), which by itself, as sir John Herschel has remarked, would have procured him a scientific immortality. It was this discovery which first fairly turned the balance of evidence in favor of the undulatory as against the molecular theory of light (see UNDULATORY THEORY OF LIGHT). It is Young's most important contribution to science. He had been elected a fellow of the Royal Society as soon as

he was 21; in 1802 he became its foreign secretary, a post which he retained till the end of his life. He resigned his professorship on his marriage, in 1804, fearing that his filling a chair of science might interfere with his success as a physician. The lectures which he delivered as professor were the foundation of the *Course of Lectures on Natural and Mechanical Philosophy*, which he published in 1807—a great work, embodying a complete system of natural and mechanical philosophy, on which he was engaged for nearly five years. A new edition of these lectures was published in 1845, edited by prof. Kelland of Edinburgh. Young's doctrine of interference was at first unfavorably received by scientific men in England. it was attacked and ridiculed in the *Edinburgh Review*, and so little interest was taken in the subject, that of a pamphlet which Young published in answer to the *Edinburgh Review*, only a single copy was sold. As has often happened, the first recognition of the importance and ingenuity of this and others of Young's speculations came from the scientific men of the continent.

Young was admitted as a fellow of the college of physicians in 1808, and was elected one of the physicians of St. George's hospital in 1810. He afterward published several medical works, which, though they were little more than compilations, and are now forgotten, show that he was thoroughly versed in the history of diseases and of medical opinion. His hospital practice, too, is said to have been successful, but he had but little success in getting patients. He retired from practice—retaining, however, his connection with St. George's hospital—in 1818, on his appointment to be secretary of the board of longitude. On the dissolution of the board of longitude, he became the sole conductor of the *Nautical Almanac*, and afterward, when the system of life-insurance began to be popular, he held, along with this post, the office of scientific adviser of a life insurance company. During the last years of his life, he was a member of a council appointed to advise the admiralty in scientific matters.

Young's greatest achievement after his great discovery of the law of interference, was made in connection with the subject of hieroglyphics (q.v.). He was the first to hit upon the process of investigation by means of which the received interpretation of hieroglyphics has been arrived at. His discovery, originally published in papers written for the society of literature, and afterward in the *Encyclopædia Britannica*, was given to the world in a book in 1823. In his later years much of his attention was given to this and cognate subjects. He was engaged on an Egyptian dictionary at the time of his death. His miscellaneous writings, contributions to the transactions of learned and scientific bodies, to reviews, and the *Encyclopædia Britannica*, were very numerous. Three volumes of them, two consisting of scientific papers, edited by Dean Peacock, the third of hieroglyphical essays and correspondence, edited by John Leitch, were published in 1855.

He died after several months of failing health, and a short period of severe illness, on May 10, 1829.

YOUNG ITALY was a name given early in the present century to an association of Italian refugees who established themselves in Marseilles, France. The association was formed in 1831, mainly at the instigation of Mazzini, and had for its principal object the establishment of a republic. Young Italy is a term now used in referring to the party in Italian politics which favors Irredentism (q.v.).

YOUNG MEN'S CHRISTIAN ASSOCIATIONS. George Williams first organized one in London, 1844, since which, similar associations, to the number of over 5000, have been formed in various countries of the world. The first one formed in America was in Montreal, in 1851, and their increase has been greater in this country than in Europe. The number in the United States and Canada in 1896 was 1455, with a membership of over 263,298. An international convention was formed of the associations of the United States and Canada in 1854. There have been ten conferences of associations of all lands. Though instituted and largely controlled by members of evangelical churches, young men of good moral character are received as associate members, enjoying the privileges of full members, but not voting. In these associations it is sought by various agencies, as reading-rooms, lectures, libraries, classes of secular instruction, gymnasia, employment bureaus, as well as by Bible classes, prayer-meetings, etc., to promote the interests, secular, moral, and religious, of young men. Women's Christian associations were introduced in New York in 1857, in Boston, 1866, and there were in 1896 in the United States and Canada 345, with about 35,000 members, of which many had boarding-houses for young women, industrial schools, and libraries, while many assist in finding employment, conduct Bible classes, etc.

YOUNGSTOWN, city and co. seat of Mahoning co., O.; on the Mahoning river, and the Erie, the Lake Shore and Michigan Southern, the Pittsburg and Lake Erie, the Pittsburg and Western and the Pennsylvania Co.'s railroads; 69 miles s.e. of Cleveland. It contains a U. S. government building, Y. M. C. A. building, city hospital, public library, Wick, Central, and Mill Creek parks, Rayen high and preparatory school, electric light and street railroad plants, waterworks supplied from the river, several national and savings banks, and about 50 churches. There are large iron and rolling mills, blast furnaces, foundries and machine shops, bridge and car works, breweries, tin and terne plate works, etc. Pop. '90, 33,220.

YPRES, or YPEREN, a t. of Belgium, formerly fortified, in the province of West Flanders, is situated in a fertile plain on both sides of the Yperlee, about 29 m. s.s.w. of Bruges (53 by railway). The marshes around the town at one time rendered it very unhealthy, but considerable improvement has been effected in this respect by drainage. Ypres was at one time one of the most important manufacturing towns in Flanders, the

number of inhabitants in the 14th c. being 200,000, and the number of looms 4,000. Its staple manufacture consisted of the cloth called, according to some, after the name of the town, diaper. The only remnant of its once flourishing manufacture is the Cloth-hall (*les Halles*), standing in the great market-place, a building of prodigious size, in the form of a trapezium, in a rich style of Gothic architecture, and surmounted by a stately square tower or belfry, with a clock and chimes. It was begun in 1230, and continued till 1342; the e. end, supported on pillars, being added in 1730. One of the wings is now used as the *hôtel-de-ville*, and other parts are occupied by different public establishments and concert-rooms. The cathedral of St. Martin is a fine Gothic edifice, with an altar of Carrara marble, a richly carved pulpit, and a picture doubtfully attributed to Van Eyck. Other buildings are the churches of St. Peter, St. James, and St. Nicolas, the old castle-ward, two colleges, several hospitals, barracks, numerous boarding and day schools, etc. The chief modern manufactures are thread, lace, linens, woolens, cottons, silk, ribbons, leather, oil, soap, tobacco. There are many tanneries, oil-mills, salt-works, dye-works, breweries. The town is connected with the Yser by canal, and is a station on the West Flanders railway. Pop. '90, 16,505.

Ypres is a very old town, its origin dating from the 9th and 10th centuries. In 1688 it was strongly fortified by Louis XIV., and in the great European wars was frequently subject to sieges.

YPSILANTI, a city in Washtenaw co., Mich., on the Huron river, and the Lake Shore and Michigan Southern and the Michigan Central railroads; 30 miles w. of Detroit. It contains the Michigan state normal school, business college, ladies' public library, electric light and street railroad plants, waterworks supplied from springs, and national and savings banks, and has manufactories of woolen goods, paper, machinery, dress stays, condiments, etc. Pop. '90, 6129.

YPSILANTI, a Fanariot family, which falsely pretends to be descended from the imperial stock of the Comneni, has furnished various champions of the Christian population under Turkish rule. The first of these, PRINCE CONSTANTINE YPSILANTI, was born in 1760 at Constantinople, and for his translation of the works of Vauban, was raised to high official rank by sultan Selim III., and was subsequently appointed hospodar of Moldavia in 1799, and of Walachia in 1802. His administration of the government of these provinces was marked by wisdom and energy; but his ill-concealed sympathies with Russia led (1806) to his dismissal and flight to Transylvania. Re-established in the government of Walachia by the Russians, he showed his hatred for the Porte by inciting (1807) the Servians to insurrection; but finding soon after that his allies the Russians had views and aims quite inconsistent with his, and unable to strive with both Russians and Turks, he took the oath of allegiance to the czar, and retired to Kiev, where he died July 28, 1816. He has left numerous works, composed in Italian, French, and Turkish.

His three sons, Alexander, Demetrius, and Nicolas, followed up the same course of policy. The eldest, ALEXANDER, born in 1783, served for some time in the Russian army, and was chosen by the "Hetairists" as their chief in 1820. In promotion of the cause of Rouman independence, he collected a large sum by subscription in Russia, and afterward invading Moldavia, succeeded in raising an insurrection in both principalities. But, little suited by natural gifts to guide the movement he had originated, he was attacked by the Turks near Galatz, totally defeated, and forced to take refuge in Austria, where he was arrested and imprisoned. Released after a time, but broken in spirit by chagrin and privations, he retired to Vienna, where he died Jan. 31, 1828.—His younger brother, DEMETRIUS, who was born Dec. 25, 1793, also commenced his career in the Russian army, and joined his brother in his schemes for emancipating from servitude the Christian population of Turkey. Sent to Greece, armed with powers from his brother, he took a glorious part in the capture of Tripolitza (Oct., 1820), but was less successful in the following year in his attack on Eubœa. His gallant defense of Argos against the Turks, stopped the victorious march of the latter, and gained (1823) for him the honorary titles of president of Argos, prince of the Peloponnesus, president of the legislative council, and senator. His stubborn resistance (1825) to the victorious Ibrahim at Napoli was another valuable service to Greece. In 1827, the grateful Hellenes made him commander-in-chief of their forces; but some difference arising between him and the president, Capo d'Istria, he resigned his post in Jan., 1830. He died at Napoli di Romania, Aug. 16, 1832. Ypsilanti was insignificant in appearance; and was as deaf to the allurements of pleasure as to the promptings of ambition.

YSAYE, EUGÈNE, violinist, b. in Belgium 1858, studied at the conservatory of Liège and at Brussels, and soon acquired a great reputation as a successful performer. In 1886 he became a professor in the royal conservatory at Brussels, and in 1894 visited the United States, where he achieved great success. In 1897 he again visited the United States.

YSSEL, or IJSSEL, a river of the Netherlands, formed by the junction at Doesburg, in Gueldres, of the Oude (*Old*) Yssel from Westphalia and the new Yssel, an offset of the Rhine, cut by Drusus. After this it flows n. and latterly n.w. past Zutphen and Deventer, forming part of the boundary between Gueldres and Oberyssel, and, passing Kampen, falls into the Zuyder Zee, after a course of about 80 m., forming at its mouth a delta, which is gradually increasing. The principal affluents are the Borket, the Schipbeek, and the Grift.—There is another river of the same name, a branch of the Rhine, in the province of Utrecht.

Y'STAD, a seaport t. in the extreme s. of Sweden, on the Baltic, in the län of Malmöhus, and about 34 m. e.s.e. of Malmö. The town is well built, and has a handsome market-place, churches, a town-house, barracks, etc. There is a good harbor, and a brisk and improving trade is carried on, steamers plying to Stockholm, Lübeck, Kalmar, Stettin, Stralsund, and Copenhagen putting in here. Pop. '93, 8540.

YT'TRIUM is a very rare metal, whose oxide is the earth of *yttria*, which is found in the Scandinavian mineral *gadenolite* (a silicate of yttria, glucina, and an oxide of cerium and iron), in *yttrotantalite*, and in one or two other very scarce minerals. Neither the metal, the oxide, nor the salts of the oxide are of any practical importance. According to Mosander, three bases have been confounded under the single name of yttria; to the most abundant of these he gives the name *yttria*, while he distinguishes the others as *erbia* and *terbia*.

YUBA, a co. in n.e. California, bounded s. by Bear river; about 714 sq.m.; pop. '90, 9636. Gold and silver are found. Co. seat, Marysville.

YUCATAN. See MEXICO.

YUC'CA, a genus of plants of the natural order *liliaceæ*, natives of North and South America, and some of which are often cultivated in gardens on account of the singularity and splendor of their appearance. *Y. gloriosa* is a native of Virginia and of more southern parts of North America, but is hardy in the northern states. Its stem is 2 or 3 ft. high, the upper part of which produces a great tuft or crown of large sword-shaped evergreen leaves, each terminating in a sharp black spine. From the center of this crown of leaves arises the flower stalk, of 3 ft. or upward in height, branching out on every side so as to form a great panicle. The flowers are bell-shaped and drooping, white with a purple stripe on the outside of each segment of the perianth. The fibers of the leaves are used by the American Indians to make a sort of cloth and cordage.—The other species have a general resemblance to this in habit and appearance. The fiber of the *yuccas* is similar to that of the *agaves* and *bromelias*, and probably is often included under the name *pita flax* or *pita fiber*.

YUDHISHT'HIRA. See PÂN'D'AVAS.

YUGA (from the Sanskrit *yuj*, join; kindred to the Lat. *jung-*, the Gr. *zeug-*, Gothic, *juk;* hence, literally, junction) denotes, in Hindu mythology and astronomy, a long mundane period of years, which is preceded by a period called *Sandhyâ*, "twilight," and followed by a similar period called *Sandhyâm's'a*, "portion of twilight." Manu, the Mahâbhârata, and the Purân'as name four such periods, three of which have already elapsed—viz, the *Kr'ita-*, *Tretâ-*, and *Dwâpara-Yuga;* while the fourth, or *Kali-Yuga*, is that in which we live. The Kr'ita-Yuga, according to these works, consists of 4,000 divine years, its Sandhy'â of 400, and its Sandhyâm's'a likewise of 400 divine years. The Tretâ-Yuga consists of 3,000, and its Sandhyâ and Sandhyâm's'a of 300 divine years each; the Dwâpara-Yuga of 2,000 divine years, with 200 such years to its Sandhyâ, and 200 to its Sandhyâm's'a; and the Kali-Yuga of 1000 divine years, with 100 such years to its Sandhyâ, and 100 to its Sandhyâm's'a. And since a divine year comprises 360 solar years of mortals, a year of men being a day of the gods, these Yugas, with their Sandhyâs and Sandhyâm's'as, would severally represent 1,728,000, 1,296,000, 864,000, and 432,000, or in the aggregate, 4,320,000 solar years of mortals—a period called Mahâyuga, or "a great Yuga;" 4,320,000,000 years being a day and night of Brahmâ. See KALPA. The notion on which the theory of these Yugas and their Sandhyâs and Sandhyâm's'as is based, as may be easily inferred from the foregoing statement, is that of a descending progression, 4, 3, 2, 1, each of these units multiplied by 1000, and in the case of the periods preceding and following the Yuga by 100 years. The deteriorating process thus indicated in the succession of these Yugas, is also supposed to characterize the relative physical and moral worth of these mundane ages. "In the Kr'ita-Yuga," Manu says, "men are free from disease, attain all the objects of their desires, and live 400 years; but in the Tretâ and the succeeding Yugas, their life is lessened gradually by one quarter." . . . "In the Kr'ita-Yuga, devotion is declared to be the highest object of men; in the Tretâ, spiritual knowledge; in the Dwâpara, sacrifice; in the Kali, liberality alone." See also for other passages the article KALIYUGA. The present or Kaliyuga of the world commenced in the year 3101 B.C., when in the year 1867, therefore, 4,968 years of the Kaliyuga would have expired.—The term Yuga is sometimes also applied to other divisions of time. The Vishn'u-Purân'a, for instance, mentions, besides the Yugas above named, a Yuga which consists of a cycle of five years, called *Sam'vatsara, Parivatsara, Idvatsara, Anuvatsara*, and *Vatsara* (see Wilson's translation of this Purân'a, 2d ed., by Fitzedward Hall, vol. i. p. 49, ff.; vol. ii. p. 254, ff.); and a Yuga, or cycle of five years, is, as Colebrooke states (*Miscellaneous Essays*, vol. i. p. 106, ff.), likewise the cycle described in the astronomical treatises connected with the Vedas. The use of the term Yuga, however, in such a special sense is not frequent, whereas its application to the four mundane ages is that which generally prevails in the classical and mediæval Sanskrit literature.—For other works, besides those already referred to, which afford information on these and other divisions of Hindu time, see *Kala Sankalita, a Collection*

of Memoirs on the Various Modes according to which the Nations of the Southern Parts of India divide Time, etc., by John Warren (Madras, 1825); and *Carnatic Chronology, the Hindu and Mohammedan Methods of Reckoning Time Explained*, etc., by Charles Philip Brown (Lond. 1863).

YUKON RIVER. See ALASKA.

YULE, the old name (still in provincial popular use) for Christmas. It points to heathen times, and to the annual festival held by the northern nations at the winter solstice as a part of their system of sun or nature worship. In the Edda, the sun is styled *fagrahvel* (fair or shining wheel); and a remnant of his worship, under the image of a fire-wheel, survived in Europe as late at least as 1823. The inhabitants of the village of Konz, on the Moselle, were in the habit, on St. John's eve, of taking a great wheel wrapped in straw to the top of a neighboring eminence, and making it roll down the hill, flaming all the way: if it reached the Moselle before being extinct, a good vintage was anticipated. A similar usage existed at Trier (see Grimm, *Deutsche Mythologie*, p. 586). The old Norse *hvel*, Ang.-Sax. *hveol*, have developed into Icel. *hiol*, Swed. and Dan. *hjul*, Eng. *wheel;* but from the same root would seem to have sprung old Norse *jol*, Swed. and Dan. *jul*, Ang.-Sax. *geol*, Eng. *yule*,* applied as the name of the winter solstice, either in reference to the conception of the sun himself as a wheel, or, more probably, to his wheeling or turning back at that time in his path in the heavens. Goth. *hveila*, Eng. *while*, denote time as wheeling or revolving. The general nature of the festival, and the way in which the observances were overlaid, or transformed and masked by the Christian institution, are noticed under the head of CHRISTMAS. In the greenery with which we still deck our houses and temples of worship, and in the Christmas trees laden with gifts, we perhaps see a relic of the symbols by which our heathen forefathers signified their faith in the power of the returning sun to clothe the earth again with green, and hang new fruit on the trees; and the furmety still or lately eaten on Christmas eve or morning in many parts of England (in Scotland, the preparation of oatmeal called *sowans* is used) seems to be a lingering memory of the offerings paid to Hulda or Berchta (q.v.), the divine mother, the northern Ceres, or personification of fruitfulness, to whom they looked for new stores of grain. The burning of the *yule-log* (or *yule-clog*) testifies to the use of fire in the worship of the sun (see BELTEIN).

YUMA, a co. in extreme s.w. Arizona, bounded s. by Mexico, w. by the Colorado river; about 10,136 sq.m.; pop. '90, 2671. Co. seat, Yuma.

YUMA, a co. in n. eastern Col., on the Nebraska border, formed 1889 from part of Washington; about 1180 sq.m.; pop. '90, 2596. It is drained by the north fork of Republican river. Co. seat, Yuma.

YUMAS, a tribe of American Indians on both banks of the Colorado river, near its junction with the Gila. The Spanish began settlements and missions among them in 1780, but the next year the Yumas massacred them. The number of the tribe was 3,000 in 1791, and is now only about 900. They are also known as the Cuchans. With some other tribes they were given a reservation of 200 sq.m. in 1865.

YUNG WING, b. near Macao, China, 1828, of humble, worthy parents; entered at 8 years of age the mission-school of Mrs. Gutzlaff; later, the Morrison school under the Rev. S. R. Brown of America, and was by him brought to America in 1847. In the family of Dr. Brown's mother he became a Christian, and forthwith devoted his life to the welfare of China. He graduated at Yale college, 1854, having excelled in mathematics, metaphysics, and English composition. While there, he conceived a plan for having Chinese youth of promise brought to America for education. He returned, reaching China, 1855, a stranger, without money or influential friends, the language nearly forgotten, but with the aim to reach the imperial ear. For 16 years he studied, taught, served the government, acquired rank, and won to his views officers high in authority. In 1871 his plan was adopted by government, and the sum of $1,500,000 granted. He was made chief commissioner of the Chinese educational mission, and then placed 112 selected Chinese young men under a 15 years' course of instruction in this country. He is now a mandarin of the second grade, intendent of the province of Kiang-Su; and was for a while associate minister to the United States.

YUNX, a genus of birds of the woodpecker family, a species of which, *yunx torquilla*, is called wryneck (q.v.). The *Y. torquilla* is the *iunx* of the Greeks. Aristotle has well described it and its long tongue, and the power of protruding and retracting it, as well as the writhing motion of its neck. It has been made familiar to readers of Greek by the adjuration in the second idyl of Theocritus (*Pharmaceutria*). The wryneck is the torcol, tercon, turcot, and torcot of the French; the torcicollo, collatorto, capertorto, vertilla, and formicula of the Italians; gjoktyta of the Swedes; natterwindl, wendhals, and drehals of the Germans; long-tongue, emmet-hunter, snake-bird, cuckoo's mate, cuckoo-maid, and cuckoo-fool of the English; gwddfdro of the Welsh, and arizui of the Japanese.

YUTHIA, often written Ayuthia, the ancient capital of Siam, is on an island formed by two arms of the river Menam, 54 m. above Bangkok. It was once a vast city, and

* In one of the Frisian dialects, *jule* or *jole* is used to signify a wheel,

contained immense buildings gorgeously ornamented. In 1767 the Burmans invaded Siam, and destroyed the city. It was rebuilt, and contains 40,000 inhabitants.

YVERDUN′, a t. on lake Neufchâtel, in the canton of Vaud, Switzerland, 20 m. n. of Lausanne; pop. '88, 6330. It is the Ebrodunum of the Romans.

YVETOT, an old t. of France, in the department of Seine-Inférieure, is situated on an elevated and fertile plain, 32 m. n.e. from Havre, and 23 n.w. from Rouen by railway. The houses are mostly of wood, roofed with slates, the principal street being upward of 2 m. long; there is a well-planted promenade, but the town contains few objects of interest. There are manufactures of linen, cotton, calico, and velvet, and a considerable trade in cattle and agricultural produce. Pop. '91, 7617. The lord of Yvetot is styled "roi d'Yvetot" in old chronicles, as the town and territory was long (till 1681) a principality. There is a tradition that Clotaire, son of Clovis, having slain one Gaulthier, lord of Yvetot, before the high altar of Soissons, endeavored to make atonement for the sacrilegious deed by conferring the title of king on the heirs of Gaulthier.

YVON′, Adolphe, b. Lorraine, 1817; studied painting under Paul Delaroche. He spent several years in Russia, and many of his historical pictures are of Russian events. His most noted work is the "Capture of the Malakhoff," 1857, executed on the spot. Other well-known historical works are: "The Battle of Solferino," and "Magenta," and "The First Consul Descending the Alps." M. Yvon has also been very successful in *genre* painting and portraiture.

Z

Z, THE last letter of the English and other west European alphabets, had no place in the original Latin alphabet, but was adopted in the time of Cicero from the Greek along with *y* (v), and thus stood last. In Greek it had the sixth place, and had the power of a double consonant, being equivalent to *ds* or *sd;* in Latin its use was confined to words of Greek origin. In High-Ger., in which it is pronounced like *ts*, it corresponds to *t* in the Low-Germanic and the Scandinavian tongues, e.g., *zeit* = Eng. *tide* (time). In Ital. *z* or *zz* mostly takes the place of the Lat. *ti*, as in *negozio* = *negotium*, *palazzo* = *palatium*, and is pronounced *ts*, or, preceded by *n*, *ds*. In Eng. and in Fr. it represents the flat sibilant sound of which *s* is the sharp. But in Eng., as in the vast majority of cases, *s* has always been employed to represent the flat sibilant sound as well as the sharp (e.g., in almost all plurals, as *bones, cards*, in words like *revise*, etc.), there is a tendency to drop the use of *z*, except in a few individual words, such as *size, prize*. Many maintain the use of *z* in words derived from the Greek, especially from verbs in *izō*, as *baptize*, and also in words formed on the analogy of these, as *legalize;* but even the advocates of this rule do not act on it consistently, and the mere English scholar is fairly puzzled. This is one of the points of English orthography most urgently calling for reform.

ZAANDAM′ or **SAARDAM**, a t. in the province of North Holland, Netherlands, is situated on both banks of the Zaan, at its entrance into the Ij (a deep and narrow bay of the Zuider Zee). Zaandam lies 5 m. n.w. of Amsterdam on the other side of the bay. In former times shipbuilding was largely carried on, but has nearly ceased. The whale-fishing, which, in 1701, employed 35 ships, has been abandoned. There is still a considerable shipping trade. The principal industries are sawing wood, preparing vegetable oil—chiefly from colza—manufacturing paper, grinding grain, mustard, dye-stuffs, snuff, etc., making starch, rope-spinning, and iron-founding. At a distance the town looks like a forest of windmills. Zaandam is a pleasant place, and many of the inhabitants are reputed to be wealthy. In 1697 Peter the Great worked in one of the shipbuilding yards as a carpenter, and the house in which he lived is carefully preserved. It was visited in 1814 by the emperor Alexander of Russia, and is now inclosed with another building, to prevent exposure to the weather. There are two Dutch reformed churches, one Lutheran, two Baptist, and two Roman Catholic churches, a Jewish synagogue, and several institutions for orphans and old people. Two public schools, a school of design, and two poor schools are maintained by the town. Pop. '90, 15,604.

ZABERN (the Roman *tabernæ*, tavern) is the name of three German towns on the w. side of the Upper Rhine, one of which was French till 1870. The first two are in the palatinate (Rhenish Bavaria)—viz., Berg-Zabern, a town of about 3,000 inhabitants, on the Erlenbach, occupied chiefly with agriculture and some small manufactures; and Rhein-Zabern, about 4 m. further e., on the same stream, with little more than 2,000 inhabitants, noted for the two battles fought there and at the village of Jokgrin, about 2 m. further s., between the Austrians and the French, June 29 and Aug. 20, 1793.

The other, which, to distinguish it from these, is called Alsace-Zabern (French *Saverne*), till the war of 1870 in the French department Bas Rhin, is now capital of a circle in the German imperial territory Alsace-Lorraine. It is situated on the Zorn, which flows into the Rhine, on the Paris and Strasburg railway and highway, and also on the Marne and Rhine canal. The to..n contains a palace and college, and had in 1890, 7341 inhabitants, employed in making cloth, pottery, leather, and hardware, and in the transport of wood, from the Vosges mountains. It belonged in the 12th c. to the bishops of Metz, and afterward to those of Strasburg. There are still some Roman antiquities in the college. In 1696 the fortifications were razed. The stately palace was rebuilt by cardinal Louis de Rohan, famous in the story of the Diamond Necklace (q.v.); it served in 1817 and 1818 as barracks for the Austrian army of occupation; in 1852 it became a home for the widows and daughters of the members of the legion of honor; and now it is again a barrack. The surrounding scenery is rich in ruins and picturesque effects. A spiral walk, called the Zabern path, about 9 m. long, leads, with many windings and 17 covered bridges, to the top of the Vosges, from which the spectator looks down on Alsace as a garden. The pass of Zabern, or Saverne, which divides the Upper and Lower Vosges, is only 1325 ft. high. The railway, the canal, the Zorn, and highway, all run side by side along the charming valley; and there is a constant succession of bridges, embankments, viaducts, and tunnels throughout the 45 minutes' journey from Zabern to Saarbourg.

ZA'BISM. In the article on Sabæans (q.v.), we spoke chiefly of certain inhabitants of Arabia Felix, the "Sabaioi" of the Greeks, or "Sabæi" of the Romans. It appears that this name was, in the 4th c. A.D., superseded by that of Himyarites, and belonged to many tribes, that derived their descent from one Sabâ ("a descendant of Eber, or descendant of Noah"), who also was called Abd Shemesh—Servant of the Sun. These Sabæans, who considered themselves pure autochthons, in contradistinction to the immigrated tribes, have often been confounded with a number of other peoples of antiquity, and with professors of many forms of religious belief and speculation; in fact, the confusion that has sprung out of the unwieldy mass of information found respecting these many varieties, and which has been hopelessly mixed up by many generations of orientalists and theologians, is almost without parallel. We shall not here survey the manifold systems and theories that have been evolved from time to time, and handed down carefully, but we shall rather—in the main following Dr. Chwolson—enumerate the principal stages of Zabism as it appears, considered as a religious phase of mankind. We must premise that we exclude at once those imaginary Zabians who were taken by the mediæval Arabic, Jewish, and Persian writers to be identical with heathen or star-worshipers, as well as those who, like the ancient Chaldeans, the ante-Zoroastrian Persians, the Buddhists, etc., were vaguely called by that name by Mohammedan and other writers of the 12th century. These writers all start from the notion that idolatry, star-worship, and Sabæism were identical, and they called nearly all those who were neither Jews or Christians, nor Mohammedans or Magians, heathens or Sabæans. Zabism had then become, like Hellenism, from being a *nomen gentile*, an appellative. Confining ourselves to historical Zabism, we have to distinguish (1) the Chaldean Zabians of the Koran. These are the "Parsified" Chaldee heathens or non-Christian Gnostics—the ancestors of the present Mendaites, or so-called Joannes Christians, who live not far from the Persian gulf, and speak a corrupt kind of Chaldee-Aramaic; and (2) the Pseudo-Zabians, or Syrian Zabians (in Harran, Edessa, Rakkah, Bagdad), or, since 830–831 A.D., remnants of the ancient Syrian but Hellenized heathens. These disappear (as Zabians) since the 12th c., but perhaps still exist, under some other name, in Mesopotamia. It is those Pseudo-Zabians who spoke the most refined Syro-Aramæan dialect. They form the chief representatives of Zabism emphatically deserving of the name. The first-named, or Chaldean (Babylonian) Zabians, who transferred that name to the Harranic Zabians, and were of great influence upon the development of these latter's peculiar speculations, are the people meant under that designation by the Koran, and by the Mohammedans of this day. They are, as we said, also known as Christians of St. John, or Mendaïtes. Among the Nabathean heathens of the n.e. of Arabia and the extreme s. of Mesopotamia, near Wasith and Bassra, there arose, in the last decennium of the 1st c. A.D. a man named Elxai (Elchasai = Scythianus), born in the n.e. of Parthia (probably an adherent of Zoroastrianism, perhaps also acquainted with Buddhism), and spread among them Parsee ideas and Parsee religious rites and customs. They called themselves Mendaïtes —i.e., Gnostics. Many of their religious legends and tales they adopted at a later period from their Jewish and Mohammedan neighbors—chiefly, it is presumed, with a view of making themselves less hated by the ruling Mohammedan powers. They received the name of Ssabiin from their constant washings, and purifications and baptisms. Their Arabic neighbors occasionally translated this word into the Arabic Al-Mogtasilah, "those who wash themselves." About a hundred years after the foundation of this sect by Elchasai, Manes was born of Mendaïte parents, and was brought up among the Mendaïtes. He remained faithful to this creed up to his 24th year, at which period he founded the new sect of Manichæans (q.v.), which did not at first depart so considerably from Mendaïsm as it did at a later period (see MANICHÆANS). To these aboriginal Zabians there succeeded, in 830 A.D., a totally different kind of sect under the same name—viz., the

Harranian Syrians. They themselves derived their denomination from one Zâbî, who is variously called a son of Seth, son of Adam, or a son of Enoch or Idris, or a son of Methuselah, or of some fictitious Badi or Mari, a supposed companion of Abraham; while the Mohammedan writers, who, like the Greeks, endeavor to derive everything from their native tongue, either declare it to be derived from *ssaba*, "to turn, to move," because they turned to the paths of untruth, instead of that of the true religion—i.e., Islam; or, as the Zabians themselves sometimes explain it, "because they have turned *to* the proper faith." Another Arabic derivation makes them take their name, still more absurdly, from a root *ssabaa* = to fall away from the proper religion, or to turn one's head heavenward—i.e., for the purpose of worshiping the angels and the stars, etc. European scholars have for the most part followed either Brooke or Scaliger, who variously hold the name to have sprung either from an Arabic root, which would point to their having come from the "east," or, again, from the Hebrew word for "host," viz., of heaven, which they were supposed to worship. The real state of the case, however, is that, whatever, the derivation of the name, it did not originally belong to the Harranians, as we have stated already, but was assumed by them, for the purpose of evading the Mohammedan persecutions, from the people mentioned in the Koran.

But it is by no means easy to say who these so-disguised Harranians really were, and what, since it was neither Judaism, nor Christianity, nor Mohammedanism, nor Magism, their religion really consisted of. Former investigators mostly took them to have been a distinct race and people, and their religion to have been composed of Chaldaism, Parsism, Judaism, Christianity, Neoplatonism, Gnosticism, and cabbalistic speculations. This, however, is far from being the fact. Broadly speaking, they might perhaps best be described as Syrians, who, partly descended from Greek colonists, had been subject so long to Syrian influences that they became in a manner Syrianized. Their religion was heathenism, the old heathenism of their Syrian fathers, which had, with incredible obstinacy, resisted not only Christianity, but rendered even Mohammedan ill-will harmless by stratagem. There can, however, be no doubt about certain foreign non-pagan elements having crept into it during the early Christian centuries. Eclecticism prevailed at that period, and it was not only Greeks and Romans that found the influence of foreign, chiefly eastern, metaphysical speculation irresistible. But apart from that peculiar syncretism, we find many other new additions to Harran idolatry in the shape of Zabism. There are, first of all, a certain number of legends about biblical personages from whom they pretend to be descendants—legends which, it may be presumed, they only, for the nonce, permitted to belong to their sacred traditions. There are further a number of laws of purity and impurity, and of sacrifices, which strongly remind of Judaism. Again, names of Greek and Roman gods, such as Helios, Ares, and Kronos, occur, a circumstance that perhaps may be explained from the prevailing tendency of the period of exchanging the names of native divinities for Greek and Roman names. Besides these foreign elements, there are certain metaphysical and physical views incorporated in their creed which are distinctly traceable to Aristotle, and finally, the theurgico-Neoplatonic religious philosophy of heathenism, such as is found in Porphyry, Proclus, Iamblichus, and the rest. All these apparently incongruous elements, however, infused into it by the circumstances of the period, do not prevent Zabism from being in reality heathenism. Were further proof needed, we should find it in the words of a celebrated Zabian, Thabît ben Korra, quoted by Barhebræus, in the shape of a panegyric on the town of Harran and its heathenism, uttered, as Barhebræus says, in his "purblind obstinacy." After speaking of Christianity—not to its advantage—for some time, Thabît rejoices over the blessings that still belong to his native place, Harran, through its having kept itself utterly unsullied by that faith. "We," he continues (the Zabians or Harranians), "are the heirs and progenitors of heathenism, which has once been gloriously spread over this globe. Blessed is he who bears his burden for heathenism's sake with firm hopes. Who has civilized the world and built its cities, but the nobles and the kings of heathenism? Who has constructed the harbors and has made the rivers navigable? Who has taught the hidden science? To whom else has the deity revealed itself, given oracles, and told the things of the future, but to the most celebrated men among the heathen? . . . . Heathens have done all these things. They have brought to light the healing of souls; they have taught their salvation; they have also made manifest the art of healing the body; they have filled the world with institutions of government and with wisdom, which is the highest good. Without heathenism, the world would be empty and poverty-stricken, and swallowed up by great misery."

Without entering into a detailed account of the many sources whence our information is derived with regard to the creed itself, we shall briefly indicate that they are written in Arabic, in Hebrew, and in Greek. The former are the most copious; those in Hebrew are chiefly represented by Maimonides; and the Greek are ascribed to various pseudonymous writers, among whom figure Aristotle and Hermes Trismegistus. From their various, and, to a great extent, contradictory statements, we owe the following indications regarding the principal points of this creed: The Creator, it teaches, is in his essence, primitivity, originality, eternity, One; but in his many manifestations in bodily figures, manifold. He is chiefly personified by the seven leading planets, and by the good, knowing, excellent, earthly bodies. But his unity is not thereby disturbed. It is, the Zabians say, "as if the seven planets were his seven limbs, and as if our seven limbs

were his seven spheres, in which he manifests himself, so that he speaks with our tongue, sees with our eyes, hears with our ears, touches with our hands, comes and goes with our feet, and acts through our members." Nothing, we are told, is more foreign to Zabism than—what holds good of the creed of the Sabæans only—rude star-worship. Zabism according to the authority of Sharastani, expresses the idea that God is too great and too sublime to occupy himself directly with the affairs of this world; that he therefore has handed over the ruling of it to the gods, and that he himself only takes the most important things under his special care; that, further, man is too weak to address himself directly to the Highest, that he therefore is obliged to direct prayers and sacrifices to the intermediate deities to whom the rule of this world is intrusted. Thus the veneration shown to planets, and even the worshiping of idols, is nothing but a symbolical act, the consequence of that original idea. There are many gods and goddesses in Zabism of this intermediate stamp. It is not the planets themselves, but the spirits that direct and guide them and deliver them which are taken as deities of this kind—deities that stand to the spheres in the relation of soul to body. Apart from these, there are those gods who cause or represent every action in this world. Every universal natural deed or effect emanates from a universal deity, every partial one from a partial deity that presides over part of nature. Everything that appears in the air, which is formed near the sky or arises from the earth, always is the product of certain gods, that preside over these manifestations, in such a manner that the rain in general, as well as every special drop of it, has a presiding numen. These spirits also mold and shape everything bodily from one form into the other, and gradually bring all created things to the state of their highest possible perfection, and communicate their powers to all substances, beings, and things. By the movement and guidance of these spiritual beings, the different elements and natural compositions are influenced in such a way that the tenderest plant may pierce the hardest cliff. He who guides this world is called the first spirit. These gods know our most secret thoughts, and all our future is open to them. The female deities seem to have been conceived as the feeling or passive principle. These gods or intelligences emanate directly from God without his will, as rays do from the sun. They are, further, of abstract forms, free of all matter, and neither made of any substance nor material. They consist chiefly of a light in which there is no darkness, which the senses cannot conceive, by reason of its immense clearness, which the understanding cannot comprehend, by reason of its extreme delicacy, and which fancy and imagination cannot fathom. Their nature is free from all animal desires, and they themselves are created for love and harmony, and for friendship and unity. They are not subject to local or temporal changes, and they rule the heavenly bodies, without finding the motion of the most heavy too heavy, or that of the lightest too light. Their existence is full of the highest bliss, through their being near to the Most High, whom day and night they praise, without ever feeling fatigue or lassitude, to whom they are never disobedient, but whose will they always fulfill with supreme delight. They have a free choice, and always incline to the good. "These spiritual beings, our lords and gods, are our intermediators and advocates with the Lord of lords and God of gods." All substances and types of the bodily world emanate from the spiritual world, which is the one from which everything flows, and to which everything returns, and which is full of light, sublime and pure. These two worlds correspond to each other, and are to each other like light and shadow. The way to approach these gods, and, through them, the highest essence, is by purifying our souls from all passions, by keeping a strict guard over our words and deeds, by fasting, heartfelt prayer, invocations, sacrifices, fumigations, and incantations. By steadfastly persevering in these and similar acts of devotion, man may reach so high a step of perfection that he may communicate even directly with the Supreme Power. The planets, as the principal representative and intermediate gods, are to be carefully observed, especially as regards—1, the houses and stations of the planets; 2, their rising and setting; 3, their respective conjunctions and oppositions; 4, the knowledge of the special times and seasons, the hours and days of the ruling of special planets; 5, the division of the different figures, forms, climates, and countries, according to their dominant stars—the prevailing notion of the Zabians being, like that of the Chaldees and the sect of the so-called Mathematicians (according to Sextus Empiricus), as well as of the Neoplatonists in general, that everything below heaven was subject, in a manner, to the influence of stars, or the spirits that inhabit and rule them. Every substance and every action, every country and every hour, has its special planetary deity. It is therefore well to study carefully the special conjunctions and figures, as well as the special mixtures of incense, which might cause the individual numen to be propitious. Thus, e.g., according to the Zabian belief, the first hour of Saturday stands under Saturnus, and it is therefore right and advisable to select at that time such prayers, seals, amulets, dresses, and fumigations as might be supposed to be particularly pleasing to that planetary god.

In order to address themselves to *visible* mediators, some of the Zabians are supposed to have directed their devotions to the stars themselves. But they soon found how futile a worship it was that addressed itself to things that appeared and disappeared in turn. They therefore manufactured permanent representatives of them in the shape of idols—idols wrought in as complete accordance as possible with the theurgical rules derived from the nature of the deity to be represented. They were of gold, to represent the

sun; of silver, to indicate the moon. The very temples in which they were placed were of as many corners as were supposed to correspond to the form of certain stars.

We know but little with regard to the cosmogonical notions of the Zabians. Sharsstani, one of our principal authorities, only quotes "Agathodæmon" as his authority for their assuming five primeval principles, viz.: the creator, reason, the soul, space, the vacuum. Out of these, all things are composed. According to another source (Kathibi), however, the Zabians assumed two living and active principles—viz., God and the soul; further a passive one, matter; finally, two which are neither living nor passive—viz., time and space. Matter seems to have been held by them to be primeval and everlasting, and to it alone the existence of evil is attributable. God created the spheres only, and the heavenly bodies therein. It is these spheres (fathers) which carry the types or ideas to the elementary substances (mothers), and out of the combination, conjunction, and motion of these spheres and elements, the varying earthly things (children) are produced. Matter is, as we said, because of its defective nature, the source of evil, of ignorance, of folly; while the form is the source and fountain-head of the good, the right, the knowledge, and the understanding. Zabism further assumes a renewal of this world after each great "world-year,"—a space of 36,425 ordinary years. At the end of these periods, the plants, the animals, and the men that had existed within it, cease to propagate themselves, and a generation of each of them, different from all previous ones, springs into life. How far this theory is identical with the Babylonian, Egyptian, and Indian theories on the same subject, we cannot here investigate; suffice it to call attention to the striking likeness apparent in them all.

Man, the Zabians teach, is composed of contradictory elements, which make him the vacillating, struggling creature he is. Passions and desires rule him, and lower him to the level of brute creation, and he would utterly lose himself, were it not for such religious rites as purifications, sacrifices, and other means of grace, by which he may be enabled to approach the great gods once more, and to attempt to become like unto them. There are different kinds of souls; or rather man's soul partakes partly of the nature of the animal soul and partly of that of the angelic soul. The soul never dies, and punishments and rewards will affect only it, but not everlastingly. But rewards and punishments will not be wrought in any other future world, but in this, only at different epochs of existence. Thus, all our present joys are rewards for good deeds done by us in former epochs; and the sorrows and griefs we endure, spring in the same manner from evil actions we committed at former stages. As to the nature of the general (world-) soul itself, they say that it is primitive, for if it were not so, it would be material, as every newly created being partakes of the material nature. Yet a material soul would be an impossibility. "The soul, which is thus an immaterial thing," says Kathibi, "and exists from eternity, is the involuntary reason of the first types, as God is the first cause of the intelligences. The soul once beheld matter, and loved it. Glowing with the desire of assuming a bodily shape, it would not again separate itself from that matter of which means the world was created. Since that time, the soul forgot itself, its everlasting existence, its original abode, and knew nothing more of what it had known before. But God, who turns all things to the best, united it to matter, which it loved, and out of this union the heavens, the elements, and other composite things arose. In order that the soul might not wholly perish within matter, he endowed it with intelligence, whereby it conceived its high origin, the spiritual world, and itself. It further conceived through it that it was but a stranger in this world, that it was subject to many sufferings in it, and that even the joys of this world are but the sources of new sufferings. As soon as the soul had perceived all this, it began to yearn again for its spiritual home, as a man who is away from his birthplace pines for his homestead. It then also learned that, in order to return to its primitive state, it had to free itself from the fetters of sensuous desires, and from all materialistic tendencies. Free from them all, it would regain its heavenly sphere again, and enjoy the bliss of the spiritual world."

From all this, it will be seen, as we stated at the outset—that the Zabians, about whom so much has been theorized and fabled, were simply heathens who had to a certain extent adopted and modified Neoplatonic ideas, such as floated in the mental atmosphere of the early Christian centuries. It would be needless to enter into a discussion about the semi-fabulous personages to whom they ascribe the foundation of their creed, such as Agathodæmon, Arani, Hermes, and the rest; or some of those mentioned by other writers, such as Zerdusht, Nawassib, Orpheus, and the rest.

The life of this sect was but short. After having first been on terms of great friendship with the ruling powers of Mohammedanism as well as with Christians and Jews, and having filled many of the highest and most responsible posts at the courts of the caliphs, they were by degrees made the butt of fanaticism and rapacity. Mulcted, persecuted, banished at different periods, they disappear from history since the middle of the 11th century. Some obscure remnants of them seem to have survived in remote corners of Mesopotamia, but they, too, no longer adhere to the original creed, but are mixed up with the Mendaïtes, mentioned above, and the Shemsijeh, or sun-worshipers. Thus obscurely ended a sect which, for 200 years, had produced a host of men pre-eminent in every branch of learning and literature, in philosophy, astronomy, history, natural history, poetry, medicine, and the rest. Many of these men, whose name and fame reached Europe, were confounded with their Mohammedan contemporaries,

chiefly because they lived in Bagdad, at that time the center of learning, the seat of the caliphs and the high dignitaries of state. The Mohammedans, however, had so high an appreciation of Zabian learning, that it became proverbial among them, and they could explain it only by tracing it to a supernatural source, notably to Hermes (Trismegistus), the father of the Zâbî, mentioned above.

We have in our sketch mainly followed Chwolson, who, aided by profound learning and acumen, has been the first to clear up the nature of Zabism, this terrible stumbling-block of many generations of investigators.—For detailed information on it and all the many other points connected with it, we must refer our readers to the large work in which he has embodied the results of his investigations: *Die Ssabier und der Ssabismus* (2 vols. St. Petersburg, 1856). See also NEOPLATONISTS, GNOSTICS.

ZACATE'CAS, a state of Mexico, bounded on the n. by Coahuila, on the e. by San Luis Potosi and Aguas Calientes, on the s. by Jalisco, and on the w. by Jalisco and Durango; 24,757 sq. m.; pop. '95, 570,814. The surface, which is intersected by a ridge of the Sierra Madre, is mountainous or hilly, with scanty supply of water. The soil in the valleys is fertile, and the climate warm, except in the higher regions. Copper, lead, quicksilver, and silver are found, the last in great abundance. Capital, Zacatecas.

ZACATE'CAS, capital of the Mexican state of that name, is situated in the windings of a deep valley or ravine, between high hills, about 439 m. by rail n.w. of Mexico. It is built over a vein of silver, which has been deeply explored. The streets are narrow and crooked, but it has a fine appearance from a distance, owing to the size and massiveness of its churches and the elegance of some of its residences. There are also a college, a cathedral, a gun-powder mill, and a mint. Pop. '95, 40,026.

ZACHARIAS, a Roman pontiff, successor of Gregory III. in 741, who is noticeable as one of the series of Greek prelates by whom the destinies of Rome and Italy were much influenced in the 7th and 8th centuries. The name of Zacharias, moreover, deserves honorable mention in connection with a work of benevolence and charity, which the Roman church afterward consecrated by intrusting it to a special religious order—viz., the redemption of captives from the pagan masters by whom they had been held in slavery. During the troubles arising out of the Lombard invasion, Zacharias, by his interposition in more than one instance in favor of the city of Rome with the Lombard kings, contributed to that prestige of the Roman see which eventually led to its obtaining the leadership of Italy, and in the end the temporal sovereignty of Rome and the adjoining territory. Zacharias died at Rome on Mar. 14, 752.

ZADONSK, a t. of Russia, in the government of Voronej, 50 m. n. of the town of that name, and about 230 m. s. of Moscow, on the left bank of the river Don. Pop. '80, 9,100. The trade of the town is not extensive, owing to the close neighborhood of the commercial towns Eletz and Voronej. The manufactures are insignificant. Zadonsk possesses a renowned cloister.

ZAFARAN'-BO'LI, a t. of Asia Minor, in Anatolia, about 190 m. e.n.e. of Scutari, at the junction of two small affluents of the Chati-su. It has four handsome mosques, a church, large baths and khans, and extensive suburbs. It has a considerable trade in saffron (whence its name), which is cultivated extensively in the surrounding country. Pop. supposed to be about 15,000.

ZAFFRE, crude oxide of cobalt, made by roasting cobalt ore and reducing it to powder, with the addition of about three parts of the finest white sand used by glass-makers. It is extensively prepared in Saxony, and is often imported into Britain. When fused into a glass, it is intensely blue, and is much used by enamelers and porcelain manufacturers as a blue color.

ZAGAZIG, a t. of Egypt; pop. '82, 19,845. It is 75 m. n.w. of Suez, on the canal leading to the isthmus from the Nile. Zagazig is the center of a great cotton trade, and is near the ruins of Bubastis.

ZAHN, JOHANN KARL WILHELM, 1800-71; b. Germany; educated at Cassel. He studied architecture and painting, lived for many years in Italy, and became professor at the Berlin academy of fine arts in 1829. His principal work is his *Die Schönsten Ornamente und Merkwürdigsten Gemälde aus Pompeji, Herculaneum und Stabiä* (1828-30).

ZÄH'RINGEN, a small village near Freiburg, in Baden, in the Breisgau, formerly a province of Austria, but annexed to Baden in 1805. It is historically noteworthy for the ruined castle from which the dukes of Zähringen took their name, the ancestors of the reigning house of Baden (q.v.). The Hapsburgs (q.v.) are traced to the same stock. Guntram or Gunthrun the rich, count of Breisgau—son of the famous Erchanger, who raised himself to the dignity of duke of Swabia and was beheaded for treason in 917—is assumed as the founder of the house of Zähringen. The Zährings claim to be descended from his eldest son, Gebhard; the Hapsburgs from the younger, Langelin. After the death of duke Berthold I., 1077, the house was divided into two lines—the ducal or Zähring line, which became extinct in the male line in 1218, with Berthold V., the founder of Bern; and the markgraf or Baden line, from which the present house of

Baden is descended. The ducal Zähringe exercised a beneficent sway over a great part of Switzerland.

ZAIRE. See CONGO.

ZAKRZEW'SKA, MARIE ELIZABETH, b. Berlin, 1829; studied medicine, in which she became proficient. Leaving Germany on account of the prejudice against female physicians, she came to New York in 1853. Having taken a medical degree at Cleveland college, Ohio, she returned to New York, where, in association with the Blackwell sisters, she founded the New York infirmary, of which she was resident physician for two years, when she settled in Boston, where she established the New England hospital for women and children, 1863.

ZALA, a co. in s.w. Hungary, adjoining Croatia and Styria; 1974 sq. m.; pop. '90, 406,699. The surface is uneven and heavily wooded. Wine, honey, and agricultural staples are the chief productions. Capital, Zala-Egerszeg.

ZALEU'CUS, the celebrated lawgiver of the Epizephyrian Locrians in Southern Italy. Of his history nothing reliable is found, the ordinary account making him a slave-shepherd, who by his extraordinary abilities having obtained his freedom, became chief magistrate. Diodorus represents him to be of good family. It is said that the people applied to the oracle of Delhi for a remedy for prevailing disorders, and were commanded to make laws for themselves. These Zaleucus gave them, which he professed to receive from Minerva. They were given 660 B.C., 40 years before those of Draco, and were the first written laws possessed by the Greeks. His laws, though severe, were for a long time greatly celebrated, and so averse were the people to a change that if any one proposed a new law he was compelled to appear in public with a rope around his neck, and if his proposition was rejected he was immediately strangled. Adultery was punished with the loss of both eyes.

ZA'MA, a city and fortress in Numidia, about 85 m. s.w. of Carthage, near which Hannibal was defeated by the younger Scipio, 202 B.C. The flower of Hannibal's forces consisted of a small veteran army, that had shared his fortunes for many years; most of the rest were of inferior quality, of many races, variously organized, and of suspicious fidelity. But his greatest deficiency was in cavalry, an arm with which he had repeatedly decided the victory in former battles. In Scipio's army, on the other hand, Numidians, under Masinissa, were present in overwhelming numbers. The onset of Hannibal's elephants, of which he had 80, was defeated and made worse than useless by the wise precautions of Scipio; the cavalry on his flanks were scattered by the furious charge of Masinissa and Lælius; his front line of mercenaries beaten back by the more numerous and better-disciplined Romans. His veteran infantry, hemmed in on all sides, fought with the courage of despair, and were cut to pieces. Hannibal having done everything, both before and during the battle, which could secure the victory, escaped with a few horsemen. Of the Carthaginians, 20,000 were left dead on the field, and an equal number taken prisoners. Of the victors, 2,000 fell in the action.

ZAMACOIS, EDUARDO, 1842–71; b. Bilbao, Spain; studied art at the Madrid academy, at Rome and Florence, and in Paris as a pupil of Meissonier. He became a *genre* painter of the first rank. Among his most popular pictures are, "Cervantes as a Recruit," "The Hunchback," "Bull Fighters Riding into the Arena," and "The King's Favorite."

ZAMBE'SI RIVER AND REGION. The extensive region in s.e. Africa, known to mediæval geographers under the general name of the empire of Monomotapa, is shown on old maps as drained by a river called Zambese, or Zambere, on the banks of which appear large towns, of which the mythical "Vigita Magna" was supposed to be the most famous. The course of the stream, which is the modern Zambesi, is, however, pretty correctly delineated, and even a small lake is shown in connection with it, not far from the real position of lake N'gami, whose existence we only became aware of a few years ago, and which we now know may be considered one of the most southern collections of inland waters which communicate with the Zambesi river and the more eastern lakes. The Nyassa or Maravi, as well as the more northern lakes, Victoria N'yanza and Tanganyika (the latter in connection with the Nile basin), are also given with such a degree of accuracy that it plainly shows, that in compiling these early maps, the distinctive features of the region must have been well known—principally, it is supposed, from Arab sources, various settlements of that people inhabiting the e. and s.e. coast of Africa from the Red sea to Sofala.

Although the lower region of the Zambesi, for a distance of at least 300 m. from its mouth, has been in possession nominally of the Portuguese since the beginning of the 16th c., forming the captaincies of Riosdi Senna, Tete, and Quilimane, yet it is only within the last few years, through the indefatigable exertions of Dr. Livingstone (1851–56, and 1858–64), Mr. Oswell, Dr. Kirk, Mr. T. Baines, Mr. James Chapman, Charles Andersson, Maj. Pinto, and other explorers, that we have got anything like an accurate or scientific idea of this vast region, which extends from 8° to 21° of s. lat., and from 14° to 37° of e. long.; and the total length of what may be considered the main stream (called Leambye in its upper course), from its mouth to the point shown on Dr. Living-

stone's map, where the Leeba river, which proceeds from lake Dilolo—on the summit of the water-shed which divides the rivers running n.w. into the Atlantic from those running s.e. into the Indian ocean—joins it, cannot be less than 1200 miles.

The river-basin of the Zambesi is coterminous, on the n., with a large area of the Congo river system, and the great lakes that drain into it; on the s. and w. an obscurely marked water-shed, crossing the Kalihari desert, separates it from the Orange river basin and the rivers that run through Ovampo land into the Atlantic; while on the s.e., a well-defined mountain-range divides the rivers flowing into the Zambesi from those which form the Limpopo river, running into the Indian ocean.

The name of Zambesi is preserved from the mouth of the river, or rather a short distance above it, to the junction of the main stream with the Chobe, in lat. 17° 31′ s., long. 25° 13′ east. Thence to its junction with the Leeba (Liba), coming from lake Dilolo, the Zambesi is called Leeambye (Liambai); and at the junction (lat. 14° 10′ s., long. 23° 35′ e.) it turns suddenly to the n.e. Part of the basin of the upper Zambesi was explored by maj. Serpa Pinto in 1878–79. Crossing from the w. several of the head-waters of the Cubango (Andersson's Okavango), formerly thought to connect with the Zambesi, Pinto found that the source of the Cuando (Kwando—Livingstone's Chobe), the chief tributary of the Zambesi, is about lat. 13° s. and long. 19° east. He passed several of its upper branches, and descended to the Leeambye by another tributary called Nhengo. The Cuando is a fine large stream, draining a large area of fertile country, and receiving several navigable affluents. Lake Dilolo, from which the Leeba flows, seems to have an outlet both to the n. and to the south. The northern outlet probably runs into one of the tributaries of the Congo.

In the region where the Leeba joins the Leambye the main stream is often as wide as the Thames at London bridge, and perhaps as deep. From the confluence to the Victoria falls there are many long tracts over which vessels as large as the Thames steamers could freely ply. But there are serious obstacles in the way of anything like navigation for hundreds of miles at a stretch—as seems now to be possible on the Congo (Livingstone) above the Yellala falls. Large areas in this region are liable to be flooded, and to stand under water for considerable periods at a time.

This part of central s. Africa may be considered as an extensive plateau or tableland, from 3,000 to 4,000 ft. above the sea-level, with an outer fringe or border of basaltic rocks, cutting through which the Zambesi river forms one of the most striking scenes in the physical geography of the universe—namely, the Victoria falls of Livingstone, or Mosiotunya, or "Smoke sounds there," of the natives. Here, a few m. to the e. of where the Chobe joins the Zambesi, the latter—a stream of 1000 yards in width—plunges down into a chasm more than 100 ft. deep, forming an immense crack in the basaltic rock at right angles to its course, and is carried along in a narrow channel some 30 m. in the same direction. Within a distance of 220 m. above the falls the river has 72 cataracts and rapids.

The Cubango (the Okavango of Andersson), draining a large district of the Benguela highlands, was supposed to run into the Zambesi; but according to Pinto it passes through lake N'gami, and emerging as the Botletle, ends in the Makarikari, an enormous basin into which many rivers run and are evaporated. In its lower course the Zambesi varies in width from 500 yards to 2 m. and more, in the rainy seasons. From the Portuguese town of Tete downward it is navigable, although with difficulty in the dry season; and it passes through one or two narrow rocky gorges in the Lupata mountains, which form ugly rapids, except when the river is in full flood. About 80 m. from the mouth it receives from the n. the waters of the Shiré, which runs out of lake Nyassa, the Maravi of old geographers, an extensive sheet of water above 300 m. long, and 50 m. across at its widest part, extending between lat. 11° and 14° 30′ s., and it enters the low country about 50 m. from the ocean, where it divides into many branches, forming a large delta, of a very unhealthy character. The most northern stream is called the Kwaka, or Kilimane, or Quilimane river; and the most southern and deepest channel, the Luabo. At the Kilimane, or Quilimane, about 18 m. from the sea, is the residence of the Portuguese governor of the region; but there are various other entrances used by slavers and contrabandists, which are not very accurately laid down in our charts; and it is both difficult and dangerous to enter the river without a competent pilot.

The Victoria falls are estimated to be 2,500 ft. above the sea-level. Tete is considered to be 400 ft.; and the rapids of lake Nyassa, where the Shiré issues from it, are 1552 ft. above the same; while lake Shirwa, a smaller lake, s.e. of Nyassa, is 2,000 feet.

The natives inhabiting the coast region drained by the Zambesi must be considered of the pure negro type; while the Makololo, who were found in the central and upper country, belonged to the Betjuana family. According to Maj. Pinto this tribe has now ceased to have a separate existence. In the reign of the third king of a dynasty of conquerors, the Luinas, the former masters of the country, again came into possession, and early in 1878 the remaining Makololos were put to death. On the upper Zambesi, between the Cuando and Cubango, Maj. Pinto discovered the Mucassequares, a tribe of Ethiopian origin, of a yellowish-white color. The Zulu tribe of Amatabele, under Mosilakatze, who inhabit the high region dividing the Limpopo from the Zambesi basin, have overrun and conquered nearly all the tribes s. of them. The slave-trade is actively carried on in the countries nominally claimed by the Portuguese; unsuccessful attempts

were made a few years ago to plant an episcopate and civilize the natives, through the influence of missionaries.

All the usual tropical productions are found, but, owing to the disturbed state of the native tribes, are but little cultivated. The animal kingdom is very similar to that of the adjacent regions of s. Africa; and an immense quantity of ivory is exported both from the w. and e. coasts. The prevalence of the tsetse (q.v.) makes traveling difficult in the interior. Extensive coal-fields exist, and gold is found in the neighborhood of Tete and Senna.—See the *Travels* of Livingstone; T. Baines's *Explorations;* Andersson's *Okavango; To the Victoria Falls of the Zambesi*, by Ed. Mohr (London, 1876); *Proceedings of the Geographical Society* (1879); and Pinto's *How I Crossed Africa* (1881).

ZA'MIA, a genus of plants or the natural order *cycadaceæ*, of which the species are found in the tropical parts of the world. They have a tree-like stem, with a single terminal bud and pinnate leaves. The wood consists of concentric circles, with very loose cellular zones between them. The male and female flowers are on separate plants, in tessellated catkins, the scales of which differ in form in the male and female plants. The central part of the stem contains much starch, especially in old plants, and a kind of sago or arrowroot is made from some of them. The central part of the stem of the bread-tree (*Z. cycadis*) of s. Africa, which is about 6 or 7 ft. high, with a scaly stem, is much used as an article of food by the Kaffirs and Hottentots, who prepare it by wrapping it in a skin well rubbed with grease, burying it in the ground until it undergoes putrefaction, bruising it between two stones, making it into cakes, and baking it in wood-ashes. There are numerous fossil species of zamia. Closely allied to it is the fossil genus *zamites.*

ZAMIO'STROBUS, the generic name given to several cones from the secondary and tertiary strata, because they were supposed to be the fruits of fossil zamias. But Mr. Carruthers has shown (*Journal of Botany*, Jan., 1867) that they belong to true coniferæ. He has, however, in the same paper, described six species of fruits belonging to zamia-like cycads, to which he has given the generic title of *cycadeostrobus.* They are all from the secondary rocks. No cycadean remains whatever have yet been found in newer deposits.

ZA'MITES, the generic name under which are included numerous forms of zamia-like leaves which occur in secondary strata. No certain traces of the trunks have yet been found associated with them, and only one species (*Z. gigas*) is accompanied with fruit, and this is so anomalous that it casts considerable doubt on the determination of the affinities of the foliage.

ZAMOJ'SKI, Andrzej, Count, 1716–92; b. Zamosc, Poland; served for a time in the Saxon army, and reached the rank of maj.general. He was one of the first nobles to emancipate his serfs. He was grand-chancellor to Stanislas Augustus, and, in 1776, drew up a code of laws. This was adopted in 1791, before which time dislike to its liberal measures for securing emancipation of the serfs had prevented its adoption.

ZAMOJ'SKI, Andrzej, 1800–74; b. Poland; the grandson of Gen. Andrzej Zamojski; educated at Geneva and Edinburgh. In 1823 he entered the Polish civil service, and in 1831 was minister of the interior to the revolutionary government. After the failure of the patriotic movement Zamojski remained on his estates, freed his serfs, carried on an agricultural paper, started a private bank, introduced steam-navigation on the Vistula, and was at the head of a great agricultural association regarded with disfavor by the government. In 1862 he was banished, and the rest of his life was spent in Paris.

ZAMOJ'SKI, Jan, 1541–1605; b. Poland; educated at Strasburg and Padua. Henry of Anjou, on his accession to the Polish throne in 1572, made him grand-chamberlain. When Henry gave up the throne, Maximilian II. of Austria was chosen king by a party of the nobility. Another party, whose leader was Zamojski, succeeded in making Stephen Báthori of Transylvania, king, who appointed Zamojski grand-chancellor. He was commander-in-chief during the war with Russia, 1580–82, and secured favorable terms of peace. His influence with Báthori, whose niece he had married, made him unpopular, and he took but little part in public affairs. On the death of Báthori he procured the election of Sigismund III., though he himself might have been king. The latter part of his life was spent in fighting the Turks, Tartars, Swedes, and other nations. He was a munificent patron of literature.

ZAMORA, an interior state of western Venezuela; area, 25,212 sq. m.; pop. '91, 246,676. The famous Barinas tobacco is grown in the mountain region, and cattle raising is carried on in the plains. Capital, Guanore.

ZAMORA, a province in n.w. Spain, once part of the kingdom of Leon, bordering on Portugal, and on the provinces of Salamanca, Leon, Valladolid, and Orense; 4135 sq. m.; pop. '87, 270,072. The surface is level and fertile; grain, fruit, and wine are the chief products. Antimony and lead containing some silver are found. Capital, Zamora.

ZAMO'RA, a very ancient t. of Spain, capital of the province of that name, is situated 40 m. n. of Salamanca, and 182 n. w. of Madrid, on the right bank of the Douro, which is here crossed by a fine bridge. It is the see of a bishop suffragan of Santiago. Zamora

was of great importance in the Moorish times, and is said to have been inclosed by seven lines of walls, with a moat between each. It is entered by seven gates, is surrounded by a wall, has a massive square tower with Norman arches, and many interesting remains of mediæval architecture. *La Magdalena*, a church of the Templars, but afterward belonging to the order of St. John of Jerusalem, is a simple solid edifice of the 12th c., slightly modernized. There are a number of other churches, besides a theological school, barracks, a prison, a normal and other schools, a library, museum, etc. It has manufactures of serges, linens, leather, hats, liqueurs, brandy, and a considerable trade in wine and grain. Sir J. Moore urged the Junta of Salamanca to repair the defences of Zamora, and receive there his stores; but his retreat had commenced before they had done deliberating. The French afterward got possession of it, and later sacked and plundered it, since which time it has never recovered these visitations. Pop. '87, 15,292.

ZA'MOSC, one of the most strongly fortified towns of Russian Poland, in the government of Lublin, 50 m. s.e. of Lublin, and 154 s.e. of Warsaw, surrounded by water and a marsh. All the houses are built in the Italian style with arcades. There is a large and beautiful castle opposite the former university, town-hall, and arsenal, churches, monasteries, theater, etc. There are beer and porter breweries. Pop. about 9200.

ZAMOUSE, *Bos brachyceros*, a species of ox or buffalo, found in the tropical parts of western Africa. It is the *bush cow* of Sierra Leone. It differs from the buffalo and all other *bovidæ* in several important particulars, especially in the very large size and peculiar fringing of the ears, and in the total want of dewlap. The forehead also is flatter than that of the buffalo. The color is nearly uniform—a pale chestnut. The hair is thin and nearly erect. The ears have three rows of long hairs springing from the inside, and a tuft of long hairs at the tip. There is a considerable space on the forehead between the horns,—which are not long, extend outward and upward, are suddenly incurved, and very sharp.

ZANE, EBENEZER, 1747–1811; b. Va.; built about 1770, at what is now Wheeling, a block-house, which was several times unsuccessfully assaulted by the Indians during the revolution. He held a number of civil and military offices. His settlement was the earliest permanent one on the Ohio. The land on the Muskingum river, where Zanesville now stands, belonged to him.

ZANESVILLE, city and co. seat of Muskingum co., O.; on the Muskingum river, and the Baltimore and Ohio, the Cincinnati and Muskingum Valley, the Cleveland, Akron, and Columbus, the Bellaire, Zanesville, and Cincinnati, the Cleveland, Canton, and Southern, the Columbus, Sandusky, and Hocking, and the Zanesville and Ohio River railroads; 57 m. e. of Columbus. It has two hospitals, public library, female seminary, high school, memorial hall, several bridges, public parks, electric lights, electric street railroads, several national and private banks, over 20 churches, and daily, weekly, and monthly periodicals. The U. S. census of 1880 reported for Zanesville, 301 manufacturing establishments, employing $4,200,409 capital and 3687 persons, paying $1,560,933 wages and $3,331,626 for materials, and having a combined output valued at $6,053,484. The principal manufactures are encaustic tile, agricultural implements, glass, bent wood, stoves, soap, clay, and pottery products, flour and barley mills, etc. Pop. '90, 21,009.

ZANGUEBAR'. See ZANZIBAR.

ZANTÉ (ancient *Zacynthus*), one of the principal Ionian islands, about 9 m. from the w. coast of the Morea, and 8 s. of Cephalonia, is about 24 m. long, 12 broad, and has an area of 168 sq. miles. The greater part of the island consists of a plain, stretching from n. to s., with a breadth of from 6 to 8 m., bounded on the w. by a line of hills. The vine is extensively cultivated on the plain, and the wine produced is considered to be of a superior quality. Currants produced from a dwarf species of vine, originally brought from Corinth, are the staple product. Pomegranates, olives, melons, peaches, and citrons also are grown. Zante is said to have been colonized by Achæans from the Peloponnesus: and it is mentioned in Homer with the epithet "woody," which, however, is not apt at the present day, although it is justly called, in an Italian proverb, "the flower of the Levant." It is subject to frequent earthquakes, which, it would seem, are likely to recur about once in 20 years. The most notable mineral feature of Zante is its pitch-wells, described by Herodotus, which are situated about 12 m. s. of the town of Zante, in a marshy district. Pop. '89, 44,070.—ZANTÉ, the capital, is the largest town in the Ionian islands, and is situated at the head of a small bay or harbor on the e. coast, on the site of the ancient town, of which the only remains are a few columns and inscriptions. The houses stretch along the semicircular outline of the bay to the distance of a mile and a half, and extend up the slope of the castle hill. Most of the streets are narrow, but clean, and the older houses built in the picturesque Venetian style; the huge lattices of wooden frame-work, resembling those employed in eastern harems, with which the windows used to be fitted, are being rapidly abolished. The principal street is broad

and handsome; the churches are numerous, and the market-place spacious. The harbor of Zanté has been greatly improved of late years; it is now protected by a long mole, and has a light-house, but is still somewhat exposed and insecure. A magnificent and extensive view is obtained from the citadel in the highest part of the town. Zanté is the see of a Greek protopapas, and of a Roman Catholic bishop. Pop. '89, 16,603.

ZANZIBAR', or ZANGUEBAR, a sultanate of East Africa under British protection. It is bounded on the n. by the independent tribes of Somal and Gallas, and on the s. by the Portuguese province of Mozambique. The extent of the coast is about 1100 m. and parallel to it are numerous islands, the most important of which are Zanzibar, containing the capital of the same name, Pemba, and Máfia (Monfia on the charts). The territories on the mainland have no defined limit toward the interior, being occupied by heathen tribes, over whom the sultan's authority is hardly even nominal beyond the sea-board. The soil along the coast is fertile in rice, millet, peas, beans, melons, pumpkins, the sugar-cane, cocoa-nut, banana, plantain, etc., and the forests supply the caoutchouc tree and many valuable species of timber. Cattle, sheep, and fowls are plentiful, and tropical wild animals abound. Rice, sugar, molasses, ivory, gums, gold, and cowries are exported. The heat on the coast is excessive, and the climate very unfavorable to Europeans. The name Zanzibar is applied to the coast from 3° n. to 10° 42′ south.

The island of Zanzibar, by far the richest and most important part of the sultan's dominions, is distant from 20 to 30 m. from the African coast; it is about 38 m. in length and from 15 to 30 in breadth. It contains an area of about 625 sq. m., and the soil is in most parts of exceeding fertility; being covered with woods and plantations, and, the frequent rains causing perpetual verdure, it everywhere presents a delightful appearance. It is very flat, the highest point being not more than 300 ft., composed entirely of coral, and abundantly watered by rivulets, which flow at all seasons of the year. The principal products are cocoa-nuts, cloves, rice, sugar-cane, manioc, millet, and fruits in the utmost abundance, especially oranges of the finest quality, which can be purchased at the rate of 1000 for four shillings. The island is intersected by paths and green lanes in every direction, affording a never-ending variety of pleasant walks and rides. The country-houses of the Arab proprietors and the huts of their slaves are thickly dotted over the surface, surrounded with gardens and fields. The hedgerows are covered with flowering creepers, and pine-apples grow among them in wild profusion. In many parts are glades of undulating grass-land, of park-like appearance, dotted with gigantic mango-trees; the ponds are covered with rushes and water-lilies; and the air is perfumed with the blossoms of the orange and clove. The pop. of the island is estimated at about 150,000. The town contains about 80,000 permanent inhabitants, while a large number of strangers come from Arabia, India, and the northern parts of Africa during the season of the n.e. monsoon. The chief people are the Arab landed proprietors, who form a sort of aristocracy, possessing large plantations and numerous slaves; besides these, there are slaves, free blacks, natives of the Comoro islands and Madagascar, and from 5000 to 6000 natives of India, who keep nearly all the shops in the town, and through whose hands nearly all the foreign trade of the place passes. The language of the court and of the Arab population is Arabic, while the slaves and the free black population speak a dialect called *Kisawahéli*, one of the great family of South African languages.

The climate of Zanzibar is extremely equable and salubrious, the thermometer having probably never risen as high as 90°, nor fallen lower than 70°. The mean annual rainfall is 56.2 in.

The capital is extensive, but, like most oriental towns, it is narrow, irregular, and ill built; the houses of the principal inhabitants and of the European residents are large flat-roofed buildings, generally with an interior court-yard, and some of them, and especially the palace of the sultan, may almost claim to be magnificent. This town used to be one of the greatest slave markets in the world. Other important coast towns are Mombasa, Kilwa, Bagamoyo (all more than 10,000), etc.

The trade of the sultanate is very considerable. In 1892 Zanzibar the town was declared a free port. In 1895 the trade of the sultanate was as follows: Imports, £1,293,646; exports, £1,199,841. The imports consist of cotton goods, brass wire, beads, arms, etc.; and the exports, of gum-copal, cloves, ivory, cocoa-nut oil, sesame, dye-stuffs, and a great variety of other articles.

By the Anglo-German agreement of July, 1895, the protectorate of Zanzibar was conferred on England, while Germany acquired all the rights of the sultan over the mainland on payment of a sum of 4,000,000 marks. The earliest settlement of Arabs on the e. coast of Africa occurred about 924 A.D.; and for several centuries flourishing republics, governed by elders, elected by the citizens, existed along the coast. Vasco da Gama visited Zanzibar in 1499, and in 1503 the dominion of Portugal was recognized by the inhabitants, who agreed to pay an annual tribute; but the Portuguese never held it for very long periods. About 1735 A.D. they were finally expelled, and in 1784 the island was taken by the imaum of Muscat, in whose family the government remained until the death of Seyed Saeed bin Sultan, in 1854, when the Arabian possessions fell to his son Seyed Thoweni, and Zanzibar and its dependencies to Seyed Majid (died, 1870), elder brother of the present ruler, Seyed Allin bin Said, who has entered into treaties with Great Britain for the suppression of the slave-trade, and yielded the protectorate to England. In addition to adjoining illus., see illus., AFRICA, Vol. I.

ZA'RA (ancient *Jadera*), the capital of Dalmatia, Austria, on the coast of the Adriatic, 73 m. n.w. of Spalatro, and about 130 s.e. of Trieste. Till 1873 Zara was strongly fortified. It is built in the form of an oval, on a narrow promontory, separated from the mainland by a moat, across which is a draw-bridge. The town is entered by two gates, one from the sea, called Porta-Marina, supposed to be partly of Roman construction; and one from the landward side, called Porta-di-Terra-Firma. The ramparts, of Venetian construction, and partly planted, afford a fine promenade to the inhabitants. There is a spacious and well-protected harbor, which, however, is somewhat shallow. The streets generally are narrow and ill paved, and the drainage defective; the town is not well supplied with water. Of its churches, the most noteworthy are its cathedral, founded by Henry Dandolo, doge of Venice, and the church of the patron saint, St. Simeon. There are many convents and monasteries; a lyceum, gymnasium, and other schools; a barrack and a naval and military arsenal; hospitals, a theater, museum, and other public buildings. There is a lofty marble column, which is all that is left standing of an ancient Roman temple; there are also the remains of a Roman aqueduct. Zara is the seat of the government of Dalmatia and the see of a Roman Catholic archbishop. The commerce is unimportant. Many of the inhabitants are engaged in fishing and in the coasting-trade. The chief manufactures are rosoglio, maraschino, leather, silk, and linen fabrics. Pop. '90, 11,496, Italians by descent, and speaking the Italian language. Anciently, Zara was the capital of Liburnia, in Illyricum; and under Augustus it was made a Roman colony. See illus., ITALIAN ARCHITECTURE, vol. VIII.

ZAPA'TA, a co. in s. w. Texas, separated from Mexico by the Rio Grande; 1370 sq.m.; pop. '90, 3562, chiefly of American birth. Stock-raising is the principal occupation. Co. seat, Carrizo.

ZARAGO'ZA. See SARAGOSSA.

ZARAISK, a Russian t. in the government of Riazan, 40 m. n.w. of the town of Riazan, and 80 s.e. of Moscow, a few miles from the right bank of the Oka, a tributary of the Volga. The town was founded in the 13th c.; and in 1531, Ivan the Terrible erected on the site of the old fortifications a strong fortress, which thrice resisted the assaults of the Tartars, and which still exists. Another noteworthy object is the cathedral of St. Nicolas, which dates from 1631. There are manufactures of soap and candles, as also several tanneries and breweries; these, however, produce only sufficient to meet the wants of the inhabitants. The commerce of the town has greatly declined since 1847, when the new road of Riazan was opened, leaving Zaraisk out of the way. Pop. '93, 6885.

ZARAND, a former co. in s.e. Hungary, bounded n.e. and s. by Transylvania. The surface is mountainous, and is drained by the White Körös, a branch of the Theiss. Mines of iron, lead, and silver are worked. Its capital was Körös-Bánya, which is now the capital of the county of Hunyad.

ZARATHUSTRA. See ZOROASTER.

ZARS'KOESELO. See TSARKOESELO.

ZARITZIN, or TSARITSINE, a town of s.e. Russia, in the government of Saratov, and 224 m. s.s.w. of Saratov, on the right bank of the Volga, where the course changes from s.w. to s.e. It is an important railway center, as well as the center of trade for all points of the Volga. Naphtha, salt, and mustard, are the chief articles of trade. There are churches, a theater, public library, and gymnasia. Pop. '97, 55,914.

ZAUSCHNERIA, a flowering plant brought from California more than 30 years ago, and named after M. Zauschner, a Bohemian botanist. There is only one species known, and it has not been called by a common name. It is a perennial, belonging to the evening primrose family (see ŒNOTHERA). It has numerous stems from 1 to 2 ft. high, with ovate and ovate-lanceolate leaves, which, like the other parts of the plant, are soft and downy; flowers sessile in the axils of the upper leaves in the form of a raceme. They are about 2 in. in length, and resemble those of the fuchsia, belonging to the same family; long calyx four-lobed, corolla four-petaled, both of brilliant scarlet. The eight stamens and the long style project beyond the corolla. The seeds, which may generally be found in the seed stores, have each a tuft of silky hairs. It flourishes in New York and New England on dry soil if protected during the winter.

ZAVAL'LA, a co. of s. Texas, drained by the Nueces and Rio Leona; 1200 sq.m.; pop. '90, 1097. The surface is nearly level, and the land mostly uncultivated. It was created in 1858 and organized in 1884. Co. seat, Batesville.

ZE'A (ancient *Ceos*), an island of the Grecian archipelago, one of the Cyclades, 13 m. e. of cape Colonna, 14 m. in length, and 8 in greatest breadth. It is somewhat egg-shaped. Its surface rises from the coast in terraces, culminating in the center in Mt. St. Elias, whose lat. is 37° 37′ n., and long. 24° 21′ east. The climate is healthy, and the soil fertile. The products are wine, fruit, barley, cotton, and silk. Attention is paid to the rearing of cattle and silkworms. Pop. '81, 3863. Pliny says that Zea was once united to Eubœa, but that four-fifths of it were carried away by the sea. Zea was the birthplace of the lyric poets Simonides and Bacchylides. The island once possessed four towns, but there is now only one, *Zea*, situated on the n.w. slope of the hill, about

3 m. from the coast, on the site of the ancient *Iulis*, of which the most important remain is a colossal lion, about 20 ft. in length, lying a short distance e. of the town. A few remains are also still to be found on the sites of the other three ancient towns. The harbor of Zea, Port St. Nicholas, about 3 m. from the town, admits the largest vessels, and is well frequented.

ZEA. See MAIZE.

ZEALAND. See ZEELAND.

ZEALOTS, often called Sicarii, were followers of Judas of Galilee. They are described by Josephus as a fourth Jewish sect, distinguished from the Pharisees chiefly by their love of liberty and contempt for death. During the last days of the Jewish state they were lawless robbers, and a terror to the land.

ZEBID, a t. of Arabia, district of Yemen, on the river Zebid, 15 m. from its mouth, 115 m. s.w. of Sanaa, and 60 n. of Mocha. The town is of great antiquity, on account of which and of the dark color of the bricks of which it is built it has a somewhat gloomy appearance. Zebid is strongly fortified, being surrounded by high walls, said to be a league in circuit, flanked with numerous towers. It contains a Sunnite college. Zebid was formerly a place of much commercial importance, but it has declined into comparative insignificance, owing to the accumulation of sand in the mouth of the river. Pop. 5000.

ZE'BRA, a name sometimes given to all the striped *equidæ*, all of which are natives of South Africa, and thus including the dauw (q.v.) and quagga (q.v.); but also in a more restricted use, designating a single species, *equus* or *asinus zebra*, a native of the mountainous districts of South Africa. In the whole group the characters more resemble those of the ass than of the horse; the tail is furnished with long hairs only toward the tip, and the hind legs are without warts; the neck is full and arched, the mane stands erect. The zebra is about 12 hands high at the shoulder. It is of a light and graceful form, with slender limbs and narrow hoofs; the head light, the ears rather long and open; the ground color white, or slightly tinged with yellow; the head, neck, body, and legs striped with black, the neck and body transversely, but not regularly; the head with bands in various directions, the legs with irregular cross stripes. The zebra lives in small herds, inhabiting the most secluded spots. Its senses of sight, smell, and hearing are very acute, and the least alarm is sufficient to make a whole herd scamper off, with pricked ears and whisking tails, to inaccessible retreats among the mountains. When attacked, however, and compelled to defend themselves, zebras do it vigorously, the herd forming in a compact body, with their heads toward the center, and their heels toward the enemy, repelling even the lion and leopard by their kicks. The zebra has been domesticated, and used as a beast of burden, but generally shows a vicious and untractable disposition. The flesh is eaten by the natives and hunters of South Africa. A hybrid has been produced between the zebra and the ass.

ZEBU', one of the Philippine islands (q.v.).

ZEBU, INDIAN OX, or BRAHMAN OX, a kind of ox, very nearly allied to the common ox, of which naturalists generally regard it as a mere variety, although some think it a distinct species (*bos Indicus*). The most conspicuous distinctive character is a large fatty hump on the back, above the shoulders. The legs are also rather more slender and delicate than in the European ox. The hump attains a very great size in animals plentifully supplied with food, and not compelled to work; in those which are ill fed or hard worked, it is comparatively small. It is alleged that intermixture takes place freely with the common ox, and that there is no difference of anatomical structure, but these statements require verification. Mr. Vasey found the number of caudal vertebræ in the Zebu to be only 18, while in the common ox it is 21. The period of gestation in the Zebu is also said to be 300 days, while in the common ox it is 270. The Zebu is diffused over India, China, the Asiatic islands, Madagascar, and the e. coast of Africa. There are many breeds, differing very much in size; the largest being larger than any oxen of Europe, while the smallest are not much larger than a large mastiff. The hump of the largest breeds is said to be sometimes 50 lbs. in weight. English residents in India esteem the hump as delicious for the table. There are hornless breeds; but most of the breeds have short horns. There is a breed with two fatty humps, one placed immediately behind the other, which is common in the vicinity of Surat. The voice of the Zebu resembles the grunting of the yak, almost as nearly as the lowing of the ox. The Zebu is used in India both as a beast of draught and of burden. It is yoked in the plow. It is occasionally used for riding. It can travel from 20 to 30 m. a day. It is very gentle and docile. See illus., Ox, vol. XI.

The Brahminy or sacred bulls of the Hindus, consecrated to Siva, are all of this kind of ox. They are caressed and pampered by the people, and to feed them is deemed a meritorious act of religion. The Brahminy bull may go where he pleases; it is not lawful to beat him, even if he be eating a valuable crop, or if he enter a shop and devour the articles exposed for sale. He soon learns to despise shouting, which is the ordinary expedient to drive him away, and makes himself at home everywhere.

ZEBULON, TRIBE OF, contained at the Exodus 57,400 men; and 40 years afterwards 60,500, who were to enter Canaan. Its lot was in the north, having Asher on the w.,

Issachar on the s., and Naphtali on the north. Extending to the sea of Galilee, and to the Mediterranean, it fulfilled Jacob's prediction—"Zebulon shall dwell at the haven of the sea." It was also part of the region in which, according to Isaiah's prophecy the gospel light first shone.

ZECCHI'NO. See DUCAT.

ZECHARI'AH, called, in the book of prophecy which goes under his name, "the son of Berechiah, the son of Iddo," but in Ezra, "the son of Iddo," was born in Babylonia during the captivity, and accompanied the first band of exiles on their return to Palestine under Zerubbabel and Joshua. Very little is known of his personal history, but enough to assure us that he was a man of influence and a leader among his countrymen. He combined in himself the offices of priest and prophet. Ezra expressly ascribes to Haggai and him the merit of stirring up, by their prophetic inspiration, the patriotic enthusiasm of the Jews to complete the rebuilding of the temple. Later traditions, which are probably more or less in the line of historic fact, state that he assisted in providing for the service of the temple (various of the liturgical psalms being ascribed to him), and that he was a member of the great synagogue (q.v.).

The prophecies of Zechariah may be divided into three parts: the first (chapters i.–viii.) consists mainly of a series of visions relating to the building of the temple, the glory of the city, the removal of all abominations out of the land, etc., and winds up with a prediction that Jerusalem will become, as it were, a center of religious worship to all the world. The second (chapters ix.–xi.) threatens Damascus and Phenicia, and the cities of the Philistines with ruin; predicts that Judah will be greater than Javan (Greece), that Israel and Judah will be reunited—though almost immediately he symbolically shows the impossibility of this—and that both Assyria and Egypt will be humbled. The third part sets forth that dark times for Judah are drawing nigh, which shall be as an ordeal for the nation. After sore trial, it shall come forth thoroughly purged from iniquity, and then the Lord will appear in his glory on mount Olivet, fight victoriously against the hosts of heathendom, and compel all who are not destroyed by His wrath to worship Him at Jerusalem. A millennium of holiness will then begin: "In that day shall there be upon the bells of the horses, 'holiness unto the Lord' . . . . . yea, every pot in Jerusalem and in Judah shall be holiness unto the Lord of hosts" (xiv. 20, 21).

Numerous biblical critics, both in Germany and England, consider the first part only to be the work of Zechariah, and it cannot be denied that the internal evidence strongly favors this supposition. There is a unity, consistency, and sequency in the visionary predictions, and a harmony both of style and matter—the imagery bearing very distinctly the impress of those two master-spirits of the exile, Ezekiel and Daniel—that no candid critic can overlook, while the remaining chapters are totally unconnected in subject with what precede; contain no allusion to the post-exilian age, and speak of idols and false prophets in a way that would be utterly meaningless if applied to the times subsequent to the return from the captivity. The style also is quite different; is softer, richer, more poetical. The spirit of Ezekiel is exchanged for that of Jeremiah or the younger Isaiah. Whether these chapters are the work of one or two authors has also been elaborately discussed, the evidence being, on the whole, in favor of the latter view.

ZECH'STEIN (Ger. mine-stone), a deposit of calcareous rock which covers the Kupferschiefer, and which received this name because it must be cut through before reaching the mineral-bearing beds beneath. It is the equivalent in Thuringia of the fossiliferous limestones of Permian age of the n. of England.

ZEDEKI'AH, originally MATTANI'AH, the last king of Judah, son of the "good Josiah" by his wife Hamutal, succeeded his nephew Jehoiachin. The latter having rebelled against his master, Nebuchadnezzar, king of Babylon, was besieged in Jerusalem, and taken prisoner, after a brief reign of three months. Nebuchadnezzar bestowed the vacant throne on Zedekiah, doubtless in the expectation of securing a faithful liegeman. If so, he was mistaken. Zedekiah was a weak unwise ruler, probably incapable of political fidelity: in the phraseology of the Jewish historian, "he did that which was evil in the sight of the Lord." Forgetting his obligations to the Babylonish monarch, he lent a ready ear to the foolish braggadocia of the nobles and princes of Judah, and in spite of the earnest and reiterated remonstrances and warnings of Jeremiah, finally consummated his perfidy by forming an alliance with Egypt, the hereditary enemy of Assyria and Chaldea. Swift destruction overtook the traitor. A Babylonish army invaded and ravaged the country, besieged Jerusalem, and after inflicting a crushing defeat on an Egyptian force that was marching to the relief of the city, reduced the inhabitants to such horrible extremities that they could no longer hold out. Zedekiah, accompanied by his wives and children, fled in the darkness of night toward the Jordan, but was overtaken and made prisoner near Jericho. The monarch and his sons were sent to Riblah, at the n. end of the valley of Lebanon, where Nebuchadnezzar then abode. The conqueror, with customary Asiatic cruelty, ordered the sons to be slain before their father's face, and then deprived the wretched parent of his eyesight. Thus maimed, and bound with fetters of brass, he was conveyed to Babylon (588 B.C.), where

he probably died. The temple and city were destroyed, the inhabitants carried off into captivity, and the kingdom of David and Solomon ceased to have a place on the earth.

ZED'OARY (Arab. *Jedwar*), the name of certain species of *curcuma* (see TURMERIC), natives of the East Indies, the root-stocks (*rhizomes*) of which are aromatic, bitter, pungent, and tonic, and are used for similar purposes with ginger. They are more used in the east than in Europe, but are imported in small quantities, and sold under the name of zedoary. The ROUND ZEDOARY of the shops is the produce of *curcuma zedoaria*, a native both of India and China, having palmate root-stocks, straw-colored within. LONG ZEDOARY is produced by *C. zerumbet*, a native of various parts of the East Indies, having long palmate root-stocks, yellow within. Zedoary is a powerful sudorific.

ZEE'LAND, a province of the Netherlands, consists of the islands Walcheren, North Beveland, South Beveland, Schouwen, Duiveland, Tholen, West Flanders, and East Flanders. It lies between 51° 20′ and 51° 45′ n. lat., and 3° 21′ and 4° 15′ 54″ e. long., and has an area of 690 sq. miles. The boundaries are: South Holland on the n., the Easter Scheldt on the e., Belgium on the s., and the North sea on the w. Pop., '75, 184,215; '95, 209,546; a proportion of 304 persons to the sq. m. The provincial capital is Middelburg. Other important towns are Flushing; Goes (pron. *Huse*), in South Beveland; and Zierikzee, in Schouwen. The greatest part of the soil, which is a rich clay, has been redeemed from the sea; and almost in the center of Walcheren, South Beveland, and Schouwen, there are seen still the high mounds of earth called "hills of refuge," which the early inhabitants formed as places of safety for themselves and cattle when a high tide burst over the newly acquired lands. The number of polders (q. v.), or drained districts, in the province amounts to about 400. It is almost entirely arable, and produces the finest crops of wheat, barley, oats, rye, peas, beans, colza, beet, flax, hemp, canary-seed, mangolds, etc. Potatoes are extensively planted; and madder for the manufacture of dyeing material forms a valuable agricultural product. Horses, horned cattle, sheep, swine, and goats are the stock. In many districts of Zeeland extensive orchards beautify the farms. The fisheries employ a large portion of the population.

The neighboring seas abound with fish, and in Schouwen many eggs are collected, myriads of water-fowls resorting thither to form their nests. The principal industries, apart from agriculture, are the preparing of madder for the market, weaving calicos, rope-spinning, ship-building, beer-brewing, soap-boiling, making vinegar, salt, starch, tobacco, tile and brick, tanning leather, grinding corn, sawing wood, etc. The people of Zeeland are kind and hospitable, and in the country parishes are much attached to their fairs, meetings for merry-making, and other old customs, which might with advantage be given up. Few marriages take place among the agricultural portion of the population till absolutely necessary, but a case of desertion rarely occurs, as it would utterly disgrace the young man who did so.

On Oct. 15, 1866, a fine ship-canal through the island of South Beveland was opened, and takes the place of the Easter Scheldt. A railway from Flushing, through Walcheren and South Beveland, communicates with the main Belgian lines at Roozendaal, and by Breda leads to Rotterdam, Amsterdam, or Germany.

ZEISBERGER, DAVID, 1721–1808; b. Zanchtenthal, Moravia; educated by the Moravians of Saxony, and lived at their settlement, Nerrendyk, Holland; went thence to England; by the aid of Gen. Oglethorpe, joined his parents, who had emigrated to Georgia several years before; went n. and was one of the founders of Bethlehem, Penn., 1740; became a missionary, laboring among the Delawares at Shamokin, and the Iroquois at Onondaga, till the breaking out of the war, 1754; the war having closed he led the Christian Indians, who had fled to Philadelphia, to Wyalusing, on the Susquehanna; established a church among the Monseys on the Alleghany, 1767; going further into the wilderness in 1772 he laid out the town Schoenbrunn, on the Tuscarawas, Ohio, and was afterward joined by all the Moravian Indians of Pennsylvania. The settlements were destroyed in 1781 by a band of Wyandotte warriors, and the Christian Indians removed to Sandusky, many of whom were treacherously murdered by some white settlers. The converts being now dispersed, Zeisberger, with a small remnant, went to what is now Michigan, 1782; went in 1786 to lake Erie and founded New Salem; emigrated to Canada, 1791, and founded Fairfield; returned with some of his converts to Ohio, congress having granted them land in 1798, and built a new station, calling it Goshen. There he preached till the close of his life. He published several works in the Indian languages.

ZEITHUN, a t. and district in the highlands of Cilicia, lying in 37° to 38° n. lat. and 34° to 35° e. long., inhabited by a community of Armenian Christians, virtually independent of the Turkish government, and forming in fact an Asiatic republic. Zeithun lies in the upper basin of the Jyhun or Pyramus, where that river crosses the Taurus mountains in descending from the table-land of Asia Minor to the low plain of Cilicia, which surrounds the n.e. corner of the Mediterranean sea. It is surrounded on all sides by inaccessible crags, except on the e., where it is bounded by the deep channel of the Pyramus. The hills are covered with magnificent pines, plane trees, and evergreen oaks. Springs and brooks, never dried up during the summer, irrigate the meadows in all directions; but the *soil*, although abounding in patches of great fertility, does not produce

grain in sufficient quantity to supply the wants of the inhabitants. The mulberry trees are, however, numerous in the orchards, and give constant occupation to the women in feeding silk-worms. The men are chiefly engaged in smelting and manufacturing the iron supplied by the mountains into plowshares, horse-shoes, nails, etc., which they exchange for corn and other articles at Marash and Kaisariyeh. The language of Zeithun is a rude dialect of Armenian, in which the only literature consists of popular songs not committed to writing. Education is much neglected among children, who, except when intended for the priesthood, are not sent to school after the age of 10 or 12. The inhabitants, like the kindred race in Armenia, are free from Asiatic vices. They resemble Europeans in their respect for women.

ZEITZ, a t. of Prussia, province of Saxony, in the government of Merseburg, 23 m. s.s.w. of Leipsic, lies in a pleasant and fruitful district, on a steep slope, on the right bank of the White Elster, over which there is a stone bridge. The town is very old, and has some good old public buildings; a cathedral and four other churches; a good library, containing 20,000 vols. besides MSS.; asylums for orphans and lunatics, an old and new castle, etc. There are manufactures of cotton, earthenware, carriages, machinery, pianos, cigars, leather, calicos, hosiery, gloves, etc.; several print-fields, breweries, and distilleries. In the neighborhood are extensive mineral-oil works. Pop. '90, 21,680. It is a station on the Thuringian railway.

ZELLER, Eduard, a distinguished German theologian and historian of philosophy, was b. in Würtemberg in 1814, and studied theology at Tübingen and Berlin. He was one of the ablest and most pronounced of Baur's disciples (see Baur), and his call to a theological chair at Bern in 1847 was the occasion of fierce controversy and opposition from the orthodox. In 1849 he was removed to Marburg; in 1862 became professor of philosophy at Heidelberg, and in 1872 at Berlin. In later years, Prof. Z. confined himself to philosophical studies. His principal work is *Die Philosophie der Griechen* (3 vols., 1844–52; 4th ed. 1876: Eng. trans. 1875). His other works are the notable book on the Acts of the Apostles (1854), *Das Theologische System Zwingli's* (1853), his essays (*Vorträge und Abhandlungen*, 2d ed. 1875), his edition, with biography, of the works of his friend, D. F. Strauss (1874–78), *Geschichte der deutschen Philosophie seit Leibniz* (1873), and *Friedrich der Grosse als Philosoph* (1886). He resigned his professorship in 1894.

ZEMINDAR, the name given to the governors of districts or large towns in India, under the mogul rule. Many of the zemindars occupied in India a position almost similar to the dukes and counts of western Europe in the middle ages; they received from their superiors, the nahobs or provincial governors, fiefs of more or less extent, for which they paid a certain due annually, being then exempted from all other imposts whatsoever. The dues paid by the zemindars were, of course, exacted, with additions, from the ryots or cultivators, and constituted a large part of the imperial revenue. Under the British government the same system of tax-collection is continued in Bengal, the zemindars in that presidency being looked upon as the hereditary lords or proprietors of their respective districts.

ZENA'NA, a word of Persian origin, signifying that part of the domain of a native gentleman of India occupied by the women of his family. In Bengal, where is the typical zenana, the dwelling consists of two houses built each round its own court. The one on the street, where dwell the father, sons, grandsons, and great-grandsons, has large, lofty, well-furnished rooms which open to the outer air. In the rear building the first floor is for cow-sheds, storage and cook rooms; above are cells, 10 to 12 ft. square, each having one door and one small grated window opening upon piazzas, which, in one, two, or three tiers, surround the inner court. Faint breath of heaven it is which, mingled with the odors from below, reaches these rooms. The only furniture of these dismal cells, even when the appointments of the gentlemen's rooms are sumptuous, are a bedstead with a strip of mat upon it, a chest, a brass cup, and sometimes another small mat to spread on the brick floor. When a son marries he brings his little bride to his father's house, and thus sometimes 50 women, each being an only wife to some one of the male occupants of the outer house, are domiciled in the zenana. Polygamy is rare.

ZEND. See Pehlevi; Persian Language and Literature.

ZEND-AVESTA. See Avesta.

ZENGG, Senj, or Segnia, an important free port of the Austrian empire, in Croatia-Slavonia, lies on the Adriatic, 71 m. s.e. of Trieste, at the termination of the Josephine road opposite the island of Veglia. Zengg is the see of a Roman Catholic bishop, has a tolerably large and elegant cathedral, an upper gymnasium, a seminary for priests, an academy, and school of navigation; a small harbor, somewhat unsafe; and some trade in grain, honey, wax, wine, salt, tobacco, wood, fish, and cattle. Pop. 3000.

ZENITH, a word (connected with the Arabic *san*, a "point"), borrowed like *nadir* (q. v.) from the Arabic, is the name given to that point of the heavens which is directly overhead, i.e. in line with the spectator's position and the center of the earth. It is thus the upper pole of the spectator's horizon as the nadir is the under pole.

ZE'NO, a philosopher of Elea, a town of Lucania, in Italy, was a favorite disciple of Parmenides. He visited Athens, and the illustrious Pericles was one of his pupils. According to the account usually given, on his return to Elea, he joined a conspiracy to deliver his native town from the tyrant Nearchus, and on the failure of his plot, was captured, and put to the torture. On being interrogated as to his accomplices, he named the principal courtiers, and is said to have bit his tongue off, and spat it in the tyrant's face. However, the historical evidence for this account is unsatisfactory; and whether Zeno perished in his attempt or survived the tyrant is uncertain. He held the usual doctrines of the Eleatic school respecting the unity and the immutability of all things, distrust in knowledge acquired through the senses, and reliance on pure reason. He did not deny that there were phenomena or appearances, but he maintained that these were not real existences. In this he anticipated the Berkeleyan theory. But he is chiefly remarkable for having been the first to employ the style of argument known by the name of dialectics, in which error is refuted, and truth sought to be established, by the *reductio ad absurdum*—a method so skillfully employed afterward by Socrates and Plato. He devoted his great powers of argumentation to enforce the doctrines first broached by Xenophanes, and more systematically developed by Parmenides. His works were in prose, but only small fragments have been preserved.

ZENO, founder of the Stoic philosophy, was born at Citium, in Cyprus. The dates of his birth and death are uncertain. He flourished in the early part of the 3d c. B.C., and was a contemporary of Epicurus. His father was a merchant, and on his trading voyages brought home with him from Athens some writings of the Socratic school. By these, Zeno is said to have been attracted to the study of philosophy. At the age of 30 he was shipwrecked off the coast of Athens, and, having lost his property, he willingly adopted the Cynic doctrines, in which contempt for riches is conspicuously taught. He attached himself first to Crates, but soon became dissatisfied with the coarse, ostentatious disregard for established usages, and the indifference to speculative inquiry, which characterize the Cynic sect. He next joined the school of the Megaric Stilpo, and there became a proficient in the art of disputation. Still unsatisfied, he betook himself to Polemo the academician. Having thus made himself master of the tenets of the various schools, he proceeded to open a school for himself, wherein he might show forth the result of all his inquiry, and develop his own peculiar system. See STOICS. He selected for the purpose the "Painted Porch" (*Stoa Poikile*), from which his sect has got its name, and there, till his 98th year, as is said, continued to teach those doctrines, which, in spite of serious drawbacks, inculcate that manly energy and simplicity, fortitude under suffering, and reverence for moral worth, which made disciples of so many of the noblest characters among the Romans. As a man, Zeno deserved and gained the highest respect. The Athenians honored him with a gold crown and a public burial, and his countrymen erected a monumental pillar to his honor. Of his numerous writings scarcely anything remains, save the titles.

ZENO'BIA, Queen of Palmyra, succeeded (271 A.D.) her husband Odenatus, who had been acknowledged by Gallienus as his colleague in the Roman empire. Nearly the whole of the eastern provinces submitted to her sway. When Aurelian assumed the purple, he marched against her with a large army, and after defeating her in several battles, besieged her in Palmyra. Her hopes of being relieved by the Persians and Arabians being disappointed, she attempted to escape by flight, but was captured, 273 A.D. Before the conqueror, her courage failed, and she saved her own life by imputing the blame of the war to her counselors, especially the celebrated Longinus, who was accordingly put to death. Zenobia was led in triumphal procession at Rome, decked with splendid jewels, and almost fainting under the weight of gold chains. She was presented by her conqueror with large possessions near Tivoli, where, in the society of her two sons, Heronnianus and Timolaus, she passed the rest of her life in comfort and even splendor. She was a woman of great courage, high spirit, and strikingly beautiful. With purity of morals in private life, she combined prudence, justice, and liberality in her administration. Her literary acquirements were considerable; she spoke Latin and Greek, as well as the oriental languages, with fluency. The balance of authority is said to be in favor of the belief that she was attached to the Jewish faith.

ZENTA, or SZENTA, a t. of Hungary, in the co. of Bács, on the right bank of the Theiss, 120 m. s.s.e. of Pesth, in a beautiful plain. Cattle-breeding is carried on. Pop. '90, 25,791. It is celebrated for the victory of prince Eugene over the Turks in 1697.

ZE'OLITE (Gr. *zeo*, to boil), the common name of a large group of minerals, often called the zeolitic family. They receive this name from their melting before the blow-pipe. They are all soluble in acids, and most of them gelatinize in acids in consequence of silica being set free. They are hydrated silicates of alkalies or alkaline earths, most of them containing alumina. Magnesia is rarely present in them. Their composition, however, is very various. They are generally found in amygdaloidal cavities, or in fissures of trap and other Plutonic rocks, as granite and gneiss, apparently as deposits from water percolating through the rock. They sometimes, but rarely, occur in veins. They are found either in crystals or of crystalline structure, often in plates or fine scales, often in needles or fibrous. Among them are *analcime*, *natrolite* or *mesotype*, *scolezite* or *needlestone* (*needle zeolite*), *stilbite*, *heulandite*, *brewsterite*, *apophyllite*, *chabasite*,

harmotome or *cross-stone*, and *laumonite*. The number of species and varieties which have been described and have received distinct names is very large.

ZEPHANI'AH (the name probably signifies a "watcher of the Lord"), a Hebrew prophet who flourished during the reign of Josiah, in the latter part of the 7th c. B.C. The subject-matter of his brief "prophecy" is the temporary desolation of Judæa ("I will utterly consume all things from off the land," i. 2), on account of the infidelity and worldliness of the inhabitants, Jerusalem being specially assailed by the author for her filth and pollution; the tyranny and the rapacity of her rulers, and the violence and treachery of her priests and prophets. At the same time the prophet predicts the destruction of the surrounding heathen nations, the Philistines, the Moabites, Ammonites, Ethiopia, and Assyria.

ZERBST, capital of the former duchy of Anhalt-Zerbst (see ANHALT), a t. of north Germany, in the duchy of Anhalt, 11 m. n.w. of the town of Dessau, and 68 s.w. of Berlin, is situated on a level sandy spot on the river Nuthe, a tributary of the Elbe. In place of the ancient walls, promenades now encircle the town. Close by is a beautiful large palace, the ducal residence. The town has 4 Protestant churches, a Roman Catholic one, and a synagogue. The church of St. Nicholas is a beautiful specimen of Gothic architecture. The town is the seat of a court of justice; has a high school, called the Francisceum; female, industrial, and other schools; a house of correction, and orphan asylum, hospitals, and a workhouse. The chief manufactures are articles in gold and silver, silk, wax, soap, machinery, chemicals, stoneware, carriages. There are many breweries, whose produce is exported in large quantities. The vegetable products are considerable, and the culture of hops is carried on. Handsome baths have been erected over a mineral spring recently discovered here. Pop. '90, 16,181.

ZERO, a term in thermometry applied to certain points of temperature. The centigrade zero is the temperature of melted ice. Fahrenheit put his zero at the point indicated by his thermometer in a mixture of mixed snow and salt, supposing such point to be absolute zero. The centigrade thermometer zero is the temperature of water formed by ice at the exact moment of its fusion. See THERMOMETER.

ZERRAHN, CARL, conductor, b. in Mechlenburg-Schwerin, July 28, 1826. He received his musical education in Hanover and Berlin, and came to America during the revolution of 1848. He joined the Germania Musical Society, which gave concerts in the principal cities of the United States, playing the first flute. In 1854 he was made conductor of the Handel and Haydn society, Boston. For many years he gave at his personal risk the only orchestral classical concerts in Boston. In 1865 he was appointed conductor of the Harvard Symphony concerts, serving until they disbanded in 1882. He has been conductor of the oratorio society of Salem, Mass., since 1868, and has conducted many of the principal musical festivals held in New England. Mr. Zerrahn is a noted conductor of oratorios.

ZEUGLODON, or BASILOSAURUS, an extinct mammal allied to the whale. It lived during the eocene tertiary period. Its remains have been found in Georgia, Alabama, Mississippi, and Louisiana. A vertebral column 70 ft. in length with some bones of the head, ribs, etc., was obtained by Dr. S. B. Buckley in Clark co., Ala., in 1842. It is now in the museum of the late Dr. Warren at Boston, Mass. Some of the larger vertebræ are a foot and a half long and a foot in diameter. It is one of the largest fossil animals known. In Clark co., Ala., its bones were so many, scattered over the surface, that some were burned and others placed in stone walls. See illus., TERTIARY PERIOD, vol. XIV.

ZEUS (Sanskrit, *div*, light, *djaus*, heaven, *devas*, god; Lat. *Ju-piter* and *Dies-piter*, i.e., father Zeus; Ang.-Sax. *Tiu*, whence Tuesday) was the greatest of the national deities of Greece. According to the most received mythology, he was the son of Cronos and Rhea, brother of Poseidon and Hera, the latter of whom was also his wife. He expelled his father and the older dynasty of the Titans; assumed the sovereignty of the world, and successfully resisted the attacks of the giants and the conspiracies of the gods. In the allotment of the world, after the dethronement of the Titans, Zeus gained the rule of heaven and air, Hades of the infernal regions, and Poseidon of the sea; while the earth was left subject to the influence of all three, though Zeus was regarded as having the supremacy throughout all departments. Crete, Dodona, and Arcadia were the places where the worship of Zeus was most cultivated; and although originally the inhabitants of these places may not have looked upon themselves as worshipers of the same god, yet, in process of time, all the local gods revered under the name of Zeus were at last merged in one great Hellenic divinity; a process which was carried still further out when he was identified with the Jupiter of the Romans and the Ammon of Libya.

Besides the epithets of Zeus from the seats of his worship, he had many titles applied to him from his various powers and functions, moral and physical. He was the father and king of gods and men; the protector of kings, of law and order; the avenger of broken oaths and of other offenses; he watched over the state, the assembly, the family, over strangers and suppliants; his hand wielded the lightnings and guided the stars; he ordained the changes of the seasons, and, in short, regulated the whole course of nature. All prophecy, too, was supposed to originate in him, and it was from him the

prophetic god Phœbus received his oracular gift. He dispensed, as it pleased him, both weal and woe to mortals; but whether he could control the Fates themselves is a point about which the ancients disagreed, as men have done in all ages where the question of free-will and fate is concerned. Of the many epithets applied to Zeus, perhaps the best known is the Olympian, from that Olympus in Thessaly whose summit was believed to be his residence as well as that of the other gods. His most celebrated festival was the Olympic, held at Olympia, in Elis, after the end of every fourth year.

Combined with such exalted conceptions of the majesty and power of Zeus, we find many stories current respecting his amours with mortals and immortals; he is represented as acting with caprice, anger, deceit. Probably, in many cases, an ancient Greek of average position and capacity did not view such matters with any very strong feeling of disapprobation. Others, again, as Xenophanes (q.v.), protested against the transference to the gods of human passions and failings; or, as Pindar, maintained that they would believe nothing of the gods that was discreditable to them; or, as Euripides, argued that such tales were sufficient to disprove their divinity; or, as Euhemerus, held that the local worship of Zeus, like that of other deities, was owing to the fact that divine honors were paid to deified men at the place of their burial, and that of course it was no wonder to find human actions assigned to gods who had once been human. In modern times the various myths were at one time explained as symbolical of various celestial and terrestrial phenomena, such as the apparent motion of the sun, the alternation of day and night, the changes of the seasons, and so forth. The most rational explanation is as follows: In early times, men thought and spoke of natural objects as if they were personal agents, employing names for them which were literally, not symbolically, significant. But from lapse of time, and the departure of various tribes from their original seats, in many countries the meaning of these words became obscured, and though men still used them, their real significance was forgotten, and terms which originally had expressed some process of nature were conceived to narrate some incident in the history of a person. For example, the expression that the sun follows the dawn was misunderstood, and gave rise to the myth of Phœbus pursuing the nymph Daphne, because the word Daphne was no longer understood. Such misconceptions were then, by successive ages, elaborated into myths more or less fanciful and even revolting. In this respect Zeus has fared no better, or rather much worse, than the other deities. In the same way as the Greek war-god Ares is a personage much inferior to the Latin Mars, so the serious and unimaginative Roman's conception of his majestic Jupiter Optimus Maximus (the best, the greatest) was more elevated than that conceived of Zeus by the sensuous Greek. But this might be expected from the different character of the two peoples. Except in the grander attributes of omnipotence and fatherly care of the universe, we can trace little in common; for the Jupiter of the Latin poets, as portrayed in Virgil and Ovid, is drawn entirely from Greek sources, and is merely the Zeus of Greek mythology with an altered name.

ZEUX'IS, the celebrated painter, was b. at Heraclea, probably the city of that name in Lucania. He is also styled of Ephesus, which means that he belonged to the Ionian school of painters. He flourished in the latter part of the 5th c. B.C., and was at Athens about the beginning of the Peloponnesian war. He excelled in the treatment of light and shade, in accuracy of imitation of natural objects, and in expressing the perfection of human, and particularly female beauty. This last he effected by selecting the finest models he could find for each separate part. His most famous pictures were "Zeus enthroned, with the Gods standing round;" "Helen;" "The Infant Hercules strangling the Serpents;" "The Female Hippocentaur." By the exercise of his art, he attained to great riches and fame, and, like his rival Parrhasius, was exceedingly conscious of his pre-eminence. He repeatedly presented rather than sold pictures to cities that were anxious to possess them, because he thought no money-price could pay for them. Greece was plundered of many of his masterpieces by her Roman conquerors; and one of the noblest, the "Hippocentaur," was lost on the passage to Rome. Designs on vases, sarcophagi, and other works of antiquity exist adorned with representations of the same subjects as Zeuxis painted, and probably were imitated from his productions.

ZEYST, a large village in the Netherlands, province of Utrecht, is surrounded by beautiful well-wooded estates and country-seats, the summer residences of many of the first families of Amsterdam. The industries are making soap, candles, and vinegar, brass and zinc founding, etc. On a rising ground, and surrounded by fine old trees, stands the Dutch Reformed church, built in 1180. There is also a Roman Catholic church. In 1746 a society of Moravian brethren settled at Zeyst, where they have built a separate quarter, consisting of public and private buildings, erected along the sides of two large grassy squares, called the Easter plain and the Wester. Besides the church, there is an excellent day and boarding-school, which is resorted to by children of parents belonging to various Protestant communions. The unmarried members live, the males in the brothers' house, the females in the sisters' house. Another building is set apart for widows. There are also family residences, work-shops, and warehouses. Pop. about 7100.

ZHITOMEE. See JITOMIR.

ZIEBACH, a co. in s.w. S. Dakota ; formed 1879 ; 1040 sq.m. Pop. '90, 510.

ZIEM, Félix, b. France, 1821 ; studied painting in Paris and in Italy. His pictures of subjects taken from Venice, Constantinople, and the east are much admired. Among them "The Grand Canal of Venice" and "View of the Bosporus" deserve mention.

ZIERIKZEE, an old and important town in the Netherlands, province of Zeeland, is situated in the s.e. of the island of Schouwen. It was fortified before the beginning of the 11th c., and owed its rise and prosperity to the shipping-trade and fishing. The walls have been leveled, planted with trees, and formed into shady walks. Zierikzee has two havens, the old and the new, two Dutch Reformed churches, a Lutheran, a Roman Catholic, a small dissenting church, and a Jewish synagogue. There are a grammar-school, school of design, and other excellent public schools maintained by the town. The principal means of living are trade in agricultural produce, shipping, ship-building, fishing, weaving calicoes, beer-brewing, drying madder, sawing wood, grinding corn, etc.

Zierikzee suffered severely in the contests between Flanders and Holland for the possession of Zeeland. In 1303 the Flemings besieged it with a large army, but were compelled, by count William of Holland, to retire, Aug. 10, 1304. In the long war of independence, after an obstinate defense, the Spaniards took Zierikzee, July 2, 1576. Pop. '90, 7060.

ZIETHEN, Hans Ernst Karl, Count, 1770–1848; b. Prussia ; became a soldier, and in the wars with Napoleon I., 1813–15, showed great ability as a general. He commanded a corps at Waterloo and checked Ney's advance. He afterward was at the head of the Sedan army of occupation. For his services he was made a count and commander-in-chief in Silesia.

ZIGZAG, in military science, a trench of approach against a fortress; so constructed that the line of trench may not be enfiladed by the defenders. See Siege.

ZIGZAG, a decoration characteristic of the Norman style of architecture. It consists of one or more moldings running in zigzag lines, and is used with great effect. The zigzags are employed in great profusion, and are sometimes undercut so as to be detached from the moldings.

ZILLAH, ancient *Zela*, a t. in Asiatic Turkey, in the vilayet of Sivas, about 30 m. w.s.w. of Tokat. It is built on a height, with a small flat conical hill in the center of the town, which is evidently the mound or road, of which another portion is still seen at Thyana, the construction of which was attributed to Semiramis. Scarcely any remains of antiquity are to be found here; an ugly fortress of the middle ages having usurped the place of its beautiful temple. This was the field of Julius Cæsar's battle with Pharnaces, of which he wrote "Veni, vidi, vici." There are several large khans, and manufactures of coarse cottons. Its annual fair, of 15 or 20 days, from the middle of November, was formerly frequented by 50,000 or 60,000 persons from the commercial towns of Asiatic Turkey. There are about 5000 inhabitants, almost entirely Turkish.

ZILLERTHAL, one of the principal valleys of the Tyrol, traversed by the Ziller, is about 50 m. long. Toward the s. and s.w., it is bounded by lofty glaciers; but toward the n., where it opens into the valley of the Inn, it is tolerably fertile. Among the eight secondary valleys are the Duxerthal—famous for its precipitous glaciers, 1200 feet high—and the Zemthal, both remarkable for several great waterfalls. The inhabitants of the Zillerthal, who number about 15,000, are celebrated even in the Tyrol for their handsome, well-built figures; and their fine Alpine songs are well known and appreciated in London and Paris. The chief wealth of the Zillerthal is derived from the rearing of cattle. Many cattle are exported; but, notwithstanding, the valley is not able to support its numerous population. Many of the men hire themselves out as servants for the summer, while others go about as peddlers, selling essences of herbs and gloves. The principal towns are Zell and Mairhofen. For some years, the valley has been much visited by artists, chiefly from Munich.

In recent times, the inhabitants of Zillerthal acquired considerable notoriety by a part of them leaving the Roman Catholic church, and emigrating. For a considerable time, they had been in the habit of reading the Bible, and were on friendly terms with tha Protestant church, although still attending the Roman Catholic service; but when, in 1826, the Catholic clergy began to enforce auricular confession with greater strictness, a number of them thought seriously of going over to the Protestant church. Ere long, they not only objected to the confessional, but to the worship of the saints, absolutions, masses for the soul, purgatory, etc. In 1830, they began to leave the church; and by 1832, the number of dissenters had amounted to 240. The emperor Francis, to whom, on his visit to Innsbrück in 1832, they addressed a petition regarding their religion, promised them toleration; but after considerable delay, they were told (1834) that they must either return to the Catholic faith or remove to Transylvania, where there were Protestant congregations. As the Zillerthalers could not agree to this, they formed the resolution, as the Protestants of Salzburg had once done, of seeking a refuge in Prussia. This was granted; and the Zillerthalers, who had been allowed by the

Austrian government to sell their property, set out Aug., 1837, for Prussia. In all, 399 men, women, and children arrived, Oct. 2, at Schmiedeberg, in Silesia, where they were to stay until the arrangements for their reception in Ermannsdorf were completed. The king gave them 22,500 thalers (£3,375) on their settlement, and (1839) made them a further grant of 12,500 thalers (£1,875) for a church and school. The colony received the name of Zillerthal, and in 1871 numbered over 400 inhabitants.—See *Geschichte der Zillerthaler Protestanten* (Nuremb. 1838); Rheinwald; *Die Evangelischgesinnten in Zillerthal* (4 Aufl., Berl. 1838).

ZIMB, a dipterous insect, exceedingly destructive to cattle in Abyssinia, as the tsetse (q.v.) is in more southern parts of Africa. It probably belongs to the same family, but this has not yet been ascertained. It is supposed to be the *zebub* of the Hebrew Scriptures (Is. vii. 18). Bruce describes it as very little larger than a bee, but thicker in proportion; the wings broader, and without color or spot; the head large; the upper lip sharp, having at the end of it a strong pointed hair, a quarter of an inch long; the lower lip with two similar bristles. The flight of the insect resembles that of the gadfly, and is attended with a peculiar buzzing. The zimb is found only where the soil consists of a rich black loam; but all the inhabitants of the sea-coast, along the southern shores of the Red sea, and southward beyond cape Guardafui, are compelled to remove their cattle in the rainy season to the nearest sands, in order to prevent their destruction by this pest, as well as those of more inland districts from the mountains of Abyssinia northward to the confluence of the Astaboras and the Nile. "As soon as this plague appears, and their buzzing is heard," Bruce says, "all the cattle forsake their food and run wildly about the plain till they die, worn out with fatigue, fright, and hunger." The camel, the elephant, and the rhinoceros are liable to the attacks of the zimb, as well as the ox; but the elephant and rhinoceros protect themselves by rolling in mud, which, when dry, coats them as a kind of armor.

ZIMMERMANN, Albert, b. Saxony, 1809; studied art in Munich, and in 1837 was made a professor in the Milan academy. His best pictures are landscapes, and the most famous are "The Brocken and its Witches," "The finding of Moses," and "Mountain View during a storm."

ZIMMERMANN, Johann Georg, a native of the town of Brugg, in the Swiss canton of Bern, in which his father was a senator, was b. Dec. 8, 1728. He was educated at home in the first instance, and afterward at Bern, preparatory to his going to the university of Göttingen to study medicine. This he did in the year 1747. By his countryman, the celebrated Haller, he was kindly welcomed; he became an inmate of his house, and had the advantage of his valuable aid in the prosecution of his studies. In these he displayed the utmost ardor, not content to confine himself to medicine, but aiming at a large and liberal culture. In his speciality, so great was the proficiency attained that on his taking his degree of doctor, in 1751, he published a work entitled *Dissertatio Physiologica de Irritabilitate*, which not only at the time attracted attention by its originality of view, but even now is held to be not without value. In 1752 he began to practice as a physician at Bern with every prospect of success; but shortly after, the post of public physician falling vacant in Brugg, his native place, he was induced to transfer himself thither. About this time he was married to a relation of his friend and preceptor, Haller. Despite the extensive practice he speedily acquired, with such a reputation for skill as brought patients from a great distance to consult him, he continued to cultivate other pursuits; and in 1756 he published a miscellany of prose and verse, remarkable as containing the first sketch of his treatise *On Solitude*, which afterward became so famous. In 1758 appeared his work on *National Pride*, an ingenious and able dissertation, which immediately became popular and carried the name of the writer, by translation, into nearly every country in Europe. That he did not, however, neglect his special department of study was proved in 1764 by the appearance of an elaborate work on experience in medicine (*Von der Erfahrung in der Arzeneiwissenschaft;* Zurich, 2 vols.). Of this the great value was instantly recognized, and it still continues to enjoy some portion of its first reputation. Zimmerman was now a man of European note; and among other advantageous offers made to him was that of the post of physician to the king of Britain at Hanover, with the title of aulic councilor attached to it. This he accepted; and to Hanover he accordingly went in 1768. His repute as a physician continued here to increase, and from all quarters came flocks of people to have the benefit of his advice. In 1770 he had the misfortune to lose his wife, and this distress was complicated by an attack of an internal malady, which soon after obliged him to go to Berlin to undergo a perilous operation. This was successfully performed, but did not preclude a return of the complaint some time after. His only daughter now died; and a son who survived sunk under the influence of disease into something like entire idiocy. Zimmerman, who had almost from his very boyhood had to struggle against a constitutional melancholy, became now, as it almost seemed, a confirmed and hopeless hypochondriac. From this deplorable state he was rescued for a time by a second marriage, into which his friends persuaded him; and as fruit of his revived interest in life he gave to the world, in 1784, his celebrated work On Solitude (*Ueber die Einsamkeit;* Leipsic, 4 vols. 8vo), a book which speedily became a popular favorite throughout Europe. In 1786 he was invited by Frederick the Great, then in his last illness, to attend him at Potsdam. On

going thither, he found that the case of the king was beyond the reach of his art. He remained, however, for some time; and as the result of his sojourn, he published in 1788 and 1790 two works on Frederick the Great, the manifold indiscretions contained in which involved him in much painful and acrimonious controversy. In excuse of much in the books not easily to be defended, everything seems to show that they were merely the first indications of a return of his constitutional malady in an aggravated and, as it proved, a finally intractable and hopeless form. His melancholy hallucinations continued to grow upon him, till he was at length little better than a mere maniac; and on Oct. 7, 1795, he died at Hanover. During these last sad years he had continued at intervals to write and publish; but in everything thus produced there was evident the wreck of his once brilliant faculties. As a physician, a philosopher, a man of general accomplishment, and a writer of singular power and felicity, Zimmerman was unquestionably one of the most remarkable figures of his time. Of Zimmerman on *Solitude* every one must needs have heard: it no longer retains the immense popularity it once had; but along with his more expressly medical treatises, which are of interest—if not very much now otherwise—in relation to the history and development of his profession, it must still continue for a time to perpetuate the name of its writer.—See *Zimmerman's Eigene Lebensbeschreibung* (Autobiography, Han. 1791); Tissot, *Vie de Zimmerman* (1797); Wichmann, *Zimmerman's Krankengeschichte* (1786); Bodemann, *J. G. Z.* (1878).

ZINC (Zn, eq. 32.5—new system, 65—sp. gr. 6.8), or *spelter*, as it is often called in commerce, is a hard bluish-white metal, lustrous externally, and when broken exhibits a foliaceous crystalline fracture. At ordinary temperatures it is somewhat brittle; but when heated to above 212° F. (100° C.), becomes ductile and malleable, and may be drawn out into wire or beaten into thin plates. At about 401° F. (205° C.) it again becomes brittle, and may be easily pulverized. It fuses at 806° F. (433° C.), and at a white heat may be volatilized; and if the vapor be exposed to the air, it burns very brilliantly, and is converted into oxide of zinc, which is deposited in copious white flakes. The temperature of its boiling-point is estimated by Deville at 1904° F. (1040° C.). On exposure to the air, zinc soon loses its metallic lustre and assumes a gray appearance, in consequence of its surface becoming oxidized, while the metal beneath is thus protected from further change—a property which renders this metal especially useful for many economical purposes. It has no action on water at ordinary temperatures, but if a mineral acid be present it readily decomposes water, and is employed to decompose the water of dilute sulphuric acid when hydrogen is required. Moreover, a hot solution of potash acts on zinc, hydrogen being liberated while oxide of zinc is formed and dissolved in the alkaline solution. Zinc precipitates from their solutions most of the electro-positive or basylous metals less oxidizable than itself.

This metal is never found in the native state; the chief ores from which it is extracted are noticed below.

The commercial zinc obtained by the ordinary methods of extraction usually contains a small quantity of lead, iron, and carbon, with occasional traces of arsenic and copper. In order to obtain it in a chemically pure state, a stream of sulphureted hydrogen is passed through a slightly acidulated solution of sulphate of zinc, and after the removal of any precipitate that may be found, the solution is boiled so as to expel the gas, after which the zinc is precipitated in the form of carbonate, by the addition of carbonate of soda. The carbonate is converted by ignition into oxide of zinc, which must be distilled in a porcelain retort with the purest available form of carbon, as, for example, charcoal prepared from loaf-sugar.

Zinc is commonly regarded as forming only one compound with oxygen—namely, the *protoxide of zinc*, ZnO, although it has been suggested that the film which is formed upon the surface of metallic zinc by exposure is a sub-oxide. Protoxide of zinc is obtained by heating the metal in the air, the white oxide thus obtained being formerly known as *lana philosophica*, from its woolly appearance; while it was known as *flores zinci*, or *flowers of zinc*, in pharmacy. The process of manufacturing this oxide, when it is required as a pigment, consists, as Prof. Miller remarks, "in distilling zinc from clay retorts into chambers through which a current of air is maintained. The volatilized metal burns at the high temperature to which it is exposed under these circumstances; and the oxide is deposited in a series of condensing chambers."—*Inorganic Chemistry*, 3d ed. p. 545. The pigment thus obtained is known as *zinc white*. The impure oxide of zinc, commonly known as *tutty*, is obtained from the flues of furnaces in which brass is melted. A hydrated oxide of zinc, $Zn(OH)_2$, is precipitated in a white gelatinous mass from the solution of the salts of zinc by the addition of potash or soda, but redissolves in an excess of the alkali. Oxide of zinc is readily soluble in acids, and is capable of being reduced by charcoal, but not by hydrogen. The most important salts formed by oxide of zinc are the sulphate and carbonate. *Sulphate of zinc*, or *white vitriol*, $ZnSO_4 + 7Aq$, occurs in large transparent, glistening, four-sided prismatic crystals, resembling those of Epsom salts. At a temperature a little below 212° F. (100° C.), the crystals lose six equivalents of their water of crystallization; at a somewhat greater heat, they lose their last equivalent, and previously to losing their water of crystallization, they fuse in it. This salt is readily soluble in water, requiring 2½ parts of the latter for its solution at 60° F. (15.5° C.). It is obtained in considerable quantity as a residue in the process

of obtaining hydrogen from dilute sulphuric acid and zinc; and it is prepared on the large scale by roasting and lixiviating zinc-blende or sulphide of zinc, which, when heated in the presence of air, is oxidized into the sulphate. *Carbonate of zinc* $ZnCO_3$, constitutes one of the most important of the zinc-ores—viz., the common or rhomboidal variety of *calamine*, a name which is derived from the property which this substance possesses of adhering after fusion in the form of reeds to the base of the furnace. Carbonate of zinc may be artificially prepared by precipitating a salt of oxide of zinc with carbonate of soda, when the required salt falls as a white precipitate; this is, however, not simple neutral carbonate, but a basic carbonate, having the composition expressed by the formula $2(ZnCO_3), 3(Zn(OH)_2)$. Of the haloid salts, the *chloride of zinc*, $ZnCl_2$, formerly known as *butter of zinc*, is the only one requiring notice. This salt is obtained in the anhydrous form by burning zinc in chlorine gas, and in the hydrated state by dissolving zinc in hydrochloric acid, and evaporating the solution, chloride of zinc being thus formed, while hydrogen escapes in the gaseous form. In the anhydrous state, it forms a whitish-gray, semi-transparent mass, which fuses readily, and sublimes at a high temperature. When exposed to the air, it soon deliquesces, and is soluble in water in all proportions. The watery solution has a burning and nauseous taste, and in a concentrated state acts as a powerful caustic. It may be crystallized with 1 equivalent of water from its aqueous solution; and it is soluble in alcohol. It "forms double salts with the chlorides of sodium, potassium, and ammonium; and a concentrated solution of the double chloride of zinc and ammonium, $NH_4Cl + ZnCl_2$, is much used for the purpose of removing the film of oxide from the surface of metals, such as zinc, iron, or copper, which are to be united by the operation of soldering."—Miller's *Inorganic Chemistry*, 3d ed. p. 546. With sulphur, zinc forms only one combination—viz., *sulphide of zinc*, or *blende* ZnS, which is one of the most abundant of the zinc minerals. Blende, when pure, is of a pale brown color, but it is commonly blackish from admixture with sulphide of iron. It usually occurs crystallized in rhombic dodecahedra, or allied forms, but sometimes is found in the massive state. Sulphide of zinc may be obtained artificially as a white precipitate, which, on drying, becomes yellow, by the addition of sulphide of ammonium to a solution of a zinc-salt. Zinc forms several important alloys, among which *brass* (consisting of 2 parts of copper to 1 of zinc) and *German silver* (q.v.) may be specially noticed. Prof. Miller sums up the characters of the salts of zinc as follows: "The salts of zinc are colorless; their solutions have an astringent, metallic taste, and act rapidly as emetics. They are distinguished by giving no precipitate in acid solutions with *sulphureted hydrogen*, but they yield a white hydrated sulphide of zinc with sulphide of ammonium."

Manufacture.—That the Romans were acquainted with the art of making brass—an alloy of copper and zinc—is proved by the analysis of some of their coins struck soon after the commencement of the Christian era. Yet zinc itself was not known in Europe as a distinct metal until Paracelsus described its distinctive properties in the 16th century. Probably the Roman brass was produced by smelting ores containing both zinc and copper, some of which are at the present day smelted in Sweden. Zinc, however, was brought from the east by the Portuguese long before it became an article of commerce in Europe, and is supposed to have been known and made into articles of use and ornament both in India and China from an early period.

There are several ores of zinc, but only two of much importance—viz., blende and calamine. Blende, black-jack, or sulphuret of zinc, contains, when pure, about 67 per cent of zinc, but, like most ores, it is rarely found pure. The usual composition of English blende is zinc 61, iron 4, and sulphur 33. It occurs in all the older geological formations, and is often associated with the ores of copper and tin, but most frequently with lead ore—occurring, of course, like these in veins. Blende crystallizes in the form of the rhomboidal dodecahedron. The crystals have considerable brilliancy, but their luster is waxy rather than metallic. In this country it is usually of a dark color, from the sulphuret of iron which it contains—hence the miners' name of *black-jack*. Sometimes it is sufficiently argentiferous to allow of the profitable extraction of the silver. Blende is found in Wales, Isle of Man, Cornwall, and Derbyshire. It is also found in a good many localities on the continent—Sweden, in particular, being rich in this ore.

Calamine, or carbonate of zinc, contains, when pure, 52 per cent of zinc, but it varies much in the proportion of metal which it contains on account of impurities. Its primitive crystalline form is the rhombohedron, but calamine as well as blende occurs more frequently massive than in crystals. It is usually either of a dull yellow or reddish-brown color. Like some other useful substances, calamine was formerly exported from England as ballast, through ignorance of its value. It was at one time raised to a considerable extent in Somersetshire, Derbyshire, and Cumberland, but it is chiefly the last county which produces it now. Belgium, Silesia, and Carinthia are well-known continental localities; and extensive deposits of it have been discovered on the n. coast of Spain, which are estimated to last for ages. Sardinia is also an important source.

Red oxide of zinc is found in New Jersey, where it is smelted. This is an oxide of zinc with a small quantity of oxide of manganese, which gives it its red color. Silicate of zinc, or electric calamine, is another rare ore, generally associated when found with calamine. Within recent years the United States has become the largest zinc-producing country in the world.

There are several distinct processes for the extraction of zinc from its ores, and of these the English, the Belgian, and the Silesian are the most important. The English process is as follows: The zinc ore (blende or calamine) is crushed between rollers to the size of hazel-nuts, and then roasted for about 12 hours, with occasional stirring, in a calcining furnace. The furnace in which the roasted ore is reduced very much resembles a glass-furnace. It is either circular or octagonal in form, and usually contains six pots or crucibles, made of Stourbridge fire-clay, about 3 ft. high by 2¼ ft. in their widest diameter. In the bottom of each pot there is an opening, from which a sheet-iron tube, in two pieces, descends about 8 ft., and under its open end there is a sheet-iron vessel to receive the condensed zinc. Zinc, being volatile at high temperatures, is smelted by distillation, and in the English process it is called distillation *per descensum*. An entire charge—that is, a charge for the whole six pots—consists of one ton of calcined ore mixed with a proper quantity of ground coke. When the pots are charged, their covers are fixed and luted on, the conical portion of the descending pipe being previously securely fixed and lined with fire-clay. The hole in the bottom of the pot is plugged with wood, which becomes converted into charcoal by the heat, and is then sufficiently porous to allow the zinc vapor to pass down, while at the same time it stops the descent of the coke or ore. The heat of the furnace is gradually raised, and soon produces vapor of zinc in the pots, which condenses as it descends the pipes, and drops into trays placed at the bottom of each pipe. Sometimes a tube becomes stopped by a lump of zinc, and when this happens, the furnace-man melts it with a bar of red-hot iron. It takes nearly three days to work off the above charge, which yields about 8 cwts. of zinc, and requires about 25 tons of coal for its distillation. It is necessary to watch the pots with great care while the process is going on, as any leakage usually causes much loss of zinc. The *rough zinc*, as it is called, is removed from the pans, where it accumulates in lumps, and melted in cast-iron pots. It is then well stirred and skimmed, and finally cast into ingots or cakes of the ordinary commercial size—the skimmings being worked over again with a new charge of ore.

The Belgian furnace differs greatly in its construction from the English. It consists of from 60 to 80 small fire-clay retorts, each about 3 ft. 6 in. long, by 8 in. in diameter, and set in a series of rectangular compartments, filling up an arched chamber. There is a clay nozzle or condenser attached to the front of each retort, and on the end of this nozzle there is a sheet-iron receiver for the condensed zinc, with a pit to collect the residue from the retorts. The retorts are charged with ground and roasted calamine, mixed with small coal free from sulphur. As the upper retorts receive less heat than the lower ones, they are not so heavily charged, and they are, moreover, supplied with less pure ores. At the end of every six hours the receivers are emptied of their melted zinc. In this process, a ton of ore can be smelted in 24 hours, and the yield from it is about 40 per cent of metallic zinc.

In the Silesian furnace, fire-clay retorts, about 4 ft. long by 1 ft. 6 in. in diameter, are arranged in two rows, back to back, and placed horizontally on a flat furnace bed, with a fire-place on a lower level running along between the backs of the retorts. A condensing apparatus comes away with a curve from the upper part of the front of each retort, and descends some 2 ft. below it. From this, the zinc, on condensing, drops on the ground, or into a tray placed to receive it.

With regard to the comparative merits of these three processes of smelting zinc, no very decided opinion appears to be yet arrived at by those who have the best means of judging. The Belgian process consumes the least fuel, but requires the greatest amount of labor; the English, on the other hand, is worked with the least amount of labor, but requires the most fuel; while the Silesian holds a sort of middle position between those extremes. Each, however, has minor advantages and disadvantages which the others have not. All three processes are in use in England.

Zinc, at ordinary temperatures, is a comparatively brittle metal; but about the beginning of the present century, it was discovered that, if heated to between 200° and 300° Fahr., its malleability and ductility were so increased that it could be rolled with facility into thin sheets, or drawn into fine wire. Since this was known, the uses of the metal, which formerly was only employed along with copper to make brass, have become greatly extended. In sheets, it is used for roofing, baths, water-tanks, spouting, and the like; also for covering ships' bottoms instead of copper. A considerable quantity is consumed for name-plates, for engraving upon, and for galvanic batteries. Perforated sheets with various ornamental patterns are manufactured for screens, blinds, light fences, and similar objects. As a material for casting artistic works, zinc possesses the desirable properties of having a low melting-point, and of taking a sharp impression from the mold, so as to require but little labor from the chaser; it has also considerable hardness. It has, in consequence, become a favorite material on the continent for making casts of statues, statuettes, and different kinds of ornaments.

Of late years, zinc has been applied with great success to the coating of sheet-iron for roofing and other purposes, and also for coating various kinds of iron wire, especially telegraphic wire. See GALVANIZED IRON.

The working of zinc-ore has progressed rapidly in the United States, as is evidenced by the following table of out-put beginning with 1885, The data previous to that time is valuable, but not so strictly accurate as to warrant its insertion in this connection:

Year.	Tons.	Year.	Tons.	Year.	Tons.	Year.	Tons.
1885.....	40,688	1888.....	55,903	1891.....	80,263	1894.....	74,004
1886.....	42,641	1889.....	.....	1892.....	84,082	1895.....	81,858
1887.....	50,349	1890.....	67,342	1893.....	76,255	1896.....	77,637

The following table gives the production of zinc in the world, in metric tons:

Year.	Belgium, France, and Prussia.	Upper Silesia.	Great Britain.	Spain.	Austria.	Russia (Poland).	United States.	Total.
1895.....	195,303	95,519	29,967	5,845	8,489	5,039	74,245	411,409
1896.....	205,511	97,409	26,294	6,000	9,403	6,264	70,432	421,313

Considerable zinc was exported from the United States in 1896, the total for the year amounting to 10,130 tons. Shipments of zinc ore also reached a large figure, the total amounting to 2075 tons. The principal states in the production of zinc are Illinois, Indiana, Kansas, Missouri, New Jersey, and Pennsylvania.

Medical Uses.—In its purely metallic state, zinc produces no effect upon the animal economy, but several of its compounds are very active medicines. As a matter of convenience, we shall consider these compounds alphabetically, beginning with *acetate of zinc*, a salt not considered in the article on the chemistry of this metal. It is obtained by dissolving, with the aid of heat, carbonate of zinc in a mixture of acetic acid and distilled water, filtering the liquid while still hot, and setting it aside to crystallize. In this process, the carbonic acid of the carbonate of zinc is displaced by the acetic acid, and escapes with effervescence. The salt is obtained in thin, translucent, and colorless crystalline plates of a pearly lustre, with a sharp unpleasant taste, soluble in water, from which the zinc may be precipitated, pure white, by sulphureted hydrogen, and evolves acetic acid when decomposed by sulphuric acid. The crystals contain three equivalents of water, and their composition is represented by the formula, $Zn(C_2H_3O_2)_2 + 3Aq$. Acetate of zinc is not much employed internally, but it is one of the most valuable local astringents, and is especially useful (in the form of solution of from 3 to 5 grains in an ounce of water) in the treatment of skin-diseases attended with much discharge, such as eczema, impetigo, etc., when the first inflammatory symptoms have subsided; and it forms a useful astringent in the milder form of ophthalmia. It was the active ingredient in sir Astley Cooper's celebrated injection for gonorrhœa in the third week—six grains of sulphate of zinc mixed with four fluid ounces of dilute solution of subacetate of lead, when sulphate of lead is precipitated, and acetate of zinc is held in solution. When employed as an ointment in skin diseases, from 4 to 10 grains finely powdered may be rubbed up with cold cream or simple ointment. *Carbonate of Zinc* is obtained for pharmaceutical purposes by the decomposition of sulphate of zinc in solution by carbonate of soda, when the carbonate of zinc is precipitated as a white, tasteless, inodorous powder, insoluble in water, but soluble with effervescence and without residue in dilute sulphuric acid. This preparation has been introduced as a substitute for *native calamine*, which formerly had a high reputation, but was so frequently adulterated as to render an officinal salt of known composition very desirable. Either in powder, or in the form of ointment, it forms an excellent astringent application for the treatment of intertrigo (or chafing of the skin), excoriations, and chronic skin diseases attended with much discharge. *Turner's cerate*, although not in the pharmacopœia, is in general use as a drying and healing ointment, and is one of the most popular remedies for superficial burns and sores. It is made by taking prepared calamine (or carbonate of zinc) and wax, 7½ ounces of each, and olive oil 1 pint. Melt the wax, and mix the oil with it, then remove them from the fire, and when the mixture begins to thicken, add the calamine, and stir constantly till they cool. *Chloride of zinc*, in the form of colorless opaque rods, obtained by pouring the concentrated solution into proper molds, is used in surgery as a powerful caustic in cases of cancer, fungous growths, etc. In toothache caused by caries, a minute portion of chloride of zinc introduced into the cavity of the tooth after the removal of the diseased parts, affords almost immediate relief. In consequence of its powerfully destructive properties, it should never be applied except by the surgeon. The solution of this salt, commonly known as *Burnett's disinfectant fluid*, is of much use in the sick-room or hospital ward as a deodorizing agent; as, however, it possesses strong caustic properties, great care must be taken that it is not administered internally in mistake for some other medicine. Few years pass without several fatal cases of this kind being recorded. *Oxide of zinc* is characterized in the pharmacopœia as "a soft, white, tasteless, and inodorous powder, becoming pale yellow when heated, and forming with diluted sulphuric acid a solution which gives a white precipitate with hydrosulphide of ammonia." It is employed internally with much success as a tonic in chorea and epilepsy, in which it must be given for a considerable period, and in gradually increasing doses till a scruple is taken daily. In doses of one or two grains combined with extract of henbane, it forms an admirable night-pill to check the perspiration in pulmonary consumption. Employed externally, either in the form of powder or ointment it forms a good astringent in cases of excoriation, sore nipples, intertrigo, slight ulcerations, etc. The officinal ointment containing 80 grains to an ounce of simple ointment is too strong for

ordinary cases, and is apt to *cake* upon the surface: these defects may, however, be removed by the addition of glycerine. *Sulphate of zinc* is employed as an astringent, a caustic, an emetic, and a tonic. As an astringent, it is given internally in small doses (of from half a grain to two grains, made into a pill with conserve of roses), in cases of chronic diarrhœa, chronic bronchitis, and long-standing leucorrhœa; while it is used topically as a lotion in old ulcers (from 5 to 20 grains to an ounce of water), as a collyrium in chronic ophthalmia, and as an injection in the abortive treatment of gonorrhœa (i.e., when we wish to cut short the disease before inflammatory symptoms appear). As a caustic, this salt, in its anhydrous state, and finely levigated, was strongly recommended by the late Sir James Simpson. He applied it in the form of powder; of a paste made with glycerine in the proportion of a dram of the latter to an ounce of the powder; or of an ointment consisting of two drams of prepared lard, rubbed up with an ounce of the powder. It has also been successfully used in the Dublin hospitals. Sulphate of zinc may be given in the same doses as the oxide as a tonic in cases of nervous palsy, and in the exhaustion dependent upon sexual excesses. In large doses, as from 15 to 30 grains, it operates as a safe and speedy emetic, and is preferable to all other emetics in cases of poisoning. In toxicological researches—as in Marsh's *Test for Arsenic*—great care must be taken to see that the zinc which is employed is perfectly free from arsenic, which is a not uncommon impurity.

ZINCOGRAPHY is essentially the same art as lithography (q.v.), zinc-plates being substituted for those of stone. One form of the art is described under the name of Anastatic printing (see PRINTING). A style of it, called paneiconography, brought forward by Gillot of Paris, for the purpose of reproducing, by lithographic, autographic, or typographic proof, any drawing with crayon or stump, or any engraving from wood or copper, is thus described: A plate of zinc finely polished is prepared, and if an original drawing is to be copied, it is done by the artist in lithographic crayon on this plate; autographic writing done with the crayon, lithographs, and fresh proofs of wood or copper-plate engravings, must be transferred in the usual way to the surface of the plate; and while still wet, an ink-roller is passed over, so as to give a deeper impression. Rosin very finely powdered is then sifted over, which adheres to the wet ink, and becomes consolidated, so that the superfluous powder is easily brushed off from the parts not covered with ink. The plate is next placed with its face upward in a shallow trough containing dilute sulphuric or hydrochloric acid sufficient to slightly cover it; the trough is then gently rocked, so as to make the acid flow backward and forward over the plate, and if this be continued for some time—an hour or upward—all the parts of the plate not covered with the ink and rosin are etched deep enough to be used as a relief-plate for printing from. In impressions where there are large interspaces, it is usual to saw them out; and in some cases, where it is found that the relief is not sufficiently high, the raised parts are re-inked, and again covered with the rosin, and submitted a second time to the action of the acid. Old engravings may be transferred by laying them to become damp on a board wetted with acidulated water, and then applying the ink-roller to the face of the engraving: the ink only acts upon the ink-lines of the engraving, and is repelled by the acid moisture which has been imbibed by the uncovered white spaces. A slight pressure will then easily produce a copy on the polished zinc-plate, which is perfected by the subsequent operations.

ZINGARELLI, NICOLO, 1752–1837; b. Naples; studied music at the Naples conservatory. He became chapel-master at the Milan cathedral in 1792, and at St. Peter's in 1804. Dismissed from the latter post on account of his refusal to produce a *Te Deum* in honor of the birth of the king of Rome, he was soon appointed director of the music school of San Sebastian at Naples; and in 1816 he became again chapel-master of Milan cathedral. He wrote some 40 operas and much church music.

ZINGEL, *Aspro*, a genus of fishes of the perch family, remarkable for the elongated form of the body, and for having the mouth situated under the projecting and rounded snout, also for the roughness of their scales. The dorsal fins are widely separated, and the ventral fins are large. Only two species are known: of which one, the zingel of the Danube (*A. zingel*), inhabits that river and its tributaries, attains a length of 15 in., and a weight of two or three pounds; the other (*A. vulgaris*) is found in the Rhone and its tributaries, and also in more eastern rivers, although unknown in those of the w. of France, and is only 6 or 7 in. long. Both are esteemed for the table.

ZINGIBERA'CEÆ. See SCITAMINEÆ.

ZINNIA, a genus of plants named after a German botanist, J. G. Zinn. They belong to the order *compositæ*, and there are about 12 species, indigenous to Mexico and the southern portions of our western territory. They are chiefly annuals, with opposite, sessile, entire leaves. There are numerous branches, each terminated by a single head of flowers. The best-known species is *Z. elegans*, with its different-tinted flowers (a variety being double), which has long been known as a garden flower. Other species sometimes cultivated are *Z. multiflora*, with red-purple rays, and *Z. angustifolia*, with a double variety, *Z. haageana*, having showy orange colored flowers. All these plants are easily raised from the seeds in gardens in the United States.

ZINZENDORF, NICOLAUS LUDWIG, Count von, the founder of the existing sect of the Moravian brethren, or Herrnhuters, was b. at Dresden, May 26, 1700. His father, a Saxon state minister, dying while Zinzendorf was a child, the latter was educated by

his grandmother, a learned and pious lady, the baroness von Gersdorf. Spener, the head of the Pietists, was a frequent visitor at her house, and his conversation, and the devotional exercises in which Zinzendorf took part, influenced his character while a mere child. In 1710 he went to Halle, where he spent six years, under the special care of Francke, the philanthropist. Zinzendorf founded among his fellow-pupils a religious society, to which he gave the name of the "order of the grain of mustard-seed." In 1716 he was sent by his relatives to Wittenberg, where Pietism was in less repute than at Halle; but he adhered to his early religious impressions. Two years afterward he traveled through Holland and France, everywhere endeavoring to convert the distinguished persons whom he met to his own religious views. On his return to Dresden, he was appointed a member of the Saxon state council, and married the sister of the count Reuss von Ebersdorf. But political life was little to his mind, and he returned to his country-seat in upper Lusatia. While residing there, he accidentally met a wandering carpenter, named Christian David, a member of the old sect of Moravian brethren, of whom some still remained in Moravia, professing the doctrines taught by John Huss. David described the persecutions to which the sect were exposed; and Zinzendorf invited him and his friends to settle on his estate. They accepted the proposal, and the colony received the name of "Herrnhut." Zinzendorf acted with great liberality to the settlers, and their success attracted much attention. In 1734 Zinzendorf went under a feigned name to Stralsund to pass an examination in theology, and was ordained a minister of the Lutheran church. In 1736 he was banished from Saxony, on a charge of introducing dangerous novelties in religion. He repaired to Holland, where he founded a Moravian colony, and afterward to Esthonia and Livonia, where he also founded colonies. In 1737, at the request of king Frederick-William I. of Prussia, he was ordained bishop of the Moravians. In the same year he went to London, where he was received with much consideration by Wesley. In 1741 he went to North America, accompanied by his daughter, and founded the celebrated Moravian colony at Bethlehem. The Herrnhuters, in the meanwhile, by their good conduct and industry, had won the respect of all classes in Saxony, and in 1748 Zinzendorf was allowed to return to Herrnhut. Having received authority by act of parliament to establish Moravian settlements in the English colonies of North America, he returned thither to do so. He finally settled at Herrnhut; and, his first wife being dead, married Anne Nitschmann, one of the earliest colonists from Moravia. He died on May 9, 1760. Thirty-two preachers, from all parts of the globe, accompanied the coffin to the grave. Zinzendorf was the author of more than 100 works in verse and prose. His hymns, used in worship by the Moravians, are objectionable on account of their pious indecency. The same may be said of his sermons, especially of those which refer to the Holy Ghost as a spiritual mother. His writings are often incoherent or mystical, but they abound with passages in which deep and original thought is expressed with great clearness and beauty.—There are lives of Zinzendorf by Spangenberg (1775), Varnhagen von Ense (in his *Biographische Denkmale*, 1830), and Burkhardt (1876).

ZION. Mount Zion is the name of the hill on which the s.w. part of Jerusalem, the city of David, or upper city, with the citadel of David, stood. At the present day only the n. half belongs to the city, the city wall running obliquely over the hill. On the w., and still more on the s. side, it descends steeply into the vale of Hinnom, to a depth of 300 feet. Mount Zion is 2,539 ft. above the level of the Mediterranean sea. With the prophets and poets of the Old Testament, Zion often stands for the whole of Jerusalem (also called "Daughter of Zion"), particularly in reference to the temple. See JERUSALEM.

ZIPS, a co. in n. Hungary, bordering on Galicia, Sáros, Torna, and other counties; 1388 sq. m., pop. '90, 163,291, of which the greater part were Germans and Slovaks. The surface is rugged, being traversed by a high range of the Carpathian mountains, and heavily wooded. The soil is not very fertile. Capital, Leutschau.

ZIRCO'NIUM (symb. Zr., equiv. 90) is the metallic constituent of the earth, *zirconia*, which is found in association with silica in the minerals *zircon* and *hyacinth*. The composition of zirconia is usually represented by the formula ZrO_2, but Swanberg regards zirconia not as a pure earth, but as a mixture of three; and to one of the metals, whose earths he thinks that he has isolated, he gives the name of *norium*. The sources from which zirconium is derived are so few (it being found only in Ceylon, one district of the Ural, and North Carolina), that it is unnecessary to enter into any details regarding it.

ZIRK'NITZ, or CZIRKNITZ, LAKE (Ger. *czirknitzersee*, *lacus lugeus* of Strabo), a small lake of Austria-Hungary in Carniola, about 20 m. s.s.w. of Laibach, and 30 m. e.n.e. of Trieste, in a deep valley to the s. of Mt. Javornik, and to the n.e. of Mt. Slivinza. The lake is about 6 m. long, and between 2 and 3 broad, is surrounded with numerous villages, chapels, and castles, contains four small islands—on the largest of which is built the hamlet of Ottok—and has no surface outlet. It is about 56 ft. deep in the deepest part, and is very irregular in shape. It is worthy of notice only on account of the very remarkable phenomenon of the occasional disappearance of its waters for several weeks, and even months, during which the bottom is often covered with luxurious herbage, which the peasants make into hay; sometimes also they manage even to sow and reap a

small crop of buckwheat in its deserted bed. The waters, however, are not perfectly regular in their disappearance—indeed, sometimes for five or six years together they have not retired at all—but generally they drain off in the end of August, and return, if the season be wet, in five or six weeks. It takes between 20 and 25 days to empty the lake, but the return of the waters is sudden and unexpected, its basin being refilled sometimes in 24 hours. The phenomenon is accounted for by the nature of the bed of the lake. It is composed of limestone, and, like all the Carniolaic plateau, is full of deep fissures and caverns, through which the waters disappear at irregular intervals, returning when the rain sets in. Some of these openings are 50 ft. deep, and the chief ones are known to the peasantry by particular names. They communicate with subterranean reservoirs, penetrating the interior of the surrounding mountains, through which the waters are replenished or drawn off. There are 12 of these openings which discharge water into the lake as well as draw it off, and 28 which draw it off only. Through the former of these the water pours in after rainy weather as from a spout. When the surface of the lake reaches the caverns of Velka-Karlanza and Malka-Karlanza, the waters are discharged by these into the valley of St. Canzian, and after disappearing several times, fall into the Unz, above Planina. Sometimes, however, the volume of water is so great that these caverns prove insufficient to carry it off, when the lake overflows and covers the neighboring country, sometimes submerging villages. In 1834, the lake was drained in January, and remained perfectly dry till the end of February, 1835, a circumstance without parallel since the time that any records of its history have been kept. The lake is pretty well stocked with fish, and at certain times is the resort of great numbers of waterfowl, which afford both sport and profit.—There is a small village of the same name on a small stream that falls into the n. side of the lake.

ZISKA,* or **ZIZKA,** JOHN, of Trocznov, the famous leader of the Hussites, was b. at Trocznov, in the circle of Budweis, Bohemia, about 1360. His family being noble, he became a page to king Wenceslas of Bohemia, but his gloomy and thoughtful temperament unfitted him, while yet a mere boy, for the frivolous occupations about court; so, embracing the career of arms, he served as a volunteer in the English army in France, and afterward joined king Ladislas of Poland with a body of Bohemian and Moravian auxiliaries, and greatly distinguished himself in the war against the Teutonic knights, deciding the dreadful battle of Tannenberg (in which the grand master and 40,000 knights were left dead on the field) by desperate charges at the head of his contingent. High honors were heaped upon him by the king; but the war (in which Ziska had lost his right eye) being now over, his restless spirit led him to join the Austrians against the Turks, and subsequently the English against the French; and returning to Bohemia soon after the murder of John Huss (q.v.), he became chamberlain to king Wenceslas. Ziska was an adherent of the Hussite doctrine; and the tragical fate of its apostles, and the tyrannical cruelties exercised by the imperial and papal officers on its adherents, excited in his mind the liveliest indignation and resentment. A widespread sentiment of a similar kind, originating as much from patriotic as from religious feelings, existed in the kingdom; and a powerful party was soon formed, which urged upon the king a policy of resistance to the decisions of the council of Constance. Ziska soon became prominent among the leaders of this party, and his personal influence with the king gained for it the latter's sanction to offer resistance, though the king's vacillating disposition incapacitated him from giving effect to his own honest convictions and taking open part with his subjects against their oppressors. After the outbreak at Prague (July 30, 1419), in which the violent behavior of the Catholics was avenged by the precipitation of 13 magistrates from the council windows, Ziska was unanimously chosen leader of the Hussites, and the first great religious conflict of Germany was commenced in earnest. The shock produced by news of this outbreak was fatal to Wenceslas, and his death gave more of a political character to the contest, as when his brother, the emperor Sigismund (the same who had allowed his safe-conduct to Huss to be violated), attempted by advancing an army of 40,000 men into the country to obtain the throne, his project was frustrated for a time by the Hussites, who insisted on their religious and political liberties being secured, and totally defeated his army with a hastily levied force of not more than 4,000. On the retirement of the imperialists, Ziska completed his conquest of Bohemia by the capture of the castle of Prague in 1421 (the town had been taken in the spring of 1420), and secured his hold of the country by the erection of fortresses, chief of which was that of Tabor, whence his party derived its name of *Taborites* (q.v.). The varied experience acquired by Ziska in foreign warfare was now of immense service to his party: his followers were armed with small fire-arms (then little known); and his almost total deficiency in cavalry was compensated for by the introduction of the *wagenburg* (or "cart-fort," constructed of the baggage-wagons), to protect his little army from the charges of the mail-clad knights. Numerous other inventions and ingenious contrivances mark Ziska's brief career as leader of the Hussites, and show his eminent qualities as an engineer and a general. In 1421, he lost his remaining eye at the siege of the castle of Rabi; but though now totally blind, he continued to lead on his troops to a

* It is often stated that John of Trocznov was called Ziska on account of his being "one-eyed," but this is erroneous; Ziska was the name of the family for generations before his time, nor does it signify "one-eyed" in either the Bohemian or the Polish language.

succession of victories almost unexampled in history—the list of 13 pitched battles fought by him, always with much inferior force, including only one defeat, and that so much resembling a drawn battle, that his opponents dared not molest his retreat. His greatest achievements were the rout (Jan. 18, 1422) of Sigismund's second invading army, which was driven into Moravia, and 2,000 men of it drowned in attempting to escape across the frozen Iglau; and his great victory at Aussig, over the German crusading army, commanded by Frederick the Warlike of Saxony, and the elector of Brandenburg. In the latter conflict, the furious onset of Ziska's troops was steadily sustained by the Saxons, who were choice troops, and the fanatic Hussites recoiled in astonishment at a successful resistance which they had never before encountered. Ziska, apprised of the circumstances, approached on his cart, thanked his men for their past services, adding, "and if you have now done your utmost, let us retire." Thus stimulated, they made a second charge still more furious than before, broke the Saxon array, and left 9,000 of it dead on the field. Sigismund was now convinced that the conquest of Bohemia was impossible, and after a time proposed an arrangement with the Hussites, by which full religious liberty was allowed; and Ziska, who had an interview with the emperor on the footing of an independent chief, was to be appointed governor of Bohemia and her dependencies. But the war-worn old chief did not live long enough to complete the treaty, for, while besieging the castle of Przibislav, he was seized with the plague, and died Oct. 12, 1424. He was buried in a church at Czaslav, and his iron war-club was hung up over his tomb. A foolish story was long current that, in accordance with Ziska's express injunctions, his skin was flayed off, tanned, and used as a cover for a drum, which was afterward employed in the Hussite army; in order that even when dead he might be a terror to his enemies.

The only accusation which can with justice be made against Ziska is on the ground of excessive cruelty, the victims being the monks and priests who fell into his hands. But atrocious cruelties were practiced on the Hussites, and it was not to be expected that the weaker party should set an example of moderation.

ZITHER, the cithern, the modern representative of the ancient *cithara*, is a popular and common instrument in Tyrol, and of late years has become more widely known. It is a flat stringed instrument, having a wooden frame and flat sounding-board, with brass strings. When to be used it is placed on a table or on the knees, and the strings are played by the right hand, the thumb being armed with a metallic *plectrum* to bring out the melody more prominently. Latterly a good deal of music has been composed expressly for the zither, the tone of which is clear, keen, but melodious.

ZIT'TAU, a t. of Saxony, 49 m. s.e. of Dresden, and 69 by railway, is situated near the Bohemian frontier. The town has many churches, the most notable of which is the Byzantine church of St. John, finished in 1836; a splendid court-house, one of the finest in Saxony, erected 1844; a good library of 12,000 vols.; a gymnasium, a normal, a free, an industrial, a Catholic, an infant, and other schools; several charitable institutions—as a work-house, infirmary, asylum for orphans, etc. Zittau is the center of the linen and damask manufacture of Saxony. There are also woolen manufactures, bleachfields, dye-works, paper, oil, and saw mills, and iron-foundries. Its position on the railway into Bohemia led the Prussians to make it a center of operations during the war of 1866. Pop. '80, 22,473; '90, 25,394.

ZLATOUST', or KLIUCHI (Golden Mouth), a t. of Russia in the government of Ufa, among the Ural mountains, about 150 m. n.e. of Ufa, on the river Ufa. It consists chiefly of wooden houses, and the inhabitants are mostly miners. It is the center of the iron and gold mines of the district. There is a brisk trade. There is an extensive manufactory of sword blades, which are considered the best in the empire; other articles of inlaid and embossed steel are also manufactured. Pop. '91, 21,105.

ZMEINOGORSK, or ZMIEF, a t. of Siberia, in a mountainous district of the government of Tomsk, upward of 350 m. s.w. of the town of Tomsk, on the river Smievka. The town is situated in the vicinity of one of the most productive silver-mines in Siberia, which was discovered in 1736, and belonged to the Demidoff family till 1745, when it became crown property. Since its discovery it has yielded nearly a half of all the silver produced by the Siberian mines. Pop. '91, 5899.

ZNAIM, or ZNAYM, a t. of the Austrian empire, in Moravia, on a rising ground close to the left bank of the Taja, 48 m. n.n.w. from Vienna. It is celebrated for the conflict which took place here between the French and Austrians, on June 14, 1809, in which the French were victorious (see WAGRAM). There are manufactures of leather, saltpeter, earthenware, and vinegar. Near it is a circular church, supposed to be as old as the 12th century. Pop. '90, 14,516.

ZOAN, one of the oldest cities of Egypt, on the eastern side of the Tanitic branch of the Nile. It was once the residence of the Pharaohs, and, in the Psalms, the field around it is described as the scene of God's marvelous works in the time of Moses. The destruction which Ezekiel foretold long since came upon it. The "field" is a barren waste. The royal city is a habitation of fishermen, and a resort of wild beasts and reptiles. The surrounding space, for nearly a mile square, is covered with mounds of great height and full of broken pottery. The area, within which the sacred inclosure

of the temple stood, is about 1500 ft. by 1250, surrounded with the mounds of fallen houses raised above it by successive elevations. There is a stone gateway to the inclosure which bears the name of Rameses the Great. Even in their ruinous condition the broken walls, columns, and 10 or 12 fallen obelisks attest the ancient splendor of the building to which they belonged; and with them are joined two black statues and a granite sphinx. The obelisks are all of the time of Rameses, 1355 B.C., and his name most frequently occurs; but the ovals of Osirtasen III., and of other kings also, have been found: and as his time goes back nearly to that of Joseph, the scriptural account of the antiquity of the city is confirmed. The wretched village *San* keeps barely alive the Arabic version of the name. See EGYPT.

ZOAR, one of the most ancient cities of Palestine, originally called Bela or Bala. It was one of the five cities of the plain of Jordan, and though doomed with the others to destruction, it was spared, at Lot's intercession, to afford him a refuge. In the account of the death of Moses it is mentioned as visible from Pisgah, and it was known in the time of Isaiah and Jeremiah, as appears from allusions to it in their prophecies. Its exact location is unknown. It was certainly in the vicinity of the other four cities —viz., in the "plain" or "circle" of the Jordan—and the narrative implies that it was near Sodom. As the plain of Jordan was on the n. side of the Dead sea, these cities must have been there instead of at the southern end of the lake as is commonly supposed. Eusebius and Jerome describe Zoar as having many inhabitants and a Roman garrison in their day. Stephen of Byzantium calls it a large village and fortress. It is spoken of as the seat of a bishop. The crusaders found it under the name Segor, and describe it as pleasantly situated and having many palm-trees. Abulfeda frequently mentions Zoghar as a place adjacent to the Dead sea.

ZO'BO, a hybrid between the yak (q.v.) and the common ox of India. It is not very unlike an English ox. It is common in the western parts of the Himalaya, and is valued as a beast of burden, as well as for its milk and its flesh.

ZÖCKLER, OTTO, a Lutheran theologian, b. 1833, in Grünberg, Hesse, studied at Giessen, Erlangen, and Berlin and became a professor at Giessen in 1863 and Greifswald in 1866. His works are numerous, including commentaries on Chronicles, Job, Proverbs, and *Das Kreuz Christi* (1875; translated into English in 1877); *Die Lehre vom Urstand des Menschen* (1879); *Gottes Zeugen im Reich der Natur* (1881); *Studies in the Bible and in Church History* (1893), etc.

ZO'CLE, or SOCLE, a square plain plinth under the base of a column.

ZO'DIAC (Gr. *zodiakos*, commonly derived from *zoön*, an animal), the name given by the ancients to an imaginary band extending round the celestial sphere, having as its mesial line the ecliptic or apparent path of the sun. It was fixed at about 16° in width, for the purpose of comprehending the paths of the sun and of the five planets (Mercury, Venus, Mars, Jupiter, and Saturn) which were then known; and as, of these planets, Mercury has by far the greatest inclination of orbit to the ecliptic, and the value of that element in his case is only 7° 0′ 9″, the width given to the zodiac was amply sufficient for the required purpose. But when the career of planetary discovery commenced in the beginning of the 19th c., the first three which were discovered (Ceres, Pallas, and Juno) at once destroyed the idea which had been long seated in men's minds, that no planets existed beyond the limits of the zodiac, by exhibiting orbits inclined to the ecliptic at no less angles than 10° 36½′, 34° 42⅜′, and 13° 3⅛′; and a large number since observed have been found to wander from 0° to 18° beyond the zodiac, from which circumstance they have, along with the three above mentioned, been denominated *ultra-zodiacal* planets. The stars in the zodiac were grouped into 12 constellations, to each of which 30°, or $\frac{1}{12}$th of the whole circle, was assigned, though it often did not fill up that space, but was only situated in it; and this equable division into *signs* was of great advantage in defining the positions of the sun and planets at any epoch.

The constellations, with the appropriate symbols of the corresponding signs, are as follow:

Aries (*Ram*) ♈	Libra (*Balance*) ♎
Taurus (*Bull*) ♉	Scorpio (*Scorpion*) ♏
Gemini (*Twins*) ♊	Sagittarius (*Archer*) ♐
Cancer (*Crab*) ♋	Capricornus (*Goat*) ♑
Leo (*Lion*) ♌	Aquarius (*Water-bearer*) ♒
Virgo (*Virgin*) ♍	Pisces (*Fishes*) ♓

As one half of the ecliptic is to the n., and the other to the s. of the equator, the line of intersection of their planes is a diameter of each, and the two points in which this line meets the celestial sphere are known as the equinoctial points. The comparative immobility, with respect to the ecliptic, of these points, suggested at once the employment of one or other of them as a point from which to reckon, and accordingly that point at which the sun crosses the equinoctial from s. to n. was fixed upon, and called the first point (or commencement) of Aries. After the sun had advanced eastward through this sign—i.e., 30° along the ecliptic—he entered the sign of Taurus, continuing his course onward through the others in the order in which they are given above, again crossing the equinoctial southwards at the point where he emerged from Virgo

and entered Libra. This was the case with the sun during the time of Hipparchus (q.v.), but though the equinoctial points move very slowly, yet they do so with great uniformity, and the westerly motion of 50″ annually which they describe along the ecliptic has at the present time separated the sign Aries from the constellation Aries, and caused the former to correspond almost to the constellation Pisces. This gradual retrogression of the signs through the constellations of the zodiac will continue till they accomplish, in about 25,868 years, a complete circuit; after which period the sign and constellation of Aries will coincide, as they did in the time of Hipparchus. Neither the zodiac nor its constellations are of much use now in astronomy, except as, like the other constellations, affording an easy though somewhat fantastic nomenclature for the stars, and a rude but sometimes convenient mode of reference to their positions.

The porticos of the temples of Denderah and Esne in Egypt, have representations of the zodiacal constellations, which are of great antiquity, and have formed a fruitful theme of discussion. M. Dupuis, in his *Origine des Cultes*, has, from a careful investigation of the position of these signs, and calculating precession at its usual rate, arrived at the conclusion that the earliest of them dates from 4000 B.C. This conclusion is controverted by M. Fourier, in his *Recherches sur les Sciences, etc., de l'Egypte*, who makes the representations at Esne 1800 years older than the other; but his hypothesis has been in turn overthrown by MM. Ideler and Biot. The truth seems to be that nothing is as yet definitely known respecting these ancient representations; for the manner in which the investigations have been mixed up with the Biblical question of the antiquity of man, has prevented any truly scientific research. The Greeks would seem to have borrowed their constellations from the Egyptians and Babylonians, and this is corroborated to some extent by occasional remarks in Greek writers as to the positions of various constellations at certain times, which positions are inconsistent with the supposition of the observer being in Greece. The zodiacal figures of the Hindus, ancient Persians, Chinese, and Japanese have such a remarkable resemblance to those of the Egyptians, that there can be little doubt as to their common origin.

ZODI'ACAL LIGHT is the name given to a singular appearance seen after sunset or before sunrise, at all seasons of the year in low latitudes, but rarely in this country, except in March, April, and May in the evenings, and six months later in the mornings. It is obviously due to illuminated (partly, perhaps, self-luminous) matter surrounding the sun in a very flat, lenticular form, nearly coinciding with the plane of the ecliptic, or rather with the sun's equator, and extending to a distance from the sun greater than that of the earth, since its apex is often seen more than 90° from the sun. It seems to have been first distinctly pointed out by Cassini, and was long regarded as the sun's *atmosphere*. This idea, however, is totally irreconcilable with mechanical principles; since, to assume so flat a form, in spite of the enormous attraction of the sun, and its own elasticity, an atmosphere would have to revolve with a velocity so great as to dissipate it into space. The only conceivable explanation of the phenomenon is, therefore, to be found in supposing it to consist (like the rings of Saturn) of an immense assemblage of small cosmical masses, rocks, stones, and pieces of metal, such as are continually encountering the earth in the form of aerolites or meteorites. For the dynamical stability of such a system, it is only necessary that each fragment should separately describe its elliptic orbit about the sun. The mutual perturbations of the system, on account of the enormous mass of the sun, will be exceedingly small, except in the case of actual collision; but some of the planets will have a considerable effect upon it. That this is the true explanation of the phenomenon, is now generally believed. Some very curious recent observations on the August and November meteorites of 1866 (see METEORS) have shown that these bodies move in orbits almost exactly the same as those of two known comets. The comet, then, is merely that portion of the ring of small masses, revolving all nearly in the same orbit, where the greatest number are, for the time collected: and it is possible that to the collisions, which must most frequently occur where the separate particles are most numerously grouped, are due the spectral phenomena of incandescent gases which have been observed in the heads of comets by Huggins and others. Such speculations, were this the place to pursue them, might easily be extended to the sudden production and changes of form, of the tails of comets which occur near perihelion, for there the separate masses must necessarily be much more crowded together, and their impacts must be increased both in number and violence.

ZO'ETROPE, or WHEEL OF LIFE, an optical instrument, so named from its exhibiting pictures of objects as if endowed with life and activity. Although only of late years introduced from America, under this name, the instrument itself, which is simply a cylindrical thaumatrope, was invented and made the subject of a patent so long ago as the year 1860. Mr. Peter Hubert Desvignes, the inventor, in his published specification, has very fully described various modifications of the cylindrical thaumatrope; and the instruments which, under the name of mimoscope, he contributed to the London exhibition of 1862, being furnished with pictures of exquisite artistic finish and beauty, were deservedly rewarded with "honorable mention." Mr. Desvignes also proposed a stereoscopic form of the instrument, in anticipation of the one already described under ster-

oscope (q.v.), and has employed models, insects, and other objects, instead of pictures, with perfect success. The truly marvelous results shown in this instrument depend, primarily, on the well-known fact that vision "persists" for a certain short interval of time after the occlusion of the visual ray. It follows from this principle that if a series of pictures, representing the different attitudes successively assumed by an object in completing a given movement, be presented to the eye so quickly that the visual impression of each picture shall continue until the incidence of the one next following, the object will remain constantly in view, and its various parts will appear to execute the movement delineated by the pictures. To avoid the grotesqueness of a number of groups all seen performing the same movement at the same time, Mr. Desvignes devised the thaumatrope, in which the cylinder turns upon a horizontal axis, and by means of an aperture at the bottom of a hood the sight is limited to the space occupied by a single group on the opposite side of the cylinder, and, both eyes being brought into consentaneous activity, the clearness and pleasantness of the illusion are greatly enhanced. In this arrangement, the groups are arranged, on the strips, one above another, and not side by side, as in the former; and they are perforated with apertures to correspond with those on the cylinder. As has been pointed out by Mr. Desvignes, the width of the apertures should never exceed one-sixteenth of an inch; and the exterior of the instrument should be painted mat black.

The effect of the apertures, in this regard, is twofold, they limit the *time* during which each group is pictured upon the retina; and they limit, or should be made to limit, the *quantity* of each group at any one instant so depicted. Obviously, if the view be *instantaneous* only, the group in that minute interval of time will not have moved to a *perceptible* degree, and will therefore appear stationary. It is for this reason that the apertures should be made very narrow (not exceeding one-sixteenth of an inch, as above stated), and then, the eye being placed close to them, the retinal images will not be slurred —as with wider apertures, and consequent increased motion of the pictures while under view, they would be—and the maximum of *definition* is thus attained. But, in this case, both the quantity of light reaching the eye, and the time of its operation, are insufficient, which defects can only be compensated by setting the instrument in violent motion, thus occasioning an inconveniently rapid recurrence of the retinal impressions. Instead, therefore, of letting the whole picture be seen for a *single* instant, let us increase the total time of visibility by arranging that successive small portions of the pictures shall be seen in *successive* instants. This is effected by withdrawing the eye a few inches from the aperture; for the eye being at the apex of the visual angle, the further it is removed from the aperture, the greater is the distance *within the visual angle* through which the aperture must travel; and prolonged in a like degree will be the *total time of visibility* for each picture. But here another difficulty is evoked, manifesting itself in one of the most puzzling phenomena of this curious instrument. The pictures are seen as *sensibly diminished in breadth*, the explanation of which is as follows: The longer the time of visibility, the greater will be the onward movement of the picture while under view; therefore, if the left-hand side of the picture come first into view, by the time the advance of the aperture permits of the right-hand side being seen, the latter will have progressed *toward* the left, and it will accordingly be seen relatively nearer to the left side than is its natural position. And this compression, of course, takes effect over the whole of the picture. In the exquisitely elaborate drawings prepared by Mr. Desvignes, this compression was allowed for, to the great enhancement of the effect.

Lastly, of the effects due to the pictures themselves. If the pictures on the strip be the same in number as the apertures, the pictures will either coincide with the apertures, in point of position, or will be equidistant, each from its adjacent aperture; in which case there will be no apparent shifting of the pictures either to right or left. But if there be 12 pictures and 13 apertures, the picture-interval will be greater than the aperture-interval, and only one picture on the strip can be coincident with an aperture; the rest will be situated in advance of the apertures, each succeeding one slightly more than its predecessor; and, as a consequence, seen through the apertures of the revolving cylinder, they will appear continuously to advance. The contrary will be the case, if the number of the pictures exceed that of the apertures.

There are a number of instruments which operate on practically the same principle as the zoetrope, such as the kinetoscope, vitascope, cinematograph, etc. The kinetoscope, like the zoetrope is adapted for only a single observer, while the vitascope projects its views upon a screen. The pictures in all of the modern instruments are taken by instantaneous photographic exposures on a long film. In the vitascope the film travels across the field just as in the kinetoscope, but behind it is placed an electric focussing lamp, and in front a projecting lens of short focus, which throws an enlarged image on the screen. The cinematograph is identical in principle to the vitascope, and differs from it only in some details of construction.

ZOGBAUM, Rufus F., artist and author. He was born in Charleston, S. C., August 28, 1849. At the age of 29 he became a student at the Art Students' League in New York, where he remained two years. He then went to Paris where he completed his studies under the direction of Léon J. F. Bonnat. Having a fancy for the field of warfare, he studied the great armies of Europe in field and garrison, and became known as the delineator of military subjects. In 1884 he wrote and illustrated a series of arti-

cles in *Harper's Monthly*, which attracted much attention. In 1887 he published a book containing them, with some additions, under the title of *Horse, Foot, and Dragoons*.

ZOLA, Emile, French novelist, was born at Paris in 1840, the son of an Italian engineer, who built the Canal d'Aix now called after his name. The younger Zola was educated at the Lycée St. Louis, and on leaving that institution secured a position in a library. At the age of twenty-four he entered the field of literature by publishing the *Contes à Ninon* (1864), followed in 1865 by *La Confession de Claude*, a work that attracted some attention, as did his numerous articles in the *Figaro, Vie Parisienne, Petit Journal* and other popular publications. Between 1865 and 1867 he produced *Le Voeu d'une Morte* (1866), *Mes Haines*, a collection of literary disquisitions, *Les Mystères de Marseille* (1867), and *Manet*, a biographical sketch. In the same year, his first genuine success appeared in the powerful novel *Thérèse Raquin* which at once gave Zola a definite place among the leading writers of the day. It is a gloomy and repellant work, showing all the power of analysis and minuteness of observation that characterize his later work; and has been tersely summed up by Vapereau as "adultery seeking safety in murder and finding only agony and remorse." Following this, came *Madeleine Ferat* in 1868, and finally in 1871, *La Fortune des Rougon*, the first of the wonderful series entitled *Les Rougon Macquart: Histoire Naturelle et Sociale d'une Famille sous le Second Empire*. This series aims to do for the latter half of nineteenth-century France, what Balzac did for the first half. Zola has summed up his purpose in the following words:

"I desire to explain how a single family, a little group of human beings, comes into relations with society at large, as it increases by begetting and giving birth to ten or twenty individuals who, though at first sight they seem quite dissimilar, when analyzed show how closely they are bound together; for heredity has its laws as well as mathematics. . . . The members of the Rougon-Macquart family, this one group that I propose to sketch, have as a family trait the gnawing of lust, of appetite, that rushes to its satisfaction. . . . Historically, they are a part of the people; they make themselves felt by contemporary society, and they rise to all spheres of life by that impulse, so truly modern, which the lower classes feel; and they explain thus the Second Empire by their individual histories." The works that have already appeared in this series are, *La Fortune des Rougons*, showing the rise of the family in a petty provincial town; *La Curée*, wherein the scene shifts to Paris; *Le Ventre de Paris*, a study of the low life of the Halles, a marvellous bit of local color; *La Conquête de Plassans; La Faute de l'Abbé Mouret*, a not very probable tale; *Son Excellence Eugène Rougon*, a strong picture of the court of the Third Napoleon, in which the character of Rougon is drawn from that of Napoleon's minister, Rouher; *L'Assommoir*, a tremendous piece of realism, and the one that first made Zola famous outside of France: *Une Page d'Amour; Nana* (1880), the life of a courtesan under the second empire; *Pot-Bouille*, a study of bourgeois-life (1882); *Au Bonheur des Dames* (1883); *La Joie de Vivre* (1884); *Germinal* (1885), one of his greatest works; *L'Œuvre* (1886), a rather dull book; *La Terre* (1888), a repulsive picture of the crudities of French agricultural life; *Le Rêve* (1888); *La Bête Humaine* (1890), a psychological story of homicidal mania; *L'Argent* (1891); *La Débâcle* (1892); and *Le Docteur Pascal* (1893).

The most powerful of the series are *L'Assommoir, Nana*, and *Germinal;* and of these, perhaps the second is that in which the author's original purpose is most faithfully and vividly worked out. An American critic has very admirably sketched its motive in the following passage: "In Zola's narrative, Nana, and the class of courted hetairæ which she typifies, is conceived as some fair ogress, into whose yawning and fatal cave multitudes of men in hurried and endless procession descend and are engulfed. There is room for all grades and ranks of the social hierarchy, from the Prince of Wales, who figures in the tale under the thin disguise of the Prince of Scotland, to the rudest athlete or contortionist whose salient muscles have provoked a moment's caprice. It is merely indispensable that each shall bring an offering of some kind in his hand. He that cannot defray the charge of the establishment, may pay the dressmaker; another shall furnish pin money; another trinkets and bouquets. There is a certain breadth and grandeur in her insatiate greed and comprehensive harlotry; her net drags great and small; she seems to have infected a whole city. Zola regards her triumph as a kind of hideous retribution inflicted by the crushed, mud-stained rabble, from which she sprang, on the sumptuous and insolent plutocracy. She had grown like a rank weed, he says, amid the garbage of the Parisian pavement; she has the gorged luxuriance of a plant whose turgid leaves betray the compost bed; with the superb curves of her soft flesh, she avenges the beggars and outcasts who gave her birth. With her, the cesspool which *L'Assommoir* had shown us fermenting among the poor, strikes upward and permeates the social mass, befouling and cankering the idle and affluent. She becomes a malignant force of nature, a pestiferous yeast, tainting and disintegrating Paris, turning it sour like curdled milk. In one chapter she is compared to a gold-spangled horse-fly, spawned from ordure, hovering above the carrion that lies rotting by the way-side, sucking venom from its putrescence, and poisoning the wayfarer, whose cheek it brushes with its fetid wing. Elsewhere in the volume she is pictured in her gorgeous dwelling, heaped with aimless, tasteless riches, as standing erect, arrogant, sphinx-like, with a drove of worshipers rooting, swine-like, at her feet. Like those antique monsters, says the author, whose redoubtable domain was strewn with bones, her heel rested upon skulls, and catastrophes environed her. At length the task of ruin and death is com-

pleted ; wretchedness has spent its store of venom ; Nana has exacted blood money for her bruised and smarting kindred ; the beggar and the outcast are avenged."

Besides the Rougon-Macquart series, M. Zola has published *Capitaine Burle* (1882); *Naïs Micoulin* (1883); *Un Rêve* (1888), an idyllic story in striking contrast to his other works, and written to aid his candidacy for a seat in the French Academy ; *L'Argent* (1891), and a number of critical sketches and papers of which, beside *Mes Haines*, already mentioned, we may note *La République Française et la Littérature* (1879); *Le Roman Expérimental* (1880); *Les Romanciers Naturalistes*, originally published in Russian in the *Messager d'Europe* (1881), and criticising the writers of the naturalistic school, Stendhal, Balzac, Flaubert, the Goncourts, and Daudet; *Nos Auteurs Dramatiques* (1881), *Le Naturalisme au Théâtre* (1881); *Études et Portraits* (1881), containing criticisms of Hugo, de Musset, George Sand, Dumas, and Sainte Beuve; *Une Campagne* (1882), partly literary and partly political; besides several dramatic pieces which are occasionally dramatizations of his novels. Among these are *Thérèse Raquin* (1875), *Les Héritеurs Rabourdin* (1874); *Le Bouton de Rose* (1878); *Renée* (1887); *Le Ventre de Paris* (1887). Zola's *L'Assommoir* was dramatized in English by Charles Reade under the title *Drink*, and made a most effective play with Mr. Charles Warner in the rôle of Coupeau. Our author was a candidate for a chair in the French Academy in 1888, and again in 1891, but both times failed of an election. In 1894 he published *Lourdes* and in 1896 *Rome*.

M. Zola must be credited with having founded a school, and one that has strongly influenced contemporaneous fiction. Its history and tendency are sufficiently set forth in the article Realism and Naturalism. See also French Language and Literature. The reader is also referred to Hazeltine's *Chats about Books* (1884), Moore's *Impressions and Opinions* (1891) ; and Saintsbury's *Essays on French Novelists* (1891)

ZOLL'VEREIN (Ger., meaning "customs-union"), a union of different independent German states, under the leadership of Prussia, so as to enable them, in their commercial relations with other countries, to act as one state. When, after the war of liberation in 1815, the political union, destroyed by the downfall of "the holy Roman empire," had been restored to a certain degree in the German "bund" (see Germany), internal commerce was felt to be trammeled and depressed by the collection of revenue at the frontiers of every petty state; nor was it possible, without united action, to carry out the policy in regard to foreign commerce which might be thought best for protecting and developing the native trade and manufactures. The first suggestion of such a union came from Prussia; but it took many years before an actual beginning was made, and still longer before it reached its ultimate extent, as the plan was opposed for a long time by the jealousies and special interests of many of the states.

From 1819 to 1828, only some of the minor principalities inclosed within the Prussian territories had been got to conform to the Prussian commercial system; but in 1828, Hesse-Darmstadt, and in 1831, Hesse-Cassel, gave in. This was followed, in 1833, by the accession of Bavaria, Würtemberg, the kingdom of Saxony, the principality of the same name, Schwarzburg, and Reuss; and in 1835–36, by that of Baden, Nassau, and Frankfort-on-the-Main. The adhesion of Hanover did not take place till 1851, of Oldenburg till 1852. When in 1868 Lübeck and the two duchies of Mecklenburg had joined the zollverein, its territory extended over the whole of what subsequently became the German empire, with the exception of Hamburg, Bremen, and a small part of Baden near Schaffhausen. The reichsland of Alsace-Lorraine was incorporated in 1871. The imperial constitution of April 16, 1871, recognizes and ratifies the privilege of the free ports so to remain until "they themselves demand admittance within the common customs-boundary."

The principle of the Zollverein's action was this: The whole territory embraced by the union formed commercially (in regard, at least, to countries beyond its limits) one state. The duties on exports, imports, and through transports were collected at all the frontiers of the union according to a uniform tariff (subject to some concessions, made on special grounds, to individual states); and the proceeds, after paying the expenses of collection, were divided among the members of the union in proportion to their several populations. In regard to the internal trade of the union, as the duties on articles manufactured for home consumption were different in the different states, a complicated system of drawbacks came into play, in order to put the commerce of all on an equal footing.

The treaty of union was agreed upon for a definite period of years, and was renewed from time to time; as in 1842, 1853, 1865, 1867. In the latter year much was done to simplify the relations of the various states to one another in respect of internal trade; and the administration of the Zollverein was so modified as to give to the various members of the union votes in its council and parliament proportionate to the number of inhabitants in each state.

Since the establishment of the German empire, the Zollverein has no longer a separate constitution of its own. Its council (representing governments) is merged in the federal council of the empire; its parliament (representing populations) in the reichstag. Affairs are managed on the principles adopted by the Zollverein in 1867, by permanent committees of the federal council—viz., those for customs and taxes, for trade and commerce, and for finance.

The net income of the Zollverein, which, in 1834, amounted only to 12,178,761 thalers, had risen in 1871, the last year in which the Zollverein had separate accounts, to 28,000,002 thalers (above $20,000,000).

ZONES (lat. *zona*, a girdle), portions of the earth's or of a planet's surface, chiefly in form of belts or girdles, divided by parallels of latitude which are defined by the inclination of the plane of the planet's equator to that of its orbit, or ecliptic. The plane of the earth's equator is inclined to that of its orbit, 23½°, and when the planet is at the summer solstice (21st of June), the sun's rays fall perpendicularly upon that parallel of latitude (the tropic of Cancer), which is 23½° n. of the equator. Conversely, at the winter solstice (22d of Dec.), the sun's rays fall perpendicularly upon that parallel called the tropic of Capricorn, which is 23½° s. of the equator. The belt thus defined, lying between the tropics, and having a breadth of 47° (23½x2), is called the torrid zone. Now, when the sun's rays are vertical to the tropics, and the sun always pours his vertical rays over some portion of it, they will be tangent to certain parallels (polar circles) lying 23½° from the poles, throwing that portion of the earth's surface bounded by one of these circles into shadow, and continually shining upon that portion bounded by the other. These circles define the boundaries of the frigid or polar zones. Lying between these and the torrid zone there are, therefore, two belts (one in each hemisphere) bounded by the tropics and the polar circles, each 43° in breadth, called respectively the n. temperate and s. temperate zone. Over some portion of their surfaces the sun always shines, but never vertically. The zones, therefore, are not bounded by arbitrary but by natural fixed lines, although in the ordinary, non-geometrical sense, they are imaginary. Connected with these natural divisions of the earth's surface are the phenomena of the seasons and climate, and of length of day and night. See SOLSTICE, SEASONS, and CLIMATE. Let us consider here the zones of a planet whose equatorial inclination is much less than the earth's. The inclination of the plane of Jupiter's equator to that of his orbit is only 3°; consequently, the tropics defining the torrid zone, that belt is only 6° wide, and the frigid zones each the same, while the temperate zones are each 84° in breadth. This condition is theoretical. Practically, if Jupiter received most of its present heat from the sun, as the earth does, and had real seasons, and supported life, there would be a series of sub-torrid and also of sub-frigid zones lying on either side of the really temperate zones. The length of day and night varies but little on Jupiter except near the poles, at which points the days and nights are alternately six of our years long, the planet making its revolution round the sun in twelve of our years, but the nights cannot be dark. The seasons, if there were any practically, would vary but little in one latitude. There would be continual summer within, and to a considerable distance beyond the tropics; continual spring further beyond, and still further continual winter.

ZOOLOGICAL STATIONS, places on the sea-coast at which institutions have been erected and furnished with all apparatus helpful in the study of zoology. The first establishment of this kind, which owed its realization to the labors mainly of A. Dohrn, was the spacious "Stazione Zoologica," founded at Naples, 1872, and opened, 1874. It is of international character, and since 1880 has received a yearly endowment of $7500 from Germany alone. The British association makes a grant and has the use of a table here. In addition to the magnificent spaces below, stocked with various kinds of sea-inhabitants, it has rooms above for the accommodation of 50 students, provided with every desirable apparatus. Institutions of a similar kind, but on a much smaller scale, have since been set up at Trieste, Boulogne, at Concarneau (Brittany), and Marseilles at Archangel, Russia, and at Newport, R. I.

ZOOLOGY (Gr. *zōon*, an animal, and *logos*, a discourse), the science which has for its subject the animal kingdom (q.v). This science, itself a branch of natural history (q.v.), is divided into a number of branches, which are often pursued as distinct sciences, the subject being too large to be thoroughly studied except in this manner; although it is also necessary that the results of investigation in particular departments should be brought together, so that the animal kingdom may be viewed as a whole, and the relations of the most widely different groups of animals to each other determined. The number of species of animals is far greater than that of plants, and the diversity among them is also greater, so that a division of the science of zoology into branches relating to different groups very naturally takes place. Thus, the branch of zoology which has the *mammalia* for its subject has been called *mazology* (Gr. *mazon*, a teat), an unhappily chosen and essentially incorrect term, which has not come into general use; and it is a curious circumstance that this, which may be called the highest branch of zoology, has no popularly received name. It is otherwise with the branches of zoology relating to the inferior classes of *vertebrata;* that which has *birds* for its subject is universally known as *ornithology* (q.v.); that which relates to *reptiles* is *herpetology* (q.v.), and the subordinate branch relating to serpents is sometimes called *ophiology;* that which relates to *fishes* is *ichthyology* (q.v.). Among *invertebrate animals* the great group of *mollusca* is the subject of the science of *malacology* (q.v.), although this term is not in such general use as some of those already mentioned; and when shells rather than the animals which bear them are considered, the term *conchology* (q.v.) is employed. No particular term is commonly applied to the branches of zoology which treat of the *crustacea*, *arachnida*, etc.; but that which relates to *insects* is universally known as *entomology* (q.v.), and the term *helminthology* (q.v.) is employed to designate that which has *worms* for its subject. No similar terms are used for the branches of this science which relate to other groups of *invertebrata.*

The science of zoology, however, divides itself into distinct sciences, not only in accordance with the divisions of the animal kingdom, but also with regard to particular branches of the subject which may be studied either in relation to animals generally or to any particular species. Thus, *anatomy* (q.v.) may be regarded as a branch of zoology,

when the term zoology is taken in its largest sense, as including man along with the inferior animals, and *ethnology* (q.v.) must in like manner be considered as belonging to it. The anatomy of the inferior animals is sometimes called *zootomy*, and the term *comparative anatomy* is employed when their structure is studied in relation to that of man, and the structure of one division of the animal kingdom in relation to that of the others. *Physiology* (q.v.) is one of the most important branches of zoology; and with it that branch of chemistry which treats of animal substances is closely connected. A very interesting branch of zoology is that which relates to the habits and instincts of animals It can hardly be said to have been constituted into a separate science, but has received much attention from those naturalists who have devoted themselves to the study of particular groups of animals. See Animal and Animal Kingdom.

We have no evidence that the study of zoology was prosecuted to any considerable extent before the time of Aristotle. In his hands it became at once a science, and the foundations of a system of classification were laid. No artificial system of classification has ever been proposed in zoology, like the sexual system of Linnæus in botany; but from the very first to the present day a natural grouping of animals has always been attempted. To this the widely marked distinctions between the principal groups almost unavoidably led. Aristotle brought to bear upon the subject the highest powers both of observation and of generalization, and some of the groups established by him still retain their place in the most modern systems. Aristotle divided the whole animal kingdom into two great sections, the highest, *enaima*, consisting of animals having blood (i.e., red blood), and the lower, *anaima*, of animals having a colorless fluid instead of blood, the former corresponding to the *vertebrata* and the latter to the *invertebrata* of modern zoologists.

No other ancient writer deserves much notice in a historic sketch of zoology. Ælian and Pliny show no capacity for the scientific treatment of the subject, and in their writings facts are largely mingled with fables. During the middle ages zoology, like other kindred sciences, was almost completely neglected. For many centuries, the only name worth mentioning, in connection with the history of the science, is that of Albert, count of Bollstädt, commonly called Albertus Magnus; whose knowledge, however, was entirely derived from Aristotle and other ancient authors, and all he did was merely to call attention to the forgotten science, without making any contribution to its advancement. From his time, in the first half of the 13th c., to the beginning of the 16th, zoology was again almost completely neglected; but the new activity of mind which then displayed itself soon sought this as well as other directions, and an impulse was more especially given to zoology as well as to some other branches of science, by the progress of geographical discovery; curiosity being awakened with regard to the strange productions of the new world, and of the eastern and southern regions, till then equally unknown. The names of Belon (q.v.) and Rondelet are the two greatest in this department at this period, and by them zoology was enriched with many new facts, while attempts were also made at a more perfect classification. Aldrovandi and Gesner (q.v.) soon followed them, besides others who began to direct their attention more specially to particular branches of zoology, some of whom greatly extended the science by their observations on the animals of newly discovered countries. It was not till after the middle of the 17th c., however, that any real progress was made in classification, founded upon a philosophical study and comparison of animals. The works of Ray (q.v.) are described by Cuvier as "the foundation of modern zoology." The materials, however, were in great part prepared, and the first outline of a system sketched by Willughby, the friend of Ray, whom Ray long survived, and whose works he edited. From the days of Aristotle, zoology had never been prosecuted with such acuteness of observation, accuracy of description, and breadth of philosophical generalization as it was by Willughby and Ray. The progress of the science now became very rapid. Buffon won for it, by his interesting descriptions and brilliant style, the general attention of the educated portion of society, not only in his own but in other countries, and was almost immediately followed by Linnæus, who, extending his studies from botany to zoology, not only extended the science by his own observations and discoveries, but rendered it far greater service by gathering together the facts ascertained by others, and by the improvement which he effected in classification. Some of the larger groups established by Linnæus have been retained by all subsequent naturalists without essential modification of their characters, and even his smallest groups—genera—have been very generally retained, although now regarded as constituting tribes or families. According to the Linnæan system, the animal kingdom is divided into six great classes, which are further brought together in groups of two each, as follows:

Heart bilocular, with two auricles, blood warm, red.	Viviparous.	1. Mammalia.
	Oviparous.	2. Birds.
Heart unilocular, with one auricle, blood cold, red.	With lungs.	3. Amphibia.
	With gills.	4. Fishes.
Heart unilocular, with one auricle, circulating fluid (*sanies*) cold, white.	With antennæ.	5. Insects.
	With tentacula.	6. Vermes.

The orders into which Linnæus divided these classes have, in the most important instances, been already noticed, either under the classes, or separately. It was, however, in constituting and defining the genera that Linnæus showed in the highest

degree his powers both of observation and arrangement. His labors in the lower departments of the animal kingdom were much less perfect than in the higher; but others speedily entered upon the field, and while new species of animals and their habits continued to be described, the study of comparative anatomy was also diligently prosecuted, and thus preparation was made for a more complete and philosophical system of zoology. The names of Pallas, Hunter, and Blumenbach are particularly worthy to be noticed; but more than any other, the name of Cuvier, who, like Linnæus, took a comprehensive view of the whole subject of zoology, and carried forward the work of minute observation as well as of generalization. His system of classification is rather an improvement of that of Linnæus than one fundamentally new, and it has formed a new starting-point for all further progress. The divisions, the classes, and many of the orders of Cuvier's system have already been noticed under their proper heads, so that it may be enough here to give the most general outline of the system, showing Cuvier's four great divisions of the animal kingdom, and the classes which he arranges under them.

Division I. Vetebrata	Class I. *Mammalia.*
	" II. *Aves* (birds).
	" III. *Reptilia* (reptiles).
	" IV. *Pisces* (fishes).
Division II. Mollusca	Class I. *Cephalopoda.*
	" II. *Pteropoda.*
	" III. *Gasteropoda.*
	" IV. *Acephala.*
	" V. *Brachiopoda.*
	" VI. *Cirrhopoda.*
Division III. Articulata	Class I. *Insecta* (insects).
	" II. *Crustacea.*
	" III. *Arachnida.*
	" IV. *Annelida.*
Division IV. Radiata	Class I. *Echinodermata.*
	" II. *Entozoa.*
	" III. *Acalephæ.*
	" IV. *Polypi.*
	" V. *Infusoria.*

The system of Cuvier has been modified by Lamarck, Virey, Duméril, De Blainville, F. Cuvier, and others; and in consequence of the progress of scientific discovery, more considerable changes have recently been proposed by eminent naturalists, some of them amounting almost to a reconstruction of the greater part of the system; while in particular departments, and especially those which contain the lower forms of animal life, Cuvier's arrangement, regarded by himself as merely provisional, may be said to have already become completely antiquated.

A complete system of the animal kingdom has been proposed by Agassiz. He adopts the four great divisions of Cuvier, but makes much change in the subdivisions, acknowledging, however, that much is still uncertain, and that a satisfactory arrangement must depend upon anatomical and embryological researches yet to be made. The following is an outline of his system:

Division I.—Radiata.

Class I. *Polypi*	Order 1. *Actinoideæ.*
	" 2. *Halcyonodieæ.*
" II. *Acalephæ*	Order 1. *Hydroideæ* (including *siphonophoræ*).
	" 2. *Discophoræ.*
	" 3. *Ctenophoræ.*
" III. *Echinodermata*	Order 1. *Crinoideæ.*
	" 2. *Asteroideæ.*
	" 3. *Echinoideæ.*
	" 4. *Holothuridæ.*

Division II.—Mollusca.

Class I. *Acephala*	Order 1. *Bryozoa* (including the *vorticellidæ*)
	" 2. *Brachiopoda.*
	" 3. *Tunicata.*
	" 4. *Lamellibranchiata.*
" II. *Gasteropoda*	Order 1. *Pteropoda.*
	" 2. *Heteropoda.*
	" 3. *Gasteropoda* proper.
" III. *Cephalopoda*	Order 1. *Tetrabranchiata.*
	" 2. *Dibranchiata.*

DIVISION III.—ARTICULATA.

Class I. *Vermes*	Order 1.	*Trematoideæ* (including *Cestoideæ*, *Planariæ*, and *hirudinidæ*.
	" 2.	*Nematoideæ* (including *acanthocephali* and *gordiaceæ*).
	" 3.	*Annelidæ*.
" II. *Crustacea*	Order 1.	*Rotifera*.
	" 2.	*Entomostraca* (including *cirrhopoda*).
	" 3.	*Tetradecapoda*.
	" 4.	*Decapoda*.
" III. *Insecta*	Order 1.	*Myriapoda*.
	" 2.	*Arachnida*.
	" 3.	*Insecta* proper.

DIVISION IV.—VERTEBRATA.

Class I. *Myzonta*	Order 1.	*Myxinoideæ*.
	" 2.	*Cyclostomata*.
" II. *Pisces* (fishes proper)	Order 1.	*Ctenoideæ*.
	" 2.	*Cycloideæ*.
" III. *Ganoideæ*	Order 1.	*Cœlacanthiæ*.
	" 2.	*Accipenseroideæ*.
	" 3.	*Sauroideæ*.
	" 4.	*Siluroideæ*.
	" 5.	*Plectognatheæ*.
	" 6.	*Lophobranchieæ*.
" IV. *Selachia*	Order 1.	*Chimæræ*.
	" 2.	*Galeodes*.
	" 3.	*Batides*.
" V. *Amphibia*	Order 1.	*Cœcilieæ*.
	" 2.	*Ichthyodi*.
	" 3.	*Anura*.
" VI. *Reptilia*	Order 1.	*Serpentes*.
	" 2.	*Saurii*.
	" 3.	*Rhizodontes*.
	" 4.	*Testudinata*.
" VII. *Aves*	Order 1.	*Natatores*.
	" 2.	*Grallæ*.
	" 3.	*Rasores*.
	" 4.	*Insessores* (including *scansores* and *accipitres*).
" VIII. *Mammalia*	Order 1.	*Marsupialia*.
	" 2.	*Herbivora*.
	" 3.	*Carnivora*.

The three Cuvierian divisions of *vertebrata*, *mollusca*, and *articulata* have been very generally retained by systematic zoologists, without much change as to the classes or even orders of animals included in each, although it is now generally admitted that the *cirrhopoda* are not to be ranked among the *mollusca*, but, as *crustaceans*, among the *articulata;* and the *polyzoa* or *bryozoa*, formerly placed with other "zoophytes" among the *radiata*, have been removed by many naturalists to a place among the *mollusca*. Among the *radiata* of Cuvier great changes have been made; and it may be well to indicate here some of the chief of the new groups which have been proposed, and pretty generally accepted by naturalists, although their proper order and their relations to each other cannot be so well set forth as in those departments of the animal kingdom which have been more thoroughly studied. Greater importance has been assigned by recent naturalists than by their predecessors to the nervous system as a basis of classification. The lowest animals, those in which no trace of a nervous system has been discovered, have been formed into a separate division of the animal kingdom, under the names *acrita* and *protozoa* (q.v.), the latter of which has obtained general preference. Higher in organization than the *protozoa* are the *nematoneura* of Owen, having a nervous system distinctly traceable in a filamentary form, and including all the higher orders of Cuvier's *radiata*. Some groups, as *anthozoa* (see ZOOPHYTE), still occupy a doubtful intermediate place between *protozoa* and *nematoneura*. To the *articulata*, Owen has, with regard to their nervous system, given the name *homogangliata* (q.v.), and to the *mollusca* the name *heterogangliata* (q.v.). In like manner, he has recently introduced in his classification of the vertebrata the terms *hematothermal* and *hæmatocryal*, these being merely words formed from the Greek, and signifying respectively *warm-blooded* and *cold-blooded*, the former including *mammalia* and *birds*, the latter, *reptiles* and *fishes*. Further information about the recent classification of some of the lower groups of animals will be found in the article WORMS.

The system of Cuvier has been extensively modified by many subsequent anatomists; notably Lamarck, De Blainville, Ehrenberg, Owen, Milne, Edwards, Von Siebold, and by Stannius, Leuckart, Agassiz, Huxley, Hæckel, and others. The accompanying outline, while serving to give an idea of the present state of classification, must not be regarded as authoritative or final, since the rapid progress of knowledge is introducing incessant change in our conceptions of the relations of the greater groups. The reverse error must, however, be guarded against—that of supposing one classification as good as another, for each really marks a stage of progress. The taxonomy of the various groups, too, has reached a considerably greater degree of permanence. The most remarkable waves of progress in Z., since Cuvier have been due at first to the morphological impulse of Geoffrey St. Hilaire; to the prosecution, in the light of the cell-theory, of the study of the simplest forms of life, and of the minute structure of the higher animals; to the pursuit of embryology under Von Baer (q. v.) and his successors; and finally, in the highest degree, to Darwin's labors, in the regions both of observation and of theory. Influenced by the theory of evolution (see Darwinism; Man; Species; Geographical Distribution of Animals, etc.), and aided by embryology, the zoologist now seeks to arrange his forms in series which should not merely represent resemblance of adult structure, but should also indicate as nearly as possible the lines of descent by which he believes these forms to have originated. Thus various recent authors, notably Hæckel and Semper, have constructed "phylogenetic" classifications of the animal kingdom in the form of genealogical trees; but these speculations, however ingenious and suggestive, cannot supersede the existing classifications, at least while our knowledge of embryology, and more especially of palæontology, remains so imperfect; for the line of descent has been made out with apparent certainty only in the case of a few genera, such as the horse (see Mammalia) and crocodile.

I. PROTOZOA.

Section A. Monera—Class 1. Monera.
Section B. Endoplastica—Class 2. Rhizopoda; 3. Foraminifera; 4. Helioza; 5. Radiolaria: 6. Infusoria; 7. Gregarinida.

II. PORIFERA.

Class I. Myxospongiæ; 2. Fibrospongiæ; 3. Calcispongiæ.

III. CŒLENTERATA.

Class I. Hydrozoa—
Sub-class i. Hydroida.—Order 1. Hydridæ; 2. Corynidæ; 3. Sertularidæ; 4. Campanularidæ.
Sub-class ii. Siphonophora.—Order 5. Calycophoridæ; 6. Physophoridæ.
Sub-class iii. Discophora.—Order 7. Medusidæ; 8. Lacernaridæ.
Sub-class iv. Graptolitida (extinct).—Order 9. Graptolitidæ.
Class II. Actinozoa—
Sub-class i. Coralligena.—Order 1. Zoantharia; (a) Malacodermata, (b) Sclerodermata, (c) Sclerobasica; 2. Alcyonaria; 3. Rugosa (extinct).
Sub-class ii. Ctenophora.—Order 4. Ctenophora.

IV. VERMES.

Class I. Platyelmia.—Order 1. Turbellaria; 2. Nemertea; 3. Trematoda; 4. Cestoidæ.
Class II. Nematelmia.—Order I. Nematoda; 2. Gardiacea.
Class III. Acanthocephala (*Echinorhynchus*).
Class IV. Chætognatha (*Sagitta*).
Class V. Rotatoria.
Class VI. Enteropneusta (*Balanoglossus*).
Class VII. Gephyrea.
Class VIII. Annelida.
Sub-class i. Discophora.
Sub-class ii. Chœtopoda.—Order 1. Achœta; 2. Oligochœta; 3. Polychœta (*Tubicola, Errantia*).
Class IX. Polyzoa.
Class X. Brachypoda.

V. ARTHROPODA.

Class I. Prototracheata (*Peripatas*).
Class II. Myriopoda.—Order 1. Chilognatha; 2. Chilopoda.
Class III. Insecta.
Section A. Amatabola.—Order 1. Anoplura; 2. Mallophaga; 3. Thysanura.
Section B. Hemimetabola.—Order 4. Neuroptera; 5. Hemiptera; 6. Orthoptera.
Section C. Holometabola.—Order 7. Aphaniptera; 8. Diptera; 9. Hymenoptera; 10. Lepidoptera; 11 Strepsiptera; 12. Coleoptera.

Class IV. CRUSTACEA.—Order 1. Trilobita (extinct); 2. Phyllopoda, (a) Branchiopoda, (b) Cladocera; 3. Cumacea; 4. Edriophthalmia, (a) Amphipoda, (b) Isopoda; 5. Stomatopoda; 6. Copepoda; 7. Ostracoda; 8. Cirripedia; 9. Schizopoda; 10. Decapoda, (a) Macrura, (b) Brachyura.
Class V. ARACHNIDA—Order 1. Merostomata, (a) Xiphosura, (b) Eurypterida (extinct); 2. Arthiogastra; 3. Araneina; 4. Acarina; 5. Linguatulina.

VI. ECHINODERMATA.

Class I. Echinoidea; 2. Asteroidea; 3. Ophiuroidea; 4. Crinoidea; 5. Holothuroidea; 6. Blastoidea (extinct); 7. Cystoidea (extinct).

VII. MOLLUSCA.

Class I. LAMELLIBRANCHIATA.
Section A. Dimya.—Order 1. Asiphonida; 2. Siphonida.
Section B. Monomya.
Class II. POLYPLACOPHORA.
Class III. SCAPHOPODA.
Class IV. GASTEROPODA.
Section A. Prosobranchiata.
Section B. Opisthobranchiata.
Section C. Pulmonata.
Section D. Heteropoda.
Class V. PTEROPODA.
Order 1. Thecosomata; 2. Gymnosomata.
Class VI. CEPHALOPODA.
Section A. Tetrabranchiata.
Section B. Dibranchiata.—Order 1. Decapoda; 2. Octopoda.

VIII. TUNICATA.

Class I. PERENMICHORDATA (*Apprendicalaria*).
Class II. CADUCICHORDATA.
Section A. Simplicia.
Section B. Composita.
Section C. Conserta.

IX. VERTEBRATA.

A. ACRANIATA (*Amphioxus*).
B. CRANIATA.
Class I. ICHTHYOPSIDA.
Section A. Cyclostomata.
Section B. Pisces.—Order 1. Elasmobranchii; 2. Holocephala; 3. Ganoidei; 4. Teleostei, (*a*) Physostomi, (*b*) Anacanthini, (*c*) Acantopteri, (*d*) Pharyngognothi; (*e*) Lophobranchii, (*f*) Plectognathi; 5. Dipnoi.
Section C. Amphibia.—Order 1. Urodela; 2. Anura; 3. Gymnophiona; 4. Labyrinthodonta (extinct).
Class II. SAUROPSIDA.
Section D. Reptilia.—Order 1. Lacertilia; 2. Chelonia; 3. Ophidia (extinct: 4. Crocodilia; 5. Plesiosauria; 6. Ichthyosauria; 7. Dinosauria; 8. Pterosauria).
Section E. Aves.
i. Saururæ (*Archæopteryx*).
ii. Ratitæ (*Carsores*).
iii. Carinatæ.—Order 1. Natatores; 2. Grallatores; 3. Rasores, (*a*) Gallanacei, (*b*) Columbacei; 4. Scansores; 5. Insessores or Passeres, (*a*) Dentirostres, (*b*) Conirostres, (*c*) Tenurostres, (*d*) Fissirostres; 6. Raptores.
Class III. MAMMALIA.
Section i. Ornithodelphia.—Order 1. Monotremata.
Section ii. Didelphia.—Order 2. Marsupialia.
Section iii. Monodelphia (or Placentalia).—Order 3. Edentata; 4. Ungulata (*a*) Perissodactyla, (*b*) Artiodactyla; 5. Sirenia; 6. Toxodontia (extinct); 7. Dinocerata (extinct); 8. Tillodontia (extinct); 9. Hyracoidea; 10. Proboscidea; 11. Carnivora; 12. Cetacea; 13. Insectivora; 14. Rodentia; 15. Cheiroptera; 16. Primates, (*a*) Lemuridæ, (*b*) Simiadæ, (*c*) Anthropidæ.

AUTHORITIES.—GENERAL MORPHOLOGY AND CLASSIFICATION.—Linnæus, *Systema Naturæ*; Cuvier, *Règne Animal*; Lamarck, *Historie des Anim. s. Vertèbres*; Owen, *Comp. For bibliography of special subjects, see the works of Bronn, Claus, Huxley, and Gegenbaur, above cited. See also ANIMAL AND ANIMAL KINGDOM; VERTEBRATA; MAMMALIA; BIRDS; FISHES; REPTILES; and articles on the several animals.

ZO'OPHYTE (derived from the Greek *zōon*, an animal, and *phyton*, a plant, and signifying an animal-plant) is a term which was employed by Cuvier, in the same sense as he employed *radiata*—viz., to designate the lowest primary division of the animal kingdom, which includes many animal organisms that are fixed to a definite spot of rock, shell, etc., and have the form of plants. His zoophytes included the anomalous groups of *infusoria*, *entozoa*, and *radiaria*,* the latter of which was subdivided into the *hydrozoa*, *anthozoa*, *acalephæ*, *echinodermata*, and *bryozoa*.* Subsequent writers excluded the infusoria and entozoa from the zoophytes, and left only those constructed on the radiated type. These were afterward found to present extreme differences of structure, and it became obvious that the lower forms of *hydrozoa* and *anthozoa* could not be associated with the *bryozoa*, which approximate closely to the lower mollusks. The term is now never employed by scientific naturalists.

ZO'OSPORE (Gr. *zōos*, living, and *spora*, a seed), in botany, the name given to those spores (q.v.), or seeds of acotyledonous plants, which being furnished with cilia, move spontaneously for a short time after being discharged from the spore-case of the parent plant. The motions of their cilia resemble those of the cilia on the epithelium (q.v.) of the higher animals, and on the external surface of some of the lower tribes, as *acalephæ* (q.v.). In these cases in the animal kingdom, as in this case in the vegetable kingdom, there is no appearance of volition, the motion being probably owing to changes of hygrometric or of electric condition, or of both. The purpose served by the ciliary motion in zoospores is evidently the wider diffusion of the species; and the cessation of the motion after a certain time permits the seed to become fixed, in order to germination. Zoospores are found in *characæ*, *algæ*, *fungi*, and *lichens*.

ZORAH or **ZOREAH** (Heb., *Tsorah'*, a hornet), probably the modern *Sŭr'ah*, a town in Palestine, is first known to us in Joshua xv., 33, where it is mentioned as a city of Judah. It was near the southeast corner of the tribe of Dan, and was the birthplace of Samson and the residence of Manoah.

ZORILLA Y MORAL, JOSE, poet, b. Feb. 21, 1817, at Valladolid, Spain, studied law at the University of Toledo and resided for a time in Mexico. His poem read at the funeral of Larra (Spanish author) first drew public attention to him. *Don Juan Tenorio*, a religious drama (1866), is his principal work. In 1864 an edition of his poems, in two volumes, was published in Paris, France. *Ecos de las Montañas* (1868), *Lecturas Públicas hechas en el Ateno* (1877), *Recuerdos de Tiempo Viejo* (1880), and *Traidar Inconfero y Mártir* (1882), the last an historical drama in three acts, are among his productions. D. 1893.

ZORN'DORF, a village of Prussia, province of Brandenburg, was the scene of many desperate conflicts of the *Seven Years' War* (q. v.). The Russians having for the second time been ordered by the czarina Elizabeth to invade Prussia, advanced toward Berlin, commiting frightful devastations, while Frederick the Great, with the bulk of his forces, was engaged with the Austrians in Silesia and Saxony. The Russians, under Fermor, were 50,000 strong, and easily drove before them Dohna's little Prussian army of 15,000; but Frederick being speedily apprised of this new invasion, hastened northward with such a re-enforcement as raised the army to 30,000; and after taking care, by the breaking down of bridges, etc. to cut off their retreat, engaged the invaders. The battle, which commenced at eight in the morning of Aug. 25, 1758, and lasted till evening, consisted mainly in a succession of furious charges, accompanied with a tremendous artillery-fire, and was not decided till Seidlitz, by an able movement, turned the Russian flank. The Russians, now discovering that they were nearly surrounded, fought with the utmost desperation, and ultimately both armies bivouacked on the field of battle. In the morning, however, Fermor drew off his forces, diminished by 20,000 men, 103 cannon, and 27 standards; having inflicted on the Prussians a loss of 13,000 men, 26 cannon, and a few standards. Generals Soltikof, Czernitchef, and prince Sulkowski were made prisoners by the Prussians on this occasion; and, oddly enough, the first named was the conqueror of Frederick II. in the next great battle between the two northern powers, at Kunersdorf (q.v.).

ZOROASTER, or rather ZARATHUSTRA (which in Greek and Latin was corrupted into ZARASTRADES and ZOROASTRES; while the Persians and Parsees altered it into ZERDUSHT), is the name of the founder of what is now known as the Parsee religion. The original meaning of the word is uncertain, and though there have been many conjectures formed about it, yet not one of them seems to be borne out by recent investigations. Most probably it only indicates the notion of "chief," "senior," "high-priest," and was a common designation of a spiritual guide and head of a district or province. Indeed, the founder of Zoroastrianism is hardly ever mentioned without his family name—viz., Spitama. He seems to have been born in Bactria. The terms he applied to himself are either Manthran, i.e., a reciter of Manthras; a messenger sent by Ahuramazda; a speaker; one who listens to the voice of oracles given by the spirit of nature; one who receives sacred words from Ahuramazda through the flames. His life is completely shrouded in darkness. Both the Greek and Roman, and most of the Zend accounts about his life and works are legend-

*These terms have been introduced since the time of Cuvier—the former, we believe, by Owen: and the latter by Farre.

ary and utterly unhistorical. In the latter, he is to a great extent represented, not as a historical but as a dogmatical personality, vested with superhuman or rather divine powers, standing next to God, above the archangels themselves. His temptations by the devil, whose empire is threatened by him, form the subject of many traditional reports and legends. He is represented as the abyss of all wisdom and truth, and the master of the whole living creation. "We worship"—so runs one of the prayers in the Fravardin Yasht—"the rule and the guardian angel of Zarathustra Spitama, who first thought good thoughts, who first spoke good words, who first performed good actions, who was the first priest, the first warrior, the first cultivator of soil, the first prophet, the first who was inspired, the first who has given to mankind nature, and reality, and word, and hearing of word, and wealth, and all good things created by Mazda, which embellish reality; who first caused the wheel to turn among gods and men, who first praised the purity of the living creation and destroyed idolatry, who confessed the Zarathustrian belief in Ahuramazda, the religion of the living God against the devils. . . . Through whom the whole true and revealed word was heard, which is the life and guidance of the world. . . . Through his knowledge and speech the waters and trees become desirous of growing; through his knowledge and speech all beings created by the Holy Spirit are uttering words of happiness."

In the old Yasna (see AVESTA, vol. II.) alone, he appears like a living reality, a man acting a great and prominent part both in the history of his country and that of mankind. His father's name seems to have been Pourushâspa, and that of his daughter, the only one mentioned of his children, Pouruchista. Very obscure, however, remains, even by this account, the time when he lived. The dates generally given are as follows: Xanthos of Lydia places him about 600 years before the Trojan war; Aristotle and Eudoxus place him 6,000 years before Plato; others, again, 5,000 years before the Trojan war. Berosos, a Babylonian historian, makes him a Babylonian king, and the founder of a dynasty which reigned between 2200 and 2000 B.C. over Babylon. The Parsees place him at the time of Hystaspes, Darius's father, whom they identify with a king mentioned in the Shâh-Nâmeh (q.v.), from whom, however, Hystaspes is totally distinct. This account would place him at about 550 B.C. Yet there is scarcely a doubt that he must be considered to belong to a much earlier age, not later than 1000 B.C.; possibly he was a contemporary of Moses. It is almost certain that Zoroaster was one of the Soshyantôs, or fire-priests, with whom the religious reform, which he carried out boldly, first arose. These were probably at first identical with the Vedic Atharvans (fire-priests), as indeed Zoroastrianism is merely an advanced stage of Brahmanism. The former creed, that of Ahura, by way of eminence, transformed, after the outbreak of the schism, the good beings of the latter into devils or devas; e.g., the purely Brahmanic Indra, Sharva, Nâsatya, etc.—unless it promoted them into saints and angels (yagatas). The conflict that led to this schism between the Iranians and those Aryan tribes which immigrated into Hindustan proper, and whose leaders became afterward founders of Brahmanism, sprung from many social, political, and religious causes. The Aryans seem to have originally led a nomad life, until some of them, reaching, in the course of their migrations, lands fit for permanent settlements, settled down into agriculturists. Bactria and the parts between the Oxus and Jaxartes seem to have attracted them most. The Iranians became gradually estranged from their brother tribes, who adhered to their ancient nomad life; and by degrees, the whilom affection having turned into hatred, considered those peaceful settlements a fit prey for their depredations and inroads. The hatred thus nourished, by further degrees included all and everything belonging to these devastators; even their religion, originally identical with that of the settlers. The "Deva religion" became, in their eyes, the source of all evil. Molded into a new form, styled the "Ahura" religion, the old elements were much more changed than was the case when Judaism became Christianity. Generation after generation further added and took away, until Zarathustra, with the energy and the clear eye that belongs to exalted leaders and founders of religions, gave to that which had originally been a mere reaction and spite against the primitive "Brahmanic" faith a new and independent life, and forever fixed its dogmas, not a few of which have sprung from his own brains.

It is, as already said in the article on the AVESTA, chiefly from the Gâthas that Zarathustra's real theology, unmutilated by later ages, can be learned. His leading idea was monotheism. Whatever may have caused the establishment of the dualism of gods, the good and the evil in the Persian religion—a dualism so clearly marked at the time of Isaiah that he found it necessary to protest emphatically against it—it was not Zoroaster who proclaimed it. His dualism is of a totally different nature. It was merely the principle of his speculative philosophy—a supposition of two primeval causes of the real and the intellectual world. His moral philosophy, on the other hand, moved in a triad —thought, word, and deed. There is no complete system of Zoroastrian philosophy to be found in the Zend-Avesta, any more than there is a developed Platonic system laid down explicitly in the Platonic writings; but from what is to be gathered in the documents referred to it cannot be doubted that Zoroaster was a deep and great thinker, far above his contemporaries and even many of the most enlightened men of subsequent ages. If proof were needed for the high appreciation in which he was held in antiquity, it might be found in the circumstance that even the Greeks and Romans, not particu-

larly given to overrating foreign learning and wisdom, held him in the very highest estimation, as may be seen by their reiterated praises of the wisdom of him whose name they scarcely knew how to pronounce.

With regard, then, to the first point, his monotheism, it suffices to mention that while the fire-priests before him, the Soshyantôs, worshiped a plurality of good spirits called Ahuras, as opposed to the Indian devas, he reduced this plurality to a unity. This one supreme being he called Ahurô Mazdaô (that Ahura which is Mazdao), or the creator of the universe—the Auramazda of the cuneiform inscriptions of the Achemenidian kings, the Ahurmazd of Sassanian times, and the Hormazd or Ormazd of modern Parsees. This supreme god is by Zoroaster conceived to be "the creator of the earthly and spiritual life, the lord of the whole universe, at whose hands are all the creatures. The following extract from the Gâtha (Ustavaiti) will leave no doubt on that much-contested point: "Blessed is he, blessed are all men to whom the living wise God of his own command should grant those two everlasting powers (viz., immortality and wholesomeness). . . . I believe thee, O God, to be the best thing of all, the source of light for the world. Everybody shall choose thee as the source of light, thee, thee, holiest spirit Mazda! Thou greatest all good things by means of the power of thy good mind at any time, and promisest us, who believe in thee, a long life. I believe thee to be the powerful holy god Mazda! for thou givest with thy hand, filled with helps, good to the pious man, as well as to the impious, by means of the warmth of the fire strengthening the good things. From this reason, the vigor of the good mind has fallen to my lot. . . . Who was in the beginning the father and the creator of truth? Who showed to the sun and the stars their way? Who causes the moon to increase and wane, if not thou? . . . Who is holding the earth and the skies above it? Who made the waters and the trees of the field? Who is in the winds and in the storms, that they so quickly run? Who is the creator of the good-minded beings, thou wise? Who made the lights of good effect and the darkness? Who made the sleep of good effect and the activity? Who made morning, noon, and night?" Ahuramazda is thus to Zoroaster the light and the source of light. He is wisdom and intellect; he possesses all good things, temporal and spiritual, among them the good mind, immortality, wholesomeness, the best truth, devotion, piety, and abundance of all earthly good. All these gifts he grants to the pious man who is pure in thought, word, and deed. He rewards the good and punishes the wicked, and all that is created, good or evil, fortune or misfortune, is his work alone.

We spoke of Zoroaster's philosophical dualism, and of its having often been confounded with theological dualism, which it is certainly very far from being. Nothing was further from Zoroaster's mind than to assume anything but one supreme being, one and indivisible. But that everlasting problem of all thinking minds—viz., the origin of evil, and its incompatibility with God's goodness, holiness, and justice—he attempted to solve by assuming two primeval causes, which, though different, were united, and produced the world of the material things as well as that of the spirit. The one who produced the *reality* (gaya) is called Vohu Mano, the good mind; the other, through whom the non-reality (ajyâiti) originated, is the Akem Manô, the naught mind. To the first belong all good, true, and perfect things; to the second, all that is delusive, bad, wicked. These two aboriginal moving causes of the universe are called twins. They are spread everywhere, in God as in men. When united in Ahuramazda, they are called Cpentô Mainyus and Angrô Mainyus—i.e., white or holy; and dark spirit. It is only in later writings that these two are supposed to be opposed to each other, not within Ahuramazda, but without—to stand, in fact, in the relation of God and devil to each other. The inscriptions of Darius know but one god, without any adversary whatsoever. But while the one side with him produced all that was bright and shining, all that is good and useful in nature, the other side produced all that is dark and apparently noxious. Both are as inseparable as day and night, and, though opposed to each other, are indispensable for the preservation of creation. The bright spirit appears in the blazing flame, the presence of the dark is marked by the wood converted into charcoal. The one has created the light of the day, the other the darkness of night; the former awakens men to their duty, the other lulls them to sleep. Life is produced by the one, and extinguished by the other, who also, by releasing the soul from the fetters of the body, enables her to go up to immortality and everlasting life.

We have said already that the original monotheism of Zoroaster did not last long. False interpretations, misunderstandings, changes, and corruptions crept in, and dualism was established in theology. The two principles then for the first time became two powers, hostile to each other, each ruling over a realm of his own and constantly endeavoring to overthrow the other. This doctrine, which appears first fully developed in the Vendidad, once accepted by some of the most influential leaders, it soon followed that, like terrestrial rulers, each of the two powers must have a council and a court of his own. The number of councilors was six, each having to rule over some special province of creation; but Ahuramazda, who at first merely presided over this council, came gradually to be included in their number, and we then read of seven instead of the usual six Ameshaspentas, or immortal saints. These six supreme councilors, who have also found their way into the Jewish tradition embodied in the Talmud, are both by etymology and the sense of the passages in which they figure, distinctly seen to be but abstract nouns or ideas, representing the

gifts which God grants to all those who worship with a pure heart, who speak the truth, and perform good actions. The first of these angels or principles (Vohu Mano) is the vital faculty in all living beings of the good creation. He is the *son* of Ahuramazda, and penetrates the whole living good creation. By him are wrought all good deeds and words of men. The second (Ardibehesht) represents the blazing flame of fire, the light in luminaries, and brightness and splendor of any and every kind. He represents, as the light, the all-pervading, all-penetrating Ahuramazda's omnipresence. He is the preserver of the vitality of all life and all that is good. He thus represents providence. The third presides over metals, and is the giver of wealth. His name is Sharavar, which means possession, wealth. The fourth (Issandarmat = Devotion) represents the earth. It is a symbol of the pious and obedient heart of the true Ahuramazda worshiper, who serves God with his body and soul. The two last (Khordâd and Amerdât) preside over vegetation, and produce all kinds of fruit. But apart from the celestial council stands Sraosha (Serost) the archangel, vested with very high powers. He alone seems to have been considered a personality. He stands between God and man, the great teacher of the prophet himself. He shows the way to heaven, and pronounces judgment upon human action after death. He is, in the Yasna, styled the sincere, the beautiful, the victorious, who protects our territories, the true, the master of truth. "For his splendor and beauty, for his power and victory," he is to be worshiped and invoked. "He first sang the five Gâthas of Zarathustra Spitama;" that is, he is the bearer and representative of the sacred tradition, including the sacrificial rites and the prayers. He is the protector of all creation, for "he slays the demon of destruction, who prevents the growth of nature, and murders its life. He never slumbers but is always awake. He guards with his drawn sword the whole world against the attacks of the demons, endowed with bodies after sunset. He has a palace of 1000 pillars, erected on the highest summit of the mountain Alborj. It has its own light from inside, and from outside it is decorated with stars. . . . . He walks teaching religion round about the world." In men who do not honor him by prayer, the bad mind becomes powerful, and impregnates them with sin and crime, and they shall become utterly distressed both in this life and in the life to come.

In the same manner as Ahuramazda, his counterpart, Angrômainyus, was in later times endowed with a council, imitated from the one just mentioned, and consisting of six devas, or devils, headed by Angrômainyus himself, who is then styled Devânam Devo = arch-devil. The first after him is called Ako Mano, or Naught Mind, the original "non-reality," or evil principle of Zoroaster. He produces all bad thoughts, makes man utter bad words, and commit sin. The second place is taken by the Indian god Indra; the third by Shiva or Shaurva; the fourth, by Naonhaitya—the collective name of the Indian Ashuras or Dioscuri; the fifth and sixth, by the two personifications of "darkness" and "poison." There are many devas, or devils, besides to be found in the Zend-Avesta, mostly allegorical or symbolical names of evils of all kinds. While the heavenly council is always taking measures for promoting life, the infernal council is always endeavoring to destroy it. They endeavor to spread lies and falsehoods, and altogether coincide together with their great chief, with the devil and the infernal hierarchy of the New Testament.

Thus monotheism was in later times broken up and superseded by dualism. But a small party, represented by the Magi, remained steadfast to the old doctrine, as opposed to that of the followers of the false interpretation or Zend, the Zendiks. In order to prove their own interpretation of Zoroaster's doctrines, they had recourse to a false and ungrammatical explanation of the term Zervana Akarana, which, merely meaning time without bounds, was by them pressed into an identity with the Supreme Being; whilst the passages on which the present Destars, or Parsee priests, still rest their faulty interpretation, simply indicate that God created in the boundless time, i.e., that He is from eternity, self-existing, neither born nor created. Two intellects and two lives are further mentioned in the Zend-Avesta. By the former are to be understood the heavenly, spiritual wisdom, and the earthly wisdom, i.e., that which is learned by ordinary teaching and experience. The two lives are in the same manner distinguished as the bodily and the mental, i.e., body and soul. From these two lives, however, are to be distinguished the "first" and "last" lives, terms which refer to this life and the life to come. The belief in the latter, and in immortality, was one of the principal dogmas of Zoroaster, and it is held by many that it was not through Persian influence that it became a Jewish and a Christian dogma. Heaven is called the "house of hymns," a place where angels praise God incessantly in song. It is also called the "best life," or paradise. "Hell" is called the house of destruction. It is the abode chiefly of the priests of the bad (deva) religion. The modern Persians call the former Behesht; the latter, Duzak. Between heaven and hell there is the bridge of the gatherer or judge, over which the soul of the pious passes unharmed, while the wicked is precipitated from it into hell. The resurrection of the body is clearly and emphatically indicated in the Zend-Avesta; and it belongs, in all probability, to Zoroaster's original doctrine—not, as has been held by some, to later times, when it was imported into his religion by other religions. A detailed description of the resurrection and last judgment is contained in the Bundehesh. The same argument—the almightiness of the Creator—which is now employed to show the possibility of the elements, dissolved and scattered as they may be, being all brought

back again, and made once more to form the body to which they once belonged, is made use of there to prove the resurrection. There is still an important element to be noticed —viz., the Messiah, or Sosiosh, from whom the Jewish and Christian notions of a Messiah are held, by many, to have been derived. He is to awaken the dead bodies, to restore all life destroyed by death, and to hold the last judgment. Here, again, a later period introduced a plurality, notably a trinity. Three great prophets are also to appear when the end of the world draws nigh, respectively bearing the names of Moon of Happy Rule, Aurora of Happy Rule, and Sosiosh, who is supposed to be the son of Zarathustra, begotten in a supernatural way; and he will bring with him a new portion of Zend Avesta, hitherto hidden from man. Even a superficial glance at this sketch will show our readers what very close parallels between Jewish and Christian notions on the one hand, and the Zoroastrian on the other, are to be drawn; but, as we have noticed under Parsees (q.v.), an attentive reading of the Zend-Avesta reveals new and striking points of contact almost on every page.

We have in the foregoing sketch mainly followed Haug, the *facile princeps* of Zend studies in these days; but we have also taken into account the views of Windischmann, Spiegel, and other prominent investigators, and principally by quoting the words of the sacred sources themselves, when feasible, put our readers in a position to judge on the main points for themselves. We cannot, however, do better than thus briefly summarize, in conclusion, the principal doctrines of Zoroaster, as drawn from a certain speech (contained in the Gâthas), which, in all probability, emanates from Zoroaster himself.

"1. Everywhere in the world, a duality is to be perceived, such as the good and the evil, light and darkness; this life and that life, human wisdom and divine wisdom. 2. Only this life becomes a prey of death, but not that hereafter, over which the destructive spirit has no power. 3. In the universe, there are from the beginning two spirits at work, the one making life, the other destroying it. 4. Both these spirits are accompanied by intellectual powers, representing the ideas of the Platonic system on which the whole moral world rests. They cause the struggle between good and evil, and all the conflicts in the world, which end in the final victory of the good principle. 5. The principal duty of man in this life is to obey the word and commandments of God. 6. Disobedience is punished with the death of the sinner. 7. Ahuramazda created the idea of the good, but is not identical with it. This idea produced the good mind, the Divine Spirit, working in man and nature, and devotion—the obedient heart. 8. The Divine Spirit cannot be resisted. 9. Those who obey the word of God will be free from all defects, and immortal. 10. God exercises his rule in the world through the works prompted by the Divine Spirit, who is working in man and nature. 11. Men should pray to God and worship him. He hears the prayers of the good. 12. All men live solely through the bounty of God. 13. The soul of the pure will hereafter enjoy everlasting life; that of the wicked will have to undergo everlasting punishment—i.e., as modern Parsee theologians explain, to the day of the resurrection. 14. All creatures are Ahuramazda's. 15. He is the reality of the good mind, word, and deed." See Parsees, Guebers, Avesta, etc.

ZOSIMUS, of Constantinople, a Greek historian, who lived in the 5th c., A.D. He wrote the history of the Roman emperors, in six books, from Augustus to 410 A.D. His style is concise, clear, and interesting. He seeks to unfold the causes of the decline of the empire, and being himself a pagan, he adduces as the chief, the neglect of the pagan religion which attended the progress of Christianity. The unsparing severity with which he assails various Christian emperors, especially Constantine, has been considered by some (e.g., Bentley) to detract from his credibility as a historian. From his own point of view, he shows a considerable degree of acuteness in his remarks. Nothing is known of his personal history.

ZOSIMUS, Pope, and successor of Innocent I., requires a brief notice on account of his connection with the history of the heresiarch Pelagius (q.v.). Zosimus was a Greek by birth, and was elected bishop of Rome, Mar. 1, 417. The African bishops had condemned the opinions of Pelagius, and this judgment had been ratified by pope Innocent. In the interval, however, Pelagius appealed to the pope; and his disciple, Celestius, came in person to Rome, where he presented a confession of faith in his own justification. Zosimus, having convened a council of bishops and submitted this to them, was induced by the specious explanations of Celestius to suspend the judgment, and even to write to the African bishops, recommending a reconsideration of the case. This apparent conflict of Zosimus with his predecessor, although it has been used by the Gallican as well as Protestant controversialists as an argument against papal infallibility, was nevertheless only temporary. On further examination of Celestius, Zosimus became sensible that he had been deceived; and even before the reply of the African bishops, confirmed and renewed their original condemnation of the Pelagian doctrine. He died Dec. 26, 418. His letters, which are curious and interesting, are found in Constant's *Epistolæ Romanorum Pontificum.*

ZOUAVES (Arab. *Zwawa*), a body of troops in the French army, which derives its name from a tribe of Kabyles, inhabiting the mountains of Jurjura, in the Algerian province of Constantine. Long previous to the invasion of Algiers by the French, these Kabyles had been employed as hired mercenaries in the service of the rulers of Tripoli,

Tunis, and Algiers; and after the conquest of the last-named country in 1830, the French, in the hope of establishing a friendly feeling between the natives and their conquerors, took the late dey's mercenaries into their service, giving them a new organization. Accordingly gen. Clausel created, in 1830, two battalions of zouaves, in which each company consisted of French and Kabyles in certain proportions, officers, subalterns, and soldiers being selected from either race; the zouaves, though retaining their Moorish dress, were armed and disciplined after the European fashion; and the battalions were recruited by voluntary enlistment. As it was soon found, however, that the system of commingling the two races did not effect the object intended, the French and Kabyles were formed into separate companies; and in 1837 they were divided into three battalions, and put under the command of a colonel. Their first col. was Lamoricière, who mainly effected their reorganization, and under whom, as well as his successor, Cavaignac (q.v.), they distinguished themselves in many a bloody conflict with the Arabs of the south. Gradually, however, the native element was eliminated, and since 1840 they may be considered as French troops in a Moorish dress. In 1852 to 1855 their numbers were greatly augmented, and they now amount to upward of 10,000 men, divided into four regiments of four battalions each. They are recruited from the veterans of the ordinary infantry regiments who are distinguished for their fine "physique" and tried courage and hardihood; clad in a loose jacket and waistcoat of dark-blue cloth ornamented with yellow braid, loose madder-colored trousers, brown cloak, madder-colored Fez cap with a yellow tassel, surrounded by a green turban, a light-blue sash of wool, yellow leather leggings, and white gaiters; and armed with a carbine and sword-bayonet. The uniform of the officers and subalterns is the same as that of the hussars.

When the French and the African elements of the original zouave battalions were separated, the Africans were constituted into a separate body, under the name of Algerian tirailleurs, a force still recruited in Algiers to form a part (three regiments) of the regular French army. They are better known as *Turcos*.

ZSCHOKKE, Johann Heinrich Daniel, one of the most eminent German authors of this century, was b. at Magdeburg on Mar. 22, 1771. On leaving school at the age of 17, he joined a company of players in the capacity of a dramatic author. He traveled with them for some time, after which he entered the university of Frankfort. There he seems to have studied all subjects from divinity to administration (*Kameralwissenschaften*). He at the same time acted as a private teacher, and published plays which brought him some reputation, but no pay. In 1795 he was disappointed in obtaining the post of ordinary professor, for which he applied, and set out on a tour through Germany and France. He settled finally at Reichenau, in the Grisons, where he opened a boarding-school. So much pleased were the governing bodies of the canton with his establishment, that they presented him with the citizenship. In return for this favor, he wrote a history of the Grisons, published at Zürich in 1798 (*Geschichte des Freistaats der drei Bünde in Rhätien*). In the same year, however, Zschokke became unpopular in the canton by advocating its annexation to the Helvetic republic established by the French, and his school was in consequence closed. He removed to Aarau, then the seat of government, where he was employed as a commissioner to settle the affairs of Unterwalden, Uri, Schwyz, and Zug, a trust which he discharged with the utmost ability and good temper. The benevolent interest, indeed, which he manifested in the sufferings of the population has made his name memorable as a national benefactor. It would be tedious to enumerate the political and administrative affairs in which Zschokke was actively engaged after this period; we find him at one time protesting against the arbitrary proceedings of the French, and at another pointing out the prudence of concession, but always taking a course marked by practical sagacity and wisdom. In 1804 he was presented with the citizenship of Aargau and appointed inspector of woods and mines. In the same year he founded the Swiss messenger (*Schweizerboten*), a publication which rapidly became popular. It was followed by the Miscellany of the Latest News (*Miszellen für die neueste Weltkunde*), which was continued down to 1813. In 1811 he added a monthly periodical, the *Erheiterungen*, to these publications. He died at Aargau, June 27, 1848. Zschokke's works are very numerous, and are always characterized by sound information, good sense, and a vigorous and effective eloquence. The most important of his historical works, not mentioned above, are *History of the Forest Cantons*, a *History of Bavaria*, a *Popular History of Switzerland*. His novels or tales are more numerous and better known; among the best are *The Creole, Alamontade, Jonathan Frock, Clementine, Oswald*, and *Meister Jordan*. As a poet and play-writer, Zschokke has less merit. The most popular of all his writings was the *Stunden der Andacht* (tr. into English as *Meditations on Death and Eternity*, 1862); it supplied a complete exposition of modern rationalism, and yet displayed such zeal and eloquence in the cause of sound morality, that it met with approbation from persons of all creeds. It has gone through 40 German editions, and, with many other works of Zschokke, has been translated into English. There are many editions of his works (one of 40 vols., in 1854). See his *Life*, by Münich (1831), and by E. Zschokke (3d. ed., 1875).

ZSCHOPPAU, a t. of Saxony, in the circle of Zwickau, and about 36 m. s.w. of Dresden, on the river Zschoppau. It has a castle and two churches; manufactures of

hosiery, cloth, lace, etc.; weaving, wool-spinning, dyeworks, bleach-fields. Pop. '90, 7869.

ZUG, one of the smallest of the Swiss cantons, has an area of 92 sq. m. Pop. '70, 20,993; '94, 23,167. The south-eastern part of the canton borders on the Alpine region, and is hilly and pastoral; the north-western part, sloping to the plain of Switzerland, and inclosing a great part of the lake of Zug, is a rich and beautiful country of cornfields and orchards. The chief exports of Zug are dried fruit, cattle, and the products of the dairy. It is represented by one member in the national council. The inhabitants speak German, and are Roman Catholic. The battle of Morgarten, which founded the independence of Switzerland, was fought on the frontier of this canton in 1315; but it was not till 1352 that Zug joined the Swiss confederation. Capital, Zug.

ZUG, capital of the Swiss canton of the same name, and near the lake of Zug, 13 m. n.e. of Lucerne. The town has been much damaged by landslips. Pop. '88, 5160.

ZUIDER ZEE, a large gulf penetrating deep into the Netherlands, between 52° 26′ and 53° 20′ n. lat., is about 80 m. in length, and 210 m. in circumference. The islands Texel, Vlieland, Ter Schelling, Ameland, and Schiermonnikoog, reaching in a chain from the most northern point of Holland, are the remains of the former line of coast, which form a breakwater against the North sea. From Dunkirk in French Flanders to the n. of Holland, the interior is defended from the sea by sand-hills or downs. Here, as at the mouth of the Scheldt, the sand-barrier was broken, and the waters, overflowing the low lands, separated the province of Friesland from the peninsula of North Holland, and having united with the small inner lake Flevo, formed the present Zuider Zee. The decisive inundation occurred in 1282.

In the Zuider Zee lie the islands of Wieringen, Urk, Schokland, and Marken. Fishing is the principal industry. The light-tower on the e. point of Marken stands in 52° 27′ 37″ n. lat.; and the inhabitants are a hardy, industrious, and independent people, who live by fishing and exporting meadow-hay. They cling tenaciously to their old customs, and never marry except among themselves. The houses are built on artificial mounds, or "hills of refuge;" and the island being liable to frequent and heavy floods, few cows or sheep are kept, no gardens or trees planted, the necessaries of life being almost all brought from the main-land.

From the s.e. of the Zuider Zee, a long narrow arm, called the Y (pronounced *I*), formerly ran nearly due w. through the peninsula of Holland. A strong sea-dyke and locks have been constructed to cut off the Zuider Zee from the Y, through which a broad ship-canal has been made between Amsterdam and the North sea.

ZUKERTORT, J. H., b. Riga, Russia, 1862; of German parents. He was educated at Breslau; edited a chess-journal at Berlin, 1867–71; in 1872 went to reside in England. He was distinguished in chess-playing, especially as a blindfold player of many simultaneous games; and his writings on the game are of recognized value. At the international chess tournaments at Paris, 1878, and again at that in London, 1883, Z. won the first prize. He d. 1888.

ZULU, or AMAZULU, is the name of that portion of the Kaffir race who inhabit Natal and the region n.e. of it, until they gradually merge into the mere negro of the e. coast, n. of the Zambesi. The Kaffir organization appears to hold an intermediate place between that of the negro and a higher type; and as we go s. and w. from the swamps and malaria of Delagoa bay and Sofala to the more healthy and bracing regions of Natal and independent Kaffraria, the Kaffir features appear, as it were, to grow more refined —the mouth protrudes less, the lips are less thick, and the nose assimilates more to that of the European, although the distinguishing type of woolly hair may still continue.

The Zulu Kaffir is a far more amiable savage than his brother the Amakosa of the Cape frontier districts. He is less warlike and predatory, more industrious, and far more willing to act in the capacity of a farm-laborer or domestic servant. In language, customs, habits, etc., although certain tribal and local differences occur, yet they may be called common to all the nation, as a Zulu Kaffir has no difficulty in understanding a native of British Kaffraria; and his views of a future state, purchase of wives, etc., are pretty similar. The Zulu is by nature social, light of heart, and cheerful; his affections are gentle, steady, and enduring; his passions are, however, strong, and called out when in a state of war. He is comparatively chaste; crimes which stain European or eastern civilization are unknown to him. He is hospitable and honest, yet greedy and stingy; he is kind to his own family, yet cruel to dumb animals; and whatever the better nature of his impulses may be, yet when his great chief commands war, he is converted into a demon. He is proud, and very easily can distinguish between an English gentleman and the loafing tribe with which too many of our colonies are afflicted. The writer of this article, by the exercise of a little kindness and firmness, has experienced the most utter devotion from individuals of the Kaffir race generally. Their reasoning powers are good, and with an improved education a Zulu rationalist might not disgrace a chair in the Sorbonne.

It is from the Zulu country, however, that those terrible tyrants who so long devastated south-eastern Africa, the chiefs Chaka, Dingaan, Moselikatze, etc., issued. The training of their subjects to a peculiar mode of warfare spread desolation and havoc for

many years among the Betjuana and other tribes of the interior, until eventually these mighty chiefs with their thousands of followers, fighting, like Homer's heroes, hand to hand, armed with stabbing assagais and shields of ox-hide, the colors of which distinguished the different regiments they were formed into, melted away with broken power into comparative insignificance before the terrible rifles of a few hundred emigrant Dutch Boers, who, in their turn, gave way to the energetic action of the British authorities (see NATAL). The Zulus, although they have very often series intestine wars among themselves, have generally lived on friendly terms with the Natal colonists. That their warlike qualities have not decayed was sufficiently shown in the war that broke out in 1879 between England and Ketchwayo (Cetewayo), the Zulu king. Within a week or two after the British forces crossed the Natal frontier the Zulus inflicted a severe blow on the invaders by surrounding a camp at Isandhlwana and annihilating the defenders. They repulsed several attacks on their strongholds; but, after the British had received re-enforcements, were defeated at Ginghilovo, and completely broken by lord Chelmsford at Ulundi on July 3. The king was captured shortly afterward, and deported to Cape Town. The Zulu country was divided among 12 chiefs. But in 1883 Ketchwayo was reinstated in the central portion of his kingdom, with an English resident. The n. e. part was put under an independent chief, and on the s., adjoining the Natal border, another strip of territory was reserved for the chiefs unwilling to come again under Ketchwayo's authority (one of whom, John Dunn, is of English blood). Ketchwayo, vanquished by a rival, died a fugitive, 1884.

A number of missionary societies of the Wesleyan, Anglican, Norwegian, and Episcopal churches labor among these tribes. Considerable interest was some time ago provoked with regard to bishop Colenso's peculiar views for the evangelizing these heathens; and Colenso's Zulu was for a while almost as famous as Macaulay's New Zealander.

The Amafengu tribe, now settled along the Cape frontier, are a broken tribe of Zulus, driven far to the s.w. by Chaka or Dingaan, then reduced to slavery by the Amakosa Kaffers, and freed by sir B. Durban in the Kaffer war of 1834–35. The principal Zulu tribes are the Amazulu, the Amahute, Amazwazi, and Amatabele. The last emigrated far northward to the mountains which separate the basins of the Limpopo and Zambesi.

ZU'LULAND. The country lying n.e. of the colony of Natal, between its e. boundary, the Tugela and Umzimyati rivers, and Delagoa bay, is generally known under the name of Zululand, or the Zulu country, inhabited by tribes of Zulu Kaffirs. The great coast chain of mountains, which form in the Cape colony the Stormbergen, and further to the n.e. the Kahlamba and Drachenbergen, still continue well defined to the n.e., running parallel to the coast, but 120 m. distant from it, separating the coast region of Zululand from the higher plateaus of the Transvaal, and rising to an average height of 6,000 or 7,000 feet. East of the Tugela river, the country spreads out into large undulating, grassy plains, but sparsely wooded; while toward the foot of the mountains the kloofs afford some excellent timber. The principal rivers are the Umvoluzi or St. Lucia river, which enters the sea about 80 m. n.e. of the Natal frontier; and the Mapoota and its branches, which drain the n. part of the region, and fall into Delagoa bay. The country along the coast between the St. Lucia river and Delagoa bay is very flat, marshy, and unhealthy. A considerable range of mountains, called the Lebombo, run from the Umvoluzi river almost in a northerly direction to beyond Delagoa bay, about half way between the coast and the first range we have mentioned, forming a supporting buttress to a plateau of high level, similar to those so common in the Cape Colony and Natal. Z. was annexed by Great Britain, 1887.

This is generally a fertile region, and, as far as the coast-line, is healthy. Sugar, cotton, and other tropical products can be grown as advantageously as in the Natal colony, to which it forms, as it were, an intermediary link between the fever-regions of the e. coast and the more healthy climate of Natal and the Cape colony. The St. Lucia river marks the boundary line beyond which, to the n.e., Europeans cannot live. Up till the outbreak of the war in 1879, no good map of the Zulu country existed, and even yet, of course, we know very little of its geology or mineral productions. None of the rivers are available for inland navigation, although a large lagoon inside the mouth of the St. Lucia river can be ascended for a few miles. The rivers which flow into Delagoa bay from the n. are sluggish streams, often with no perceptible current, and can be ascended a considerable distance. A large quantity of ivory, rhinoceros' horns, hides, etc., are collected in this region by traders from Natal; and cattle, Indian corn, etc., thrive well in the country before the swampy region commences. The principal tribes are all of the Zulu race—the Amazulu inhabiting the region bordering on Natal; the Amahute, Amazwazi, etc., the country in the neighborhood of Delagoa bay. The Portuguese have a very decayed fort and settlement on Delagoa bay, garrisoned by a few mulatto soldiers, and carrying on some trade with the natives and Dutch Boers, in gunpowder, muskets, calico, etc., in exchange for ivory, horns, and other native produce; and a contraband one in slaves is also, we fear, winked at by the authorities, as captures are often made on the coast by British ships. The Dutch emigrant Boers, who very much required a port on the seaboard of s.e. Africa, would long since have seized

on Delagoa bay, if it were not from a wholesome dread of the very unhealthy climate, which appears to affect those stalwart sons of the highlands of s.e. Africa more even than it does Europeans or North Americans. See illus., AFRICA, vol. I.

ZULULAND - ZULUS, a region of s.e. Africa, along the Indian ocean; bounded, e. by the Indian ocean, s. by Natal, w. by Transvaal, extending n. to Delagoa bay. The part on the coast, about 120 m. in width, is marshy in the n. between St. Lucia river and Delagoa bay, but in the s. are good pasture plains. From the coast the land gradually rises to a mountain range about 6,000 ft. high. The soil is fertile, producing rice, cotton, sugar, and the usual tropical fruits. The northern part is unhealthy for foreigners. The people belong to the Kaffir race, and are in most respects far superior to the negroes. Generally mild and kind-hearted, they are in war very ferocious. The Portuguese have a small fort on Delagoa bay, garrisoned by mulattoes. At the bay there is a small export trade in horn, gold-dust, ivory, and gems, in return for cotton fabrics, gunpowder, and muskets. The American board has had a successful mission among the Zulus since 1836 in the region of Port Natal, though it was broken up by war in 1838. In 1879 the English waged a disastrous, costly, and unjust war with the Zulus. When the Transvaal was annexed to England, a district which had been overrun by the Dutch settlers passed under the jurisdiction of the British government. A special commission, to which the claims of Cetywayo, king of the Zulus, and the Boers were referred, decided that the land belonged to the Zulus, and should be surrendered to them immediately. The colonial authorities determined to disregard this decision, and to allow the squatters to remain in the disputed territory. This was the cause of the war. That the English desired to possess the territory of the Zulus is evident from the conditions of the ultimatum sent to Cetywayo. These were the surrender of certain chiefs, changes in marriage customs among the natives, the establishment of a British residency at the king's kraal, and the disbandment of the army. These conditions would have brought the country under British influence. Cetywayo was enraged when he received the proposals, and gave orders for an immediate advance of his army. Three columns of British troops from Natal invaded Cetywayo's territory. Severe battles took place, attended with great loss on both sides. At the battle of Ulundi the Zulus, 15,000 strong, were routed, Cetywayo fled, the army was broken up, and all the important chiefs submitted. See ZULU.

ZUMALA-CARREGUY, DON TOMAS, the most distinguished of the generals who supported the cause of Don Carlos during the Spanish civil war of 1833–40, was born in 1789 at Ormaiztegui, in the Biscayan province of Guipuzcoa. Of an aristocratic, though not wealthy family, he was deeply imbued from infancy with royalist sentiments, which gathered strength with increasing years, till they led him, like the Vendean leaders, to sacrifice fortune and life for a prince wholly unworthy of such devotion. At the time of the invasion of the peninsula by Napoleon, Zumala was a student of law at Pampeluna, and like many of the Spanish youth, he deserted his studies to take up arms against the invader, serving in Mina's corps till the close of the war. He afterward served under Quesada in the "army of the faith;" and on the re-establishment of absolutism, was raised to the rank of col., and appointed governor of Ferrol. He displayed excellent administrative qualities; but his decided leaning to the party of the Carlists (though he repelled indignantly all proposals to proclaim Don Carlos king during the life of Ferdinand VII.) becoming known, he was tried by a council of war, and acquitted. In 1832, when the army was purged of all officers suspected of Carlism, Zumala was dismissed, and retired to Pampeluna, where he lived in retirement till the death of Ferdinand and the rising of the Basque population called him to head the Carlist insurrection (Oct. 11, 1833). His motley army was without uniform, ill fed, and ill paid; yet the profound esteem in which "el Tio Tomas" was held by his followers enabled him to maintain an effective discipline. The overwhelming superiority in number of the Christinos, however, forced him to adopt a defensive system of tactics; so, holding the command of Biscay and Navarre, and the strongholds of Fuenterrabia and Irun, to assure his retreat into France, if necessary, he kept his opponents at bay, defeated Rodil in the valley of Amescoas (Aug. 1, 1834), routed another force of Christinos at Viana (Sept. 7), gained a second victory in the Amescoas valley in the following spring, completely defeating Valdez, after a battle of four days, and routed Iriarte near Guernica. These brilliant successes of his skillful and devoted partisan flattered the too sanguine and somewhat weak-minded Don Carlos with the hope of speedily seating himself on the throne, rendered him less willing than formerly to be guided by the counsels of Zumala, and led him to interfere with the latter's schemes, to his own detriment. Accordingly, after another year's successful fighting with the Christinos, Zumala was ordered to lay siege to Bilbao; but on June 15, 1835, he received a gun-shot wound so severe that he died ten days afterward. With Zumala's death, all hope of success for the Carlists was extinguished; and though the war dragged on desultorily for some years longer, the result was never doubtful. Zumala was as distinguished for generosity and disinterestedness as for fidelity; and so much had he impoverished himself by liberality to his soldiers, that neither his wardrobe nor his treasury supplied the means for his decent interment.—See Henningsen's *Twelve Months' Campaign with Zumala-Carreguy in Navarre and the Basque Provinces* (2 vols., Lond. 1836).

ZUMPT, Karl Gottlob, 1792–1849; educated at Heidelberg and Berlin. In 1838 he became prof. of Roman literature at the university of Berlin. His Latin grammar, which appeared in 1818 and was translated into English by Dr. L. Schmitz, was very successful. Among his works, besides editions of Cicero, Quintilian, and Quintus Curtius, are *Annales Veterum Regnorum et Populorum* (1819), and *Ueber dem Stand der Bevölkerung und die Volksvermehrung im Altertum* (1841).

ZUNI INDIANS, a tribe belonging to the Pueblos, a semi-civilized remnant of the Aztec empire; they inhabit a district of New Mexico about 200 miles s. e. of the Moquis settlements, and number about 2,000 souls. Their town (Zuni) is about half a sq. m. in area, and their houses, some of which are three and four stories high, are built of adobe. Ladders to the roof are used as a means of entrance. They have also smaller settlements in the district. The people are busied principally in agriculture, care little for the chase, and are peaceful in disposition, hospitable and industrious, receiving but little aid from the federal government. The authorities are a governor and a high priest; the latter is the oracle of the tribe, and its temporal and spiritual ruler, whose orders are the laws which are simply carried into execution by the government. Their traditions say that their people came from the n. w. on their march southward; that all Pueblo Indians belong to a common race and are members of the Aztecs or Montezumas; that some of the forefathers remained behind during the nation's migration, but that the greater body ultimately formed the empire of Mexico. They have also traditions of a flood; of the founding of their present town; of their subjugation for a time by the Spaniards; of the arrival of the first American in New Mexico, and of the Mexican and Navajo war. Several of their chief men made a pilgrimage to the Atlantic ocean, 1882, to procure some of its water which they deem sacred. They visited several cities, and excited a great deal of interest; being guided by Mr. Frank H. Cushing of the Smithsonian Institute at Washington, who has been adopted into the tribe, and has dwelt with them some years, for the purpose of studying their manners and customs.

ZUNZ, Leopold, b. Detmold, Germany, 1794; educated at Berlin, and became a preacher in the German-Jewish synagogue, and for some years teacher in a Jewish school, moving in 1835 to Prague, and again in 1839 to Berlin, where he was director of the normal seminary. He was a scholar and historical critic of the highest rank. In 1845 the government made him a member of the commission for investigating the educational status of the Prussian Jews. He wrote many books and essays on Hebrew literature, language, and history. He d. 1886.

ZURBARAN, Francisco, 1598–1662; b. Spain; studied painting, and imitated the manner of Caravaggio. His works, besides those at court, are found in churches, monasteries, and cathedrals, especially in Madrid and Seville. His "St. Thomas of Aquinas received into Heaven," regarded as his best work, was executed in 1625.

ZÜRICH, a canton on the n.e. frontier of Switzerland, is drained by the Rhine and its tributaries. Area 666 sq. m.; pop. '94, 351,917. It is traversed by ridges of lofty hills, running n.w. and s.e., between which lie three valleys, forming almost its whole surface—those of the Toss, the Glatt, and the Limmat. The lake of Zürich penetrates Zürich for a distance of 26 m., and connects it with the cantons of Schwyz and St. Gall. Zürich has not a fertile soil, but it is carefully cultivated. A considerable quantity of corn is raised in the canton, though not enough to supply the wants of the population. Vineyards and orchards are numerous; but the pasture lands are of much greater importance, and cattle form the chief wealth of the agricultural population. Zürich was one of the earliest seats of the cotton manufacture in Europe, and the spinning and weaving of cotton are still prosecuted with great success. The silk manufactures are nearly as important; and, more recently, the progress made in the manufacture of railway locomotives and other machinery has been a cause of some alarm to English engineers. The mechanics of Zürich divide their attention between agriculture and manufacturing industry, and are among the most prosperous and best educated workingmen in Europe. The canton is represented in the National Council by 17 representatives.

ZÜRICH, the capital of the canton of the same name, is situated at the point where the Limmat issues from the lake of Zürich, and unites with its tributary, the Sihl. Its population, including suburbs, in '96 was 130,000. It is one of the most prosperous manufacturing and commercial towns of Switzerland; yet the narrow streets and lofty houses of its older quarters, on the high ground e. of the river, give it the quaint appearance of a mediæval city. There are many interesting old buildings—the most remarkable being the cathedral, erected in the 11th century. There are a university, gymnasium, botanical gardens, a library and museum. The town library is extensive; and numerous museums of natural history, etc., indicate the intelligence and cultivated tastes of the population.

ZUTPHEN, a fortified t. in the Netherlands, province of Gelderland, is beautifully situated on the right bank of the Yssel, where that river is joined by the Berkel, in a picturesque district of country, chiefly under cultivation, and variegated with abundance of wood. It is one of the oldest towns in the kingdom, but has many elegant modern buildings. There are tanneries, spinning and weaving factories and manufactures of oil, paper, soap and carpets. Pop. '90, 17,044.

At Rysselt, a village near Zutphen, is a reformatory, called the Netherlands Mettray, in which about 150 boys are educated, and taught farm-labor and various handicrafts. It was founded in 1851, and has done much good. Nearly one-half of the boys have been withdrawn by their parents. The others obtain situations through the directors. The largest number have taken to farm-labor and gardening, for which the reformatory specially prepares them. Many have become soldiers and sailors; others smiths, house-painters, shoemakers, tailors, bakers, bricklayers, house-servants, etc. The institution is maintained by annual contributions, legacies, and a small charge for each boy. The receipts are about $17,500 annually, of which, on an average, a half is from legacies and contributions. The expenditure is about the same.

ZVENIGOROD'KA, an old t. of Russia, government of Kiev, on the Tikritch, a tributary of the Bug, about 125 m. s. of the town of Kiev. Pop. about 12,000. There are some manufactures and a trade in cattle.

ZVOR'NIK, a t. of Bosnia, which the Austrians, now administrating Bosnia, occupied in 1878 only after severe fighting, is on the Drina, about 60 m. n.e. of Bosna-Serai. The town is strongly fortified, standing on the face of a steep hill, at the summit of which is a strong fortress commanding the valley of the Drina. It has several mosques, Greek and Roman Catholic churches, lead-mines, and a considerable trade in timber. Pop. '85, 3030.

ZWEI'BRÜCKEN. See Deux-Ponts.

ZWICKAU, a picturesque, irregularly built, ancient-looking t. of Saxony, in a pleasant valley on the left bank of the Mulde, 60 m. s.w. of Dresden. The river is crossed here by three bridges. The town is the capital of the circle of Zwickau, and is the seat of a district court, court of appeal, and other public offices. Of its churches the most noteworthy is that of St. Mary, the finest Gothic edifice in the Erzgebirge, dating from 1453, distinguished by its tall tower, from which an extensive view can be obained; it contains a very fine altar-piece, by the old German master Wohlgemuth, and other interesting works of art. There are also a splendid court-house and exchange; a cloth hall, a district infirmary; a gymnasium, with a library of 20,000 vols.; a burgher, Catholic, trade, and other schools; an old castle, which has been converted into a workhouse. The town is prosperous, and the population increasing. There are cloth manufactories, breweries, dye-works, chemical works, tanneries, oil and saw mills. The chief source of its wealth, however, and that of the neighboring villages are the rich beds of coal in the surrounding district. There are also large iron-works in the neighborhood. The town is connected by railway with Leipsic, Dresden, and other important places, and has a considerable transit trade. Pop. '80, 35,005 ; '90, 44,198.

ZWINGLI, Ulrich, one of the most important of the reformers, was b. Jan. 1, 1484, at Wildhaus, in the canton of St. Gall, Switzerland, and was one of eight sons of the amtmann of that place. He studied first at Bern, then at the university of Vienna, where he devoted himself to philosophy; and afterward at Basel, where, under Wyttenbach, he directed his attention to theology. He became pastor in 1506 in Glarus. At this time his studies were chiefly directed to the Latin classics and the church fathers; but having begun to learn Greek in 1513, he from that time devoted himself to the New Testament. He wrote out the epistles of Paul in the original language, and learned them by heart, which was of great service to him afterward in his disputations. In the capacity of army chaplain, he attended the campaigns in Lombardy of the inhabitants of Glarus for the pope against the French, in 1512, 1513, and 1515, for which service he received a pension from the pope till 1517. In 1516 the liberal-minded administrator, Geroldseck, invited him to be preacher in the convent of Maria-Einsiedeln, famous for its pilgrimages. Here Zwingli began to preach against many abuses prevailing in the church; he also called on the bishops of Sitten and Constance to bestir themselves for the improvement of the church under the guidance of the Word of God. So little was he then suspected, that the papal legate, Antonio Pulci, conferred on him, in 1518, the diploma of chaplain to the holy see. He was soon afterward called to Zürich; and he entered on his office as pastor in the great cathedral there, Jan. 1, 1519, with a discourse, in which he declared himself for the pure gospel unfettered by glosses. In this office, to which was joined in 1521 that of canon in the cathedral, he laid the foundation of his subsequent work as reformer. The same cause that had stirred Luther into activity gave the impulse to Zwingli. In 1518 Bernardin Samson, a Franciscan from Milan, came to Switzerland for the purpose of selling indulgences for the benefit of the papal court. Zwingli, who was still in Einsiedeln on Samson's first appearance, opposed him both there and afterward in Zürich with the whole force of his pulpit eloquence, and succeeded so well that Samson was not allowed to enter the town of Zürich. From this time Zwingli, although attacked by the monks and many of his brother canons, advanced with rapid steps in his reforming career; for the magistracy of Zürich supported his measures to such a degree that, as early as 1520, they issued an order throughout their jurisdiction that the Word of God should be taught without human additions. In 1522 the reformation was formally established in Zürich. At this time Zwingli wrote his first book against the fasts of the Roman church; he also began to study the Hebrew language. The offers of high promotion made to him by Adrian VI. could not

make him waver. In Jan., 1523, the government of Zürich invited all theologians disposed to enter the lists with Zwingli to a conference at Zürich, which was attended by 600 clergy and laity. Zwingli had arranged the articles of faith, to the number of 67, which were to be the subject of the conference, and defended them so ably against the attacks of the celebrated Joh. Faber, afterward bishop of Vienna, that the council of Zürich declared in favor of Zwingli's doctrines, and upheld him and his assistants in adhering to them. The second disputation, Oct., 1523, at which Zwingli, before more than 900 people, spoke against the worship of images and the mass, was the cause of the removal of all pictures and statues from the churches of the city of Zürich and its jurisdiction; and this was followed in 1524 by the abolition of the mass. In the same year Zwingli entered into the married state with Anna Rheinhard, aged 43, the widow of a nobleman of the name of Meyer von Knonow. In the following year he published his creed, *Von der Wahren und Falschen Religion* (Of the True and False Religion). He had thus, in a few years, placed the work of reformation in his native land on a solid footing. He now pressed zealously forward in the same course; while the magistracy of Zürich, who all along actively supported him, abolished the begging friars, brought matters relating to marriage before the secular courts, and instituted a better management of church property. On a great many points, Zwingli was at one with Luther and the other German reformers; only, in regard to liturgical matters, he carried out his reform more radically according to the Bible, and rejected the dogma of the presence of Christ in the Lord's-supper. In order to heal the breach that had, as early as 1524, broken out between the two parties of the new religion on the latter point, a meeting between the Saxon and Swiss reformers was brought about by Philip, landgrave of Hesse, at Marburg in 1529. The conference lasted for three days, but little progress was made toward unity of opinion. See SACRAMENTARIAN. In 1531 open war broke out between Zürich on the one side, and the Catholic cantons of Lucerne, Schwyz, Uri, Unterwalden, and Zug on the other; and Zwingli, by command of the council of Zürich, had to take the field with the banner of the canton, which had always been borne by a priest. On Oct. 11 came the conflict; and as their opponents were more than double in number, and also better led, the Zürichers were beaten, and Zwingli was among the fallen. His collected works were published in Zürich in 1545, in 4 vols.; a selection, in 2 vols., appeared in 1819–21, edited by Usteri and Vögelin.—See the lives by Rotermund (1818), Hottinger (1820), Christoffel (1857), and Mörikofer (1869).

Of all the reformers, there is none more fitted to excite our love and respect than Zwingli. Fearlessly honest in purpose; with a clear head and eye for the truth; less violent, if less eloquent than Luther; more candid and open-minded, if less systematic and penetrating in spiritual insight than Calvin; he stands before us quite as original, if not as prominent as these reformers. His work was not so great as theirs, his influence not so extended; but his character was quite as genuine, and his labor, in some respects, quite as enduring.

ZWIRNER, ERNST FRIEDRICH, 1802–61; b. Silesia; studied architecture at Breslau and Berlin. In 1833 he was made architect to the Cologne cathedral, supervised the restoration of the old building, and planned the new n. and s. portals and the transept. Many of the modern churches and palaces in the towns on the Rhine were designed by him.

ZWOLLE, the capital of the Netherlands province of Overyssel, is situated on the Zwarte Water, and by the canal called the Willemsvaart has connection with the Yssel. It is one of the finest towns in the kingdom, having many beautiful private and public buildings. Both within and without the gates are pleasant promenades and drives, shaded by large trees. The surrounding country consists of rich meadows and cultivated fields, adorned by pretty country-seats. Zwolle has three extensive suburbs—Diezenpoorten, Kamperpoorten, and Sassenpoorten. It is most favorably situated for commerce, having, by navigable waters and railways, communication with the provinces around the Zuider Zee, Hanover, England, and other maritime nations. The trade in farm-produce and stock is very great. Principal industries are ship-building, tanning leather, rope-spinning, beer-brewing, soap-boiling, weaving calicoes and stockings, book and plate printing, making salt, cooperage, and refining sugar. The most important buildings are the town-house, palace of justice, and great church. There are many excellent charitable institutions; and, besides those for the ordinary branches of education, a flourishing grammar-school, in which pope Adrian VI. was partly educated, and a school of design. Zwolle has a cabinet of natural history, a literary and a musical society. Here the poet Rhynvis Feith (1753–1824) was born, and Thomas à Kempis lived during 71 years. Pop. 1893, 28,310.

ZYGODAC'TYLA (Gr. yoke-footed), a name given by some naturalists to a section of *pachydermata*, distinguished by having two principal hoofs upon which the animals walk, so that the foot resembles that of the *ruminantia*. This section includes only one family, the *suidæ*.—The term ZYGODACTYLOUS BIRDS is often applied, in ornithology, to those birds which have the toes in pairs, two before and two behind, as most of the *scansores*, or climbers (q.v.).

ZYGOPHYLLA'CEÆ, a natural order of exogenous plants, allied to *rubiaceæ*, and containing about 100 known species, herbaceous plants, shrubs, and trees, chiefly natives of

sub-tropical countries. They have opposite, generally pinnated leaves, without stipules. The flowers are solitary, or two or three together; the calyx 4 to 5-parted; the petals alternate with the calycine segments, and clawed; the stamens twice as many as the petals, generally rising from the back of small hypogynous scales; the ovary simple, 2 to 5-celled, with two or more ovules in each cell. The fruit is capsular, rarely somewhat fleshy, with 4 or 5 angles or wings. The most important genus is *guaiacum* (q.v.). The abundance of species of *zygophyllum* and some other genera constitutes one of the most striking features of n. African and Arabian deserts. The flowers of *Z. fabago* are employed as a substitute for capers, under the name of *bean-capers*. Those of *melianthus major*, a native of the cape of Good Hope, abound so much in honey that it is obtained from them for use by merely shaking the branches. The Turks use the seeds of *peganum harmala* both as a spice and for dyeing red.

ZYMOMETER: an instrument for testing the value of a sample of yeast, and for examining the progress of fermentation. It is founded on the production of carbonic acid in a given time, which is the consequence of the reduction of maltose. The speed of the fermentation is inversely as the square of the weight of the yeast.

ZYMOTIC DISEASES have been already referred to, and the most important of them are mentioned in the article Nosology. The class of diseases to which Dr. Farr has assigned this now generally accepted term comprises those which are *epidemic*, *endemic*, and *contagious*, as, for example, *fever*, *small-pox*, *plague*, *influenza*, *cholera*, *hooping-cough*, etc. As Dr. Farr observes: "The diseases of this class distinguish one country from another, or one year from another; they have formed epochs in chronology; and as Niebuhr has shown, have influenced not only the fate of cities, such as Athens and Florence, but of empires; they decimate armies and disable fleets; they take the lives of criminals that justice has not condemned; they redouble the dangers of crowded hospitals; they infest the habitations of the poor, and strike the artisan in his strength down from comfort into helpless poverty; they carry away the infant from the mother's breast, and the old man at the end of life; but their direst eruptions are excessively fatal to men in the prime and vigor of age. They are emphatically called the *morbi populares*." It must not be assumed, as the origin of the word (*zymē*, the Gr. for a ferment) might lead the reader to infer, that all the so-called zymotic diseases are true fermentations, for the class is intended to comprehend all the principal diseases which have prevailed as *epidemics* or *endemics*, and all those which are *communicable either by human contact or by animals in a state of disease*, as well as the diseases that result from the *scarcity and the deterioration of the necessary kinds of food*, or from *parasitic animals*. The diseases of this class thus arrange themselves into the four orders of *miasmatic*, *enthetic*, *dietic*, and *parasitic* disorders, of which *fever*, *syphilis*, *scurvy*, and *worms* may be regarded as the types.

Dr. Carpenter, in a memoir on *The Predisposing Causes of Epidemics*, shows that the conditions which give rise to zymotic diseases may be referred to the three following categories: (1.) Conditions which tend to introduce into the system decomposing matter that has been generated in some external source, as, for example, putrescent food, water contaminated by sewage or other decomposing matters, and air charged with miasmatic emanations. (2.) Conditions which occasion an increased production of decomposing matter in the system itself. The best example of this class of conditions is afforded in the puerperal state (or childbed), in which the tissue of the womb is undergoing rapid disintegration, and the decomposing matters which would be harmless at other times, are now able to act upon the blood of the woman, so as to induce that most fatal of all the zymotic diseases, puerperal fever. (3.) Conditions which obstruct the elimination of the decomposing matter normally or excessively generated within the system, or abnormally introduced into it from without. For example, any obstacle to the elimination of urea or uric acid, carbonic acid, biliary matters, lactic acid, etc., gives rise to as true poisoning as if these substances had been injected into the blood-vessels. The most important of the laws by which zymotic poisons are governed are noticed in the article Virus. The word zymotic, now commonly used by medical writers as a term to express a class of diseases which are preventable by the removal of known causes, should not be regarded as meaning more than this, or as embracing any scientific group of diseases. It is employed to class together all the diseases characterized by the property, which they have in common, of suddenly attacking large numbers of people. These may be subdivided according to their causes, whether due to *malaria*—in which case the diseases are endemic; to *specific disease poisons*, which are communicable either by direct contact, or by the indirect channels of air, water, etc.; to *parasites*, or to *scarcity* or *inferior quality* of *food*. The diseases of the group, therefore, fall into the four orders of *Miasmatic*, *Enthetic*, *Parasitic*, and *Dietic* disorders. The causation of the two latter orders is easily grasped, and can in every case be traced. But in the two former it is not always so clear. According to the germ theory (q.v.) of infectious diseases, the origin *de novo* of a fever poison is as impossible as the production of a man or a dog without parents. Day by day we observe the discovery of one after another of the septic organisms causing disease, and it is but natural to conclude that within a short time all the specific causes of the diseases referred to

will have been traced. It is urged by those who oppose the germ theory that there must have been at some time a spontaneous origin of the poisons, and that there still may be. The argument, however, has no weight. The question of the origin of the first contagium is to pathology what the origin of species is to physiology. The pathologist who is investigating the causation of specific diseases is no more to be troubled with the former problem than the biologist who is studying the phases of embryonic development should be with the latter. It has long been known that infectious diseases differ greatly in infectiveness. Few of the highly infectious diseases have at any time been supposed to arise *de novo*, but some of the less infectious —such as, for instance, typhoid fever—are still in certain quarters said to be of spontaneous origin, and due to the decomposition of excrementitious matters. But those who hold such a view must show in what way the decomposing matter acts. Common septic bacteria, we know, cause diarrhea, but they do not cause typhoid fever. A case of this fever, let us suppose, occurs in a small community. To all appearance the conditions of the place are unchanged and the house affected does not differ from its neighbors. How is it to be explained according to the spontaneous origin theory? In such cases it seems to be forgotten by what subtle channels contagium may be carried; further, the fact is overlooked that the stage of incubation in such diseases is indefinite, and that a chance visitor may have left the poison behind, while apparently in good health. Every case of a specific fever can be traced, by patient search, to infection. The prevalence of certain infectious maladies, more especially of those fevers which are common in childhood, is, according to Dr. Wilson, "in great measure attributable to the culpable neglect arising from the popular belief—amounting almost to fatalism—that children must contract them at some time, and that there is therefore little use in endeavoring to take any protective steps where the disease is epidemic. The consequence is that the epidemic continues to spread as long as susceptible victims are to be found in the community, and dies out only for a time when almost all these have been attacked." And it has been stated by Mr. Simon, "that the deaths which occur in this country (England and Wales) are fully a third more numerous than they would be if our existing knowledge of the chief causes of disease were reasonably well applied throughout the country; that of deaths, which in this sense may be called preventable, the average yearly number in England and Wales is about 120,000; and that of the 120,000 cases of preventable suffering which thus in every year attain their final place in the death-register, each unit represents a larger or smaller group of other cases, in which preventable disease, not ending in death, though often of far-reaching ill effects on life, has been suffered. And while these vast quantities of needless animal suffering, if regarded merely as such, would be matter for indignant human protest, it further has to be remembered, as of legislative concern, that the physical strength of a people is an essential and main factor of national prosperity; that disease, so far as it affects the workers of the population, is in direct antagonism to industry; and that disease which affects the growing and reproductive parts of a population must also in part be regarded as tending to the deterioration of the race."

ZYPÆUS, or VAN DEN ZYPE, FRANCIS, 1578–1650; b. Malines, Flanders; jurist and canonist, and author of several legal works. His brother HENRY, 1577–1659, abbot of Saint André, also was an author.
